5. In combination with the tower-uprights A, external rails or ways, F, and adjustable brackets F', for supporting said rails from the uprights, substantially as described.

6. In combination with the prismatic tower, the external lamp-carriage and guides therefor, and supports for the lamps extending above the carriage-frame, whereby the lamps are supported above the top of the tower, substantially as described.

7. In combination with a prismatic tower having a polygonal platform or rail at its top, the lamp-carriage having upwardly-extended posts for supporting the lamps, said posts being arranged in position to rise above said rail or platform opposite its sides, substantially as shown.

8. In combination with the tower uprights A and rails F, a chair, J, immediately secured to the rail, a clamp attached to the upright, and means for adjusting the rail-chair with reference to the clamp and upright, substantially as described.

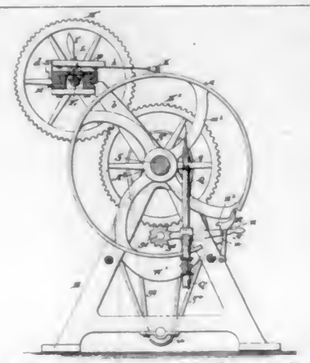
9. The combination, with a skeleton tower and a lamp-carriage capable of moving up and down exteriorly to said tower, of a supporting-post, E^2, attached to said moving carriage, and a bracket for immediately supporting the lamp, constructed to rotate upon said post, whereby said lamp may be caused to swing within reach of the attendant standing within the tower.

10. The combination, with a skeleton tower and a lamp-carriage adapted to move up and down exteriorly to said tower, provided with upwardly-extended posts E^2, of the lamps L, brackets L', tubes L^2, and set-screws L^3, whereby the lamps are supported above the frame-work of the carriage, may be swung inwardly within reach of the attendant standing upon the platform M, and may be adjusted and fastened in any position desired.

11. In combination with the external lamp-carriage, rails F, exteriorly secured to the tower, and with the hoisting-ropes, the brackets E', provided with wheels *e*, fitted to the rails, and with the eyes E^2, to give attachment to the hoisting-ropes, substantially as described.

12. In combination with a triangular tower, the exterior hexagonal lamp-carriage consisting of posts E^2, located opposite the angles of the tower and directly joined by horizontal girts *d'*, parallel with the tower-sides, and intermediate posts, E^2, supported in the same circle with those first mentioned by girts d^2 and necessary braces, substantially as described.

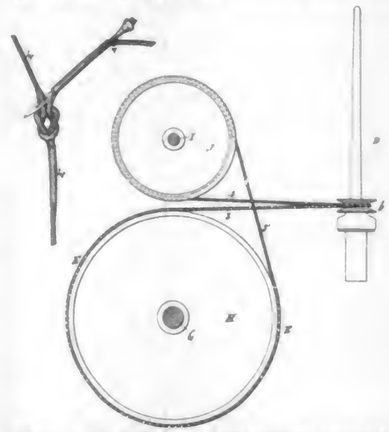
13. In combination with the two-part diagonal braces of a skeleton tower, the recessed junction-plate N, provided with flanges *n* and the nuts N^2, having the collar n^4, and constructed to project outside the junction-plate to give attachment for a wrench, substantially as described.



14. In combination with the two-part diagonal braces of a skeleton tower, the recessed junction-plates N, constructed to mutually close each other when in position, and provided with apertured cross-bars *n'*, whereby the tie-bolt holds said plates more accurately in position opposite each other, substantially as shown.

15. In combination with the junction-plate N, having the semicircular end openings and flanges, *n*, the cylindrical nut N^2, provided with the collar n^4, and exterior squared head n^5 to receive the wrench, substantially as described.

296,376. AUTOMATIC TELEGRAPH. RUFUS ANDERSON, Peekskill, N. Y. Filed Mar. 17, 1883. (No model.)

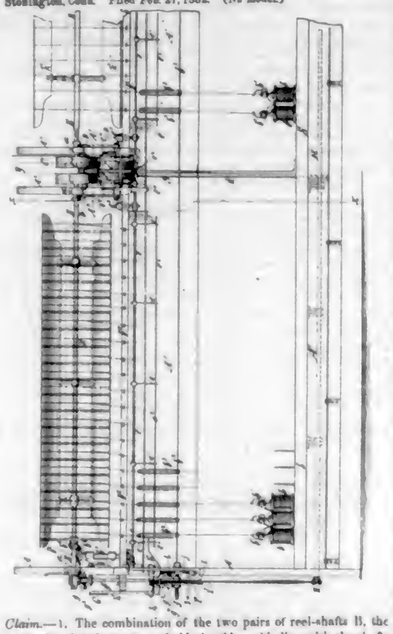


Claim.—1. The combination, with the drum, the sliding carriage and contact-roller carried thereby, and the screw-shaft, of mechanism for engaging the carriage with said screw-shaft and simultaneously bringing the contact-roller in contact with the drum, substantially as described.

2. The combination, with the drum, the carriage-support, the sliding carriage, and the screw-shaft, of the pivoted arm D, having the spring *k* secured thereto, and carrying the contact-roller, the knife-edge plate F, secured to said arm and extending downward through the carriage, and the pivoted disk L, provided with a suitable handle, and having the eccentric pin l^3 extending loosely through said arm D, substantially as described.

3. In an automatic telegraph-transmitter, the combination, with a drum for the reception of a message in non-conducting spaces, and actuated at will by one of two sets of gearing, one of which is adapted to give the drum a much greater rate of speed than the other, of the gear-wheel E^3, mounted upon the drum-shaft and intermediately connected with the screw-shaft, the short shaft S^2, carried by the lever N, the pinion S^4, mounted on the short shaft and arranged to mesh with said gear-wheel, the belt-wheel W', also mounted on said short shaft, and means for transmitting motion to said belt-wheel, substantially as described.

296,377. SPINNING-FRAME AND METHOD OF UNITING THE ENDS OF BANDS THEREOF. JOHN E. ATWOOD and EUGENE ATWOOD, Stonington, Conn. Filed July 19, 1879.



Claim.—1. The combination of a driving-pulley and a guide-pulley having parallel axes, and arranged one over the other, a spindle arranged at one side of said pulleys, with its whirl in a horizontal plane about midway vertically between said pulleys, and a driving-band encircling both of said pulleys and said whirl, and comprising two portions extending horizontally between the whirl and adjacent sides of the two pulleys, and a portion extending directly from one pulley to the other and passing between the said horizontal portions, substantially as described.

2. The combination of a driving-pulley and a guide-pulley having parallel axes, and arranged one over the other, two spindles arranged on opposite sides of said pulleys, with their whirls in a horizontal plane about midway vertically between said pulleys, and two driving-bands, each encircling both of said pulleys and the whirl of a spindle, and each comprising two portions extending horizontally between the whirl around which it passes and the adjacent sides of said pulleys, and a portion extending directly from one pulley to the other and passing between said two horizontal portions, substantially as herein described.

3. The combination of the driving-pulley H and the flanged guide-pulley J and their shafts, arranged parallel with each other and one over the other, the spindle D and its whirl *b*, arranged as described, and the driving-band E, encircling both of said pulleys and said whirl, and comprising the horizontally-extending portions S S and the portion S', passing between the portions S S, all substantially as herein described.

4. The method of uniting the ends of the bands, which consists in looping the end portions into each other so as to lock or engage each with the other, and then sheathing the ends each within the portion of the band from which it proceeds, substantially as herein described.

296,378. MACHINE FOR REELING SILK, &c. JOHN E. ATWOOD, Stonington, Conn. Filed Feb. 27, 1882. (No model.)

Claim.—1. The combination of the two pairs of reel-shafts B, the shafts of each pair being arranged side by side and in line with the shafts of the other pair, friction-wheels c^4 upon the adjacent inner ends of said shafts, with friction driving-wheels c^3, on which the wheels c^4 rest, means for raising any one of the reel-shafts independently of the others, to carry its wheels c^4 out of contact with its driving-wheel c^3, a driving-pulley, C, arranged between the pairs of shafts and midway between the shafts of each pair, and mechanism for transmitting motion from this pulley C to all of the friction driving-wheels c^3, all substantially as and for the purpose specified.

2. The combination of the two pairs of reel-shafts B, provided with friction-wheels c^4, and arranged, as herein described, with two friction driving-wheels, c^3, and an interposed gear-wheel, c^3, connected together and arranged below the shafts, which are in line on each side of the machine, the friction-wheels c^4 of the reel-shafts resting on the friction driving-wheels c^3, the hand-levers D, whereby any one of said reel-shafts may be raised independently of the others to carry its wheel c^4 out of contact with its friction driving-wheel c^3, the single driving-pulley C and pinion *c*, and the gear-wheels *c'*, for transmitting motion from the pinion *c* to the interposed gear-wheels c^3, all substantially as specified.

3. The combination, with the rod b^{10}, of the drop-wires b^3, each composed of a single piece coiled at about the middle of its length to form an eye, and having two parallel portions extending from said eye to and coiled around said rod b^{10}, substantially as herein described.

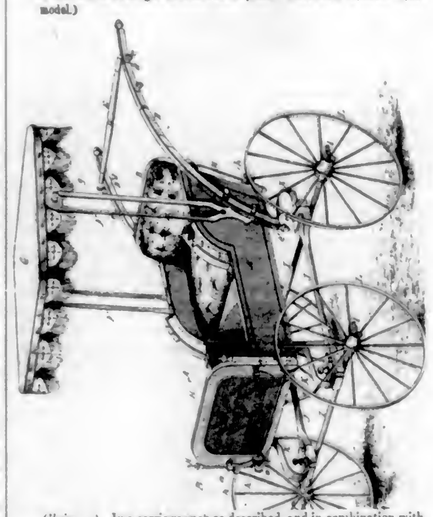
4. The combination, with one or more reels and driving mechanism therefor, of a separate stop-motion for each reel, a rotary counter or trip for each reel, and a separate drop-lever adapted to be released by said counter or trip and to act upon the stop-motion to stop the reels, substantially as herein described.

5. The combination, with a reel and a stop-motion for automatically stopping the same when a thread breaks or runs out, of a counting device, which operates through said stop-motion to stop the reel when a sufficient quantity of material is wound thereon, and a target or indicator operated by the counting device, and adapted to show by its position whether the stoppage of the reel is due to a sufficient quantity of material being wound thereon or to a thread breaking or running out, substantially as herein described.

6. The combination, with one or more reels, driving mechanism therefor, and independent stop-motions of a separate rotary counter or trip and a separate drop-lever for each reel, mechanism for advancing the counters with a step-by-step motion, and mechanism for turning the counter or counters backward when released, substantially as herein described.

7. The combination, with the two pairs of reels and their common driving mechanism, of separate stop-motions for the several reels, the ratchet-wheel counters F and their attached pulleys I, the belts I' and means for driving them, the screw-threaded studs *f*, the drive-pawls g^3, and the drop-levers G, having pins h^3, and adapted to act upon the stop-motions to stop any one of the reels, substantially as herein described.

8. The combination, with two pairs of reels and their common interposed driving mechanism, of separate stop-motions for the several reels, the ratchet-wheel counters F, their attached pulleys I, belts I' and means for driving said belts, the screw-threaded studs *f*, the drive-pawls g^3, the drop-levers G, having pins h^3, and adapted to act on the several stop-motions, and the adjustable stops for arresting the backward movement of said counters F, substantially as herein described.



9. The combination, with a rotary counter, F, of a drop-lever, G, fulcrumed at one end, and a rest, A', for supporting the free end of said lever, substantially as specified.

10. The combination, with a rotary counter, F, of a drop-lever, G, fulcrumed at one end, a rest, A', for supporting the free end of said lever, and a stop, *a*, for arresting said lever in its fall, substantially as specified.

11. The combination, with a rotary counter, F, of a drop-lever, G, a fulcrum stud or pin, A, providing for the adjustment of said lever toward and from said counter, and a rest, A', for supporting the free end of said lever, and also adjustable, substantially as specified.

12. The combination, with the frame A and a rotary counter, F, of a drop-lever, G, a fulcrum-stud, A, screwed into said lever and adapted to be turned in said frame, and an adjustable rest, A', for supporting the free end of said lever, substantially as specified.

296,379. CHILD'S CARRIAGE. CLEM BAILEY, Kinston, N.C., assignor of one-half to Oettinger Brothers, same place. Filed Nov. 16, 1883. (No model.)

Claim.—1. In a carriage such as described, and in combination with the running-gear, the detachable body mounted directly upon the springs and provided with folding legs, substantially as described.

2. In a carriage such as described, and in combination with the running-gear thereof, the removable body mounted directly upon the springs, and provided with folding legs and the separable rockers, substantially as described.

3. In a carriage such as described, the combination, with the body, of curved handle-bar supports adapted to serve as rockers for the cradle.

4. In combination with the body, removably secured to the running-gear, as described, the folding legs attached to the body, and provided with means for securing them in position when folded, substantially as described.

5. As a means for uniting the handle-bars to the body of the carriage, and in combination therewith, the hook-joint, key-plate, and thumb-screws, arranged and applied substantially as described.

6. In combination with the carriage-body, handle-bar supports, and top standards, the hook-joints, key-plates, and thumb-screws for fastening the handle-bar supports and standards to the body, as set forth.

7. In combination with the standards and the pivoted top or canopy, the spring-brake to sustain the top in position on the rod.

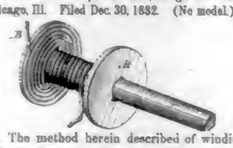
8. The combined carriage-seat and chair, constructed, substantially as described, in sections, with the back rest removably connected to the seat, and the front support hinged to the latter.

9. In a carriage such as described, the removable seat and back rest constructed in sections, united as described, and adapted to form a chair when removed from the carriage-body.

10. In a carriage such as described, the detachable running-gear consisting of the axles provided with sockets for the reception of the side bars, in combination with the springs and thumb-screws.

11. In combination with a carriage-body such as described, the folding legs and detachable rockers.

12. In a carriage such as described, the S-shaped springs provided with a base-plate and interlocking ears for attachment to the axle, and with perforated ears for attachment to the body.



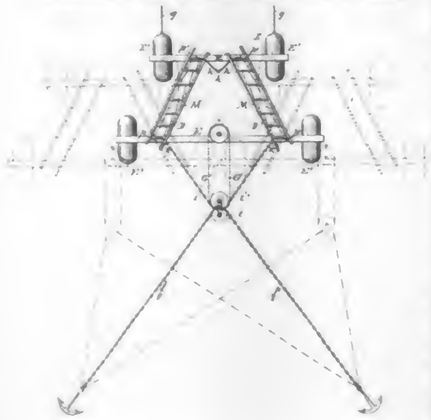
13. In a carriage such as described, the combination, with the sectional body, of the springs attached to the body by the thumb-screws for securing the sections together.

14. In combination with the removable curved handle-bar supports, the detachable handle-bar provided with pins for attachment to the handle-bar supports, as set forth.

15. In combination with the carriage-body provided with detachable legs, and adapted to be applied to the running-gear, the curved handle-bar supports provided with means for attachment to the legs, as and for the purpose set forth.

16. In a carriage such as described, and in combination with the body thereof, the detachable running-gear, the folding legs, and the curved handle-bar supports, whereby the carriage may be converted into a cradle.

296,380. ELECTRIC HELIX AND METHOD OF WINDING THE SAME. FORBE BAIN, Minneapolis, Minn., assignor to the Bain Electric Company, Chicago, Ill. Filed Dec. 30, 1882. (No model.)



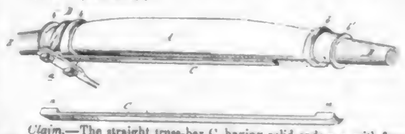
Claim.—1. The method herein described of winding an electric helix, consisting in winding a small portion of the helix from the core outward until said portion is completed and the end of the wire lies at the top, and then winding the remaining portion of the helix with the other end of the wire from the core outward, and leaving said final or second end also on top, substantially as and for the purpose set forth.

2. The method, substantially as hereinbefore described, of winding an electric helix, which consists in winding one coil with the layers superposed and leaving the end of the wire on top, and then winding the remaining coils and leaving the end of the wire on top.

3. An electric helix composed of a continuous wire, one coil of which has the consecutive layers of wire superposed and the end left on top, and the remainder of the wire wound in the usual way with the end left outside the coils, substantially as described.

296,381. HYDRAULIC MOTOR. HERMANN BAUMOTTE, Vossnaiken, (near Kupferdreh,) Prussia, Germany, assignor to himself and Rudolph Noggerath, St. Johann on Saar. Filed Nov. 19, 1883. (No model.)

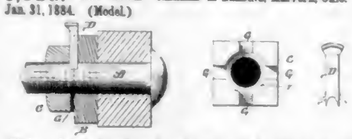
Claim.—1. In a hydraulic motor, the combination of a floating main frame, converging auxiliary frames arranged symmetrically to the direction of the current, and endless paddle-chains mounted on sprocket-wheels of said auxiliary frames, the paddles of said chains being arranged diagonally to the axis of the chain and at right angles to the direction of the current, substantially as set forth.



2. In a hydraulic motor arranged at an angle to the direction of the current, the combination of a supporting-frame, longitudinal guide-ways, a paddle-chain mounted on sprocket-wheels of said frame, and lateral paddle-bars having anti-friction rollers at the ends, one roller being made larger and the second roller being arranged with a cavity at its end, the second roller being arranged in said cavity and at right angles to the axis of the larger roller, substantially as described.

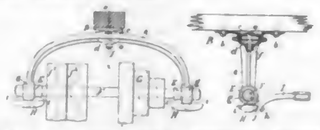
3. In a hydraulic motor, the combination of two symmetrically-arranged converging paddle-chain motors with forward-extending water gates or deflectors located between the rear ends of the motors, said water-gates being connected to each other, so as to divide the current, substantially as set forth.

4. In a hydraulic motor, the combination of floating paddle-chain motors and an intermediate chain attached to two points at the front of the motor-frame and connected at its center point to an anchoring-chain, substantially as set forth.



5. In a hydraulic motor, the combination of two floating paddle-chain motors supported on a connecting main frame, an intermediate front chain attached to two points of said frame, an anchoring-chain connected to the said center of the intermediate chain and anchored at both ends, a steering or adjusting chain extending from the motor-frame to the point of connection of the intermediate and anchoring chains, a sprocket-wheel at the outer end of said steering-chain, and motion-transmitting gearing, by which the sprocket-wheel is caused to travel along the anchoring-chain, so as to shift the motor to one side or the other from its normal position, substantially as specified.

296,382. AXLE-TRUSS. ALLEN J. BEACH, Linden, Mich. Filed Dec. 1, 1881. (No model.)

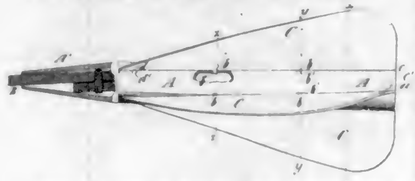


Claim.—The straight truss-bar C, having solid ends *a a*, with faces corresponding to the surface of the skeins, combined with the skeins B, having flanges *b*, and with the securing-clips D, whereby the truss-bar extends in substantially a straight line from skein to skein, so as to give the axle a limited amount of spring, and yet arrest the movement of the same under unusual strain, substantially as described.

296,383. NUT-LOCK. CHARLES E. BELDING, Malvern, Ohio. Filed Jan. 31, 1884. (Model.)

Claim.—In a nut-lock, the combination of the bolt, a nut, a forked key, and a plate or washer, the plate or washer and the nut being provided with grooves, so that when the key is driven into position its forked ends will be expanded around the sides of the bolt, substantially as shown.

296,384. SHAFT-HANGER. THEODORE BERGNER, Philadelphia, Pa. Filed Feb. 23, 1884. (No model.)

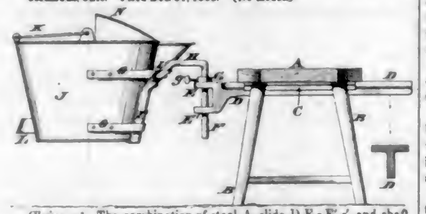


Claim.—1. A duplex hanger for counter-shafts mounted and universally adjustable upon a stationary foot-plate, substantially as and for the purposes described.

2. In combination with the frame, single or duplex, of a hanger, the journal-box, oil-dish, and clamping set-screw, substantially as and for the purposes set forth.

3. The combination, in a single or duplex hanger, of a reversible journal-box, reversible oil-dish, and reversible belt-shifter arm, substantially as and for the purposes described.

296,385. ROTATOR FOR SHIPS' LOGS. JOHN BLISS and GEORGE H. BLISS, Brooklyn, N. Y. Filed Feb. 18, 1884. (No model.)

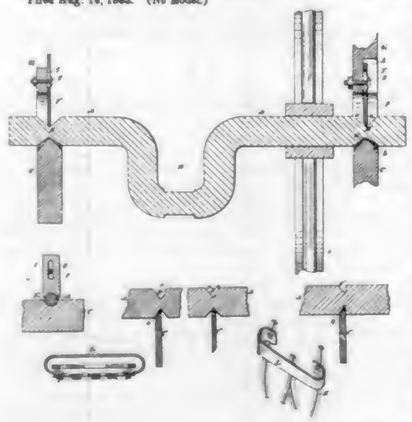


Claim.—1. A rotator for ships' logs, having an approximately cylindric body with a tapering forward end, and having spiral wings or blades which taper from their rear ends forward and form helicoidal surfaces radial throughout their length to the longitudinal center or axis of the body, substantially as herein described.

2. A rotator for ships' logs, having an approximately cylindric body with a forwardly-tapering end, and having spiral wings or blades which have a gradual taper from the place of largest diameter to the forwardly-tapering end, the taper of said end forming an approximate continuation of the taper of said wings or blades, and which form helicoidal surfaces radial throughout their length to the longitudinal center or axis of the body, substantially as herein described.

3. The combination, with the rotator-body A, of the wings or blades C, provided between their ends with teats or projections *b*, which enter holes *b'* in the body, and maintain the said wings or blades in spiral alignment on the body, substantially as herein described.

4. The combination, with the rotator-body A, of the wings or blades C, provided with tongues *c d*, and projections *b*, entering slots and holes *c' d' b'* in said body, and serving to preserve the spiral alignment of the said wings or blades, substantially as herein described.



296,386. COMBINED MILK BUCKET AND STOOL. GEO. C. BOVEY, Columbus, Ohio. Filed Dec. 21, 1883. (No model.)

Claim.—1. The combination of stool A, slide D E e F *e'*, and shaft F, to which latter is fastened the milk-bucket J, said shaft being provided with a shiftable collar, G *g*, for the purpose described.

2. As a new article of manufacture, a milk-bucket having attached to it the shaft F, provided with a bend, H, socket I, and shiftable collar G *g*, as and for the purpose specified.

296,387. SHAFT-SUPPORT. ANDREW J. BRILL, Cincinnati, Ohio. Filed Aug. 16, 1883. (No model.)

Claim.—1. The shaft having a groove at right angles to its length and diminishing in cross-section as its approaches the center of the shaft, and the lower bearing-piece having a sharp edge engaging the bottom of the groove, the edge being curved in the direction of its length to fit the convexity of the shaft, substantially as and for the purposes specified.

2. A shaft having an annular groove in cross-section diminishing in size toward the center of the shaft, in combination with the lower bearing, the sides of the upper edge of which are beveled to form a knife-edge, the bottom of the annular groove resting on said knife-edge, and the sides of said groove being free from the beveled upper edge of said lower bearing, substantially as and for the purposes specified.

3. A shaft having an annular groove in cross-section diminishing in size toward the center of the shaft, in combination with the lower bearing, the sides of the upper edge of which are beveled to form a knife-edge, the bottom of the annular groove resting on said knife-edge, and being curved in the direction of its length to fit the convexity of the shaft, the sides of the groove being free from the beveled upper edge of said lower bearing, substantially as and for the purposes specified.

4. In combination, the shaft having annular groove in cross-section diminishing in size as it approaches the center of the shaft, and a lower bearing-piece having a substantially sharp edge engaging the bottom of said groove, the sides of the groove being free from the beveled sides of said bearing, substantially as and for the purposes specified.

5. In combination, the shaft having annular groove in cross-section diminishing in size as it approaches the center of the shaft, and a bearing-piece having a sharp edge engaging with the bottom only of said groove at one side of the shaft, and an upper bearing-piece having a sharp edge engaging the bottom only of said groove at the opposite side of said shaft, substantially as and for the purposes specified.

6. In combination, the shaft having annular groove provided with beveled sides, and a lower bearing-piece having beveled sides terminating in a sharp edge engaging said groove, and the upper bearing-piece having beveled sides terminating in a sharp edge engaging said groove, substantially as and for the purposes specified.

7. The shaft having annular groove and meeting beveled sides, in combination with two opposite bearing-pieces located at substantially opposite sides of its periphery, and each having a sharp edge engaging the bottom of said groove, and curved in the direction of its length to fit the periphery of the shaft at the bottom of the groove, substantially as and for the purposes specified.

8. The mechanism of annular beveled edge bearings and a knife-edge support, in combination with a knife-edge upper support, substantially as and for the purposes specified.

9. In combination, the shaft having annular groove provided with beveled sides and narrow bottom, and lower bearing-piece provided with sharp edge engaging the bottom of said groove, and the upper bearing-piece provided with slot and setting-screw device, substantially as and for the purposes specified.

10. In combination with the shaft having annular groove, substantially as herein described, the knife-edge lower bearing, and the upper bearing having a knife-edge and slot and set screw or bolt, substantially as and for the purposes specified.

11. In combination, a machine-stand having the yoke cast to the leg, the yoke carrying a knife-edge bearing, and the leg carrying a knife-edge bearing, and the shaft, crank, and slotted bearing-pieces, substantially as and for the purposes specified.

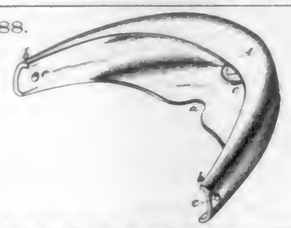
12. In combination, a machine-stand having the yoke cast to the leg, the yoke carrying a knife-edge bearing, and the leg carrying a knife-edge bearing, and the shaft, crank, and slotted bearing-pieces, substantially as and for the purposes specified.

13. In combination, a machine-stand having the yoke cast to the leg, the yoke carrying a knife-edge bearing, and the leg carrying a knife-edge bearing, and the treadle-shaft, crank, and slotted bearing-pieces, the leg being provided with recess for reception of a bearing-piece, substantially as and for the purposes specified.

14. In a sewing-machine stand, a half-yoke for supporting a bearing of the treadle-shaft, said half being screwed to the leg at each side of the stand, substantially as and for the purposes specified.

15. In combination with the leg of a machine-stand, the knife-edged bearing located in the leg and adapted to engage a groove in the shaft, substantially as and for the purposes specified.

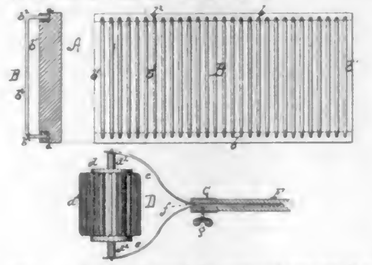
16. In combination with the leg of a machine-stand, the knife-edged bearing located in and cast to the leg and adapted to engage a groove in the shaft, substantially as and for the purposes specified.



17. The half-yoke provided with a knife-edge bearing cast to the yoke, substantially as and for the purposes specified.

18. In a sewing-machine, the combination of the stand, fly-wheel, crank, adjustable knife-edge bearings C F, and shaft provided with annular grooves, substantially as and for the purposes specified.

296,388. EYE-PROTECTOR. RUFUS CHOATE, WILLIAM H. ROHRER, and ANDREW H. RAGAN, Washington, D. C. Filed July 24, 1883. (Model.)

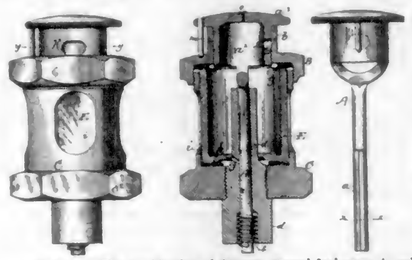


Claim.—An eye-shield consisting of a projection shield formed of paper-pulp, adapted to fit and be secured to the face of the wearer above

296,388.

and below the eyes, said shield having a narrow horizontal front opening or slit, substantially as set forth.

296,389. PLAITER AND PUFF-FLUTER. JANE A. CLOTHIER, Cumberland, Wis. Filed Aug. 27, 1883. (No model.)



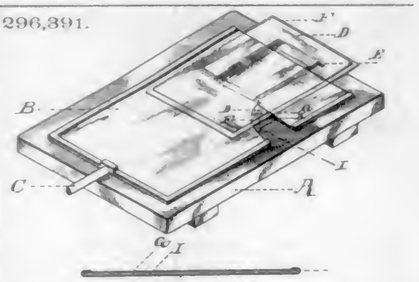
Claim.—1. The plate A, having the rabbet *a* on each side, in combination with the frame B, consisting of the side pieces, *b b*, and transverse strips *b'*, as set forth.

2. The plate A, having the rabbet *a* on each side, in combination with the frame B, consisting of the side pieces, *b b*, and transverse strips *b'*, said strips having the curves b^2 and middle portions, b^3, the latter out of the plane of the side pieces, *b b*, as set forth.

3. The presser-roller D, consisting of the body *d*, radial wings *d'*, and arbor d^2, in combination with the adjustable handle E, as set forth.

296,390. OIL-CUP. ISAAC H. CONGDON, Omaha, Nebr. Filed Feb. 1, 1884. (No model.)

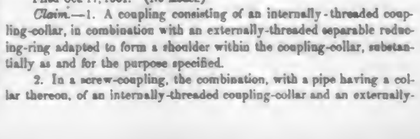
Claim.—1. The combination of the cam-shaped feed-stem A and guide-stem *d* with spiral spring *f*, adapted to hold the cap of guide-stem A close on top of the cylindrical cap-nut B, substantially as and for the purpose set forth.



2. The combination of the cam-shaped feed-stem A, having the cylindrical top *a* and oblong hole L, cut through said cylindrical portion, with the cap-nut B, having the oblong hole K, cut through the extended rim of the same, substantially as and for the purpose described.

296,391. ART OF PRINTING BY SUNLIGHT OR OTHER LIGHT, AND APPARATUS THEREFOR. EZRA COPE, Hamilton, Ohio. Filed Jan. 5 1884. (No model.)

Claim.—1. In a sun-printing apparatus, an envelope provided with an exhaust-aperture, and having one of its layers of proper transparency, and one or both of its layers of collapsible limpness, substantially as and for the purpose specified.

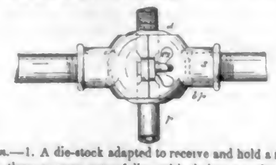


2. In a sun-printing apparatus, an envelope provided with an exhaust-aperture, and having one of its layers of proper transparency, and one or both of its layers of collapsible limpness, and adapted to receive a sensitive sheet or a negative, or both, substantially as and for the purpose specified.

296,391.

3. The improvement in the method of securing close contact between the negative and sensitive sheet in the art of sun-printing, which consists in connecting them together and exhausting the air from between them, substantially as set forth.

296,392. SHOE-CALK SHARPENER. JOHN H. CUNNINGHAM, Etna, assignor to himself and William M. Fishaven, Allegheny, Pa. Filed Jan. 11, 1884. (No model.)

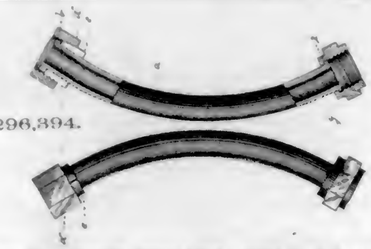


Claim.—1. In a tool for sharpening calks and other articles, the combination, with two files arranged parallel, of a clamp-handle composed of two plates or leaves, each provided with two parallel V-shaped grooves for the reception of the adjacent ends of the files, and devices for securing the leaves or plates together, substantially as and for the purposes specified.

2. In a tool for sharpening calks and other articles, the combination, with two files arranged parallel, of a handle provided with clamping-plates for securing the adjacent ends of the files at one extremity of the tool, and a detachable hand-rest provided with devices for clamping the adjacent ends of the file at the opposite extremity of the tool, substantially as and for the purposes specified.

3. In a tool for sharpening calks and like articles, the combination, with two files arranged parallel, of a detachable clamp for securing the adjacent ends of the two files, said clamp provided with a handle which extends in the axis or line of the files, substantially as and for the purposes specified.

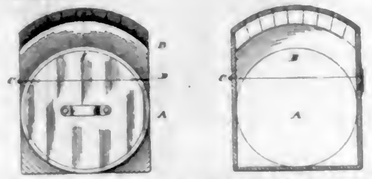
296,393. SCREW-CUTTING DIE. JAMES M. DODGE, Indianapolis, Ind. Filed Nov. 22, 1883. (No model.)



Claim.—1. A die-stock adapted to receive and hold a movable block containing three or more sets of dies, with their respective guides so arranged that the axis of each die and its guide may, at will, be placed and held at right angles with the axis of the handles and coincident, or nearly so, with the longitudinal center of the tool when complete, preserving its working-balance, substantially as described.

2. The movable multiple-faced die and guide herein described, the opening on one side adapted to receive and guide the pipe, the opposite face provided with a die for cutting a thread upon the pipe, in combination with any suitable die-stock for receiving and clamping the same, substantially as described.

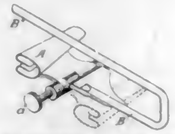
296,394. COUPLING DEVICE. DANIEL P. DERCOLI, Pittsburg, Pa. Filed Oct. 17, 1881. (No model.)



Claim.—1. A coupling consisting of an internally-threaded coupling-collar, in combination with an externally-threaded separable reducing-ring adapted to form a shoulder within the coupling-collar, substantially as and for the purpose specified.

2. In a screw-coupling, the combination, with a pipe having a collar thereon, of an internally-threaded coupling-collar and an externally-

threaded reducing-ring adapted to form a shoulder within the coupling-collar, substantially as and for the purpose specified.



296,395. TRUNK. ABEL R. EARL, St. Louis, Mo. Filed Jan. 9, 1884. (No model.)

Claim.—1. A trunk the top of which is made of strips connected by V-joints, substantially as shown and described.

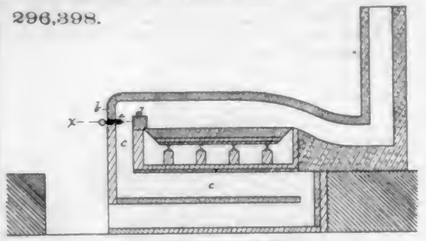
2. A trunk the top of which is made of strips connected by V-joints and provided with round corners, as set forth.

296,396. REVERSIBLE BINDING ATTACHMENT FOR SEWING-MACHINES. LYNDES F. ELLSWORTH, Wilton, N. Y. Filed Aug. 13, 1880. (No model.)

Claim.—1. A binding attachment for sewing-machines, consisting of a supporting-rod adapted to be adjustably secured to the presser-bar above the bed-plate, and in a line at right angles to the path of the needle, a scroll guide or guides, and means whereby the opening or mouth of the said guide or guides may be presented to either the outer or inner side of the needle-path, substantially as described.

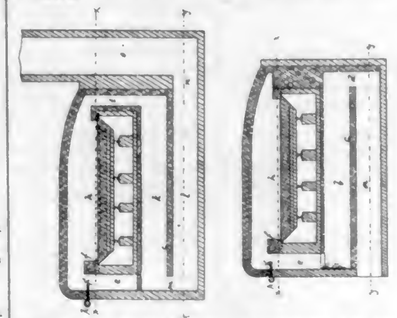
2. In a binding attachment for sewing-machines, the combination, with a suitable support, of a hinged binding-guide adapted to be adjusted to reverse positions, substantially as described, and for the purpose set forth.

296,397. ERASER. GEORGE ELSEY, Springfield, Mass. Filed Feb. 6, 1883. (No model.)



Claim.—1. The combination of a base-piece, *a*, having projections *c*, an erasing material, a handle-piece, *i*, and means to hold the parts in position, substantially as and for the purposes stated.

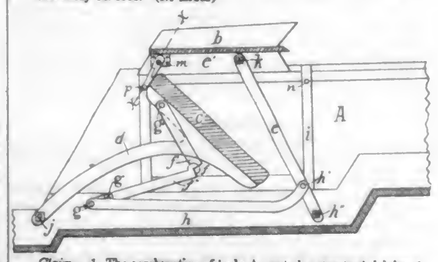
2. The piece *i*, screw *j*, and erasing material A, in combination with a base-piece, *a*, having boss *b*, pins *d*, and projections *c*, all constructed and operating substantially as shown.



296,398. BRICK NOZZLE FOR GAS-FURNACE PIPES. JOHN EVANS, Etna, Pa., assignor of one-half to George A. Chalfant, same place. Filed June 1, 1883. (No model.)

Claim.—In furnaces for burning gaseous fuel, the combination, with the air-flue and bridge-wall, of the refractory gas-induction nozzles arranged in the furnace-walls and projecting into the air-flue to a point at or near the bridge-wall, said nozzles having beveled delivery ends and sockets for the reception of the gas-supply pipes, substantially as and for the purposes specified.

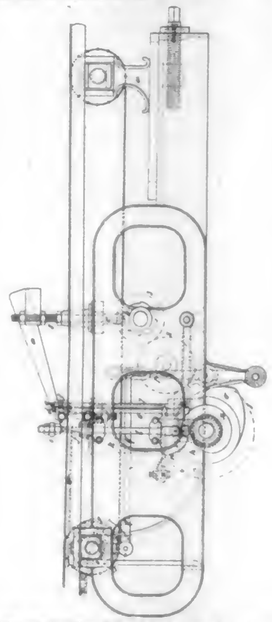
296,398.



296,399. HEATING-FURNACE. JOHN EVANS, Etna, Pa., assignor of one-half to George A. Chalfant, same place. Filed June 1, 1883. (No model.)

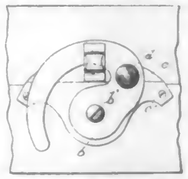
Claim.—1. In a heating-furnace, the combination of the following elements, viz: return air-flues extending under the bed, and having the receiving and delivery ports at the front end of the furnace, a vertical chamber in front of the bridge-wall communicating with the air-flues, waste or smoke flues extending forward under the bed, and then back to the stack at the sides of the air-flues, and having the receiving and delivery ports at the rear end of the furnace, said air and waste-product flues being arranged alternately and in vertical planes, and a gas-main having branches which discharge the gas into the vertical air-chamber at or near the bridge-wall, substantially as and for the purposes described.

2. In combination with the bed of a heating-furnace, a regenerator-chamber arranged beneath the same, said chamber composed of a series of air and waste-product flues constructed in the form of return-flues, as specified, the air-flues having their receiving and delivery ports at the front of the furnace, the waste-product flues having their receiving and discharge ports at the opposite or rear end of the furnace, and the air and waste-product flues arranged parallel and alternating, whereby the air and waste products travel in reverse direction, and the air travels progressively from the coolest to the hottest part of the furnace, substantially as specified.



296,400. JUMP-SEAT CARRIAGE. DUDLEY E. GALE, Salisbury, Mass. Filed May 14, 1883. (No model.)

Claim.—1. The combination of body A, seats *b c*, standard *d*, jointed support *f*, jamping-iron *e*, and connecting-rod *h*, with said rod pivoted at its rear end to jumping-iron *e* at *h'*, above pivot *h''*, and having its front end pivoted to section *f''* of support *f* at *g''*, below pivot *g*, substantially as specified.



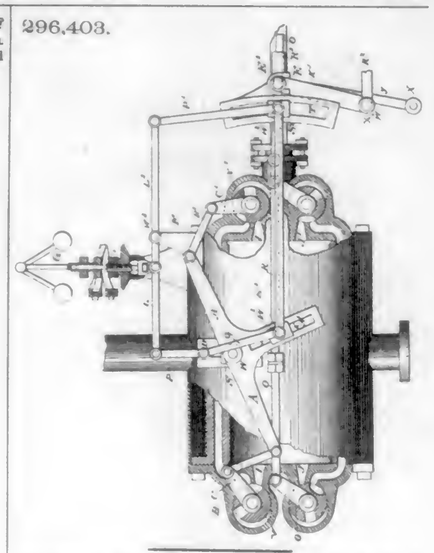
2. In combination with seat *b* and body A, the spring *l*, secured to base *c'* of the seat, and provided with the actuating-knob *p* and stud *t*, to engage seat *u* in the body, substantially as specified.

296,401. MACHINE FOR CARDING BUTTONS BY MEANS OF ELECTRICITY. LOUIS GILLON, Les Lilas, near Paris, France. Filed Jan. 7, 1884. (No model.) Patented in France Mar. 8, 1883, No. 154,136, and in Belgium Mar. 10, 1883, No. 60,710.

Claim.—The combination of the chutes *a*, pins *d e*, electro-magnet *k*, notched pole-piece *j*, and bar *i* with mechanism, substantially as described, for moving the pins *e* and the bar *i*, and for moving a card over the notched pole-piece and under the bar *i*, substantially as herein shown and described.

296,402. FASTENER FOR THE MEETING-RAILS OF SASHES. WILLIAM GOFORTH, Windsor, Mo. Filed Apr. 26, 1883. (Model.)

Claim.—The sash-fastening herein described, composed of the latch having its shank pivoted on the sash B, and provided with the tongue curved on an arc struck from its pivot and beveled from its point upward, and adapted to be swung twice over the joint between sashes A B, and the stop having a lateral ledge or plate projected from its upper end and arranged on sash A in position to be engaged by the latch-lever, substantially as described, and for the purposes set forth.



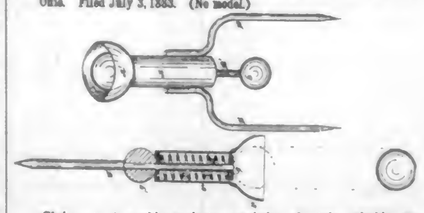
296,403. CUT-OFF MECHANISM. WM. FARR GOODWIN, Stelton, N. J. Filed May 9, 1883. (No model.) Patented in England May 23, 1883, No. 2,584.

Claim.—1. In combination with the induction-valves of a steam-engine, the adjustable lever or rock arms A A A′, links B B′, crank-arms C C′, pivot W, and rod R, combined together into a working system, in the manner and for the purpose substantially as described.

2. In combination with the levers A A A′, links B B′, crank-arms C C′, valves V V′, and rod R, the adjustable pivot-bearings S, S′, and S², slot K, support D, and link *q*, arranged to operate in the manner and for the purpose substantially as illustrated and described.

3. The lever or combined levers A A A′, links B B′, crank-arms C C′, the link-arm K′, slot T, pivot W², and rods R and R′, combined together and arranged to operate in the manner and for the purpose substantially as illustrated and described.

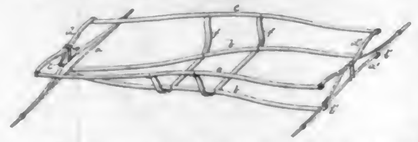
296,403.



296,404. AUTOGRAPH-ALBUM. WILLIS C. GRANT, Norwalk, assignor to himself, and Robert V. MURRAY and William Engel, both of Cleveland, Ohio. Filed Mar. 14, 1883. (No model.)

Claim.—An autograph-album provided with a series of leaves to receive autographs, another series of leaves furnished with spaces consecutively numbered, said spaces each adapted to receive a sentence of a romance or the like, and provided with two columns—one for the numbers of the spaces and the other for the entry of the page on which the writer's autograph is entered—and a series of leaves divided into spaces suitable to receive sketches, said spaces also being consecutively numbered, substantially as set forth.

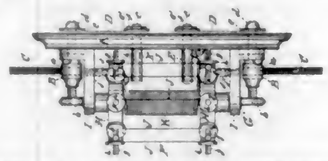
296,405. MARBLE-PROJECTOR. JOHN H. GREENWOOD, Columbus, Ohio. Filed July 3, 1883. (No model.)



Claim.—1. A marble-projector consisting of a tube suitably supported and having an interior spring-plunger, the outer end of said plunger being provided with a target, and means, substantially as described, for compressing the spring of the plunger and retaining it in this position until released by a blow on the target, substantially as and for the purposes described.

2. The tube A, provided with legs B, in combination with the plunger B′, located partly within said tube, and provided with a spring, as C, the outer end of said plunger being provided with a target, *b*′, and mechanism for retaining it in this position until released by a blow on the target *b*′, substantially as and for the purposes described.

3. The tube A, having a flared upper end or bowl, A′, and a perforated bottom, *a*, and provided with legs B, in combination with the plunger B′, having a head or disk, *b*, and a target, *b*′, located partly within the tube A, and provided with a notch, *d*, adapted to engage with the bottom *a*, that portion of the plunger which is within the tube being surrounded by a spring, C, compressed between the head *b* and the bottom, substantially as and for the purposes described.



4. The toy substantially as set forth, and consisting of legs B, tube A, spring-rest *a*, spring C, plunger B′, carrying the target *b*′, and spring locking device, the top of the tube being adapted to receive and sustain a marble or other pellet, substantially as and for the purposes described.

296,406. VEHICLE RUNNING-GEAR. WILLIAM W. GRIER, Hilton, Pa. Filed Feb. 7, 1884. (No model.)

Claim.—The combination, in a no-perch vehicle-gear, of diagonal springs connected to the middle of the front axle and to the rear axle at or near its ends, with cross-springs fastened to the head-block and at the top of the rear axle, side springs connected to the ends of the cross-springs, and braces uniting the diagonal and side springs, substantially as and for the purposes described.

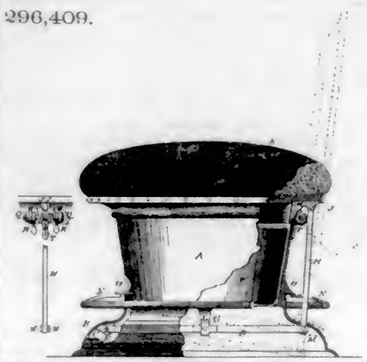
296,407. LIGHTNING-ARRESTER FOR TELEGRAPH AND TELEPHONE LINES. JOHN GRIFFIN, Philadelphia, Pa. Filed Oct. 13, 1883. (No model.)

Claim.—1. In a telegraph and telephone lightning-protector, the combination of the spring K with the reel F, screw-stops *j*″ *j*′, and pins *j j*, the spring surrounding the shaft G and being confined at one end to a disk, H, of the reel, and at the other end to the base A, substantially in the manner and for the purpose set forth.

2. The combination of the screw-stops *j*″ *j*′ and pins *j j* with the disks H H and housings I I, substantially as and for the purpose set forth.

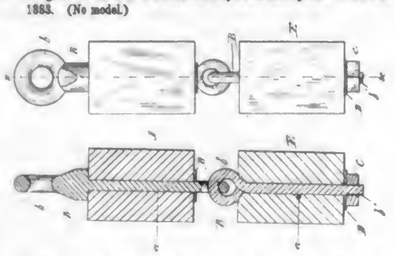
296,408. BUTTON. JOSIAH HARRINGTON, Berkswell Lodge, 66 Water Lane, Brixton, County of Surrey, England. Filed Mar. 28, 1882. (No model.) Patented in England June 22, 1881, No. 2,729.

Claim.—A button having a post, *a*², and the foot-piece *a*, rigidly connected to the outer end, and projecting from one side of said post at a right angle thereto, and provided with recesses, in combination with the spring-bow or foot-piece *a*′, having the lugs *a*³, the foot-piece *a*′ being of larger diameter and adapted to embrace the foot-piece *a* in the same plane therewith, and to be retained either in an open or closed position by the elasticity of its arms and the lugs and recesses, all substantially as and for the purpose set forth.



296,409. SPITTOON-HOLDER. BENJAMIN H. HASKINS, Mechanicsville, N. Y., assignor of one-half to John Young, same place. Filed Jan. 28, 1884. (No model.)

Claim.—1. A spittoon-case or a spittoon provided with a hinged cover encircled with a pedal-rail having provisions for engaging with stationary fulcrum-points on said case, and capable of depression at all points of its periphery, in combination with mechanism connecting said pedal-rail with said hinged cover, adapted to secure the elevation of said cover by the depression of said pedal-rail, the whole being constructed and arranged to operate substantially in the manner described, and for the purposes set forth.

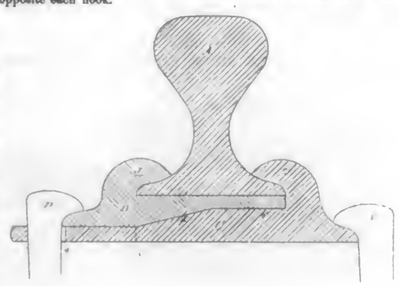


2. A circumambient pedal-rail having provisions for engaging with fulcrum-ledges on the spittoon-case or spittoon, in combination with mechanism connecting said rail with the cover of the spittoon-case or spittoon, whereby said case or spittoon will be uncovered by the act of depressing said rail at any point in its periphery, substantially in the manner described and set forth.

3. A spittoon case or holder having a chamber for the reception of the spittoon, a hinged cover adapted to be used as an ottoman or foot-rest, and provided with mechanism whereby said cover may be raised, so as to open said case for use, by the depression of an encircling foot-rail, substantially in the manner described and set forth.

296,409.

296,410. SASH-WEIGHT. CHARLES EBERHARD HEISE, Chicago, Ill., assignor of one-half to James N. Raymond, same place. Filed Dec. 20, 1883. (No model.)

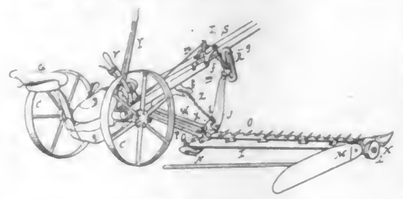


Claim.—1. A sash-weight composed of a solid and separate body having a hole through it from end to end, and a bolt extending through the hole, and provided with a loop or ring at one end and means whereby it is secured to the body at the other, substantially as and for the purposes set forth.

2. A sash-weight body, A, of lead cast under pressure, having a hole, *a*, extending through it from end to end, in combination with the metal bolt B, provided with a ring or loop, *b*, at one end and a threaded section, *b*′, at the other, and the fastening-nut C, substantially as and for the purposes set forth.

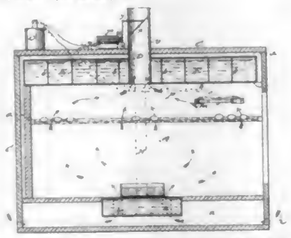
296,411. RAILWAY. RUFUS A. HOUGHTON, Defiance, Ohio. Filed Oct. 1, 1883. (No model.)

Brief.—A rail-support consists of a bed-plate and intermediate plate with irregular adjacent surfaces, each plate formed with a projecting hook to engage the foot of a rail, and constructed with the greater bulk of metal opposite each hook.



Claim.—1. A base and support for railway-rails, and as a means for securing the same upon the ties, the bed-plate C and intermediate plate, B, each provided with a projecting hook, as described, said plates constructed with the greater bulk or thickness of metal directly opposite said hooks, substantially as and for the purpose set forth.

2. In combination with the rail A, the intermediate plate, B, and bed-plate C, adapted to grasp the foot of the rail, said plate constructed with a broken upper surface, substantially as described.

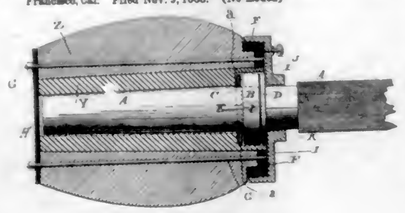


3. In combination with the rail A, and as means for securing the same upon the ties, the bed-plate C, provided with the opening *a*, incline surface *b*, horizontal plane *c'*, and the hook *c*, and intermediate plate, B, having hook *d*, and an under face substantially conforming to the upper face of the plate C, as set forth, whereby the inner end of the said plate B is thinnest and the shank of the hook *c* is made of a minimum length, substantially as and for the purpose set forth.

296,412. MOWER. HENRY A. HOWE, Albion, N. Y. Filed June 9, 1883. (No model.)

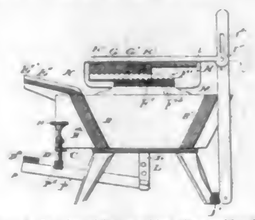
Claim.—In a mower, the connection between the forward end of the combined draw-bar and shoe with the slotted guide-bracket by a rolling joint, consisting of a rounded neck passing through the slot in the guide-bracket, and held therein by a screw-nut with a spherical washer, substantially in the manner described.

296,413. INCUBATOR. FRANK HUMPHREVILLE, Lancaster, Pa. Filed May 11, 1883. (No model.)



Claim.—1. In an incubator, the upper tank divided into compartments, the lower tank, the boiler with central and side flues, and connecting-pipes, in combination with the heating source, substantially as and for the purpose herein specified.

2. The combination, with the egg-trays having wire bottoms, of guides or ways formed with two horizontal arms, the distance between the said arms being equal to the distance between the upper arm of one guide and the lower arm of the guide next above, as and for the purpose set forth.



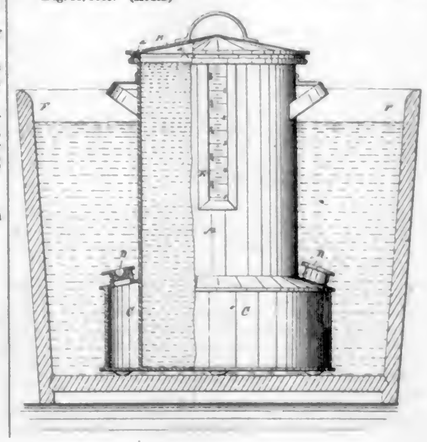
3. The combination, in an incubator provided with ventilating-openings *i i*, leading into the air-space *a*, of the tank I, provided with flues, as passages *l l*, leading from said air-space to the egg-chamber, whereby only warm air is introduced into said egg-chamber, substantially as and for the purpose set forth.

296,414. HUB FOR VEHICLE-WHEELS. BENJAMIN F. JACOBS, San Francisco, Cal. Filed Nov. 9, 1883. (No model.)

Claim.—The combination, with the hub Z, axle A, and rabbeted boxing Y, of the detachable collar B and washers C D, adjustably mounted on said axle, the recessed annular plate F, having a corrugated surface, the disk H, bolts G G, and detachable cap I, substantially as shown and described.

296,415. MACHINE FOR FELTING AND SIZING HATS AND OTHER FABRICS. ROSWELL S. JUDSON and CHARLES M. ACKERMAN, Mattawan, N. Y. Filed Jan. 19, 1884. (No model.)

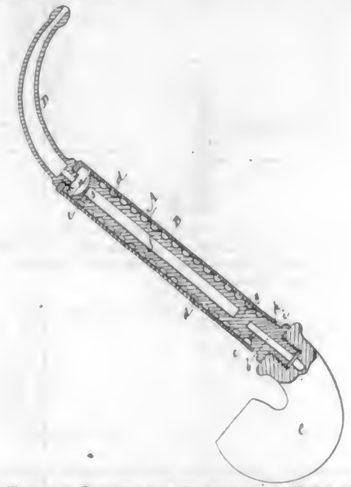
Claim.—1. In a hat-sizing machine, the combination of the tub, the corrugated bed mounted thereon, the guides secured on the outer sides of said tub, the standards L, secured and movable vertically in said guides, the rubber having lateral eyes, the rods or rails passed through said eyes and supported on standards L, and suitable operating mechanism, substantially as and for the purposes set forth.



2. In a sizing or felting machine, the combination of the tub having a corrugated or roughened bed, and provided with guides K on its outer sides, the standards secured and movable vertically in said guides, and provided on the upper end with a horizontal rod, the rubber supported on said rod and movable, as described, the brackets O, pivoted at their upper ends, and the treadles pivoted to the lower ends of said brackets, and connected with standards L, substantially as set forth.

3. The combination of the tub, the corrugated bed, the vertically-adjustable rubber support, the rubber, the rod, having one end secured rigidly to the rubber and extended therefrom, the lever J, pivoted at its lower end, and provided near its upper end with a slot, J^2, and a pin passed from the rod I into or through said slot, substantially as set forth.

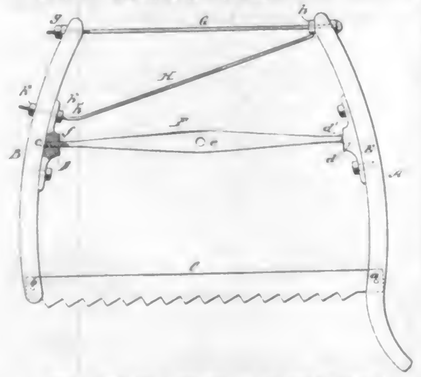
4. The hat-sizing machine herein described, composed of the tub provided with a table and a corrugated rubber, as described, and having guides K secured on its outer sides, the standards L, the rods O, mounted thereon, the rubber provided with eyes sliding on said rods, the bar I, extended from said rubber, the lever J, pivoted at its lower end, and provided near its upper end with slots J^2, wherein the bar I is connected, the brackets Q, pivoted at their upper ends, and the treadle pivoted to the lower ends of the brackets and connected with the standards L, substantially as set forth.



5. In a sizing-machine, the bed F, having grooves formed in its upper face and terminating at a point near the sides thereof, and provided with vertical openings formed through it from the center of the grooves, substantially as and for the purposes set forth.

296,416. CREAMING-CAN. JOHN A. KENDALL, Hamilton, Mo. Filed Aug. 11, 1883. (Model.)

Claim.—The milk-can A, provided at its lower part with the closed annular warm-water or air chamber C integral therewith, said chamber having openings and plugs for said openings, in combination with the cold-water vessel F, as and for the purpose described.

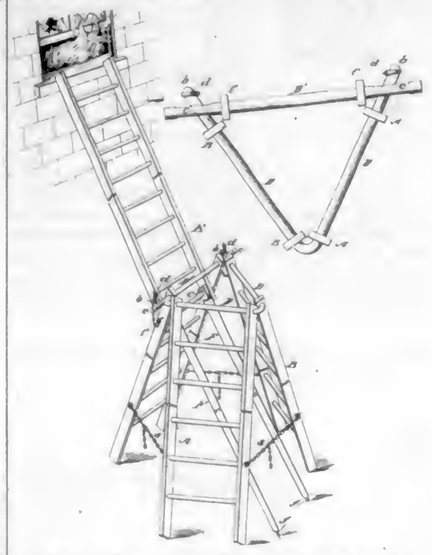


296,417. PIPE-STEM. JURGEN PETER LAWSE, Butler, N. J. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a pipe-stem, the combination, with the spirally-grooved core A, having the longitudinal passages *b f* and the transverse passages *c e*, of the outer casing, B, having the mouth-piece D secured to it, and projecting beyond the end of the core to form the chamber *m* between its end and the end of the core, substantially as herein shown and described.

2. In a pipe-stem, the spirally-grooved core A, having its upper end cup-shaped, as at *n*, and provided with longitudinal passages *b f*, the transverse passages *c e*, and the hole *s*, in combination with the outer casing, B, having the mouth-piece D secured to it, and projecting beyond the end of the core to form the chamber *m*, substantially as herein shown and described.

296,418. BUCK-SAW FRAME. THEOPHILUS LAROCQUE, Williamstown, N. Y. Filed Feb. 18, 1884. (No model.)

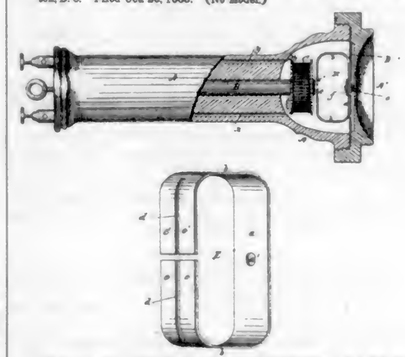


Claim.—1. The bar A, provided with the socketed casting E, and the bar B, provided with a screw-tapped casting, D, in combination with the truss-rod F, having ball *d'* to turn in socket *d*, and screw-threaded shank *f* entering screw-tap *c*, substantially as and for the purposes set forth.

2. The diagonal brace H, having eye *h* at one end and collar h^2 at the other, in combination with the bars A B and tie-rod G, passing through eye *h*, substantially as and for the purposes set forth.

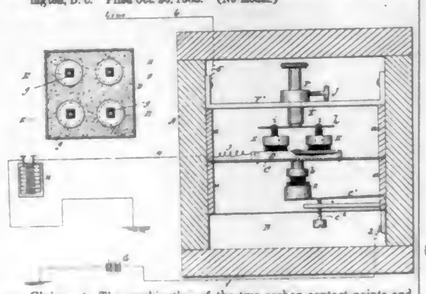
296,419. FIREMAN'S TOWER. EUGENE B. MAGNUS, South Norwalk, Conn. Filed Jan. 15, 1884. (No model.)

Brief.—The ladders are hung and supported upon a triangular frame and are connected together by chains near their lower ends. A supplemental ladder having suitable props is supported upon one of the upper rungs of any of the lower ladders.



Claim.—1. The combination, with the scaling sides or ladders A B C of the tower, of a triangular upper connecting device constructed to provide for the swinging or turning of the ladders respectively upon its several sides or legs, essentially as described.

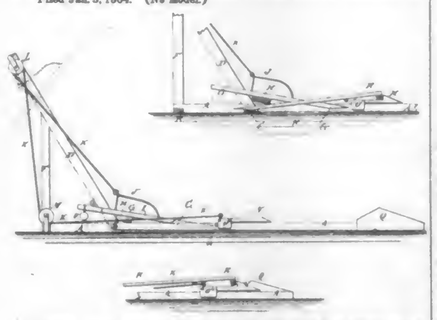
2. The combination, with the ladders A B C, of a triangular upper connecting device composed of independent sections D D', the one of which is made to form two sides or legs of the triangle, and the other the remaining leg thereof, and which are constructed to provide for the swinging of the ladders on them, and to allow of the dismemberment and securing of said sections and the ladders carried by them, substantially as specified.



3. The combination, with a many-sided ladder-tower, substantially as described, of the supplementary ladder E, slotted at its lower ends, and the upper slotted and lower pointed props F F, essentially as and for the purposes herein set forth.

296,420. RECEIVING-TELEPHONE. JAMES A. MALONEY, Washington, D. C. Filed Oct. 26, 1883. (No model.)

Claim.—The combination, in a receiving-telephone, of a non-magnetic diaphragm, a magnet, and a multiple-reed armature, under the arrangement and for operation substantially as hereinbefore set forth.



296,421. TELEPHONE-TRANSMITTER. JAMES A. MALONEY, Washington, D.C. Filed Oct. 26, 1883. (No model.)

Claim.—1. The combination of the two carbon contact-points and interposed loose iron filings or other finely-subdivided metal, substantially as and for the purpose hereinbefore set forth.

2. The combination, substantially as hereinbefore set forth, of the diaphragm C, carbon contact-plate D, having on its face loose iron filings or other finely-divided metal, carbon contact button or buttons E, and adjustable carrier F.

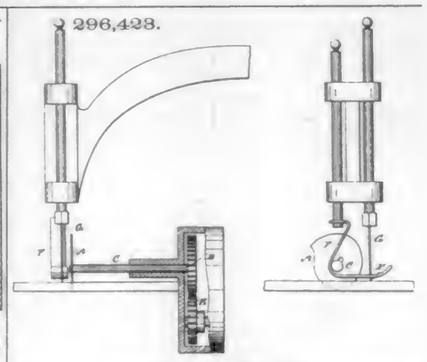
296,422. HAY-STACKER. JAMES BASCOMB MATLOCK, Huntsville, Mo. Filed Jan. 3, 1884. (No model.)

Claim.—1. A hay-stacker constructed substantially as herein shown and described, comprising the base-bars A, having stops P and trip-blocks Q, the hinged base-frame B A′ C, the inclined bars D, the elevating-rake G H, the cords and pulleys K L M, and the sliding catches N, as set forth.

2. In a hay-stacker, the combination, with the base-bars A, the inclined bars D, the base-frame B A′ C, and the elevating-rake G H, of the sliding catches N, ropes K, and the pulleys L M, substantially as herein shown and described, whereby the said rake can be raised by drawing upon the said ropes, as set forth.

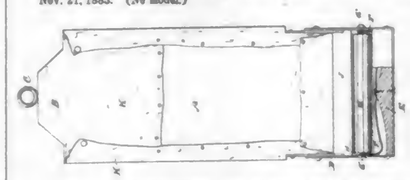
3. In a hay-stacker, the combination, with the elevating-rake G H, the ropes K, and the base-bars A, of the sliding catches N, substantially as herein shown and described, whereby the said ropes can be operated to raise the elevating-rake by the outward movement of the collecting-rake, as set forth.

4. In a hay-stacker, the combination, with the base-bars A, the collecting-rake G H, and the sliding catches N, of the trip-blocks Q, substantially as herein shown and described, whereby the said sliding catches can be released automatically from the collecting-rake, as set forth.



5. In a hay or straw stacker, the combination, with the base-frame having an inclined track at one end and trip-blocks at its other end, of the two rakes, the rope for elevating one rake, the sliding catches connected to said rake-elevating rope, and the stops for arresting the rearward movement of said catches, one of said rakes engaging with said catches, substantially as and for the purpose set forth.

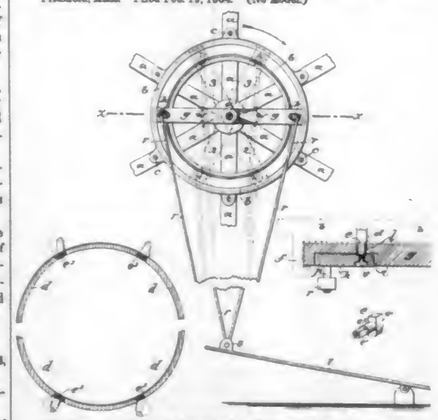
296,423. TRIMMER FOR SEWING-MACHINES. DANIEL MAUS, Utica, N.Y. Filed Aug. 2, 1883. (No model.)



Brief.—An eccentric rotary trimmer-disk is provided with serrations upon the cutting-edge.

Claim.—A rotary trimming-disk having an eccentrically-curved and sharpened edge of constantly-varying radius, with teeth or serrations upon the portion of its periphery having the greatest projection from the center, combined with a sewing-machine, substantially as shown and described.

296,428.



296,424. BOSOM-BOARD. SAMUEL MAXIM, Wayne, Me., assignor to Norris Kendall Lincoln and Ellis L. Lincoln, both of same place. Filed Nov. 21, 1883. (No model.)

Claim.—1. The combination, with the bosom-board, of the swinging U-shaped frame D, hinged or pivoted thereto, the cross-bar E, fixed to the bottom of the U-shaped frame, the U-shaped spring F, the roller G, journaled in the U-shaped spring, and guides for controlling the roller in its yielding movement in the swinging frame, substantially as shown and described.

2. The combination, with the bosom-board, of the slotted and swinging U-shaped frame D, provided with slots, the cross-bar E, made thickest in the middle, the U-shaped spring F, fastened at its middle to the cross-bar E, the roller G, journaled in the U-shaped spring, and the headed pins G′, forming the journals of the roller and extending through the slots of the swinging frame to guide the roller in its yielding motion, as described.

296,425. DRIVING MECHANISM FOR SEWING AND OTHER MACHINES. SAMUEL MAXIM, Wayne, Me., assignor to Edward M. Smith, Pittsfield, Mass. Filed Feb. 19, 1884. (No model.)

Claim.—1. A driving mechanism for sewing or other machines, constructed with a ring, *b*, forming or fixed to a drive-wheel, and having a slot, *d*, links *g*, reversely-set plates *k*, carrying studs *e*, for engaging the walls of slot *d* at opposite side of the drive-ring alternately, to rotate the ring or wheel continuously in one direction by connecting-rods

r and a treadle or lever, substantially as shown and described.

2. The combination, with the drive-ring *b*, of the pivoted links *g*, carrying the reversely-set plates *k*, having the studs *e*, for engaging the slot *d* of the ring *b*, and said ring having the groove *f*, in which the outer ends of the links *g* are guided, substantially as shown and described.

3. The links *g g*, halved together at their centers, recessed at *g′* at their opposite faces, and carrying buffers *w*, in combination with the ring *b* and means for moving the links, substantially as shown and described.

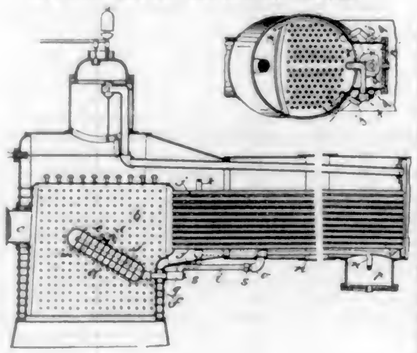
4. The combination, with the ring *b*, studs *e*, links *g*, and plates *k*, of the recesses *i*, shaped at *i′* for reversely-set stops to the plates *k*, substantially as shown and described.

5. The combination, with the ring *b*, studs *e*, links *g*, and plates *k*, of the springs *m*, substantially as shown and described.

6. The combination, with the ring *b*, link *g*, and plates *k*, of the stud *e*, having a head, e^3, for engaging the slot *d* of ring *b*, a round portion, e^2, journaled in a bearing, *l*, of the link *g*, and a square or angular end, e', on which the plate *k* is rigidly fitted, substantially as shown and described.

7. The combination, with the ring *b*, link *g*, plate *k*, and stud *e*, of the screw *o*, substantially as shown and described.

296,426. COAT-PATTERN. WILLIAM J. MCCARTIN, St. Louis, Mo. Filed Aug. 16, 1883. (No model.)

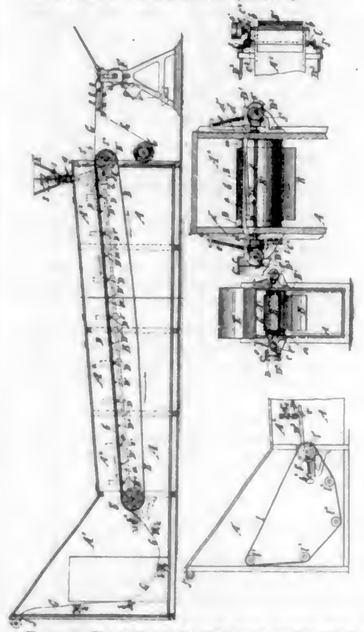


Claim.—1. A coat-pattern formed with a recess to receive an arm, a corner contiguous to the neck, and extensions to surround the body, as set forth.

2. A coat-pattern formed with a body, A, a recess to receive an arm, a corner, D, contiguous to the neck, extensions A^1 A^2 to surround the body of the person, and a leveling device.

3. A coat-pattern made substantially as herein shown and described, and provided with a liquid level, as and for the purpose set forth.

296,427. FEED-WATER HEATER. PATRICK MCGIVERN and WILLIAM E. FRYE, Crestline, Ohio. Filed Oct. 27, 1883. (No model.)



Claim.—1. The water-table feed-water heater arranged in the fire-box, and removably secured to the sides thereof by brackets and clips, and supported at its lower end by detachable feed and delivery pipe connections extending through the fire-box to the outside, whereby said pipes and feed-water heater may be disconnected for cleaning or repair without having to enter the fire-box.

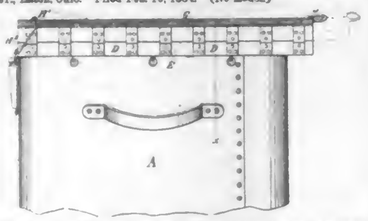
2. The feed-water pipe connected to the water-heater *a* by an outside section, *i*, connecting with an inside section, *n*, and connecting with the heater through the fire-box side and with a detachable joint, substantially as described.

3. The delivery-pipes *j j*, connected to the water-heater *a* through the fire-box side, and by detachable joints, and having inside extensions discharging the water at or about the water-level, and below it, and at opposite ends of the tube-section of the boiler, substantially as described.

4. In a feed-water heater for locomotive-boilers, located in the fire-box, two delivering-pipes extending therefrom into the tube-section of the boiler by outside connections through the fire-box and the bottom of the boiler, one of said pipes extending in the heater to the upper portion of the same and discharging at or about the water-level at the rear ends of the tubes, and the other pipe opening into the lower part of the heater and discharging at a lower point in the boiler, near the front end of the tubes, to cause circulation of water in the heater when the pump is not working, substantially as described.

296,428. METHOD OF FLOCKING PAPER AND OTHER FABRICS, AND MACHINE THEREFOR. JOHN MCMILLIN and JAMES MCADAMS, New York, N.Y. Filed Jan. 7, 1884. (No model.)

Claim.—1. The method of flocking paper or other fabric, consisting in printing with adhesive substance on the fabric, in moving the fabric during and after printing continuously forward, and then upward to a point of delivery, in delivering flock upon the printed fabric as it moves, in subjecting the fabric to a beating operation during its forward movement and after the flock has been delivered upon it, and in subjecting the fabric to a second beating or a shaking operation as it moves upward to the point of delivery, substantially as and for the purpose herein described.



2. The combination of a closed flocking-box having a flexible bottom, an endless apron or carrier arranged to travel immediately above the said bottom, and serving to move the fabric continuously forward, beaters arranged below the bottom of the box for acting thereon, a printing-machine for printing with adhesive substance on the fabric before it enters said box, and a hopper or distributer for flock arranged at that end of the box at which the fabric enters, substantially as and for the purpose herein described.

3. The combination of the closed flocking-box A^2, having a flexible bottom, *a*, the endless apron or carrier B, the stationary hopper or

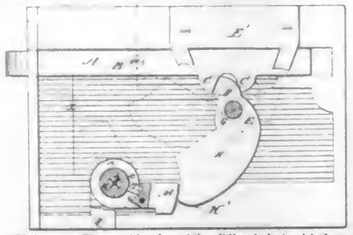
distributer E, for delivering flock into said box, beaters for acting upon the said bottom *a*, and a printing-press from which the paper or fabric passes continuously into said box, substantially as and for the purpose herein described.

4. The combination of the closed flocking-box A^3, having a flexible bottom, *a*, the endless apron or carrier B, the flock-hopper E, a printing-press from which the paper or fabric passes continuously into said box and to said carrier, means for producing an upward movement of the flocked paper or fabric as it leaves said carrier, and beaters or shakers for acting on the paper or fabric during such upward movement, substantially as and for the purpose herein described.

296,429. MAIL-BAG. FREDERICK MICHAEL and ROBERT WILLIAMS, Jr., Eaton, Ohio. Filed Feb. 16, 1884. (No model.)

Claim.—1. The combination, with a pouch having longitudinal pockets formed in its edges at the mouth, of a cover-piece provided with welts adapted to pass into the pockets and close the pouch, a hasp on the cover-piece, and means for locking the hasp on the pouch, substantially as herein shown and described.

2. The combination, with a pouch, of a sliding cover-piece for closing it, a hasp on the cover-piece, and a lock-casing secured to the pouch and adapted to receive and hold the free end of the hasp, substantially as herein shown and described.

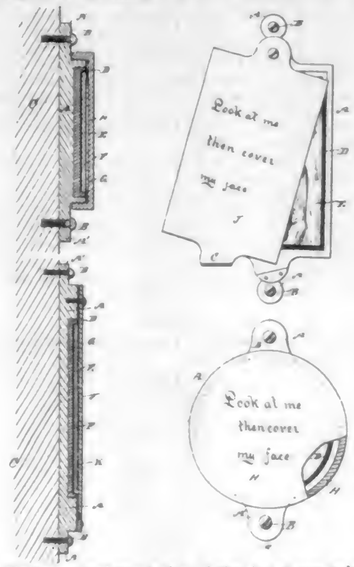


3. The combination, with a pouch, of a sliding cover-piece for closing the pouch, a hasp on the sliding cover-piece, and a combined lock-casing and tag-holder secured on the pouch, substantially as herein shown and described.

4. The combination, with a pouch, of the welts C, the shouldered plates D, the cover-piece G, and the welts H on the same, substantially as herein shown and described.

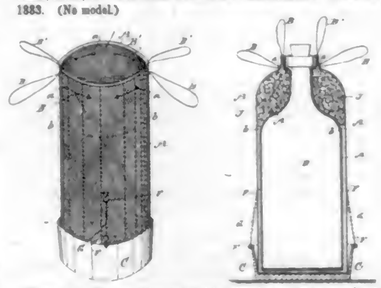
5. The combination, with the pouch A, of the welts C, the cover-piece G, the welts H, secured to the same, and of the shouldered plates or strips D, projecting beyond the end edges of the pouch, substantially as herein shown and described.

6. The combination, with a mail-pouch, of a sliding cover-piece, a hasp on one end of the same, the lock-casing K, provided with notches N, the cover L, provided with the transverse groove O, and of a bolt-and-lock mechanism for locking the cover in place, substantially as herein shown and described.



296,430. LOCK. MARTIN LUTHER MIKESELL, Muscatine, Iowa, assignor, by mesne assignments, to Mary Eliza Mikesell, same place. Filed Dec. 13, 1883. (No model.)

Claim.—1. The combination of the sliding bolt A with the weighted tumbler H, secured to the knob-shank, and provided with a toe on its upper end engaging said bolt, and with a concavity *f* at its lower end, and a swinging stop, M, mounted to rotate on a bushing, *k*, and lock against the lower end of the weighted tumbler, said bushing being constructed to be operated by a key, and provided with a pin for engaging the said swinging stop, substantially as set forth.



2. The combination of the weighted tumbler with the devices for locking said tumbler in place, said devices consisting of a stop, M, having a groove *n*, terminating in a stud, *o*, and a bushing, *k*, on which said stop is mounted, a pin, *m*, on said bushing and within the groove *n*, and a key-post and webs *b c* in the center of said bushing, substantially as set forth.

296,431. TOMBSTONE. SOLOMON R. MILLER, Mount Union, Pa. Filed Aug. 27, 1883. (No model.)

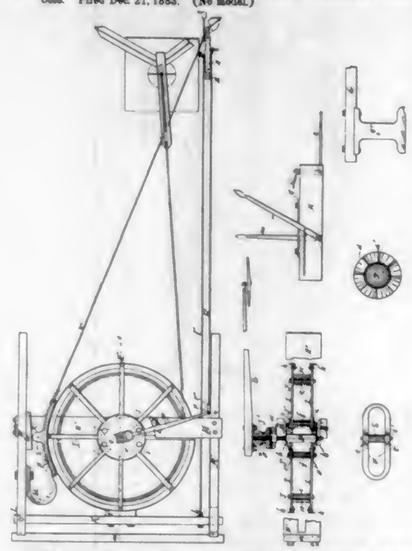
Claim.—A tombstone having a hollow box or case made fast thereto, said case being provided with a round cover overlapping and screwing on an annular projection thereof, a rubber lining, D, with a raised rim, and a glass plate forced within said rim, as shown and described, whereby a picture of deceased may be protected from air and moisture.

296,432. REFRIGERATOR FOR COOLING CONTENTS OF BOTTLES, CANS, &c. BERNHARD MOEBIUS, Chihuahua, Mexico. Filed Oct. 27, 1883. (No model.)

Claim.—1. The combination, with a bottle or other vessel, of two sacks or bags passed around the same, and of a freezing-mixture held between the two bags, substantially as herein shown and described.

2. The combination, with the two sacks or bags A A'—one contained within the other—of the eyes *a*, fastened in the sacks or bags at or near the upper edge, and of the cords B B', passed through the said eyes, substantially as herein shown and described.

3. The combination, with the sacks A A', of the basin or cup C, suspended below them, substantially as herein shown and described.



4. The combination, with the sacks or bags A A', of the chains G and the basin or cup C, substantially as herein shown and described.

5. The combination, with a bottle or other vessel, of two sacks or bags of fibrous material, and pieces of fibrous or other material held between the two bags, substantially as and for the purpose set forth.

6. The combination, with a bottle or other vessel, of two sacks or bags of fibrous material, pieces of fibrous or other material held between the two bags, and the outer liquid-holding vessel, whereby the bags are kept saturated by their lower portions being in contact with the cooling-liquid, while the balance of the outer surface is exposed to the air to facilitate cooling by evaporation, substantially as and for the purpose set forth.

7. A refrigerator for bottles, &c., consisting of two bags, A A', of which the latter is contained within the former, the two bags being sewed together at *b*, substantially as herein shown and described.

296,433. HOISTING APPARATUS. JAMES H. MONTGOMERY, Denver, Colo. Filed Dec. 21, 1883. (No model.)

Claim.—1. The hereinbefore-described hoisting apparatus, consisting, substantially, of a frame-work, the drum-wheel attached thereto, upon which to wind and unwind a hoisting-rope, a friction-brake, rope, and lever for regulating the descent of the weight, an adjustable arm for the purpose of revolving the drum-wheel, mechanism for disengaging the arm from the drum-wheel, and a lock whereby the weight is prevented from lowering, all operating as described and specified.

2. The drum-wheel B, composed, substantially, of the shaft D, the flanges *e*, having slots *d'* made therein, arms I, the distance-washers *f* and *c*, the band F, the rims *h*, and the bolts *j* and *j'*.

3. In a hoisting apparatus, the combination, with the drum-wheel E and shaft D, of the hub *d*, the thimble *g*, and sweep G, whereby force applied to the arm revolves the drum-wheel.

4. In a hoisting apparatus, the combination, with the drum-wheel E, the shaft D, the hub *d*, and thimble *g*, of the lever P, fulcrumed to the frame, and having the rope R attached to the end thereof, the pulley *r'*, and hand-lever *n*, whereby the sweep is thrown out of gear.

5. In a hoisting apparatus, the combination, with the drum-wheel E, of the brake-block E', brake-lever K, the rope *l'*, the hand-lever *m*, and ratchet N, all operating as specified.

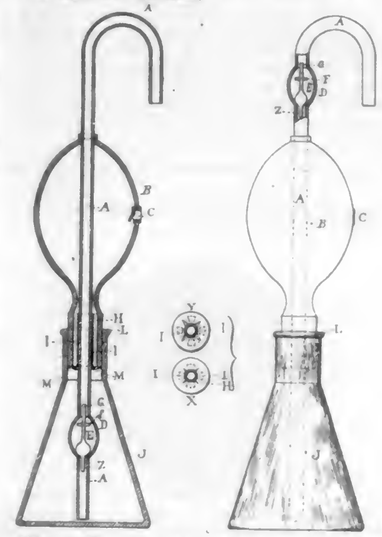
6. A roller-lock consisting, substantially, of a brake-shoe, F, having lugs *t* thereon, and the roller S.

7. In a hoisting apparatus, the combination of the roller-lock, consisting of the brake-shoe F, having lugs *t* thereon, carrying the roller S, the sloping block W, spring U, the cord V', and the foot-lever V, all operating as described.

8. In a hoisting apparatus, the combination, of a drum or wheel, the roller-lock, composed of the brake-shoe F, the roller S, and tapering wedge W, all operating as specified.

9. The forked lever P, fulcrumed at P', whereby the thimble is disengaged from the drum-wheel.

296,434. EXTENSION-TABLE. GEORGE MULLER, New York, N. Y. Filed Oct. 26, 1883. (No model.)



Claim.—1. The combination, in a table, with the legs *a b c d*, side frames, *g g'*, end frames, *h h'*, top *k*, and grooved strips *r*, of the legs *e f*, slide-partitions *l l'* and shelves *m m'*, and hinged leaves *n n'*, the parts being constructed and arranged so that the said slide-partitions and shelves can be pushed into the body of the table to allow the leaves to fall, as set forth.

2. In a table, the combination, with the legs *e f*, and slide-partitions *l l'* and shelves *m m'*, of the grooved strips *r*, the side frames, *g g'*, slotted for the passage of the slide-partitions, and the end pieces, *h h'*, grooved for the ends of the shelves *m m'* to slide in one above the other, substantially as and for the purposes set forth.

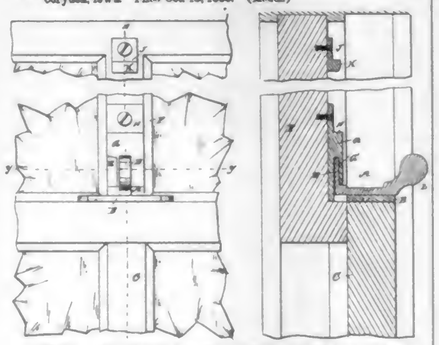
296,434.

296,435. DECANTING-PUMP. ELVIN O. MURDOCK, New York, N. Y. Filed Aug. 17, 1883. (No model.)

Claim.—1. The combination of a containing-vessel, J, a compressible bulb, B, provided with valve C, a tube, A, having a valve, E, and a stopper, H, provided with channels I, said tube passing entirely through the bulb B, and being free to slide vertically through it, substantially as described, for the purpose specified.

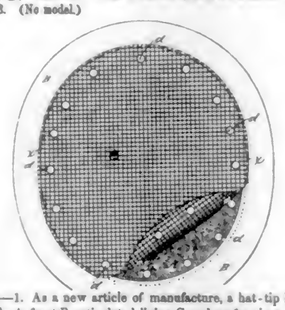
2. The combination of a containing-vessel, J, a compressible bulb, B, provided with valve C, a tube, A, and a stopper, H, provided with channels I and valves M, said tube passing entirely through the bulb B, and being free to slide vertically through it, substantially as described, for the purpose specified.

3. The combination of a containing-vessel, J, a compressible bulb, B, and a tube, A, the tube having a valve, E, and the bulb a valve or hole, C, and a stopper with channels I and valve M, substantially as described.



296,436. HOSE. JOHN MURPHY, Brooklyn, N. Y. Filed Jan. 21, 1884. (No model.)

Claim.—1. As an article of manufacture, a hose containing an interior and exterior layer of rubber, and interposed between said layers of rubber a textile fabric cut straight, surrounded by a textile fabric cut on the bias, substantially as set forth.



2. In a hose, the combination, with a textile fabric cut straight, of a textile fabric cut on the bias and so arranged that the textile fabric cut on the bias is outside of the textile fabric cut straight, substantially as and for the purpose set forth.

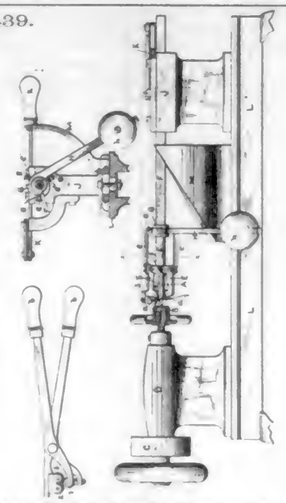
296,437. WINDOW AND DOOR BUTTON. EVANDER B. NEWCOMB, Corydon, Iowa. Filed Oct. 13, 1883. (Model.)

Claim.—In a window-lock, the combination, with a pivoted lever, A, having an upright lug provided with a beveled edge, of the plate G, provided with a vertical recess, G', having a beveled edge and a shoulder, H, above said recess, and of a plate, J, near the top of the sash, provided with a lug, K, whereby the sashes may be locked when fully closed, or the lower sash be supported when raised to its fullest height or when only partially raised, substantially as herein shown and described.

296,438. HAT-TIP. JOHN F. NEWTON, Jr., Boston, Mass. Filed Sept. 20, 1883. (No model.)

Claim.—1. As a new article of manufacture, a hat-tip having the asbestus body A, front B, reticulated lining C, and perforations *d*, the body being interposed between the lining and front and secured in position by the stitches *x*, substantially as set forth.

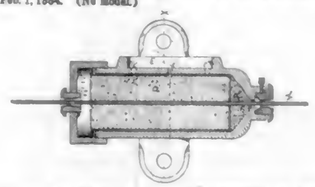
2. A hat-tip constructed substantially as described, and provided with the perforations *d* around the periphery of its body, in combination with the crown E, having the central ventilator, *m*, substantially as set forth.



3. As a new article of manufacture, a hat-tip having its body composed wholly or in part of asbestus, and this I claim whether said body is made with or without perforations, substantially as specified.

296,439. MACHINE FOR FORMING TEETH UPON FILE-BLANKS. WM. T. NICHOLSON, Providence, R. I. Filed May 28, 1883. (No model.)

Claim.—1. The combination, substantially as before set forth, of a clamp or suitable holder for a file-blank, a revolving tooth-generating cylinder, substantially as described, and arranged relatively to the file-blank, so that the axis upon which it revolves shall be oblique to the longitudinal axis of the blank, suitable means, as described, for causing either the file-blank to be rotated upon its axis or the generator to be revolved upon the blank, and suitable means, as described, for causing pressure to be exerted by the generator upon the blank, to form cutting-teeth thereon, as set forth.



2. The combination, substantially as before set forth, of a clamp or suitable holder for a file-blank, a series of revolving tooth-generating cylinders, substantially as described, the last one of such cylinders in the series having its teeth arranged at a greater obliquity to the axis of the cylinder than the teeth of the preceding generators in the series, suitable means, as described, for causing either the file-blank to be rotated on its axis or the generator to be revolved around the blank, and suitable means, as described, for causing pressure to be exerted by the generator upon the blank, to form cutting-teeth thereon, as set forth.

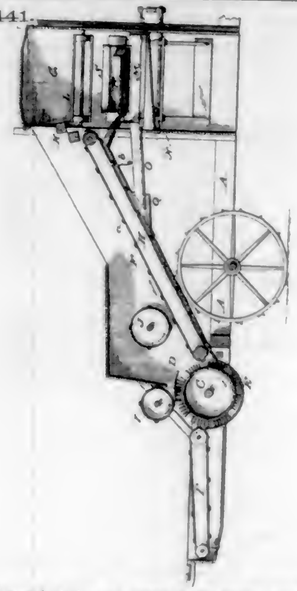
3. The combination, substantially as before set forth, of a clamp or suitable holder for a file-blank, a series of tooth-generating cylinders, substantially as described, the last one of such generators in the series being arranged, as described, relative to the file-blank, so that the axis upon which it revolves shall be oblique to the longitudinal axis of the blank, suitable means, as described, for rotating the blank upon its axis, suitable means, as described, for giving a movement to the tooth-generating tool lengthwise of the blank, and a pattern-face conforming to the shape of the file-blank, whereby the generating-tool can be made to press upon a tapering file-blank throughout its length.

4. The combination, substantially as before set forth, of a clamp or suitable holder for a file-blank, a series of tooth-generating cylinders mounted in the ends of levers, as described, and pivoted to a sliding bar, the axis of which coincides with the axis of the blank-holder, means, as described, for giving a to-and-fro movement to said bar, means, as described, for causing the generators to approach radially toward each other to conform to the taper of the blank, and means, as described, for rotating the blank upon its axis.

296,440. WIRE-OILING DEVICE. JAMES B. OLIVER, Sewickley, Pa. Filed Feb. 1, 1884. (No model.)

Claim.—1. The method of oiling wire, consisting in passing it through oil-saturated compressed sawdust or similar material, substantially as and for the purpose described.

2. A wire-oiler consisting of a suitable case containing oil-saturated sawdust or similar material, and having wool or similar material surrounding the wire-exit opening, substantially as and for the purposes described.



296,441. THRASHING AND CLEANING MACHINE. WILLIAM H. PARRISH, Salem, Oreg. Filed Sept. 29, 1883. (No model.)

Claim.—1. In combination with a traveling endless feed-apron, an upwardly-moving thrashing-cylinder and a concave above the same, and an elevator-apron directly in rear of said cylinder and concave, said parts being arranged as shown, whereby the straw and grain are delivered from the feed-apron to the elevator-apron without materially changing the direction of their travel.

2. In combination with an overshot thrashing-cylinder and a concave above the same, a traveling feed-apron having its delivery end close to the mouth of the concave, and a ribbed beater located over the mouth of the concave, substantially as and for the purpose explained.

3. The combination, with overshot thrashing-cylinder C and its concave D, located above the same, endless traveling feed-apron B, elevator H in rear of the cylinder, and beater J, located over the receiving end of the elevator, all substantially as shown and described, whereby

296,441.

grain placed upon the feed-apron is caused to pass between the cylinder and concave and up the elevator without materially altering its direction.

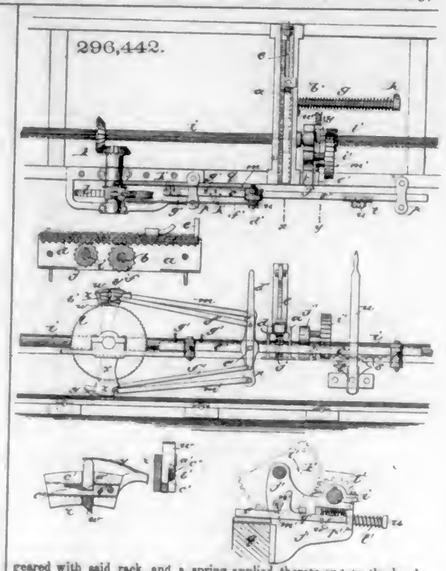
4. The combination, substantially as herein shown and described, of a thrashing-cylinder and concave, a trunk extending backward from said cylinder and concave, an elevator-apron within said trunk, a cleaning mechanism independent of the elevator-apron and a tailings-spout extending from the cleaning mechanism into the elevator-trunk beneath the elevator-apron, whereby said apron is caused both to elevate the grain from the thrashing-cylinder and to return the tailings thereto from the cleaning mechanism.

5. In combination with a thrashing-machine, a grain-cleaner, and an elevator-trunk extending from the former to the latter, a tailings spout arranged substantially as shown and described, to return the tailings from the cleaner into the elevator-trunk, whereby they are reconveyed to the thrashing-machine.

6. The combination, substantially as herein shown and described, of a thrashing-cylinder and concave, a grain cleaner or separator, a trunk, F, connecting the thrashing and cleaning mechanisms, an endless elevator-apron, H, within said trunk, and a shaking-trough, O, arranged substantially as shown, to receive the tailings from the cleaner, and having its discharge end extended into trunk F beneath the apron H, substantially as and for the purpose explained.

7. In combination with cylinder C and with a spiked concave above the same, a smooth concave below said cylinder, an elevator-trunk extending upward from the smooth concave to a cleaner or separator, a grain-cleaner, and a tailings-trough arranged to receive the tailings from the cleaner, and having its discharge end extended into an opening at the under side of the elevator-trunk, substantially as shown.

8. The herein-described thrashing and cleaning machine, consisting of thrashing-cylinder C, spiked concave D above said cylinder, smooth concave E below said cylinder, trunk F, extending upward from concave E, cleaner G, located at the delivery end of trunk F, carrier H within said trunk, riddle M, shaking-shoe P, and trough O, arranged substantially as shown, to deliver the tailings into trunk F.



9. The combination, substantially as set forth, of cylinder C, concaves D E, trunk F, cleaner G, carrier H, beaters I J, cylinders K, straw-carrier L, riddle M, shaking-shoe P, tailings-spout O, and pocket Q, all constructed and arranged to operate substantially as set forth.

10. In combination with elevator H and grain-cleaner G, having a shaking-shoe, a curved chute or board, R, connected with the shoe, and serving, substantially as explained, to deliver the grain at the head of the riddle and from side to side thereof.

296,442. SAW-MILL SET-WORKS. ROBERT R. PARSONS, Jackson, Miss. Filed Nov. 9, 1883. (No model.)

Claim.—1. In head-blocks for saw-mills, the combination, with the head-block having on its under side a rack, and the setting-shaft geared with said rack, of the shaft having its bearing in the head-block and

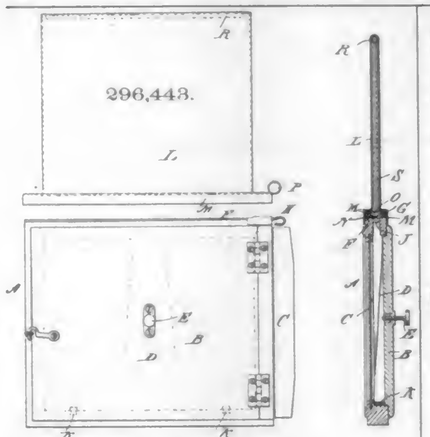
296,442.

geared with said rack, and a spring applied thereto and to the head-block, substantially as and for the purpose set forth.

2. In a saw-mill head-block, the head-block having on its under side a rack, the setting-shaft geared with said rack, and the shaft geared with the said rack, and having a spring applied thereto and to the head-block, in combination with the ratchet-wheel, whose shaft is geared with the setting-shaft, and the hand-lever having a toothed segment gearing with the rack of a sliding bar carrying the ratchet-wheel-operating mechanism, substantially as and for the purpose set forth.

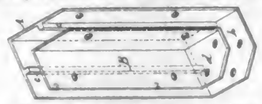
3. In a saw-mill head-block, the combination, with the setting-shaft geared with the head-block, and the shaft having a spring applied thereto and to the head-block, said shaft being geared with the head-block rack, of the stop-wheel having a series of pin-holes and the buffer-slide having a horn, a buffer-spring, and a supplementary spring to return the buffer-slide to its normal position after the movement of the horn out of the plane of movement of the pin of the stop-wheel, substantially as and for the purpose set forth.

4. In a saw-mill head-block, the setting-shaft geared with the head-block and with the shaft carrying a ratchet-wheel, and the shaft geared also with the head-block, and having a spring applied thereto and to the head-block, in combination with the sliding bar having stops, one on each side of one of its guides, and carrying a lever provided with pawls engaging with said ratchet-wheel, the hand-lever having a toothed segment gearing with a rack on said sliding bar, the stop-wheel having a stop-pin, and the spring buffer-bar having a horn, substantially as and for the purpose set forth.



5. In a saw-mill head-block, the combination, with the pawl-arms connected centrally to the axis of the ratchet-wheel and to a centrally-pivoted lever, and spring-catches fitted to slide vertically in the pawl-arm heads, of the slides fitted to slide in the latter and in the catches at right angles to the plane of movement of said catches, and having at intermediate points between their ends notches or recesses with inclined surfaces, said slides being connected to a hand-lever centrally pivoted upon the aforesaid lever, substantially as and for the purpose set forth.

6. In a saw-mill head-block, the combination, with the stop-wheel having a stop-pin and gearing with the setting-shaft, of the sliding spring buffer-rod having the horn, and the supplementary readjusting-spring connected to a fixed point and to the sliding buffer-rod, substantially as and for the purpose set forth.

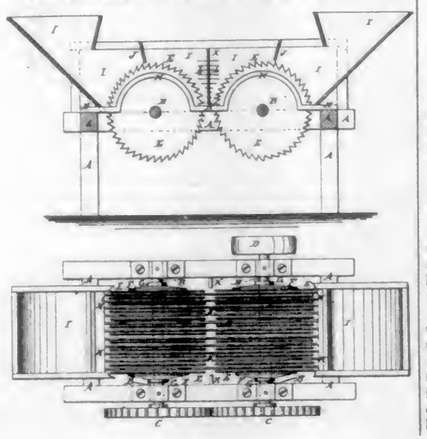


7. The stop-wheel *i'*, having a series of pin-holes, *k'*, and the buffer-slide *o'*, having horn *n'*, and buffer-spring *l'*, in combination with the setting-shaft *i* and the knees *e*, having springs *g*, for shifting the knees back, said wheel *i'* being geared with said setting-shaft, substantially as described.

296,443. PHOTOGRAPHIC-PLATE HOLDER AND CASE. SEBASTIAN S. PECKINPOGH and GEORGE JEFFERY WHITE, Big Rapids, Mich., assignors to said White. Filed Sept. 25, 1883. (No model.)

Claim.—The combination, with a plate-holder, of the plate or strip D and the adjusting-screw E, substantially as herein shown and described.

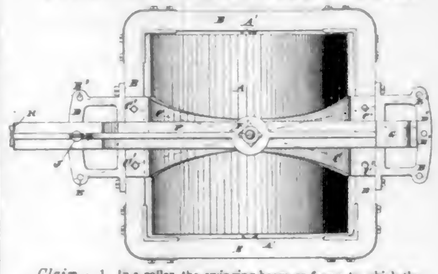
296,444. CORNER-STAY FOR TRUNKS, BOXES, &c. PARDON T. PERKINS, Oswego, N. Y. Filed Oct. 31, 1883. (No model.)



Claim.—1. The within-described corner-stay for boxes, trunks, and analogous articles, consisting of an angular plate adapted to embrace the corner of said article, and provided with tongues or projections adapted to engage with grooves or indentations in the two adjacent sides of the article, said plate adapted to be secured in position by rivets, screws, or other suitable means, substantially as set forth.

2. A corner-stay for boxes, trunks, and analogous articles, consisting of an angular metallic plate corresponding to the corner of the box, and provided on its inner sides with tongues for engaging with grooves in the sides of the box, and having at its base a web resting against the under side of the box, and fastening devices for securing said plate in position, substantially as shown and described.

3. The combination of a box or analogous article provided near its corners with vertical grooves *a a*, the angular plate A, provided with the web *b* and tongues *c c*, the angular plate B, provided with the web *d*, and rivets or other suitable fastening devices for securing said plates, respectively, to exterior and interior corners of the article, substantially as described and shown.

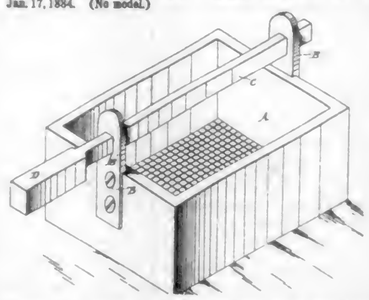


296,445. MACHINE FOR PULVERIZING CLAY. MARSHALL POPE PHILLIPS, Lakeland, La. Filed Oct. 3, 1883. (No model.)

Claim.—1. The combination, with two opposite sets of rotary saws in a hopper, of the intermediate partition, K, having pins L, as shown and described.

2. The combination, with a set of rotary saws on the same shaft and within the same hopper, of the cross-partition J, arranged above the saws, as shown and described.

296,446. STREET-ROLLER. CHARLES K. PECKLES, St. Louis, Mo., assignor to Richard C. Pope, same place. Filed Aug. 16, 1883. (No model.)

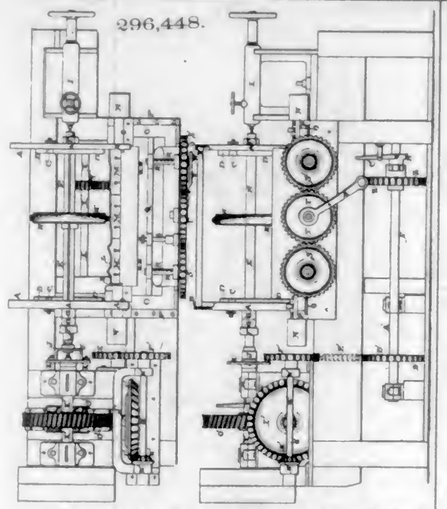


Claim.—1. In a roller, the swinging beam or frame, to which the tongue is secured, supported by an arch to which it is pivoted above the center of the roller, in combination with suitable means for connecting the beam to the frame of the roller, substantially as set forth.

2. In a roller, the swinging frame or beam, to which the tongue is secured, supported by an arch to which it is pivoted above the roller-in combination with the brackets secured to the frame of the roller, and having three holes each, one in the center and one in each corner, and adapted to engage a socket on the swinging frame or beam, and to be connected therewith by a suitable pin, substantially as and for the purpose set forth.

3. The combination of roller A, frame B, arch C, counterbalanced swinging frame or beam F, pivoted to the arch, and having means at one end for the attachment of the tongue, and a socket, I, to receive the brackets on the frame, and the brackets D D′, secured to the frame B, all substantially as shown and described, for the purpose set forth.

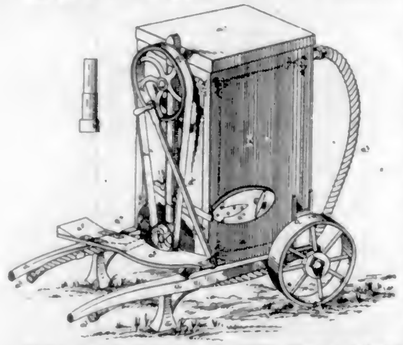
296,447. ASH-SIFTER. HENRY C. PIGUERON, Spring Lake, N. J. Filed Jan. 17, 1884. (No model.)



Claim.—The combination, with an ash-sieve, of the lugs B, having squared apertures B′, the squared rod C, passed through the apertures B′, and having a squared enlarged handle part, D, substantially as herein shown and described.

296,448. MACHINE FOR PLANING POLYGONAL BODIES. JAMES PLENKHARP, Columbus, Ohio. Filed Sept. 8, 1883. (No model.)

Claim.—1. In a planing-machine, the combination of the slowly-revolving heads A, between which the pieces of lumber are clamped, and rapidly-revolving planer-head L, the wheels S′ T, screws R, the slide in which the planer is journaled, and the stop S, the slide being provided with the flange Q, substantially as shown.



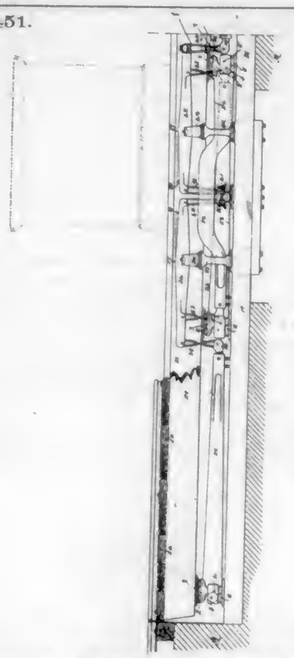
2. In a planing-machine, the combination of the two heads A, between which the pieces to be planed are clamped, the planer L, located to one side of the heads, and a mechanism for causing it to rapidly revolve, and suitable intermediate shafts or gearing located under the frame for driving the heads with a slow motion, with the short shaft G′, pinion H′, wheel I′, screw-shaft J′, and worm-wheel on the main shaft, for communicating the motion of the intermediate shafts or gearing to the heads, substantially as described.

296,448.

3. The combination of the heads A, provided with the flanges B upon their outer edges, the expansible rings D, which are applied to the inner sides of the heads, and the screw-operated wedges, which are placed between the ends of the rings, substantially as shown.

296,449. COTTON-HARVESTER. WILLIAM J. POWELL, Marshfield, Mass., assignor to the Powell Cotton Harvester Company, Concord, N. H. Filed May 22, 1882. (No model.)

Claim.—In a cotton-harvester, in combination with the flexible tubes a^3, the claws b^3 in the nozzle, supported by the yielding elastic band c^3, substantially as described.



296,450. MANUFACTURE OF NUT-PICKS. HENRY MARCUS QUACKENBUSH, Herkimer, N. Y. Filed Mar. 24, 1882. (No model.)

Claim.—The manufacture of nut-picks substantially as herein described, consisting in the selection of a metallic rod ornamented upon its surface to form the handle, reducing a portion of this rod in a lathe to form the point, and finally compressing the point in a die, by which it is condensed and rendered stiff and hard and the desired curvature imparted to it.

296,451. PLATFORM-SCALE. WILLIAM W. REYNOLDS, Rutland, Vt., assignor to the Howe Scale Company, same place. Filed Aug. 10, 1882. (No model.)

296,451.

Claim.—1. In a weighing-scale, the combination, with the two mounting-levers 23 24, arranged side by side and fulcrumed at opposite ends, of the cross-lever 41, the extension-levers 48 34, and connections, substantially as described.

2. In a weighing-scale, the combination, with the two mounting-levers 23 24, arranged side by side and fulcrumed at opposite ends, and occupying an inclined or oblique position with relation to the body of the scale, of the cross-lever 41, the extension-levers 48 34, and connections, substantially as described.

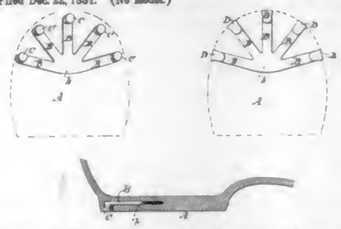
3. In a weighing-scale, the combination, with the mounting-lever 24, of the cross-lever 41, the extension-lever 34, and connections, said mounting-lever being curved to pass said cross-lever, substantially as described.

4. In a weighing-scale, the combination, with the two mounting-levers 23 24, arranged side by side and fulcrumed at opposite ends, of the mounting-lever 25, the cross-lever 41, the extension-levers 34 48, and connections whereby the vibrations of said mounting-levers are transmitted to said cross-lever, substantially as described.

5. In a weighing-scale, the combination, with the mounting-levers 25 26, arranged in line, of the cross-lever 41, the extension-levers 38, 44, and 48, and connections whereby the vibrations of said mounting-levers are transmitted to said cross-lever, substantially as described.

6. In a weighing-scale, the combination, with the two mounting-levers 23 24, arranged side by side and fulcrumed at opposite ends, of the mounting-levers 25 26, arranged in line with each other and with the levers 23 24, the cross-lever 41, the extension-levers 34, 48, 44, and 38, and connections whereby the vibrations of said mounting-levers are transmitted to said cross-lever, substantially as described.

7. The combination, with the levers 25 and 44, provided with single knife-edge pivots, of the lever 48, provided with a triple knife-edge pivot, the yoke 7, and the shackles 1, 46, and 8, substantially as described.

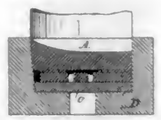


8. The combination, with the extension-levers 38 48, of the intermediate extension-lever, 44, and means for vertically adjusting said last-named lever, substantially as described.

9. The combination, with the mounting-levers 23 24 and the extension-levers 34 48 and cross-lever 41, of the supports 37 62, formed to bridge said mounting-levers, and connections whereby the vibrations of said mounting-levers are transmitted to said cross-lever, substantially as described.

296,452. WASHING COMPOUND. ANNIE E. RHOADS, Baraboo, Wis. Filed Aug. 2, 1883. (No specimens.)

Claim.—The herein-described washing compound and dirt-extractor, consisting of sal-soda, saltpeter, and gum-camphor combined about in the proportions given.



296,453. RUBBER SHOE. FREDERICK RICHARDSON, Providence, R. I. Filed Dec. 22, 1881. (No model.)

Claim.—1. The combination, with the heel of a rubber shoe, of the radial single metallic arms B, separated by intervening spaces and united only at their inner ends, said arms being embedded in the heel, and having their outer ends provided with wearing-points extending through the tread-surface of the heel, and separated by intervening portions of the rubber, substantially as described.

2. The metallic heel protector consisting of the single arms B, radiating from and united only by the center piece, *b*, and provided at their outer ends with points projecting at right angles to the plane of the arms, substantially as described.

296,454. DIE FOR MAKING RUBBER HEELS. FREDERICK RICHARDSON, Providence, R. I. Filed May 15, 1882. (No model.)

Claim.—1. The improved die-plate C, provided with the depressions to receive the projections *b'* of the wearing-plate B, and also with the slitted raised bead *b''*, to receive the radial portion of the wearing-plate, substantially as described.

2. The combination, with the mold D, of the die-plate C, having depressions and the slitted bead, as shown and described, whereby said die-plate is adapted to receive and hold the skeleton wearing-plate having the projections *b'*, for the purposes set forth.

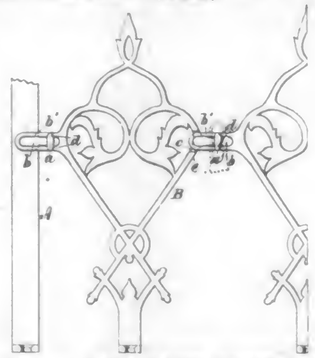
296,455. HEEL-PLATE FOR RUBBER SHOES. FREDERICK RICHARDSON, Providence, R. I. Filed May 15, 1882. (No model.)

Claim.—1. As an improved article of manufacture, the skeleton plate B, formed with the rim *g*, and the bars *e*, provided with the ribs *f*, substantially as and for the purposes set forth.

2. The combination, with a rubber boot or shoe, of the skeleton plate B, embedded in the heel thereof, and formed with the rim *g*, and the bars *e*, provided with the ribs *f*, substantially as and for the purposes set forth.

296,456. PEN. WILLIAM T. RIGHTMYER, Meriden, Conn. Filed May 26, 1883. (No model.)

Claim.—The writing-pen herein described, provided with a slitted concavo-convex nib or point, the upper surface of which is concaved longitudinally of the pen, and the under surface or contact-point convexed, as and for the purposes herein specified.



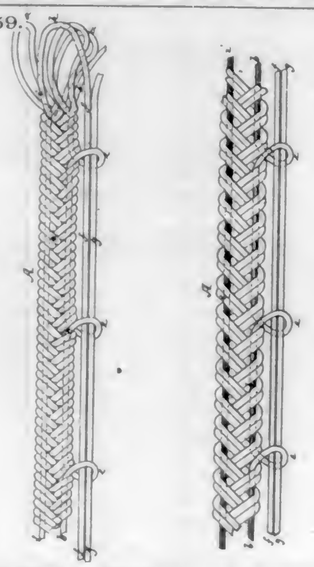
296,457. FRUIT-BOWL. DANIEL C. RIPLEY, Pittsburg, Pa. Filed Dec. 20, 1883. (No model.)

Claim.—A glass dish or bowl having a pivoted metallic bail or handle secured thereto by metallic lugs, substantially as and for the purposes described.

296,457.

296,458. ADJUSTABLE CRESTING FOR BUILDINGS. TIMOTHY ROGERS, Springfield, Ohio, assignor to the Rogers Fence Company, same place. Filed Mar. 24, 1883. (No model.)

Claim.—1. In adjustable cresting, an ornament-section having a T-headed hook extending from the frame of the ornament on one side, and adapted to engage with an elongated slot in a frame-bar extending from the frame of the ornament-section connecting therewith, substantially as set forth.

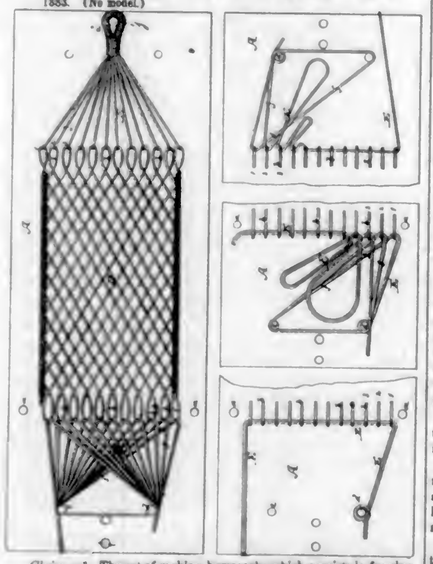


2. An adjustable cresting having its finial-post and ornament-sections each provided at their connecting parts with a T-headed hook and a slotted bar, said hook being formed upon one part of the connection and the slotted bar upon the other, and brought into engagement by turning one of the sections at right angles with the other, to allow the hook to pass through the slot in the bar in securing the sections together, substantially as set forth.

3. In combination with the finial-post A, having the bent T-headed hook *a*, of the ornament-section B, provided with horizontally-slotted bar *b'*, having the slot *b*, engaging therewith, substantially as set forth.

4. The combination, with the ornament-section, of a frame-bar bent at right angles from its vertical line, so as to form a depression on either side of the hook thereon, to allow the slotted bar on the connecting-section which engages with said hook to lie therein, and to slide endwise under the ends of said hook in adjusting the cresting, substantially as set forth.

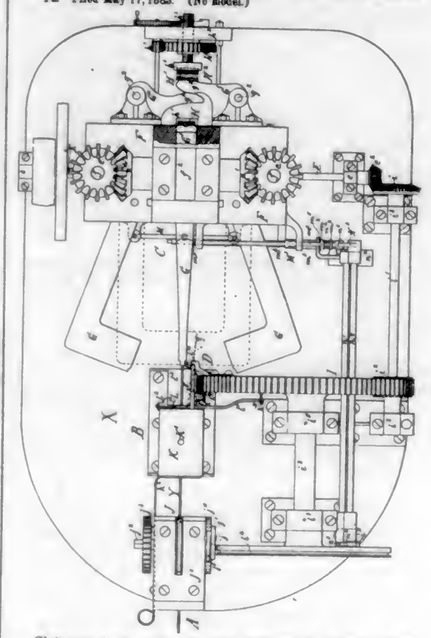
296,459. SELVAGE FOR HAMMOCKS. ALBERT O. ROOD, New York, N. Y., assignor to Vincent P. Travers, same place. Filed Oct. 25 1883. (No model.)



296,459.

Claim.—1. The selvage for hammocks, A, consisting of a number of braided strands, in combination with the straight strand *i*, passing longitudinally therethrough, as set forth.

2. The selvage for hammocks, A, consisting of a number of braided strands, in combination with the strand *b*, having loops *e* formed therein, and the strands *f* and *i*, the strand *i* passing through the selvage and the strand *f* through the loops *e*, substantially as described.



296,460. ART OF MAKING HAMMOCKS. ALBERT O. ROOD, New York, N. Y., assignor to Vincent P. Travers, same place. Filed Nov. 17, 1883. (No model.)

Claim.—1. The art of making hammocks which consists in forming the hammock-body with loops *b b* in the ends thereof in any known manner, then forming each end of the hammock by drawing the cord E, from which the hammock end is to be made, in a straight line through the end loops *b b* of the hammock-body, and in then drawing said cord from between said end loops *b b*, forming of it the converging strands of the hammock end, and in finally uniting these strands into a terminal eye, *i*, substantially as herein shown and described.

2. The art of making hammocks which consists in forming the hammock-body with loops *b b* in the ends thereof in any known manner, then forming each end of the hammock by drawing the cord E in a straight line through the loops *b b* that are at the ends of the hammock-body D, in then drawing this cord out from between the end loops *b* and holding it temporarily, in then coiling or winding the outer part of this cord, and in then forming from this coiled or wound portion the eye *i* at the end of the hammock, substantially as herein shown and described.

296,461. HORSESHOE-NAIL MACHINE. JOSEPH ROY, Philadelphia, Pa. Filed May 17, 1883. (No model.)

Claim.—1. The combination of a pair of swinging hammers, suitable means for operating said hammers, a pair of levers, G', and a spring, whereby the hammers are caused to exert simultaneously equal blows upon a nail-rod, substantially as described.

2. In a nail-machine, the combination of two pairs of swinging spring-hammers, each hammer having a cam-arm, *g*, with shafts E *f f f'*, arranged in a quadrangle, each provided with a cam, *f²*, and two driving gear-wheels, *d'*—one on each side of the cam—and with the springs H H' and levers *g'*, substantially as and for the purpose described.

3. In combination with a gas-furnace, B, four swinging hammers, G, cams *f²*, four pairs of gear-wheels, *d'*, four bell-crank levers, G', two central springs, H H', acting, respectively, on the respective pairs of bell-crank levers and causing these levers simultaneously to operate upon two hammers of a pair, and each pair of said hammers being thus made to act alternately upon an iron rod supported and guided by the furnace, and constantly and uniformly heated by the flame of the same, substantially as described.

4. In combination with the hammers and levers of a nail-machine, the frame H³, clasps *h'*, having screw-shanks *h²* and nut-wheels *h⁴*, and the springs H H', substantially as and for the purpose described.

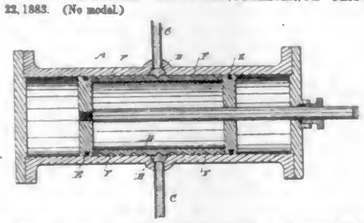
5. The combination, with the forging-hammers and gas-furnace of a nail-machine, of the cutter *i⁵*, having a sloping surface, *i¹⁰*, and pivoted to a support of the nail-machine, the spring lifting-lever *l'*, and the wheel I, having a corresponding cutter and an actuating-pin, *i⁹*, substantially as and for the purpose described.

6. The combination, with the forging-hammers and gas-furnace, of the wheel I, provided with an oblique-edged cutter, *i¹⁰*, and with actuating-pins *i⁹* and *i⁹*, the oblique-edged cutter *i⁵*, and means for moving the end of the nail-rod obliquely sidewise for cutting it off and lifting and holding the cutter *i⁵* up and in contact with the nail-rod, and readjusting the nail-rod and said cutter to their original position after the nail is cut off, substantially as and for the purpose described.

7. The combination, in a nail-machine, of a swinging cutter l^{6}, having a sloped surface, l^{11}, spring-lever l^{7}, having an upright arm, l^{12}, and pin l^{14}, and wheel L, having a corresponding cutter and a pin, l^{3}, substantially as and for the purpose described.

8. The combination, in a nail-machine, of the cutting-off mechanism D, comprising means for elevating and lowering the stationary cutter, with the deflecting and readjusting spring-lever L, substantially as and for the purpose described.

9. In a nail-machine, the combination, with forging mechanism C, of a gas-furnace, B, having openings k k', door k^{2}, and gas blow-pipe K', comprising an outer pipe, k^{3}, having a pointed nozzle, k^{4}, and an inner pipe, k^{5}, having a pointed nozzle, k^{7}, and means for regulating the said gas blow-pipe, substantially as and for the purpose described.



10. The combination, with the furnace, the cutting-off mechanism, and forging-hammers, of grooved wheel I', having the V-shaped deflection i^{7}, grooved feeding-rolls J, gears j^{2}, ratchet-wheel j^{4}, pawl j^{5}, pawl-lever j^{6}, and pin j, substantially as and for the purpose described.

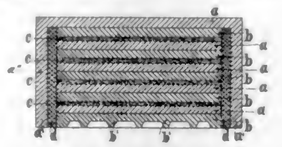
11. The combination, in a nail-machine, of the grooved wheel I', having the V-shaped deflection i^{7}, grooved feeding-rolls J, gears j^{2}, ratchet-wheel j^{4}, pawl j^{5}, pawl-lever j^{6}, and pin j, substantially as and for the purpose described.

12. The combination, with forging-hammers G, of the checks M M', wheel I', having cam I^{11}, and the intermediate connecting mechanism—to wit, levers n^{2} n^{10}, shafts n' n^{3}, and levers N N' N^{2}—substantially as described.

13. In a nail-machine, the combination, with a single centrally-operating power-spring, of a pair of bell-crank levers, a pair of swinging hammers, a gas-furnace provided with a gas blow-pipe, and a feeding mechanism, substantially as and for the purpose described.

296,462. PACKING, LUBRICATING, AND COOLING THE PISTONS OF AIR-COMPRESSORS. CHAS. F. RUFF, Phœnixville, Pa. Filed Aug. 22, 1883. (No model.)

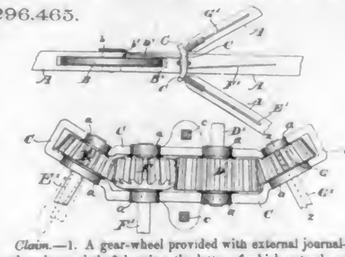
Claim.—1. The combination, with the cylinder A, provided on its inside, at the center, with an annular groove, B, and inlet and outlet pipes C C on the outer opposite sides of the cylinder and communicating with said groove, of a suitably-packed piston, substantially as set forth.



2. The combination, with the piston provided with a series of annular grooves, F, of the cylinder A, having an internal central groove, B, and the outlet and inlet pipes C C, substantially as set forth.

296,463. MANUFACTURE OF PAPER. WILLIAM RUPP, New York N. Y. Filed Feb. 20, 1884. (No specimens.)

Claim.—1. Combining infusorial earth with the pulp in the manufacture of paper, for the purpose set forth.

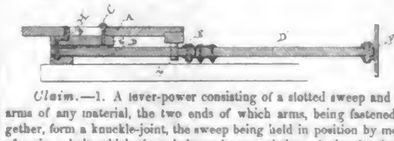


2. In the manufacture of absorbent paper, the substitution of infusorial earth for a portion of the paper-stock.

296,464. VOLTAIC PILE. AUGUST SCHROEDER, Stettin, Germany Filed Sept. 29, 1883. (No model.)

Claim.—In a voltaic pile, the combination of the bottom plate, b, provided with downwardly-extending projections b', with the top plate, a, the downwardly-projecting part a'' of which surrounds all the other plates, and comes with its teeth a' in the level of the projections b', as described, and for the purpose set forth.

296,465. SHAFT-BEARING IN WHEELS. SAMUEL SCHUCH, Indianapolis, Ind., assignor to Ewald Over, same place. Filed Feb. 12, 1884. (No model.)



Claim.—1. A gear-wheel provided with external journal-bearings, a, and an internal shaft-bearing, the latter of which extends only a portion of its length, the remaining portion being formed flaring, substantially as described, and for the purposes specified.

2. The combination of a gear-wheel having external journal-bearings, a, independent boxings therefor, a loose non-circular internal shaft-bearing, and a correspondingly-formed shaft, substantially as set forth.

3. The combination of a casing or frame-work having boxings for the wheels, wheels mounted in said boxings and provided with internal shaft-bearings, said shaft-bearings being adapted to engage with the shafts but a portion of their length, the remaining portion being formed flaring, whereby the line of the shaft may be varied without changing the position of the wheels, substantially as set forth.

4. In a grain-drill, the combination, with the frame-work, of the gear-box C, gear-wheels D E F G, mounted therein, the wheels E and G being provided with conical bearings, and the shafts E' F' G', mounted in and driven by said wheels E F G, and means for operating the same, substantially as described, and for the purposes specified.

296,466. LEVER-POWER. DAVID W. SHELEY and WILLIAM W. SHELEY, Albany, N. Y., assignor of one-fourth to William H. King, same place. Filed Jan. 7, 1884. (No model.)

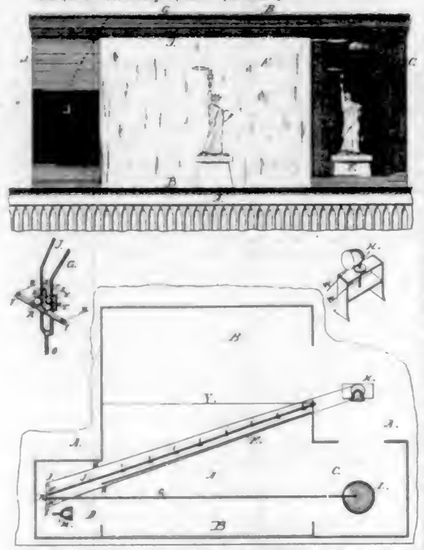
Claim.—1. A lever-power consisting of a slotted sweep and two arms of any material, the two ends of which arms, being fastened together, form a knuckle-joint, the sweep being held in position by means of a pin or bolt, which pin or bolt can be passed through the slot therein to keep such arm from moving sidewise, and underneath which said sweep having the slot shall be a wheel, which wheel shall revolve against a part of a circle or ellipse forming the side or end of a plane of any material under said sweep opposite to the knuckle-joint, and then against either of the turned-up edges or sides of said plane or against pieces of any material affixed to or upon said plane, and which sweep shall have at one of its ends rods or rollers, substantially as described, and for the purpose set forth.

2. In a lever used for pressing purposes, the combination of a sweep forming such lever, in which shall be a slot through which a pin or bolt passes to prevent a lateral motion of said arm, and a wheel affixed to and placed either underneath or on top of such sweep, as described, and for the purposes set forth.

3. In a lever used for pressing purposes, the combination of a sweep forming such lever, having a slot therein, a wheel affixed to and placed either on top or underneath said sweep, and a plane of any material placed either above or below said lever, the end of which opposite the knuckle-joint in said lever shall either be turned up in the form of part of a circle or ellipse, or to or upon which such end shall be affixed a piece of metal or wood to form a part of a circle or ellipse, and the edges of said plane adjoining said part of the said circle shall either be turned up, or along or upon the sides of said plane shall be affixed pieces of any material in such a manner as that the inner faces of said turned-up edges or of said pieces, if prolonged, would form an angle of ninety degrees or less, substantially as described, and for the purposes set forth.

4. In a lever used for pressing purposes, the combination of a sweep forming such lever, having a slot therein, and having at one end thereof rods or rollers, one of which is held in position on each side of one of the arms forming the knuckle-joint of such lever, and a wheel affixed to and placed either on top or underneath said lever, and a plane of any material placed either above or below said sweep, substantially as described, and for the purposes above set forth.

5. A sweep for a lever, made of any material, constructed with a slot therein, for the purposes above set forth.



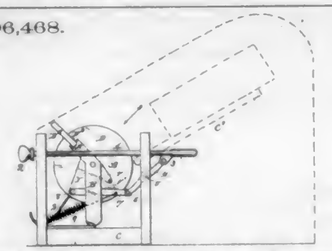
6. A lever consisting of a sweep constructed with a slot therein and turning around a pivot, and the two arms joined together, and which form a knuckle-joint, in one of which arms, at or near the knuckle-joint, shall be a rod or pin, which is inserted into the slot in said sweep, and

is acted upon by said sweep to turn the said arms of said lever, for the purposes above described.

7. In a lever for pressing purposes, the plane which is placed between the sweep which moves upon a pivot and has a slot therein, and the end of one of the arms of said lever, which, with the other arm, forms a knuckle-joint, for the purposes above described.

8. In a lever for pressing purposes, the combination of the slotted sweep moving on a pivot, and the plane underneath and upon which said sweep is placed and to which said sweep is affixed, for the purposes above set forth.

296,467. THEATRICAL APPLIANCE. JOHN W. SHERMAN, New York, N. Y. Filed July 30, 1883. (No model.)



Claim.—1. The combination, with a theatrical stage or cabinet, a side exhibition-compartment open to the stage but closed at the front, and a vertical plate of glass so fitted or adjusted in front of the stage at a horizontal angle as to face the side compartment, of a light concealed upon the side of the stage opposite to the exhibition-compartment in position to throw its rays across the front of the glass into said compartment, a second concealed light placed overhead in said compartment, and a third concealed light placed in the rear of the compartment, and adapted to be reflected either into said compartment or upon the stage in the rear of the glass plate, all substantially in the manner and for the purpose herein set forth.

2. The combination, with a theatrical stage or cabinet fitted with a glass reflecting-plate, E, and with concealed illuminating-burners L M and i i on opposite sides of said plate, of a gas-main, O, to supply said burners, branch pipes J G, connecting the main with the burners, stop-cocks N N in said branch pipes, a coupling-rod, R, connecting the cock-levers, and side pipes, S S, connecting each branch pipe above and below its controlling-cock, substantially in manner and for the purpose herein set forth.

3. The combination, with a gas-main supplying the burners illuminating a vertical glass reflecting-plate upon a theatrical stage, the branch pipes connecting said main with the burner, stop-cocks in said pipes, and a coupling-rod, R, connecting the cock-levers, and with a rotating light and reflector, H, adapted to illuminate either the stage in the rear of the glass or objects placed at the side thereof in front of the plane of the glass, of cords W W, extending from either end of the coupling-rod R, or from the cocks connected thereby, to the device upholding the rotating light, whereby the movement of the cocks in opening and closing shall operate to reverse the position of said light and reflector, substantially in the manner and for the purpose herein set forth.

296,468. MECHANICAL AUTOMATIC CIGAR-SELLER. DANIEL WEBSTER SHIRK and CARY OBERLIN COLE, Grand View, Iowa. Filed May 22, 1883. (Model.)

Claim.—1. In a cigar-seller, the combination of the shaft A, the disks or arms D, secured thereto, segments E F and pivoted segment H,

means for tilting said segment, the receiver I, spring L, delivery-board S, and an operating mechanism for moving the parts, substantially as shown.

2. In a cigar-seller, the combination of the shaft A, disks or arms D, secured thereto, segment F, rocking receiver I, spring L, cam P, delivery-board S, and an operating mechanism for moving the parts, substantially as specified.

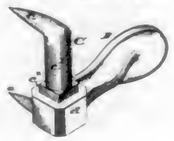
3. In a cigar-seller, the combination of the shaft A, disks or arms D, secured thereto, segments F, rocking receiver I, spring L, cam P, delivery-board S, tappet-rod T and shaft therefor, coin-receiving arm U, guard-lever V, suitable tripping mechanism therefor, and an operating mechanism for moving the parts, substantially as described.

4. The combination of the shaft A, disks or arms D, secured thereto, segment F, rocking receiver I, spring L, cam P, delivery-board S, tappet-rod T, shaft M, crank N, tripping-lever W, guard-lever V, coin-receiving arm U, and an operating mechanism for moving the parts, substantially as set forth.

5. The combination of the shaft A, disks or arms D, secured thereto, segment F, rocking receiver I, spring L, cam P, delivery-board S, tappet-rod T, shaft M, crank N, tripping-lever W, guard-lever V, coin-receiving arm U, lever Y, having a finger, Y^{2}, for grasping the coin, and an operating mechanism for moving the parts, substantially as specified.

6. The combination of the shaft A, coin-receiving arm U, secured thereto, lever Y, having finger Y^{2} for grasping the coin, guard-lever V, tripping mechanism therefor, cigar-receiver I, tilting mechanism therefor, delivery-board S, and an operating mechanism for moving the parts, substantially as shown.

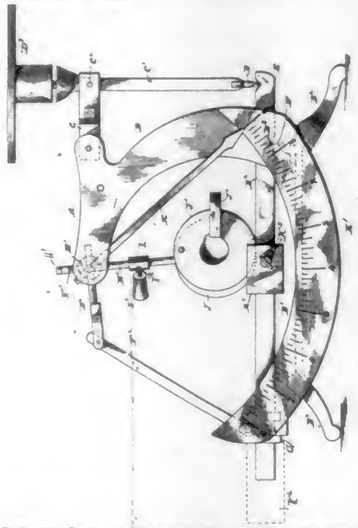
7. The combination of the shaft A, coin-receiving arm U, secured thereto, guide-trough B^{9}, a device for grasping the coin, guard-lever V, tripping mechanism therefor, cigar-receiver I, tilting mechanism therefor, and an operating mechanism for moving the parts, substantially as described.



8. The combination of the shaft A, coin-receiving arm U, secured thereto, ears U', having receiving-grooves U^{3}, guide-trough B^{9}, a device for grasping the coin loose on shaft A, guard-lever V, tripping mechanism therefor, rocking cigar-receiver I, and mechanism for moving the parts, substantially as described.

9. The combination of the shaft A, coin-receiving arm U, secured thereto, ears U', having grooves U^{3}, guide-trough B^{9}, lever Y, having finger Y^{2}, guard-lever V, tripping mechanism therefor, cigar-receiver I, tilting mechanism therefor, and an operating mechanism for moving the parts, substantially as shown and described.

10. The combination of the pivoted cigar-receiver, a suitable tilting device therefor, a coin-receiver that is rigidly secured to the shaft, a loosely-mounted lever provided with a finger or other device for grasping the coin, a guard-bar for retaining the coin in the receiver, a lever for tripping the guard-bar, actuating mechanism therefor, springs or other devices for retaining the parts in their normal positions, and a bar or lever provided with suitable connections for operating the mechanism, substantially as specified.



11. The combination of an inclosing-case provided with an inclined feeding-board, a pivoted cigar-receiver, a suitable device for tilting said receiver, a coin-receiver that is rigidly secured to the actuating-shaft, an operating-lever provided with a device for grasping the coin, a guard-bar for retaining the coin in the receiver, a lever for tripping the guard-bar, actuating mechanism therefor, springs for returning the parts to their normal position, and a suitable operating bar or lever, all combined and arranged to operate substantially as shown and described.

296,469. FASTENER FOR DOORS, WINDOWS, GATES, &c. ALEXANDER G. SIMPSON, Arcadia, Mo. Filed Aug. 20, 1883. (No model.)

Claim.—The combination, in a fastener, of the journal C and the arm D, said journal having the two parts c' and c^2, and said arm having the eye d, to enable the arm to turn upon the part c' and be prevented from turning when upon the part c^2, as described.

296,470. WEIGHING-SCALE. EMILE SIEBERT, Buffalo, N. Y. Filed Dec. 18, 1883. (Model.)

Claim.—1. In a scale, the combination, with the indicating-hand and a graduated plate having indicating-marks, of a pendulum having a weight supported eccentrically to the pivotal points of the pendulum-support.

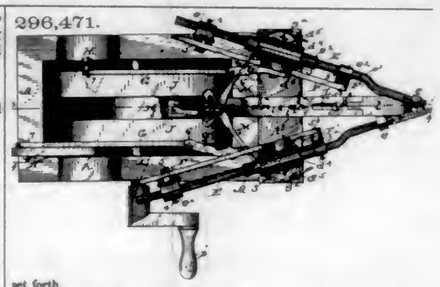
2. In a scale, the combination, with an indicating-hand, a pendulum, and a shaft upon which the hand and the pendulum are mounted, the pendulum being provided with a weight supported eccentrically to the axis of said shaft, of a graduated scale having equidistant indicating-marks.

3. In a scale, the combination, with the pendulum, of a supplemental weight connected thereto eccentrically to the point of oscillation of the pendulum.

4. In a scale, the combination, with the pendulum having a supplemental weight connected thereto eccentrically to the point of oscillation of the pendulum, and a stop to limit the movement of the said supplemental weight, of a pen connected to the pendulum and capable of adjustment radially from the point of oscillation and circumferentially around the pendulum-stem.

5. In a scale, the combination, with the supporting-platform and the pivoted guide, of the pivoted beam, the pendulum-shaft, the means for connecting the beam and the shaft, the shaft being provided with an indicating-hand, and a pendulum having a supplemental weight supported eccentrically to the point of oscillation of said shaft.

6. In a scale, the combination, with the supporting-platform, the standard, and the pivoted guide-arm, of the pivoted beam having an adjustable collar, the pendulum-shaft provided with an adjustable arm, and the link connecting the arm and the collar together.



7. In a scale, the combination, with the supporting-platform, the standard, and the pivoted guide-arm, of the pivoted beam, the distance between the pivotal points of the arm and its connection with the standard being approximately the same as the distance between the pivotal point of the beam and its contact with said standard, and the pendulum-shaft having an adjustable arm, the beam and shaft being adjustably connected together.

296,471. GIN-SAW-FILING MACHINE. FRANK M. SIBK, Newnan, Ga. Filed Sept. 26, 1883. (No model.)

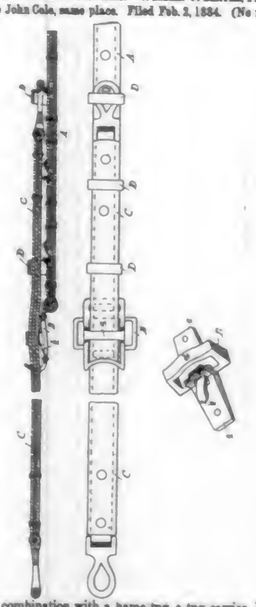
Claim.—1. In a saw-sharpening machine, the combination, with the grooved disks J J and pivoted levers H H, of the file-bars E E, the posts D D′, and the angle-bars and connecting-rods for imparting a properly-limited movement to said file-bars, substantially as described.

2. The combination, with the grooved disks J J and cam K, of the pivoted levers H, file-bars E, the angle-bars, connecting-rods G, the posts D D′, the feed-bar L, and springs M, substantially as and for the purposes

296,471.

set forth.

3. The grooved disks J and posts D D′, composed of the jointed sections and arranged to turn at their bases, in combination with the file-bars E, pivoted levers H, the angle-bars, and connecting-rods G, substantially as and for the purposes specified.



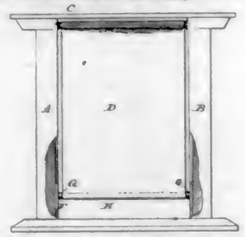
4. The combination of the grooved disks J, pivoted levers H, file-bars E, the angle-bars, and connecting-rods G, with the posts D D′, each formed of two jointed sections, the jaws d^3, flanged sleeves d, nuts d^3, pins 2, and the adjustable brackets C, substantially as and for the purposes stated.

5. The grooved disks J, slotted pivoted levers H, posts D D′, and file-bars E, in combination with the grooved guide-pieces D^2, links F′, angle-bars F, and connecting-rods G, substantially as set forth.

6. The frame A, carrying the adjustable brackets C, in combination with the shaft I, carrying grooved disks J, the posts D D′, guide-pieces D^2, file-bars E, angle-bars F, connecting-rods G, and levers H, arranged and operating substantially as and for the purposes set forth.

7. The grooved disks J and posts D D′, in combination with the pivoted levers H, slotted at their upper ends, the guide-pieces D^2, file-bars E, having eccentric front extremities provided with shank and carrying the nuts or collars s, the collars s s' s^2, the jointed connecting-rods G, having slotted rear ends, and the open links F′, substantially as and for the purposes specified.

296,472. HAME-TUG AND BUCKLE. WARREN C. SLATER, Fremont, Mich., assignor to John Cole, same place. Filed Feb. 2, 1884. (No model.)



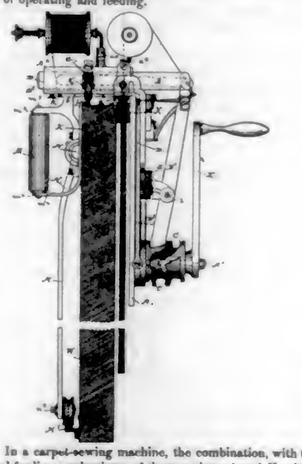
Claim.—1. In combination with a hame-tug, a tug-carrier, B, having loop a, and spring b, arranged under said loop, substantially as and for the purposes specified.

2. In combination with a hame-tug, a tug-buckle, D, consisting of the longitudinal bar c, provided with the loop d and tongue e, substantially as and for the purposes specified.

3. A hame-tug, A, provided with a series of buckles, D, in combination with a trace provided with a cockeye upon each end, so as to be reversed and arranged to engage with the tongue of one of the series of buckles, substantially as described.

4. The combination, with the tug A and tug-carrier B, the latter provided with a spring, b, of a series of buckles, D, secured to said tug, and the trace C, when constructed, arranged, and operating substantially in the manner and for the purposes described.

296,473. WINDOW-SHADE FIXTURE. NICHOLAS SLINGLAND, Falls Village, Conn. Filed Feb. 23, 1884. (No model.)



Claim.—1. The combination of vertical parallel guides on the jambs of a window-frame, a spring-roll arranged to automatically roll up the shade, a slat in the lower end of the shade, and a shoe arranged upon each of the guides on said jambs, the said slat extending from the shoe on one side to the shoe on the opposite side, and engaged with the respective shoes, the bearing of the said shoes upon the jambs made elastic, substantially as described.

2. The combination of vertical guides on the respective jambs of a window-frame, an automatic shade-roller, a shade attached thereto, a shoe fitted to move up and down on the guide of each of said jambs, a slat at the lower end of the shade, one end resting in a socket on one of the shoes and extending across into a socket on the shoe at the opposite side, and a spring introduced between the shoes and slat, whereby a yielding pressure is produced upon said shoes against their respective jambs, substantially as described.

296,474. CARPET-SEWING MACHINE. ALPHONSO BUDD SMITH, San Francisco, Cal., assignor to Solon Pattee, same place. Filed Apr. 26, 1883. (No model.)

Brief.—Interchangeable feeding devices are provided, whereby the machine is adapted for feeding on a bench-support or upon the edges of the carpet. The side plates are adjustable to satisfy the requirements of either condition of operating and feeding.

Claim.—1. In a carpet-sewing machine, the combination, with the stitch forming and feeding mechanisms, of the two plates A and K, which support said mechanisms, one of said plates being provided at the top with an arm extending across over the other plate, and the other plate being secured adjustably to the said arm, whereby the plates may be adjusted toward or from each other, substantially as set forth.

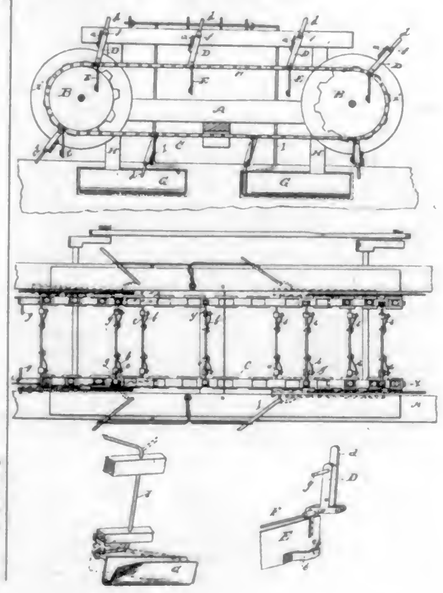
2. The combination of the box A^4, the fixed depending plate A, having stud A′ and brackets b d, and the actuating mechanism connected therewith, and rear plate, K, having the guide-handle, and adapted to slide laterally toward and from the fixed plate, and a binding-screw, substantially as hereinbefore described, for the purpose set forth.

3. The combination of the frame adapted to travel astride of the edges of material to be stitched together, carrying wheels g g, a work-supporting bench, W, having fixed track, the clamps w X, and the steady-bar, with traction-wheel and the guide-rail on the back of the work-bench, substantially as hereinbefore described, for the purpose set forth.

4. In a carpet-sewing machine, the combination of the traveling frame adapted to carry all the stitch-forming mechanism, and to rest astride of and move over the edges of the material to be stitched, a work-supporting bench having a guide-track for the frame, and a clamping device to hold the material in a vertical position, a fixed rack placed in relation to the guide-track, as described, and a pawl or vibrating finger, D, and operating mechanism attached to the said traveling frame, the movements of which in one direction cause the finger to engage with the rack and propel the frame forward, and in the other direction to pass over the rack without engaging, substantially as hereinbefore described.

5. The combination, with the adjustable traveling frame having a horizontally reciprocating and vibrating looper, of the fixed lever D′, having the head D^4, provided with the two slots, and interchangeable feeding devices to be secured in the slots, substantially as set forth.

6. The combination of the stationary bench W, track H, notched plate w, clamp-bar X, and movable clamps Y, substantially as hereinbefore described.



7. The combination of the stationary bench W, track H, notched plate w, clamp-bar X, movable clamps Y, and lower guide-rail, H′, carrying-frame, and steadying-bar N, with its roller, substantially as described.

296,475. TACK OR FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Nov. 24, 1883. (No model.)

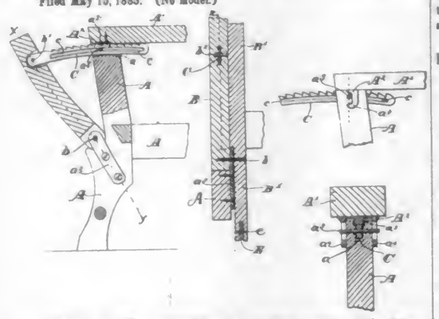
Claim.—The herein-described metallic cut tack or fastener, consisting, essentially, of the head a, with tapering sides and extended portions or ends, and having the convexed upper surface and concaved under surface, c, said under surface being provided with spurs, as represented, and the pointed prong b, integral with the head, projecting from the concaved under surface, c, thereof, and tapering on all its sides from heel to point, with two of its sides flush or even with the tapered sides of said head, all as shown, and for the purpose specified.

296,476. PROPELLING APPARATUS FOR VESSELS. JAS SCOTT SMITH, Marshall, Ark. Filed Dec. 4, 1883. (No model.)

Claim.—1. The combination, in propelling mechanism for vessels, consisting of the sprocket-wheels and working-chains having bracket-arms secured thereto, said arms being provided with a spring-bar, which is pivoted on a cross-rod passing through the bracket-arms, whereby the paddles are held against undue strain, substantially as described.

2. A propelling apparatus consisting of the sprocket-wheels and chains, the latter having bracket-arms, in combination with the guide and tripping mechanism, whereby motion is imparted to the paddles and also released, for the purpose set forth.

3. The combination, in a propelling apparatus consisting of the sprocket-wheels and chains, the latter provided with bracketed spring-arms, of the hinged paddles provided with the cushioning devices, all operating together as set forth and described.



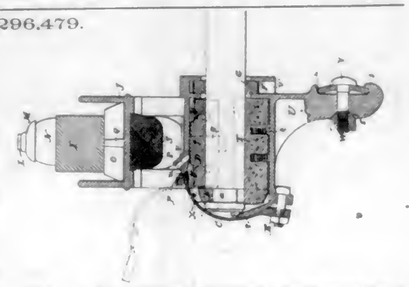
4. The combination, in an apparatus for propelling vessels, of the sprocket-wheels and chains provided with bracket-arms, and with the paddle-blades having on their backs springs and compression-balls interposed between said springs and paddle, for preventing concussion of the paddle-blades against the bracket, as described.

296,477. TILE-MACHINE. JOHN S. SMITH, Jackson, Mich., assignor of one-half to Theadore G. Bennett, same place. Filed Nov. 30, 1883. (No model.)

Claim.—A conveyer formed by the combination of the grooved shaft A A', and semicircular flanged and feathered reversible and interchangeable sections C C', substantially as and for the purpose set forth.

296,478. RECLINING-CHAIR. OTTO STECHHAN, Indianapolis, Ind. Filed May 15, 1883. (No model.)

Claim.—1. The combination, in a reclining-chair, of the frame-work A, the reclining back B, the notched bars C, the arms A', hinged to the front uprights of said frame-work and extending back and resting upon the rear uprights thereof, and catches upon the under side of said arms, which enter the notches in said bars when said arms are in lowered position, and are withdrawn from said notches by raising the arms, substantially as shown and specified.



2. The combination, in a reclining-chair, of the frame-work, the back, the rack-bars having longitudinal slots therein, pins extending through the rear uprights of said frame-work and said rack-bars, hinged arms, and catches on said arms which engage with the notches in said rack-bars, substantially as shown and specified.

3. The combination of the frame-work, the back, the rack-bar, the hinged arm A', the device A^3, having catch a^3, and hooked portions a^4, and pins a^2, extending through the rear uprights of said frame-work, and adapted to engage with said hooked portions a^4, substantially as set forth.

296,479. CAR-AXLE BOX. JOHN STEPHENSON, New York, N. Y. Filed Apr. 18, 1883. (No model.)

296,479.

Claim.—1. The combination, in a car-axle box, of a grooved axle, a forked key fitted to said axle, and grooves in the box receiving the limbs of said key and extending into the oil-well, whereby the play of the key is made the medium of elevating the oil from the well to a point above the axle, substantially as set forth.

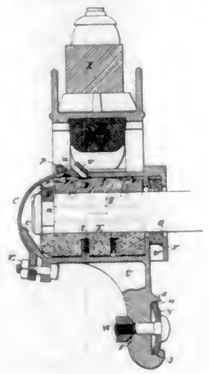
2. The combination of the box, a bearing-block in contact with the top of the box, and provided with an oil-basin, y, and a key check-plate having limbs extending into the well, and fitted to its grooves, to elevate the oil into the basin, substantially as set forth.

3. A car-axle box provided with a key-plate fitting a groove in the axle and in grooves in the box, and with a bearing in contact with the flat top of the box, and confined between the rear wall and the key-plate, substantially as set forth.

4. A car-axle box in which the journal is locked longitudinally by a key-plate, and provided with a dust-chamber containing a surrounding dust-collar in contact with the axle, the collar being free to gyrate within its chamber, or controlled by the axle, substantially as set forth.

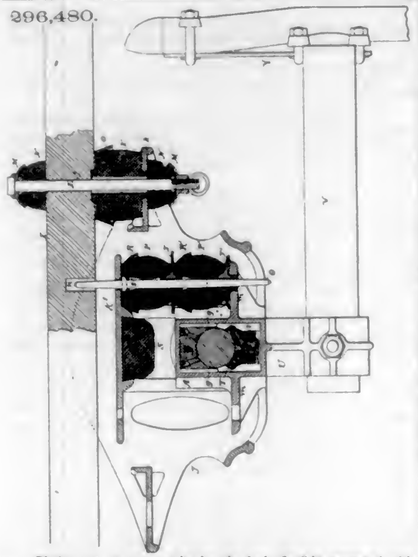
5. A car-axle oiling-pad independent of the box-shell, and having in combination vertical plates bent outward at their upper edges and shaped to conform to the journal, with felt between the plates held firm in position for journal-contact by the outward spread-plates, and provided with a supporting-spring, substantially as set forth.

6. The combination of a car-axle box and axle-journal, oiled by a pad of felt resting on the spread-wings of two vertical plates clasping the felt, and holding it up to the journal by a supporting-spring resting on the floor of the box, substantially as set forth.



7. An oiling-pad arranged beneath the grooved axle, and provided with an extension projecting beneath the neck of the axle, substantially as set forth.

8. A car-axle-box oiling-pad of felt or analogous material provided with blocks or pieces of hard material secured immovably therein for contact with the journal, substantially as set forth.



9. A car-axle box provided with an oiling-pad of felt or analogous material having screws a^2 secured immovably therein, for the purpose specified.

10. A car-journal oiling-pad having felt or similar fabric between two vertical plates, the upper portion of the plates and felt diverging in lines conforming to the curve of the journal, the parts of the felt for journal-contact having metal or other hard substance inserted, and upheld by the curved metal plates, as and for the purposes specified.

296,480. CAR-AXLE BOX. JOHN STEPHENSON, New York, N. Y. Filed July 23, 1883. (No model.)

296,480.

Claim.—1. A tram-car having the body flexibly connected with its pedestals through the medium of springs capable of lateral play, arranged between the pedestals and sills, and provided with axles having annular grooves and bearings within the boxes sliding in the pedestals, whereby lateral movement of the boxes with respect to the axles is prevented, substantially as set forth.

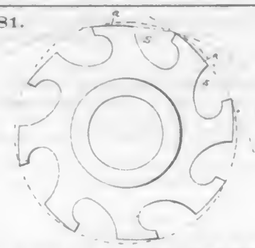
2. The combination, in a tram-car, of the sills, pedestals, intervening springs, bolts passing therethrough, and cushions at the end of each bolt, and with the two pedestals on opposite ends of the axle held in relative position by the axle-boxes locked on the journals, substantially as set forth.

3. A tram-car with pedestals receiving the boxes and intervening springs, flexible elastic cushions between the car-body and the pedestals, the axle-journals locked within the boxes, and the connections arranged to permit the pedestals to change position independently as the axles approximate the radial lines of curves, and to restore the pedestals to their normal positions as the car comes upon the straight portions of the track, substantially as set forth.

4. A tram-car having its axles locked in the axle-boxes, and cushions secured in flanged seats, so as to permit movement of the body independent of the pedestals by which the axles and wheels are impelled, substantially as set forth.

5. A tram-car having at each side of the axle-box a spring resting on a disk, and the upper end of the spring capped by a re-enforce inverted cup, with its bottom indented into a cavity of the spring, the indentation of the cup-bottom receiving the collar of the pintle, substantially as set forth.

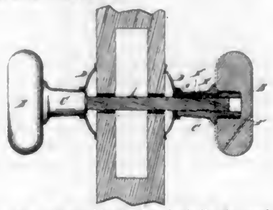
6. A tram-car having at each side of the axle-box a spring in two or more sections, an inverted cup and disk between the springs, an inverted cup above the upper spring, with central bosses upon the cup and disk interlocking each other and extending into recesses in the springs, and a central pintle extending through all the parts, substantially as set forth.



7. A car-pedestal having an elastic bumper-cushion arranged in and supported by a socket beneath the bed-plate and in suspense above the axle-box, substantially as set forth.

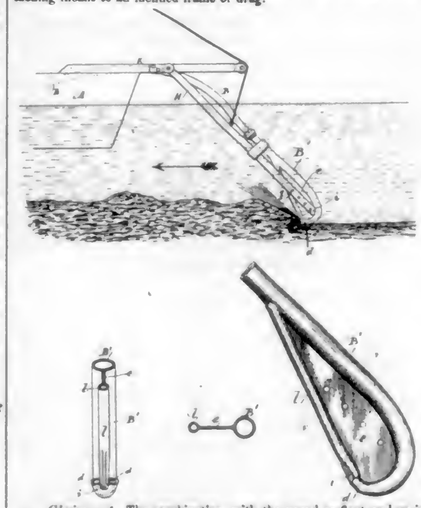
8. A car-pedestal having at the under side of the bed-plate a socket or receptacle for retaining a bumper-cushion, substantially as specified.

296,481. CUTTER-HEAD. JOHN D. STRICKLER, Worcester, assignor to Oscar L. Noble, Boston, Mass. Filed Jan. 28, 1884. (No model.)



296,481.

Claim.—A rotary cutter composed of a slotted body and teeth, having faces *a a* formed as arcs of circles, the radii of such arcs being longer than the radii of the body, as set forth.

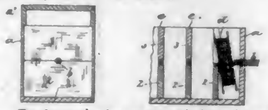


296,482. KNOB ATTACHMENT. OSCAR STODDARD, Detroit, Mich. Filed Jan. 2, 1884. (No model.)

Claim.—In a self-attaching knob and spindle, the combination, with a knob-shank having the spindle-opening and inclined key-channel, and vertical channel at inner end, of an inclined key serrated on its under surface, having the hooked inner end, as set forth, and a square spindle having the serrated surface A', the whole when arranged and combined as set forth.

296,483. HYDRAULIC APPARATUS FOR REMOVING SAND-BARS, &c. ROY STONE, New York, N. Y. Filed Sept. 24, 1883. (No model.)

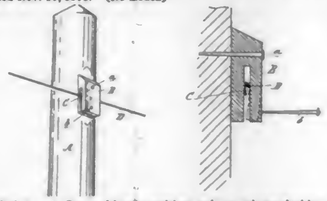
Brief.—A plow is formed of a curved water-pipe having two upwardly-directed jet-nozzles, and a branch pipe with a downwardly-directed nozzle, and connected to the main pipe by a web, forming the attaching means to an inclined frame or drag.



Claim.—1. The combination, with the vessel or float and an inclined connection or drag, of a curved water-pipe at the lower end terminating in the jet-tube *d*, having an upward inclination, and acting to project the solid materials upwardly into the current in the river, substantially as set forth.

2. In a hydraulic excavating apparatus, the pipe B', the jet-tubes *d d*, having an upward inclination, and a jet-tube, *i*, between the tubes *d*, substantially as set forth.

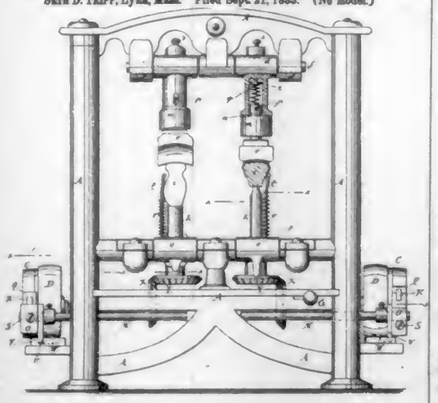
3. The combination, in a hydraulic plow, of a pipe through which water is forced, jet-nozzles for the issuing water at upward and downward inclinations, to loosen and raise the solid materials into the current of the river, and a web, *s*, at the front of the water-pipe, to cause the plow to rise and pass over any obstruction that is not removed by the water, substantially as set forth.



4. In a hydraulic excavating apparatus, the pipe B', web *s*, jet-tubes *d*, branch pipe *l*, and connections to the scow and to the water-pumps, substantially as set forth.

296,484. SHOW-BOX AND REEL-HOLDER. GEO. C. TATE, Malden, Mass. Filed May 14, 1883. (No model.)

Claim.—The box *a*, having apertures in its ends, and transverse partitions *c*, each having a central aperture, and a movable portion above said aperture, combined with the rod *b*, adapted to pass endwise through the end apertures of the box and the central apertures of the partitions, and to support reels placed between said partitions, the endwise movement of the rod enabling some of the reels to be released and removed from the box without disturbing or removing the whole series of reels, while the removability of the upper portions of the partitions enables them to be displaced while the rod is being inserted through the box and reels, so that the reels can be inclined to facilitate the insertion of the rod, as set forth.



296,485. MEANS FOR SUPPORTING AND INSULATING ELECTRICAL WIRES. JOHN WATSON TRINGHAM, Windsor, Ontario, Canada. Filed Nov. 19, 1883. (No model.)

Claim.—1. In combination with a pole or other suitable support, the means of securing the wire to such pole, which consists of a bifurcated block whose arms are constructed to approach each other and clamp the wire in a fixed position between them, substantially as and for the purposes described.

2. The combination, with a pole and cross-arm or other suitable support, provided with a hole, of a bifurcated top pin, which, being forced into said hole, will clamp the conductor, substantially as described.

296,486. MACHINE FOR LEVELING BOOT AND SHOE SOLES. SETH D. TRIPP, Lynn, Mass. Filed Sept. 21, 1883. (No model.)

Claim.—1. In a machine for leveling boot and shoe soles, the combination, with the shaft Z, connected with the drive-shaft B by bevel-gear wheels Y X, of the right and the left worms *a b* and the worm-segments *c d*, carrying the last *i* and the presser-foot *e*, substantially as herein shown and described, whereby the last and presser-foot are made to move in unison, as set forth.

2. In a machine for leveling boot and shoe soles, the combination, with the presser-foot rod *n* and the worm-segment *d*, of the socket *m* and the spring *q*, substantially as herein shown and described, whereby the said presser-foot will adjust itself to the varying thicknesses of the soles, as set forth.

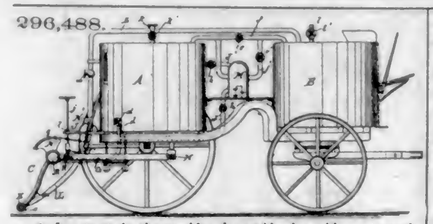
3. A machine for leveling boot and shoe soles, constructed, substantially as herein shown and described, with two worm-shafts, two pairs of right and left worms, and two pairs of worm-segments arranged to carry their lasts and presser-feet at the same time and in opposite directions, to adapt the two pairs of lasts and presser-feet to be attended by the same operator, as set forth.

4. In a machine for leveling boot and shoe soles, the combination, with the last-carrying segment *c* and the last *i*, of the rod *t* and spring *v*, substantially as herein shown and described, whereby the heel of the boot or shoe will be held from rising on the last when pressure is applied to its toe, as set forth.

5. In a machine for leveling the soles of boots and shoes, the combination, with the pulley C and the socket-arm O, of the brake-shoe Q, the brake-block P, shaft N, and the pivot-screw S substantially as herein shown and described, so that the axes of the said pulley, shoe, and block will be in a straight line, or nearly so, when the brake is in use, and the brake-shoe axis will be carried out of the line when the motion of said pulley is reversed, withdrawing the brake-shoe from the pulley, as set forth.

6. In a machine for leveling the soles of boots and shoes, the combination, with the screw-nut J, moving upon the drive-shaft B, and the shaft N, carrying the brake-sockets O, blocks P, and shoes Q, of the arms M and the springs and stops *k l*, substantially as herein shown and described, whereby the brake will be applied and withdrawn automatically, as set forth.

296,487. TACKLE. KING UPTON, Peabody, Mass. Filed Sept. 17, 1883. (No model.)



Claim.—In a tackle, the combination, with the rope and blocks, of the swiveled connecting device for connecting the standing end of the rope with one of the blocks, whereby the said rope is permitted to twist or rotate on its axis independently of the connected block, substantially as and for the purposes set forth.

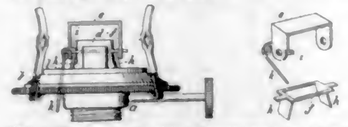
296,488. STREET-CLEANING MACHINE. BERGEN VAN GAASBEEK, Mount Vernon, N. Y. Filed Sept. 28, 1882. (No model.)

Claim.—1. The water-discharge pipe E, provided with the series of nipples *c*, and the inclosed pipe K, provided with the nipples *p*, in combination with the tank A and tank B, said tanks connected, respectively, with pipes E and K, substantially as and for the purpose set forth.

296,488.

2. In a street-cleaning machine, the combination, with a water-tank, pressure-tank, and distributer, of a furnace for heating the water or air, or both, substantially as and for the purposes set forth.

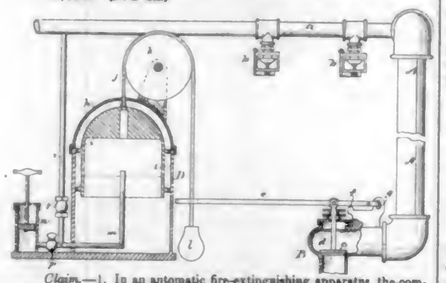
3. The combination, with the tank A, of the connected pipes D and E, the latter being provided with the series of nipples *c* or apertures, substantially as and for the purposes set forth.



4. In a street-sprinkling device, the pipe D, hinged to the rear cross-bar, H, of a stage or parallel frame, in combination with the winding-shafts *g* and *j j* and chains *g'* and *j' j'*, for adjusting the distributer, substantially as and for the purposes set forth.

5. The central bar, F, pivoted in the carriage, in combination with the sliding bars G G, cross-bars H H', winding-shaft *g*, chain *g'*, and pipe D, hinged to the rear cross-bar, substantially as shown, and for the purposes set forth.

6. In a street-sprinkler, the combination, with the water-pipe having nipples and connected to the water-tank, of the air-pipe, with nipples adapted to project into the nipples of the water-pipe, and connected to the compressed-air tank, substantially as and for the purpose set forth.

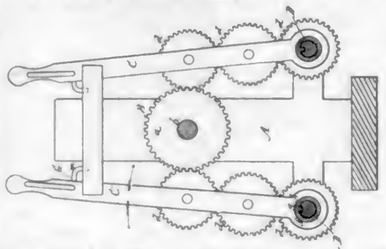


7. In a street-sprinkler, the combination, with the compressed-air tank and the water-tank, of the air-pipe having nipples and the water-pipe surrounding the air-pipe, and having nipples, into which the nipples of the air-pipe project, said air and water pipes having connection with the compressed-air and water tanks, substantially as and for the purpose set forth.

296,489. LAMP-EXTINGUISHER. WILLIE C. WALTER, Richmond, Va. Filed Sept. 17, 1883. (No model.)

Claim.—In a lamp-extinguisher, the combination, with the slotted frame *f*, constructed as described, and provided with the outwardly-inclined legs *h h* and opposite end journals for the hood, of the rectangular hood *e*, having its downward arms perforated to receive the journals of the frame, and one of the arms provided with the stop *i*, and an eye for receiving the operating-rod *k*, the whole adapted to be applied to a lamp-burner, substantially as specified.

296,490. AUTOMATIC FIRE-EXTINGUISHING APPARATUS. CALEB C. WALWORTH, Boston, and OSBORN B. HALL, Malden, Mass. Filed Nov. 17, 1883. (No model.)

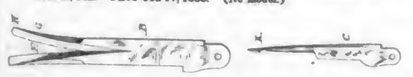


Claim.—1. In an automatic fire-extinguishing apparatus, the combination of a water-supply pipe, with distributing branches connected therewith, and provided with extinguishers adapted to be opened and rendered operative by heat at the danger-point thereof, a water-excluding valve arranged in said supply-pipe, a tank supported by compressed air, with connections by which the air also communicates with and fills the water-distributing pipes, so as to be liberated by the opening of an extinguisher, and devices connecting said tank and water-excluding valve, and adapted to open the valve and admit the water by the falling of the tank at the liberation and escape of the air therein by the opening of an extinguisher, substantially as specified.

2. In an automatic fire-extinguishing apparatus, the combination of supply-pipe A, its branches *a*, and automatic extinguishers *b* thereon arranged, a water-excluding valve, *c*, arranged in said supply-pipe, an air-tank, *i*, arranged to be supported by compressed air, and with devices for compressing and confining the air therein, a pipe, *s*, communicating with said air-supply devices and with the water-distributing pipes, a cord, *j*, supported by sheave *k* and attached to said tank, a weight, *l*, suspended by said cord, and a valve-weighting lever, *e*, arranged to be actuated by said cord and its weight, and to thereby open the valve and liberate the water, when the tank falls, by reason of the escape of the air therein, at the liberation of an extinguisher by heat, substantially as specified.

3. In combination with valve *c* and lever *e*, the latter pivotally connected with the valve-stem, and means to actuate said lever, the fulcra *f g*, arranged at different distances from the valve-stem, to vary the relative lengths of the arms of the lever at and after the commencement of the rising movement of the valve, substantially as specified.

296,491. DIFFERENTIAL GEAR. JONATHAN B. WEST, Rochester, N. Y. Filed Sept. 6, 1883. (No model.)



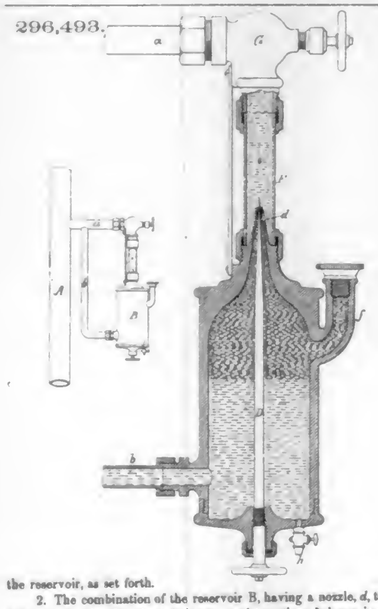
Claim.—1. In a differential gear, the combination of a series of cone-gears attached together in one body, a lever turning loosely upon the shaft which is to be driven, and a set of pinions mounted on the lever, the upper one engaging with the cone-wheels, the lower one resting loosely on the shaft and connected therewith by a spline which allows free longitudinal movement on the shaft, but imparts rotary movement as the gearing is turned, as set forth.

2. In a differential gear, the combination of the cone-gears *a a a*, all attached together, the lever C turning on the shaft to be driven, the set of spur-pinions *d d d*, mounted on the lever, the upper one engaging with the cone-gears, the lower one engaging with the shaft by a spline, and the block E provided with a set of graduated notches, *i i i*, corresponding with the wheels of the cone-gear, the end of the lever being retained by said notches, as shown and described, and for the purpose specified.

3. The combination, in a differential gear, of the cone-gears *a a a*, the lever C, the pinions *d d d*, engaging with the cone-gears at the top and with the shaft D at the bottom, the block E, provided with the graduated notches *i i i* and holes *k k k*, and the catch G, attached to the lever engaging with said holes, all arranged to operate in the manner and for the purpose specified.

4. In a differential gear, the combination, with a set of cone-gears, of two levers turning on shafts on opposite sides of the cone-wheels, a set of pinions mounted on the shafts, the upper ones engaging with the cone-gears and the lower ones fitted on the shafts, and provided with splines engaging with the shafts, whereby one shaft can be driven by the other shaft through the medium of the cone-gears, as set forth.

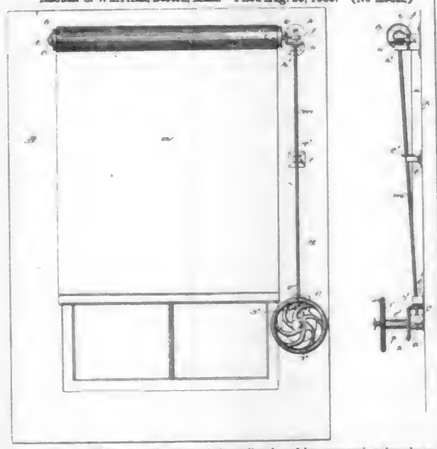
296,492. LOCK-STITCH RIPPER. ELIJAH HARVEY WHEELER, Corpus Christi, Tex. Filed Oct. 17, 1883. (No model.)



Claim.—As an improvement in rippers, the combination, with the knife-handle A, of the lock-stitch ripper comprising the blade B, bifurcated or slotted centrally at one end, the adjoining edges of which are beveled inwardly and ground sharp, one prong of said blade being rounded, as and for the purpose set forth.

296,493. LUBRICATOR. JOHN R. WHITACRE, Canton, Ohio. Filed Oct. 22, 1883. (No model.)

Claim.—1. The combination of the reservoir B, having in the top a nozzle, *d*, with the needle-pointed valve D, adapted to the nozzle, and having a threaded stem adapted to a threaded opening in the bottom of

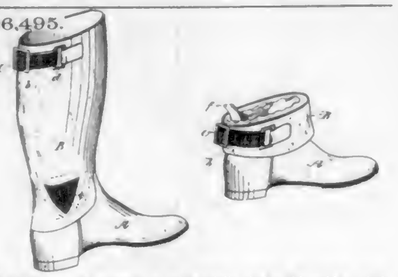


296,493.

the reservoir, as set forth.

2. The combination of the reservoir B, having a nozzle, *d*, the needle-pointed valve D, adapted thereto, and to a threaded opening in the reservoir, and the tube F, secured to the reservoir and surrounding the upper end of the nozzle, as set forth.

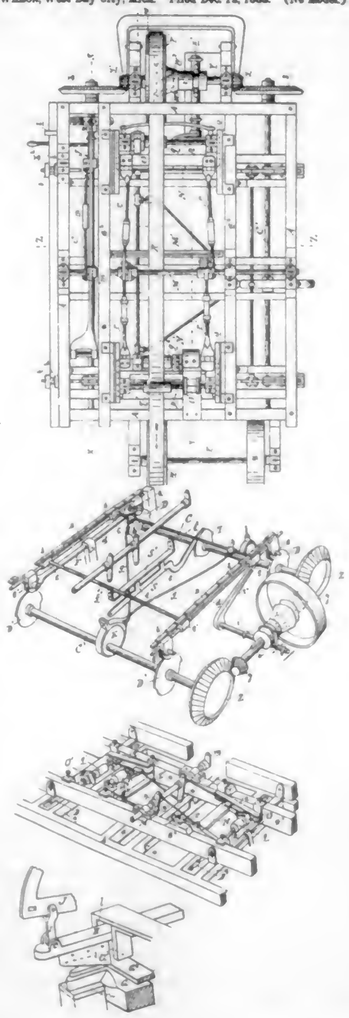
296,494. APPARATUS FOR OPERATING WINDOW-SHADES. REUBEN S. WHITTIER, Boston, Mass. Filed Aug. 20, 1883. (No model.)



Claim.—The combination of the roller *b* and its supporting-brackets with the shaft *m*, handle *r*, gearing connecting the said handle, shaft, and roller, and guides or brackets *h'*, *t*, and *o'*, for engaging and steadying the shaft, substantially as described.

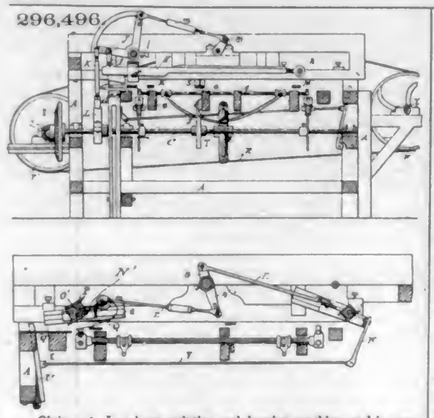
296,495. RUBBER BOOT. JOHN J. WILLIAMSON, Boston, Mass. Filed July 28, 1883. (No model.)

Claim.—1. The combination, in a boot, of a rubber foot portion, a thin, flexible leg, and the gores *e*, let into the lower portion of the leg, all substantially as and for the purposes described.



2. A rubber boot the foot part of which is of india-rubber compound of substantially the usual thickness, and is adapted to be drawn upon the foot of the wearer without traction upon the leg part, and which has

296,495.



a closed leg part of gossamer or substantially similar thin rubber-cloth material, provided with means of attachment to the leg or body of the wearer, substantially as described.

296,496. HOOP POINTING AND LAPPING MACHINE. FITCHLAND L. WILSON, West Bay City, Mich. Filed Dec. 12, 1883. (No model.)

296,496.

Claim.—1. In a hoop pointing and lapping machine, and in combination with the table upon which the hoop-blanks are supported, two or more carrier-bars extending across the table of the machine, and provided with racks or retaining-ledges to engage with the hoop-blanks, in combination with devices for imparting a four-motion feed to said carriers, whereby the hoop-blanks are carried intermittently over the table from front to rear, substantially as and for the purposes described.

2. In combination with the stationary table of the machine, and the pressure-bars M, secured above said table, a carriage operating in the plane of said table, and actuated by mechanical devices which give it a to-and-fro and up-and-down motion, whereby the racks or carrier-bars B B, which are secured to or form the ends of said carriage, form a feeding device by which the hoop-blanks are intermittently carried over the table from front to rear, substantially as and for the purpose described.

3. In a hoop pointing and lapping device, the combination of the feed-carriage with an eccentric, E, which imparts a to-and-fro motion thereto, and with the cams D D D' D', upon which the four corners of the carriage are supported, and which impart an up-and-down motion to said carriage, substantially as and for the purpose specified.

4. In a hoop pointing and lapping machine, the combination of the carrier-bars B B, cross-heads *c c'*, attached to the under sides of said bars, guide-bars *d*, passing through said heads, transverse bars *f f'*, connecting the cross-heads *c* and *c'*, respectively, eccentric E, for imparting a reciprocating motion to the said carrier-bars B, rods *g g*, connecting the eccentric to the bar *f*, friction-rollers *e e'*, attached to the outer ends of the guide-bars *d*, and cams D D', engaging with the rollers and constructed to give a vertically-reciprocating motion to the said bars B, substantially as and for the purpose specified.

5. In a hoop pointing and lapping machine, the combination of the carrier-bars B B, constructed to have a rising-and-falling and to-and-fro motion, with the guides *i i*, secured to the front end of the table of the machine, whereby the hoop-blanks formed in a pile between these guides may be withdrawn therefrom by the carrier-bars one by one and carried over the table, substantially as described.

6. In a hoop pointing and lapping machine, a lapping device consisting of two reciprocating carriages supported in guides oppositely inclined above the table over which the hoop-blanks are carried, and each provided with a revolving cutter-head, substantially as and for the purposes described.

7. In a hoop pointing and lapping machine, the combination of the shaft C, eccentric L, mounted on said shaft, rod K, attached to said eccentric, lever J, joined to the rod K, link I, depending from and joining the levers J and H, lever H, and knife G, mounted on said lever H, all combined and operating substantially as described.

8. In a hoop pointing and lapping machine, a carriage reciprocatingly actuated by suitable devices between inclined guides adjustably secured above the table over which the hoop-blanks are carried, in combination with a revolving cutter-head secured upon said carriage, and the spring pressure-foot Q, substantially as and for the purposes described.

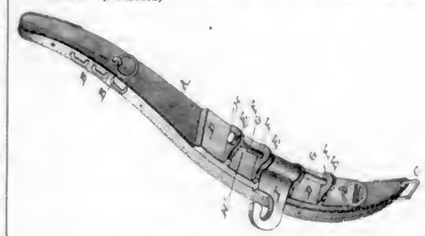
9. A clamping device adapted to prevent the hoop-blanks from being pulled endwise while operated upon by the lapping device, consisting of the bar S, pivotally secured at its rear end to the main frame, and provided with the studs *s*, in combination with a resistance-plate, S', adjustably secured to the main frame, and means, as T, whereby said clamping device is operated, substantially as described.

10. The clamping device designed to prevent the loops from being pulled endwise by the action of the cutter-knives which perform the lapping, the same consisting of the bar S, pivoted at one end to the frame below the table, and engaging with its free end upon a cam which intermittently lifts the bar, and thereby presses one or more hoop-blanks between it and the stationary pressure bar or plate S', secured above the table, substantially as described.

11. In a machine for pointing and lapping hoops, and in combination with the two carriages N N', provided with cutter-heads O O', pulleys *q* and *q'*, journaled upon the same, and the belt R, passing over said pulleys and communicating motion thereto, devices for operating the two cutter-heads of the cutter-heads, and a butting device which adjusts each hoop-blank lengthwise before it is lapped by the second cutter-head, all combined and operating substantially as and for the purpose described.

carriages simultaneously, so that the belt is tightened when the cutter-heads are in operation, substantially as described.

12. The combination of the carriages N N', bearing revolving cutter-heads O O', with the rock-shaft M, rocker-arms *n n'*, secured to the shaft M, and links *r r'*, joining said arms with the carriages, substantially as set forth.



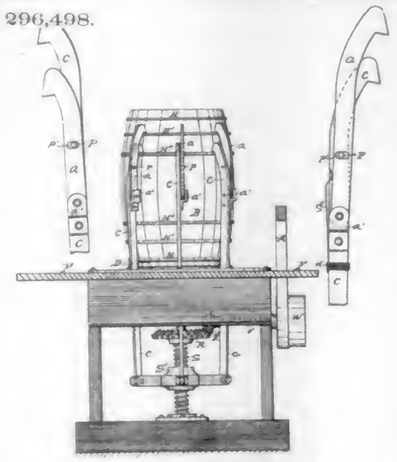
13. In combination with two lapping devices arranged to operate successively one on each end of a hoop-blank, a butting device constructed to push the ends of the hoops to be lapped, varying in length, to a regulated distance from the cutter-head, substantially as and for the purpose specified.

14. In a machine for pointing and lapping hoops, the butting device herein described, consisting of the vibrating arm U, pivotally attached to the main frame, rod V, attached to said arm, and arm W, attached to the rod V and to the carriage N, substantially as and for the purpose specified.

15. In a machine for pointing and lapping hoops, and in combination with the feeding-carriage thereof, mounted on cams secured to shafts C C', located at the front and rear of the machine, respectively, and deriving its motion from an eccentric on one of the said shafts, and the lapping devices, means for imparting motion to the said shafts and lapping devices, consisting of the bevel-gears *z'*, secured to the outer ends of said shafts, bevel-pinions *y'*, meshing with said gear, shaft *v'*, carrying the said pinion on its opposite ends, taper sleeve w^3, feathered to the shaft *y'*, pulley *w'*, loosely mounted on the shaft *v'*, and provided with the taper projection w^3, to engage with the taper sleeve w^3, belt R, imparting motion to the pulley *w'*, rock-shaft *x'*, engaging with the sleeve w^3, and shipping-lever x^3, attached to the shaft *x'*, all constructed and operating substantially as and for the purposes specified.

16. In a machine for pointing and lapping hoops, the combination of the following parts: a table upon which the hoop-blanks are supported, a carriage constructed to have a rising-and-falling and to-and-fro motion, which carries the hoop-blanks intermittently from front to rear, taking them one by one from the bottom of a pile of hoop-blanks placed between guides in the front end of the machine, a pointing device pointing the hoops by a shearing action, two reciprocating carriages supported in inclined guides above the table, and provided with cutter-heads which lap the hoop-blanks upon their ends lengthwise the grain, a clamping device which prevents the hoop from being pulled laterally by the action

296,497. HAME. EMERSON E. WINSTEAD, Dresden, Tenn. Filed Nov. 10, 1883. (No model.)



Claim.—The combination, with the hame having plate D, provided with the projecting perforated steps E, and trace-hook I, having eye J, of the removable lock-bolt G, constructed with the spring-catch H' below its head H, whereby the bolt is locked, removably, between the upper and under side of the topmost step or projection, as shown and specified.

296,498. BARREL-TRUSSING MACHINE. JOSEPH WINTERBOTHAM, Joliet, Ill. Filed Nov. 15, 1883. (No model.)

Claim.—In the barrel-trussing machine described, the combination of the hub or cross-head S' and its operating mechanism with the hooked bars *a* and *c*, pivoted together as shown, one of said bars being provided with the transverse slot I'' and the other with the stud P, to operate in said slot to prevent the slotted bar from falling too far in either direction, and means for throwing the pivoted bar forward toward the barrel, as and for the purpose set forth.

296,498.

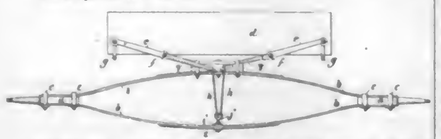
3. A combined spring and axle for wagons and other vehicles, consisting of stub-axles secured between the ends of spring-plates, substantially as herein shown and described.

4. Levers *e*, pivoted to a block, *g*, attached to one member of a vehicle-spring, and connected by one arm to the other member of said spring, and also connected by the other arm to the body of the vehicle, substantially as described.

5. The levers *e*, pivoted to block *g* on the upper member of spring *b*, connected to the body by the jacks *g*, and connected to the lower member of the spring by the link *h*, with or without eye-screw *j*, substantially as described.

6. A carriage having side springs, and also having the body connected to said side springs by levers *e*, blocks *g*, and rods *h*, or equivalent means, substantially as described.

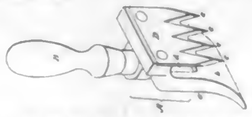
296,499. PROTECTIVE HEAD-COVERING OR HOOD. ANTON WIENKWSKI, New York, N. Y. Filed Oct. 17, 1883. (No model.)



Claim.—1. A protective head-covering consisting of a hood provided with glass-covered eye-openings, an interior mouth-piece, an induction air-tube connected with said mouth-piece, a valve within said induction air-tube adapted to automatically open inwardly for the admission of air, and an eduction air-tube, also connected to said mouth-piece, provided with a valve adapted to open outward automatically for the discharge of air, substantially as described.

2. A protective head-covering consisting of a hood provided with glass-covered eye-openings, a mouth-piece below said openings, an induction air-tube connected with said mouth-piece, having a funnel-shaped terminal provided with filtering material, an automatic inlet-valve within said tube, and an eduction-tube, also connected to said mouth-piece, and provided with an automatic valve adapted to open outwardly, said tubes being passed up over the top of said hood, which latter is provided with means for retaining the tubes in place, substantially as described.

3. A protective head-covering comprising a hood provided with glass-covered eye-openings, an induction air-tube opening opposite the mouth of said hood, provided with an automatic inlet-valve, and an eduction air-tube, also connected to said hood opposite the mouth, and provided with an automatic outlet-valve, said tubes being passed up over the top of said hood, which latter is provided with means for retaining the tubes in place, substantially as described.



296,500. SPRING-WAGON. THOMAS P. YATES, Factoryville, N. Y. Filed Sept. 14, 1882. (No model.)

Claim.—1. As an improved article of manufacture, an elliptical spring having journal-bearings at its ends, as set forth.

2. A combined spring and axle for road-wagons and other vehicles, the same being constructed with a joint in the spring, substantially as herein shown and described.

296,501. ICE-CHIPPING TOOL. HERMANN ALBRECHT, Philadelphia, Pa., assignor to the American Machine Company, same place. Filed Feb. 6, 1884. (No model.)

Claim.—1. An ice-pick in which a guard, A, handle B, and blade D, provided with one or more chipping-teeth, are combined, substantially in the manner set forth.

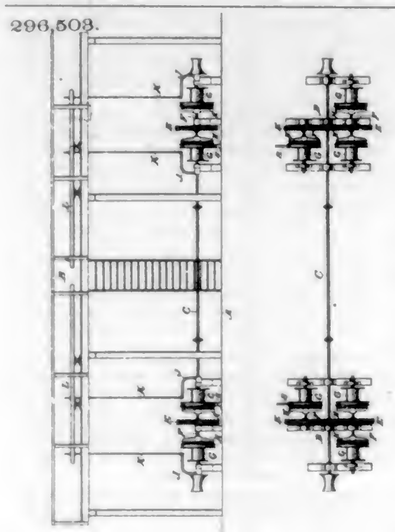
2. The combination of the guard A, having an opening, *d*, and curved flange *b*, with the handle B and blade D, attached to the guard, substantially as set forth.

296,502. FIRE-ESCAPE. CHARLES BINGLEY ANDERSON, Maysville, Ky. Filed Apr. 23, 1883. Renewed Mar. 5, 1884. (No model.)

Brief.—The cylinder around which the rope is passed and to which the belt is secured is locked to the fastening-hook by a locking-rope until the person to be lowered is ready to descend.

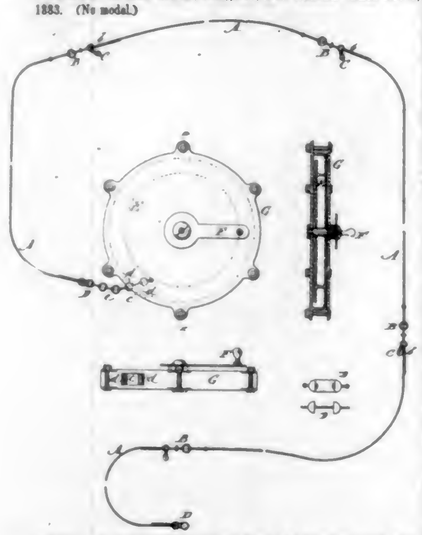
Claim.—1. A fire-escape consisting of a rope having a snap-hook and ring, a traveling cylinder-bearing engaging a turn of the rope and having a yoke, and opposite the same, above the cylinder, having a transverse bar and a locking-rope, substantially as specified.

2. In a rope fire-escape, the combination, with a traveling bearing having the yoke *g*, of the rope *a*, having a hook, *b*, the belt or band V, and a locking-rope, *l*, substantially as specified.



296,503. DREDGER. HORACE B. ANGELL, San Francisco, Cal. Filed Oct. 15, 1883. (No model.)

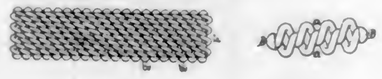
Brief.—Chains leading to anchors on each side of the hull are wound on drums controlled through clutches thrown by elbow-levers, connecting-rods, and operating-levers operative from the lookout-platform.



Claim.—1. In a dredging apparatus, the means for operating the ropes by which the scow is swung from side to side, consisting of the rope-winding drums, and friction-clutches by which they may be engaged or disengaged from the driving-shaft, in combination with the levers J and L and connecting-rod K, whereby the drums may be operated from a distant point, substantially as herein described.

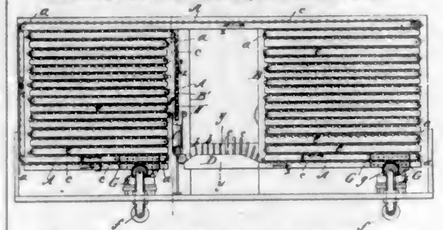
2. In a dredging apparatus, and in combination with ropes or chains leading over pulleys to anchors upon each side of the scow, drums turning loosely at opposite ends of a shaft, and each having one of the ropes secured to it, friction-clutches by which they may be alternately engaged and disengaged, and levers J L and connecting-rods K, substantially as and for the purpose herein described.

296,503.



296,504. MEASURING DEVICE FOR SURVEYING AND OTHER PURPOSES. ALFRED ATKIN, Wanganui, New Zealand. Filed Nov. 9, 1883. (No model.)

Claim.—An improved measuring device for surveying and other purposes, consisting of the wire A, composed of a series of sections, the swivels B, uniting said sections, the tallies C, the opening and closing swivels D on the outer and inner ends of the wire, and the chain *e*, for connecting the swivel on the inner end with a reel, substantially as herein shown and described.



296,505. ORNAMENTAL CHAIN. GEORGE A. BARNETT, Providence, R. I. Filed July 13, 1883. (No model.)

Claim.—1. The combination, with the spiral wires *a a*, of the caps B B, constructed to cover the ends of the spirals, as described.

2. An ornamental chain composed of interlocked spiral wires, the ends of each pair of which are covered by a cap, which forms the edge of the chain, as a new article of manufacture.

296,506. APPARATUS FOR PAINTING BOBBINS, &c. LUTHER C BALDWIN, Manchester, N. H. Filed July 10, 1883. (No model.)

Claim.—1. In an apparatus for painting and drying bobbins and other like articles, the traveling endless belt provided with work-carrying spindles or mandrels, and arranged to form one or more vertical tiers of forward and backward horizontal courses of travel, substantially as specified.

2. In painting and drying apparatus for bobbins and other like articles, the endless belt A, arranged to travel backward and forward throughout a vertical series of courses, and provided with work-carrying spindles or mandrels *b b*, in combination with the rollers *a a* and a rotary paint-brush, E, essentially as described.

3. The combination of the friction-belts G G with the endless traveling belt A, carrying spindles or mandrels *b b*, and the rotary paint-brush E, substantially as and for the purposes specified.

4. The work-rotating friction-belts G G, provided internally with a series of rollers or supports, *l l*, arranged so that said supports in the one belt are in intermediate relation with those in the other belt, for operation in connection with a work-carrying belt arranged to pass in between the friction-belts, and with a mechanically-driven paint-brush, essentially as described.

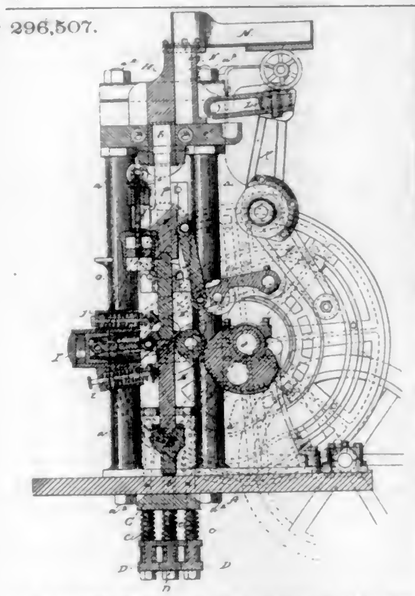
5. In an apparatus for painting and drying bobbins and other like articles, the combination, with the endless traveling belt A and its spindles or mandrels *b b*, of the receiving stand or guide D, constructed to flex the belt as it passes therethrough, and to give said mandrels an upward pitch or inclination, whereby the placing of the bobbins or like articles on the mandrels is facilitated, substantially as shown and described.

6. In combination with the endless traveling belt A and bobbin or other work carrying spindles or mandrels *b b* thereon, the inclined delivering device or ejector H H, for operation on the inner ends of the bobbins or like articles carried by said mandrels, essentially as specified.

7. In an apparatus for painting and drying bobbins and other like articles, the combination of an endless traveling belt armed with spindles or mandrels for supporting the work, a mechanically-driven and self-feeding brush for painting the bobbins or like articles, a device for rotating the work while being painted, and a device for automatically delivering or ejecting the work after it has been painted and dried, substantially as described.

8. The combination of the endless belt A, arranged to travel forward and backward first through one tier, B, of upper and lower courses, and then through another tier, B′, of like courses, the spindles or mandrels *b b*, carried by said belt, the receiving stand or guide D, constructed to flex the belt A, as described, the work guiding or steadying and rotating friction-belts G G, applied to each tier B B′, the rotary paint-brushes E E, and the work-delivering device H H, essentially as and for the purposes herein set forth.

296,507. MACHINE FOR PRESSING ARTIFICIAL BLOCKS OR BRICKS, &c. ALBERT BALL, Claremont, N. H., assignor to the Sullivan Machine Company, same place. Filed Apr. 11, 1883. (No model.)

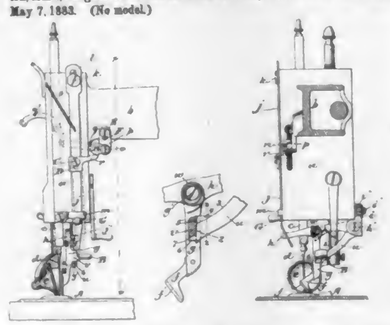


Claim.—1. In a press, the combination of a bed-piece, groups of supporting-springs under said bed-piece, and a toggle-joint lever resting at one end upon said bed-piece and carrying a plunger at the other end, the several parts being constructed substantially as described, and arranged in the same vertical plane.

2. The combination, with the sliding head H and the levers K K, of the equalizing-bar L, centrally pivoted to an extension of said sliding head, and connecting at its outer ends with levers K K by means of ball-and-socket joints, substantially as and for the purpose set forth.

3. In a press, the combination, with the toggle-joint, of an air-cushion, I, and the two springs *i j*, the latter arranged one against each section of the toggle-joint, substantially as and for the purpose set forth.

4. In a press, the combination of an air-cushion, O, with the plunger, substantially as described, and for the purpose set forth.



296,507.

5. In a press, the combination of an air-cushion, O, and the piston thereof, the cut-gear o, yoke P, and plunger, substantially as described, and for the purpose set forth.

6. In a press, the combination, with the hopper, of a separate extension secured to the sliding head, and forming the back of the throat both of the hopper and sliding block, substantially as and for the purposes set forth.

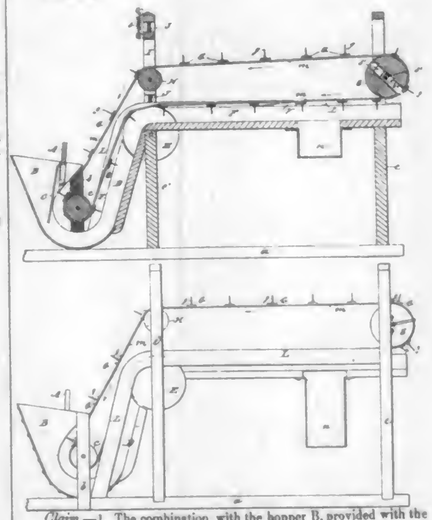
296,508. SEWING-MACHINE TRIMMER. LYMAN L. BARBER, Boston, Mass., assignor to the Barber Trimmer Company, Portland, Me. Filed May 7, 1883. (No model.)

Claim.—1. In a sewing-machine, the combination of a knife-holder having a trimming-knife, a lever to which said knife-holder is pivoted, mechanism for oscillating said lever about its fulcrum, whereby the knife is vertically reciprocated, and a guide which governs and secures the downward and forward movement of the knife, substantially as described.

2. In a sewing-machine, the combination of a knife-holder having a trimming-knife, a pivoted support or lever to which said holder is pivoted, mechanism for oscillating said support and reciprocating the knife-holder in contact with the fulcrum, and a guiding-fulcrum, 2, on which the knife-holder is tilted while moving downwardly, whereby the knife is given simultaneous downward and forward motion, as set forth.

3. In a sewing-machine, the combination of a knife-holder carrying a trimming-knife, a lever to which said holder is pivoted, and mechanism, substantially as described, for oscillating said lever so as to reciprocate the knife vertically, with means for imparting to it a forward movement, and means for disengaging said lever from the operating mechanism, substantially as stated.

4. In a sewing-machine, the combination of a knife-holder having a trimming-knife, a pivoted lever to which said holder is pivoted so as to reciprocate vertically, as described, and a guide-bar, as *u*, having a face, as 2, which serves as a fulcrum for the knife-holder when in operating position, and guiding-faces which control the position of the knife when not operating, substantially as described.



5. In a sewing-machine, the combination of a knife-holder having a trimming-knife and a slotted offset, *b*, a vertically-movable support to which said bar is pivoted, means for disengaging said support from the operating mechanism thereof, fixed guides 2 and 3, with which said slotted offset is engaged, and a spring whereby, when the support is disengaged from its operative mechanism, the knife-holder and its support are raised until the offset *v* rises above the guide 2, and the knife-holder is then turned on its pivot and moved backwardly on the guide 3, as set forth.

6. In a sewing-machine trimmer, the combination of the knife and knife-holder, the pivoted lever to which the knife-holder is pivoted, the reciprocating slide-bar which engages and operates said lever, but may be disconnected, as described, the adjustable bracket on said bar, and the cam and spring for reciprocating said slide-bar, all substantially as described.

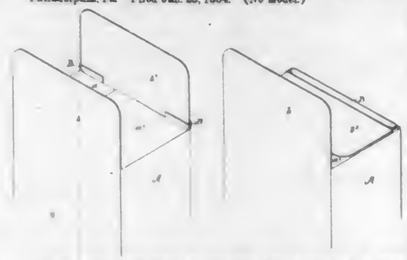
7. The oscillating take-up link *q*, provided with the cam *n*, combined with the slide or bar *j*, having the arm *r* and notch *j''*, the spring *s*, the pivoted knife-holder support *h*, and the knife-holder *g*, as set forth.

8. The combination of the knife-holder support *h*, the knife-holder *g*, having knife *f*, the laterally-movable slide or bar *j*, and the hanger *i*, adjustably secured to the head of the machine, whereby the knife-holder and knife may be adjusted with reference to the needle, as set forth.

296,509. ELEVATOR FOR SEED-COTTON AND OTHER MATERIALS. SIDNEY W. BARTHOLOMEW, Castalia, N. C. Filed Aug. 25, 1883. (No model.)

Claim.—1. The combination, with the hopper B, provided with the grooves *d*, of the adjustable feed-board A, having ribs C, substantially as shown and described, whereby the quantity of seed-cotton or other material drawn up the flue can be regulated to prevent clogging of the machine, as set forth.

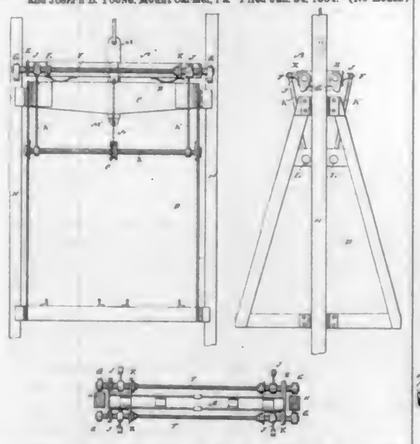
2. The combination, with the flue D, provided with the tracks F, broken away at the turn of the flue, and rake-heads G, of the wheels E, forming a continuation of the tracks, and serving the double purpose of tracks and reducing the friction of the rake-heads at the turn of the flue by causing the wheels to revolve, substantially as shown and described.



3. The combination, with the endless bands *m* and rake-heads G, secured at right angles to the bands, and provided with vertical teeth *g*, of the idle-pulley H, journaled in the sliding frame I, and adjusted in grooves J by springs *s*, whereby the bands can be kept constantly tight, substantially as shown and described.

4. The combination, with the endless bands *m* and rakes G *g*, secured thereto, as set forth, of the flue D, provided with tracks F and side strips, L, substantially as shown and described.

5. The combination, with the bands *m*, rakes G *g*, and flue D, provided with the chute-*n*, of the tracks F, having inclines V V, substantially as shown and described.



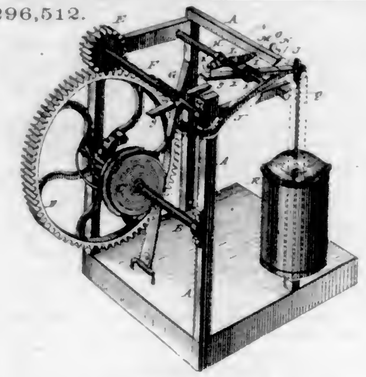
6. The combination, with the drum S, provided in its middle with a hole, *s'*, passing diametrically through it, and bands *m*, having rakes G *g*, of the loose bar X, inserted in the hole *s'*, and provided with the recess *s²*, and shaft *s²*, having its middle portion squared, substantially as shown and described.

296,510. FLAP-RETAINER FOR PAPER BOXES. JACOB C. BAUER, Philadelphia, Pa. Filed Jan. 23, 1884. (No model.)

Claim.—The combination of the outer flaps, *b* and *b'*, of a paper box, with a retainer, B, applied to one flap and being movable over and off from the other flap, substantially as described.

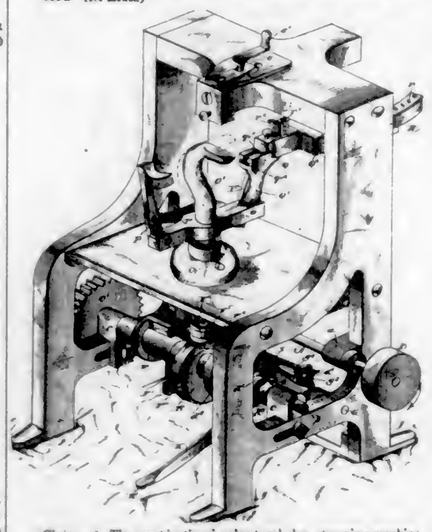
296,511. SAFETY-CATCH FOR ELEVATORS. AUGUST J. BECKER and JOSEPH B. YOUNG, Mount Carmel, Pa. Filed Jan. 24, 1884. (No model.)

Claim.—1. The combination, with an elevator car or cage, of a frame carrying shafts provided with cam or eccentric disks on the ends, which disks are adapted to engage with the upright guide-posts in the well, springs adapted to be compressed upon applying strain to the cage, suspending bar or rod, and of chains extending from the said frame over suitable pulleys to the rod or bar from which the cage is suspended, substantially as herein shown and described.



2. The combination, with an elevator car or cage, of the frame A, the springs B, under the same, the shafts F, held in the frame A, the cam or eccentric disks G on the ends of the same, and the chains N, extending from the suspension bar or rod M over pulleys O on shafts L to the frame A, substantially as herein shown and described.

3. The combination, with an elevator car or cage, of the frame A, the springs B, the shafts F, the cam or eccentric disks G on the ends of the same, the arms J, the rods K, the shafts L, the pulleys O, and the chains N, extending from the suspension bar or rod M over the pulleys O to the frame A, substantially as herein shown and described.



296,512. CHURN-POWER. JAS A. BOALS, Burgettstown, Pa., assignor to W. P. Vance and Alexander McClintock, both of same place. Filed Nov. 15, 1883. (No model.)

Claim.—In a mechanical motor for churns, the combination of the actuating mechanism, shaft F, having pinion E, star-wheel G, bifurcated lever I J, having box *i*, pin K, and friction-roller P, shaft H, and adjustable spring L, substantially as set forth.

296,512.

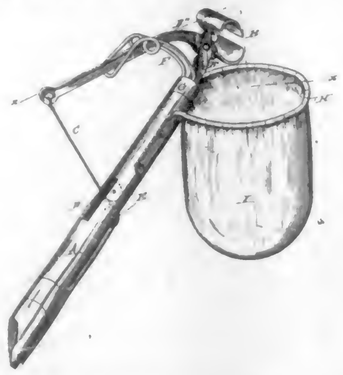
296,513. MACHINE FOR STAMPING BOOTS AND SHOES. CHARLES M. BOLLES and MICHELL E. BYRON, East Pepperell, Mass. Filed Jan. 31, 1884. (No model.)

Claim.—1. The combination, in a boot and shoe stamping-machine, of shoe-supporting devices, mechanism carrying the stamping-dies, and devices connecting the supporting devices with said stamping mechanism, adapted, upon the movement of the supporting devices, to throw said mechanism, with said dies, completely into or out of position, and actuating means, substantially as set forth.

2. The combination, in a boot or shoe stamping machine, of shoe-supporting devices, mechanism carrying the stamping-dies, which dies are normally out of position for stamping, means for automatically throwing the stamp-carrying mechanism into position above the shoe-supporting devices, and thereby cause the stamping-dies to come into proper position for stamping, and actuating means, substantially as set forth.

3. The combination, in a boot and shoe stamping machine, of shoe-supporting devices, mechanism carrying the stamping-dies and adapted to be thrown into and out of position for stamping, shoe-supporting devices, a pivoted lever adapted to be moved so that its upper end bears against the heel of the shoe, and connected with the stamping mechanism, so as to actuate the same when moved, and actuating means, substantially as described.

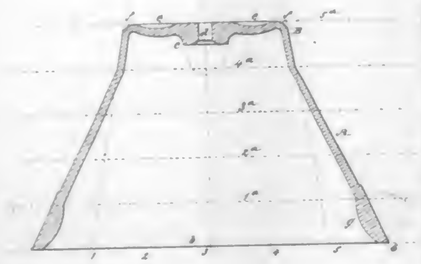
4. The combination, in a boot and shoe stamping machine, of shoe-supporting devices, mechanism carrying the stamping-dies, which dies are normally out of position for stamping, a vertically-adjustable block located in the top of the machine above the supporting and stamping devices, and adapted to have the stamp-dies successively come in con-



tact therewith and depress said dies for stamping, and actuating devices, substantially as described.

5. The combination, in a boot and shoe stamping machine, of stamping devices provided with a depending rack, shoe-supporting devices carrying a wedge-shaped block adapted to engage said rack when the support is elevated, and means for elevating said support, substantially as described.

6. The combination, in a boot and shoe stamping machine, of stamping devices adapted to be thrown into or out of position, and having a depending rack, a pivoted heel-rest adapted to be moved so that its upper end will bear against the shoe-heel, a block sliding on guides adapted to support the front end of the shoe, a wedge-shaped block mounted on said sliding block, and connections whereby the movement of the pivoted heel-rest throws the stamping mechanism into position, and at the same time moves said sliding block into position for elevation to the stamping devices and causes said wedge-shape block to engage said rack, and devices for effecting such elevation, substantially as set forth.

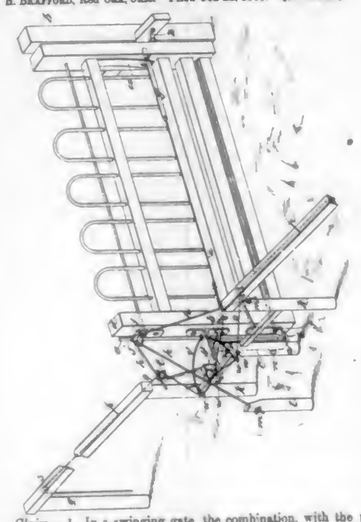


7. The combination, in a boot and shoe stamping machine, of stamping devices located in the upper part of the machine, shoe-supporting devices located beneath the same, mechanism connected to said supporting devices for intermittently elevating said support to the stamp, and actuated by a sliding toothed disk revolving and sliding longitudinally on its shaft and a collar bolted adjustably to said shaft, to limit the longitudinal motion of said toothed disk, substantially as set forth.

296,514. FRUIT-PICKER. JOSEPH ALFRED BOTTOMLEY, Greenville, Conn. Filed Nov. 2, 1883. (No model.)

Claim.—In a fruit-picker, the combination of the pole having a bag or receptacle at its end, and having pulleys in a longitudinal slot near the end, a pair of cutters or nippers secured with one arm in the end of the pole, and having their cutting-edges at right angles to the axis of the pole, an operating-cord attached to the end of the free arm of the cutters and passing between the pulleys in the pole, a spring secured in the end of the pole and forming a double arch, having coils at the middle of the arches, and having its doubled end bearing against and sliding upon the inner edges of the free arm, as and for the purpose shown and set forth.

296,515. BELL. MARCUS M. BOWERS, Baltimore, Md. Filed Sept. 13, 1883. (No model.)



Claim.—1. A bell cylinder or shell having its sides constructed to form the flare by a series of interrupted straight lines or surfaces arranged to diverge in a downward direction, substantially as specified.

2. A bell cylinder or shell having its head or cap made concave on its top, substantially as and for the purpose herein set forth.

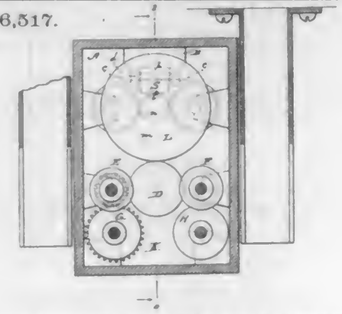
3. As an improved article of manufacture, a bell cylinder or shell having its body portion of truncated form, its head or cap of diminishing tapering construction, and concave on its top, and its hammer-swell arranged within it, essentially as shown and described.

296,516. GATE HANGING AND OPERATING APPARATUS. JOHN H. BRAFFORD, Red Oak, Ohio. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a swinging gate, the combination, with the pivotal hinging-rod, of the gate having the upper and lower hinging-brackets and the intermediate arm, said rod passing through said brackets and arm, and said arm carrying a pulley or roll, the latch-rod, and the operating-cords connected to said latch-rod and passing over said pulley, substantially as and for the purpose set forth.

2. In a swinging gate, the combination, with the pivotal hinging-rod having the cord-supporting struts, of the gate having the upper and lower hinging-brackets, and the intermediate arm carrying a pulley or roll, said rod passing through the brackets and arm, and the operating-cords connected to the latch-rod, and passing over the said pulley or roll, and through eyes or over rolls of said struts, substantially as and for the purpose set forth.

3. In a swinging gate, the combination, with the hinge-post having the plate provided with angle ends supporting the pivotal hinging-rod, of the gate having the upper and lower hinging-brackets, and the arm intermediately disposed between said brackets and carrying a roll or pulley, the cord-supporting struts connected to the hinging-rod, and the operating-cord connected to the latch-operating rod and passing through eyes or over pulleys of the struts and the pulley of said arm, substantially as and for the purpose set forth.



4. In a swinging gate, the combination, with the post having a plate provided with angle ends, and the pivotal hinging-rod connected by adjustable stays to posts, of the gate having the upper and lower hinging-brackets, and the intermediate arm carrying a pulley, the spring-actuated latch and its rod, and the operating-cord connected to said rod and passed through eyes or over pulleys of the struts connected to said pivotal or hinging rod, and over the pulley of said arm, substantially as and for the purpose set forth.

296,517. CAR-AXLE BOX. RUSSELL BREWER, Newark, N. J. Filed Jan. 16, 1884. (No model.)

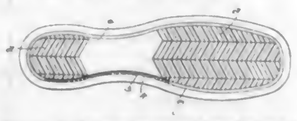
Claim.—1. In a car-axle box, the double roller L and a convex oscillating piece, S, operating in connection with said double roller, and with a plain bearing in the upper part of the box, substantially as specified.

2. In a car-axle box, the combination, with the lower submerged lubricating-rollers, G and H, provided with gear, substantially as shown, of the upper lubricating-rollers, E and F, the double rollers L, and means for securing parallelism between the said double rollers and the journal

296,517.

D, whereby the lubricating material may be raised in a positive manner and discharged on the journal and friction-rollers, substantially as specified.

296,518. SHOE. WILLIAM A. BRISTOR, Indianapolis, Ind. Filed Dec. 18, 1883. (No model.)



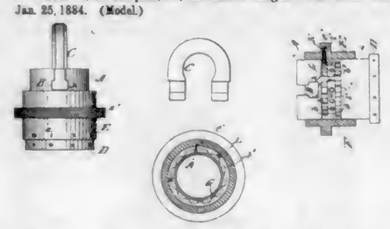
Claim.—1. The process of making shoes which consists, first, in stitching the ball of the sole and toe of the upper together while wrong side out, then turning the shoe, then placing the insole, shank, and counter in position, then completing the stitching and afterward finishing the shoe in the ordinary manner, substantially as set forth.

2. The combination, in a shoe, of the sole A, the upper D, the rear half-insole, B, the shank C, and counter D', said several parts being constructed, arranged, and secured together substantially as shown and specified.

3. A shoe the forward portion of which is stitched together by a row of stitches at the outer edge of the sole, and the remaining portion of which is stitched together by a row of stitches nearer the center of the sole, both said seams being inside the point where the sole and upper come together, substantially as described, and for the purposes specified.

296,519. OUTER SOLE FOR BOOTS AND SHOES. ALFRED A. BROOKS, Boston, Mass. Filed Nov. 5, 1883. (No model.)

Claim.—1. An india-rubber outer sole provided with a perforated intermediate layer of fibrous or textile material, the india-rubber above and below the said layer uniting through the said perforations, substantially as described.



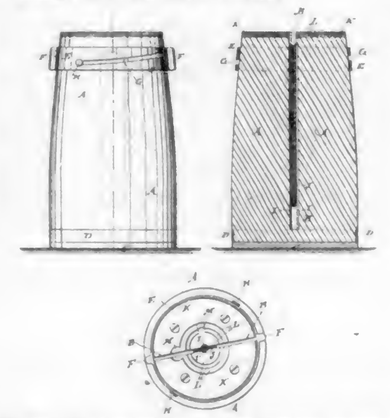
2. An india-rubber outer sole provided with a perforated intermediate layer, *a*, and with a channel at its outer face, substantially as described.

3. An india-rubber outer sole provided with a molded channel, combined with an independent protecting-rand to cover the stitches made through the said outer sole, substantially as described.

4. As an improved article of manufacture, a molded India-rubber sole channeled, and having an intermediate layer of textile material, to strengthen the same in the line of the channel for the reception of stiches, substantially as described.

5. A molded india-rubber sole having one face corrugated and provided with a molded channel, and having an intermediate layer of fibrous material in the line of the channel, to strengthen the said sole where it is to receive stitches through it to attach it to a boot or shoe, substantially as described.

296,520. PERMUTATION-PADLOCK. JOHN W. BRUFF and WILLIAM E. T. MERRILL, Philadelphia, Pa.; said Merrill assignor to said Bruff. Filed Jan. 25, 1884. (Model.)

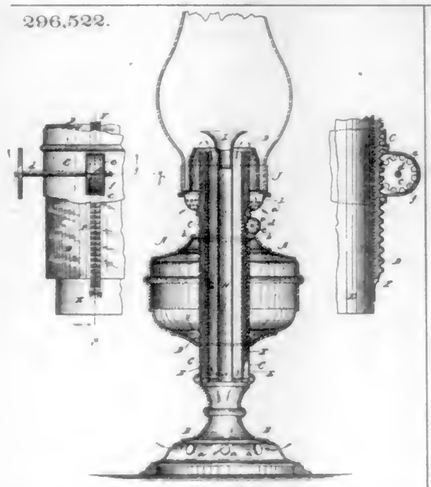


Claim.—1. In a padlock, a cylinder having a dovetailed rabbet or recess across its upper end for the staple, and a notched or toothed groove surrounding said cylinder, in combination with an encircling collar having suitable means, substantially as described, for engaging with the teeth or notches of the groove, whereby the staple may be locked or unlocked by a series of movements of substantially different character of the collar.

2. The cylinder A, recessed at B, for the reception of the staple, and formed with the circumferential groove F, having shoulders *b b'*, a bridge, G, and recess L, in combination with the collar or sleeve E, provided with pin *i* and spring *i'*, and the staple C, fitting the channel B, said cylinder and sleeve being numbered or lettered, substantially as described.

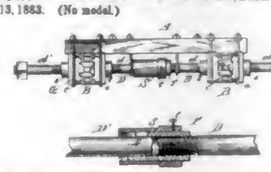
3. The cylinder A, having the groove F, with shoulders *b b'*, notched or toothed, as described, in combination with the collar or sleeve E, having the pin *i* and spring *i'*, adapted to engage with said teeth and notches, substantially as described.

296,521. ENGRAVER'S BANGLE-CLAMP. HENRY CARPENTER, Flushing, N. Y. Filed Feb. 14, 1884. (No model.)



Claim.—1. An engraver's bangle-clamp constructed substantially as herein shown and described, and consisting of the tapered and slotted block having recessed clamping-plates K attached to its upper end, and provided with a tapered and slotted band, E, guide-pins H, and a V-spring, J, as set forth.

2. In an engraver's bangle-clamp, the combination, with the tapered and slotted block A, provided with recessed clamping-plates K, of the tapered and slotted band E, the guide-pins H, and the V-spring J, substantially as herein shown and described, whereby the parts of the clamp can be readily drawn together and separated, as set forth.



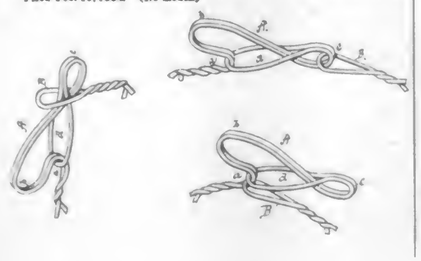
296,522. LAMP. WILLIAM P. CASPERSON, Chicago, Ill. Filed Oct. 1, 1883. (No model.)

Claim.—The combination of the described rack F and pinion *c*, and of the disks *f*, mounted on shaft *d*, one on each side of the pinion, and having a diameter at least as great as that of the circle described by the points of the teeth of the pinion, adapted to guide the rack in a true vertical position, and compress the wick on each side of the rack, and prevent the teeth of the pinion from coming in contact with the wick, substantially as described.

296,522.

296,523. VEHICLE-AXLE. SAMUEL T. CAVETT, Evansville, Ind. Filed Sept. 13, 1883. (No model.)

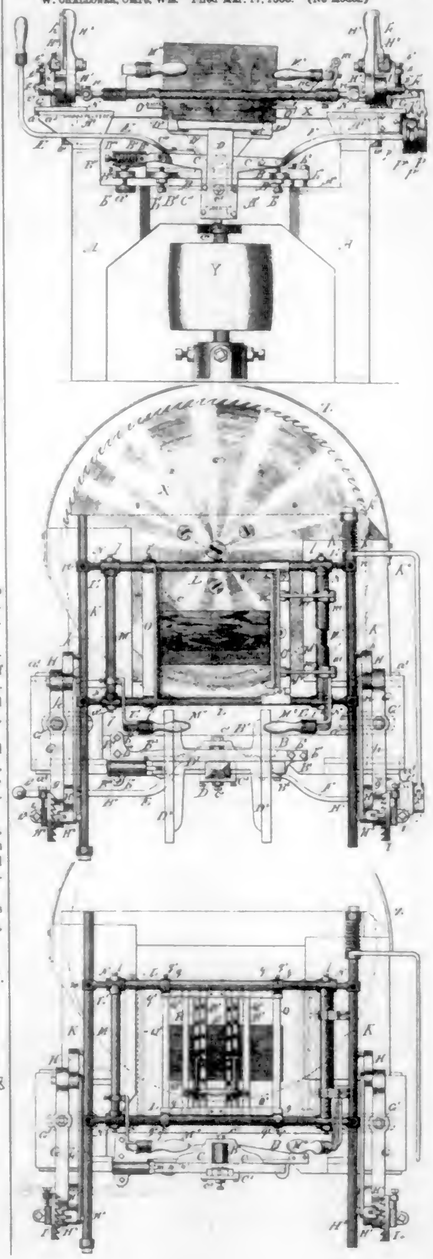
Claim.—1. The combination, with the two axle-sections, of the coupling-box, secured to the inner end of one of said sections, and receiving the inner and of the other section loosely, substantially as described.



2. The combination, with the two axle-sections and the coupling-box fixed to the inner end of one section and receiving the inner end of the other section loosely, and provided with the lubricating slot or opening, of the adjustable sleeve fitting upon said coupling-box and provided with a lubricating-slot, and means for holding and releasing said sleeve, to permit the rotation of the same, substantially as described.

3. The combination, with the bolster and bearing-boxes secured thereto, of the two axle-sections, provided with intermediate journals, arranged in said bearing-boxes, suspended in loops depending from the bolster, and having their inner ends loosely coupled to revolve independently of each other, substantially as described.

4. The combination, with the bolster, its lubricating bearing-boxes, and the loosely-coupled axle-sections, having intermediate journals in said bearing-boxes, of the brace eyes or loops secured to the bolster and embracing the inner portions of the axle-sections, respectively, substantially as and for the purpose set forth.



5. The combination, with the bearing-boxes having apertures, as described, of the hinged grease-caps, adapted to cover said apertures, substantially as set forth.

296,524. BALE-TIE. WINFIELD SCOTT CHAPPEL, New Egypt, N. J. Filed Feb. 19, 1884. (No model.)

Claim.—The locking loop or link A, adapted to receive a loop on the end of the bale-wire, and formed with the curved part *a*, the looped part *b*, loop *c*, and end loop, *d*, constructed and operating substantially as described, and for the purpose set forth.

296,525. SHINGLE-SAWING MACHINE. JOHN CHALLONER and JOHN W. CHALLONER, Omro, Wis. Filed Mar. 17, 1883. (No model.)

Claim.—1. The combination, with a shingle-sawing machine, of a removable tipping table and a spalt-carriage adapted, as described, to replace said tipping table when the latter is removed, substantially as set forth.

2. The combination, with a shingle-sawing machine, of holding-dogs constructed, substantially as described, so as to be capable of movement away from their operative position, and a spalt-carriage arranged to be brought into operative position between said dogs when the dogs are moved out, substantially as set forth.

3. The combination, with a shingle-sawing machine, of a spalt-carriage provided with mechanism, substantially as described, to hold the spalt from above, so that the ends and sides of the spalt may be clear.

4. The combination, with a shingle-sawing machine, of a spalt-carriage having supporting-bars, and dogs constructed, substantially as described, to project below said bars and into the upper surface of the spalt.

5. In a shingle-sawing machine, a spalt-carriage composed of side timbers, as Q Q, end pieces connecting said side timbers, supporting-bars, as Q^3 Q^3, connecting the end pieces, and arranged between the side timbers, and a series of dogs arranged between said bars Q^3 Q^3, so as to engage with the upper surface of a spalt, all combined substantially as stated.

6. The combination, with the frame of a spalt-carriage, of a pair of dog-bars having dogs arranged diagonally, as described, so as to project below the frame of the carriage, and mechanism, substantially as stated, for giving said bars an oblique movement, all substantially as described.

7. In a machine for sawing shingles, the combination of a horizontal carriage with a spalt-frame carrying movable bars, provided with downward-projecting dogs for supporting a spalt and carrying it against the saw, substantially as set forth.

8. In a sawing-machine, the combination of a horizontal carriage, spalt-frame, movable head-blocks connected to the guides of the carriage by bell-cranks, and pawls and segments for lowering either guide to change the inclination of the spalt-frame, substantially as set forth.

9. The combination, with the timbers of the spalt-frame, of the dog-bars R R', suspended therefrom, and carrying diagonal depending dogs r r', the said bars being adapted to be moved in opposite directions, substantially as set forth.

10. The combination of the spalt-frame, timbers Q Q' Q^2 Q^2 Q^3, transverse frames S S, dog-bars R R', having end extensions, R^1, with diagonal slots r^3, central projections, R^2 R^4, with perforations r^2 and r^4 and diagonal dogs r r', links T and U, standards V, arms W, and handle w, substantially as set forth.

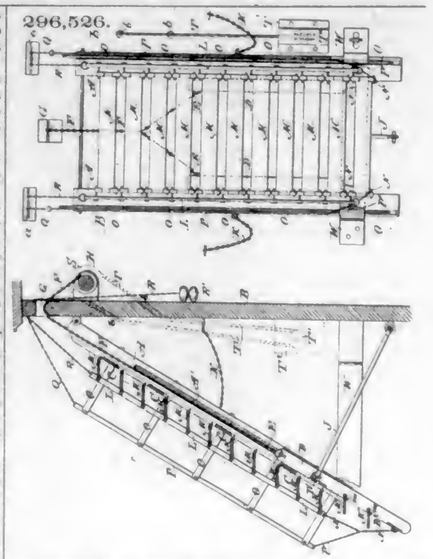
11. In a shingle-machine, a spalt-frame having dog-bars suspended therefrom, adapted to move in opposite directions, and provided with diagonally-depending dogs, pointing in opposite directions, in combination with standards, links, and lever-arms connected to the upper portion of the spalt-frame and to the movable dog-bars, whereby a downward pressure on the said lever-arms will force the dogs into a spalt held beneath and lock them in such position, substantially as set forth.

12. The combination of the guides K K and telescoping frame supported between them, and the head-blocks, bell-cranks, and links supporting said guides, with the lever H^2, pawl H^3, segments I, slotted for the reception of the bolt h', adjusting-screws i^3 i^3, nut i^4, collar *i*, and lugs i^2 and *g*, whereby the said segment may be adjusted vertically to regulate the thickness of the shingles sawed from the spalt, and also laterally to regulate the frame for the last shingle, substantially as set forth.

296,526. FOLDING STAIRCASE. CHARLES H. CHASE, New Orleans, La. Filed Dec. 4, 1883. (No model.)

Brief.—The invention consists of a pivoted section and a section adapted to slide therein, provided with a chain for raising it and a brace pivoted to the wall and sliding section. Folding hand-rails are pivoted to the section and provided with chains and weights for folding the same. Pivoted steps are united by rods pivoted to them, and a chain is attached to the rods, controlled by a weight. Connected with the sections is a chain operated by a shaft and drum, and means for revolving the shaft from the inside or outside of the structure, and a pivoted locking-bar secures the device to the structure when not in use.

Claim.—1. A folding staircase constructed, substantially as herein shown and described, of two sections, one adapted to slide within the other, as set forth.



2. The combination, with a pivoted staircase-section, of an additional section adapted to slide within the first, and of a chain for raising the sliding section, substantially as herein shown and described.

3. The combination, with a pivoted staircase-section, of a sliding section adapted to slide within the pivoted section, a chain for raising the sliding section, and a brace pivoted to the wall and to the sliding section, substantially as herein shown and described.

4. The combination, with a pivoted staircase-section, of an additional section adapted to slide within the same, a chain for raising the sliding section, a folding railing pivoted to the pivoted section, and of chains and weights for automatically folding the railing, substantially as herein shown and described.

5. The combination, with a folding staircase, of pivoted steps, a pivoted rod uniting them, a chain attached to one end of the rod, and a weight suspended from the inner end of the chain, substantially as herein shown and described.

296,526.

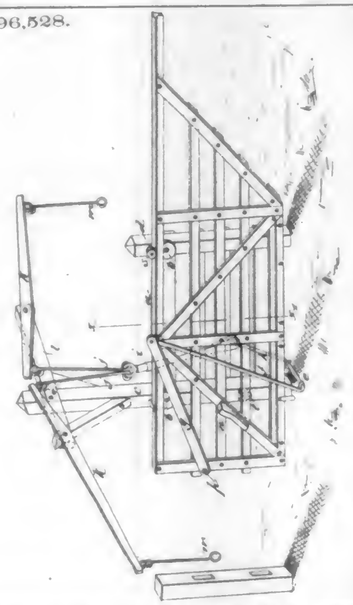
6. The combination, with the pivoted side bars A, of the sliding side bars D, the shaft H, the chain F, the pulley S on one end of the shaft, the steps M and M', the endless chain T, and the pulley T', substantially as herein shown and described.

7. The combination, with the pivoted side bars A, of the sliding side bars D, the chain F, the shaft H, means for revolving the shaft from the inside or outside of the building, &c., the steps M M', the rods L, pivoted to the steps M, the rods O, the railing-bars P, the chains Q R, attached to the bars P and rods L, respectively, and of the weights Q' and R' on the inner ends of the chains Q and R, substantially as herein shown and described.

8. The combination, with a pivoted folding staircase, of the pivoted locking-bar W, and means for holding the free end of the same to the building, substantially as herein shown and described.

296,527. EYEGLASS-HOLDER. HERBERT G. CHASE, New York, N. Y. Filed Jan. 19, 1884. (No model.)

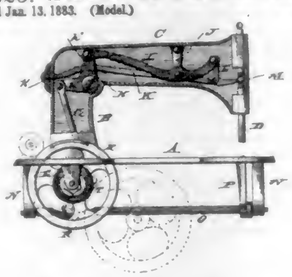
Claim.—1. An eyeglass-holder consisting of a body portion, a safety-pin made substantially parallel with the body, and a hook having a closed top with a depression or cavity formed in the top of the hook, as and for the purpose specified.



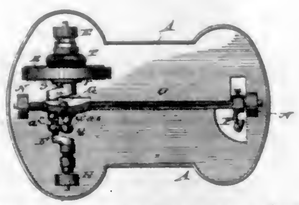
2. An eyeglass-holder consisting of a body portion, a safety-pin made substantially parallel with the body, a hook having a closed top with a depression or cavity in the top, and a guide-tongue above the hook, forming a part thereof, touching or nearly touching the body, but standing away from the body at its top, as herein shown and described.

3. An eyeglass-holder consisting of a body portion, a safety-pin made substantially parallel with the body, a socket to receive the end of the safety-pin struck out from the body of the holder, a hook having a closed top and a depression or cavity in the top, and a guide-tongue, forming a part of the hook, standing above the same and serving as a guide to the glasses in entering the hook, as set forth.

296,528. GATE OPENING AND CLOSING APPARATUS. ANSON W. CHILCOTT, Mattoon, Ill. Filed July 26, 1883. (No model.)



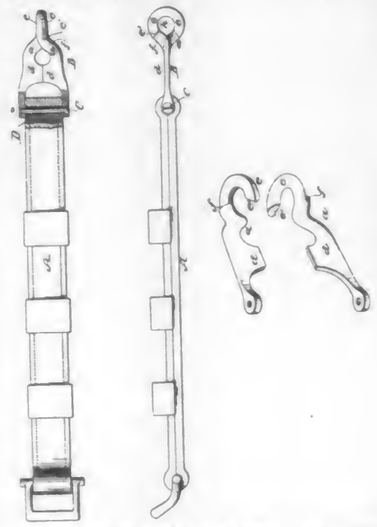
Claim.—In a gate opening and closing mechanism, the combination, with the pivoted levers *k* above and on either side of the gate, connected at their inner ends with the rod *i* by means of the links *j*, of the crank-shaft secured beneath the gate, and provided with long and short arms *f h* parallel to and in the same plane with each other, the latter being connected with the rod *i* below the center of the gate, and the former being connected to the connecting-rod *g* above the center of the gate, the con-



296,528.

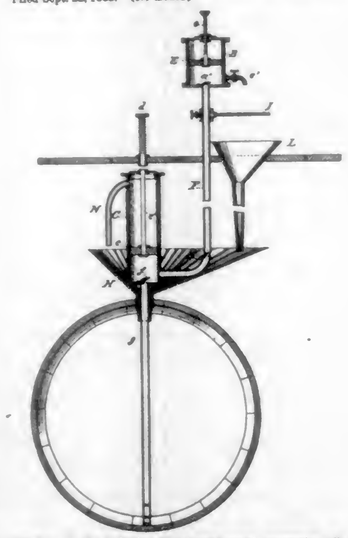
necting-rod *g* being pivoted to the front part of the gate, substantially as set forth.

296,529. SEWING-MACHINE. PETER J. CLEVER, Brunswick, Mo. Filed Jan. 13, 1883. (Model.)



Claim.—1. The combination of the crank-shaft, means for rotating the same, the reciprocating drive-arm connected to the crank-shaft and to the bell-crank lever, the bell-crank lever, the horizontal lever-bar supported by a pivoted link and connected to the bell-crank lever, the horizontal hinged arm linked to said lever-bar, and the needle-bar connected with the free end of the arm, substantially as set forth.

2. In a sewing-machine, the combination of the crank-shaft, the needle-bar, the intermediate connecting mechanism embodying a drive-rod, bell-crank lever, horizontal lever-bar, suspending-link, hinged arm, and connecting-link, the rock-shaft carrying the shuttle, and the operating-arm connected to the crank-shaft and to the rock-shaft by a universal joint, substantially as set forth.

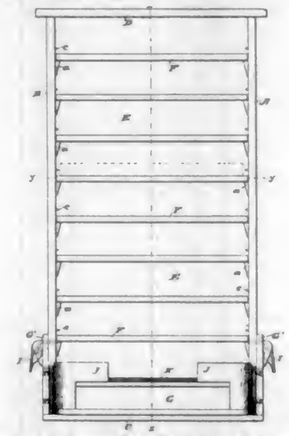


296,530. HAME-CLIP. EDWARD DELOS COLE, Macon, Ill. Filed Sept. 28, 1883. (No model.)

Claim.—1. The clip B, formed of the sections *a a*, in combination with the screw C and sleeve D, substantially as and for the purposes set forth.

2. The hame-clip B, composed of the hooked sections *a a*, formed with the plates *d d*, shoulders *f f*, and diagonal ends *e' e'*, in combination with the screw C and sleeve D, substantially as and for the purposes set forth.

296,531. MEASURING-PUMP. SHERMAN M. COLE, Adamson, Iowa. Filed Sept. 22, 1883. (No model.)

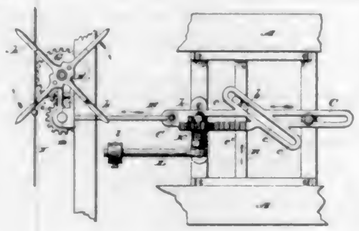


Claim.—1. In a device for elevating and measuring oils or other fluids through the bung-hole of a barrel, the pump-cylinder having the pump-tube rigidly secured to its bottom, and extending to and resting on the bottom of the barrel, in combination with a registering measuring-receptacle having a gaged float, valve, and faucet, a valved pipe connecting the measuring-receptacle with the pump-cylinder, the piston, pistoq-rod, and pump-lever, and a funnel-seat through which the pump-tube passes into the barrel, substantially as specified.

2. In a measuring-pump, the combination, with the measuring-receptacle, the pump and valve-tube connecting, and the drip-funnel seated in the bung-hole of the barrel, of the adjustable grate-rest secured to the valve-pipe beneath the measuring-receptacle and above the drip-funnel, substantially as specified.

3. In an elevating and measuring pump, the corrugated drip H and air-inlet funnel seated in the bung-hole of a barrel beneath the discharge-faucet of the measuring-receptacle B, and the intermediate adjustable grate-rest, I, for the receiving-vessel, all combined and adapted to operate substantially as specified.

296,532. POOL-RACK. HUGH W. COLLENDER, New York, N. Y. Filed Feb. 13, 1884. (No model.)



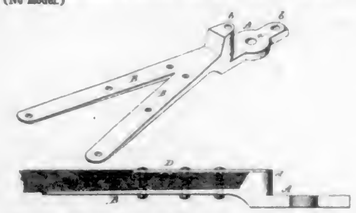
Claim.—1. In combination with a pool-rack or set of shelves adapted to receive the players' balls, and from which the balls may be successively discharged or thrown out, a carriage-like device adapted to slide up and down in front of the rack, and provided with means for guiding the contents of the shelves as successively discharged, and a suitable receptacle adapted to be placed within said carriage and receive the contents of the pool-rack, all substantially as set forth.

2. In combination with the side pieces, A B, of a pool-rack, a set of hinged or pivoted shelves adapted to tip upwardly and forwardly at their rearmost edges, and suitable means for successively tipping said shelves so as to discharge their contents in succession, substantially as set forth.

3. In combination with a set of hinged or pivoted shelves adapted to tip upwardly and forwardly at their rearmost edges, suitable stops to prevent said shelves from tarning too far, substantially in the manner and for the purposes set forth.

4. In combination with a pool-rack capable of discharging the contents of its ball-supporting surfaces antomatically, a carriage adapted to receive the discharged contents of the shelves, substantially as described, the said carriage being provided with means, as set forth, for deflecting and guiding the balls toward its middle, to insure their proper reception within any suitable receptacle carried by the said carriage, all substantially as set forth.

296,533. CHECK-ROW ATTACHMENT FOR CORN-PLANTERS. MATTHEW FRANKLIN CONNETT, Springfield, Ill. Filed Nov. 21, 1883. (No model.)



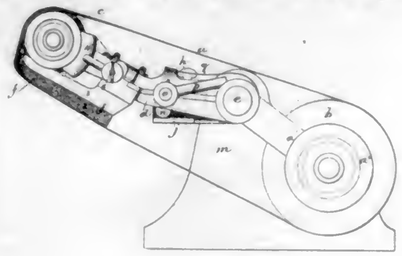
Claim.—1. A check-row attachment for corn-planters in which are combined the following elements, viz: a chain or sprocket wheel adapted to be rotated intermittingly in one direction by the action of a knotted check-row line, a longitudinally-reciprocable bar arranged at a right angle to the seed-slide, and provided with a diagonal cam-slot, which engages with a stud or pin upon the latter, and means, substantially as shown, for connecting said sprocket-wheel and slotted bar, whereby each partial rotation of the former will cause the latter to be moved longitudinally and said seed-slide to be operated, substantially as and for the purpose specified.

2. The combination of a longitudinally-reciprocable bar provided with a diagonal slot and arranged at a right angle to the line of movement of the seed-slide, a stud or pin secured to the latter and engaging with said diagonal groove, a pitman-rod connected with the bar and driven from a crank or pitman wheel, and suitable means for driving said wheel, substantially as shown and described.

3. In combination with the slotted seed-slide-actuating bar C, provided with the toothed rack *c²*, the pinion K, shaft *k*, and radial weighted arm L, substantially as and for the purpose set forth.

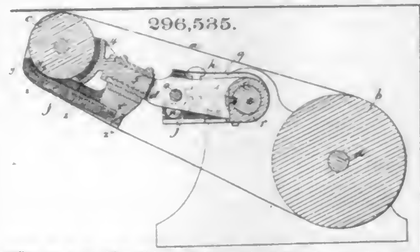
4. In combination with the seed-slide B, provided with the stud *b*, the bar C, having the diagonal slot *c'*, the pinion D, provided with the arm *d*, the connecting-rod E, the shaft F, the gear-wheel G, the sprocket-wheel H, having the arms *h*, and the line I, provided with the knots *i*, all constructed and operating substantially as and for the purpose shown and described.

296,534. CARRIAGE-PERCH IRON. WILLIAM H. COOPER, New Haven, Conn., assignor to M. Seward & Son, same place. Filed Feb. 11, 1884. (No model.)



Claim.—As an article of manufacture, the herein-described perch-iron, consisting of the bar A, constructed with the straps B B diverging from the rear end of the said bar in a plane substantially parallel therewith, but above the top of said bar, and with an upward extension, *d*, to form a shoulder against which the wood portions of the perch may abut, substantially as described.

296,535. ABRADING-MACHINE. FREDERICK W. COY, Boston, Mass. Filed Mar. 8, 1884. (No model.)



Brief.—The frame carrying the upper pulley and intermediate support is pivoted on an axis between the two pulleys. When the outer end of the frame is in its lowest position, the distance between the pulleys is least and the belt is loose. When the article to be ground is pressed against the belt, it raises the end of the frame, the distance between the pulleys increases, and the belt is tightened. Removing the pressure lowers the frame and loosens the belt automatically. The yoke carrying the upper pulley swivels and is adjustable in the swinging frame.

Claim.—1. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, an intermediate support for said belt, and mechanism whereby the belt is tightened by pressure exerted on the belt and its intermediate support, and automatically loosened when said pressure is removed, as set forth.

2. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, a pivoted frame, whereby one of said pulleys is supported and adapted to be moved with relation to the other

296,535.

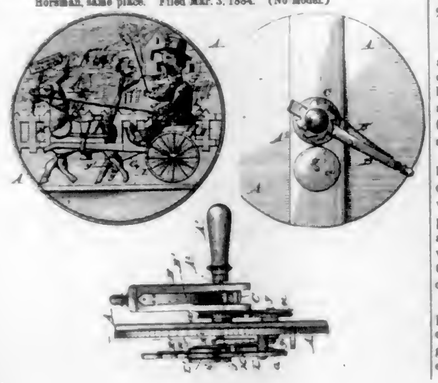
pulley, so as to either tighten or loosen the belt, and an intermediate support for the belt, connected to said pivoted frame, whereby, when pressure is exerted against the belt and its support, the belt is tightened, and when said pressure is removed the belt is automatically loosened, as set forth.

3. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, a pivoted frame supporting one of said pulleys, an intermediate support for the belt, connected to the pivoted frame, and a stop to limit the belt-tightening movement of said frame, as set forth.

4. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, a pivoted frame supporting one of said pulleys, an intermediate support for the belt, connected to the pivoted frame, and a spring whereby the swinging end of the frame is automatically moved to loosen the belt, as set forth.

5. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, a pivoted frame supporting one of said pulleys, an intermediate support for the belt, connected to said frame, and means, substantially as described, for varying the normal position of the pivoted frame and the pulley supported thereby, as set forth.

6. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, a pivoted yoke supporting the journals of one of said pulleys, and adapted to be turned so as to give the axis of the pulley any desired longitudinal inclination, and means, substantially as described, for turning said yoke and for holding it in any position to which it may be turned, as set forth.



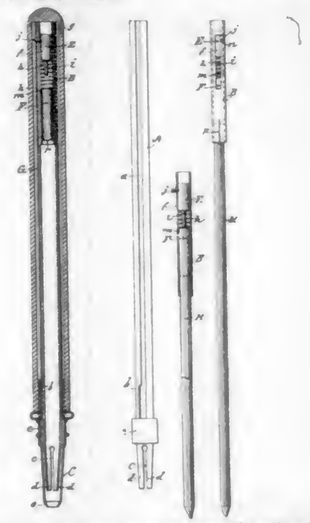
7. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, one having a crowning periphery, and an intermediate support having a convex or crowning abruptly-curved surface at one end arranged to curve the belt abruptly in its passage from one pulley to the other, as set forth.

8. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, one having a crowning periphery, and an intermediate support having a convex or crowning abruptly-curved surface arranged to curve the belt abruptly in its passage from one pulley to the other, and thereafter presenting, successively, a straight surface and a concave surface of gradually-increasing depth, as set forth.

9. The combination, with the supporting and driving pulley *b*, of the bearing or support for the arbor of said pulley, provided with the circular enlargement a^2, as set forth.

10. In an abrading-machine, the combination of an abrasive belt, two supporting-pulleys therefor, and mechanism whereby the belt is tightened by pressure exerted thereon, and automatically loosened when said pressure is removed, as set forth.

296,536. TOY. JESSE A. CRANDALL, Brooklyn, N. Y., assignor to E. I. Horsman, same place. Filed Mar. 3, 1884. (No model.)



Claim.—1. The combination of a clacker having a disk applied on the spindle and an automaton on the face of the disk, substantially as described.

2. The combination of a loaded clacker applied on a spindle having a handle secured to it, a disk, and an automaton applied on the face of the disk, substantially as described.

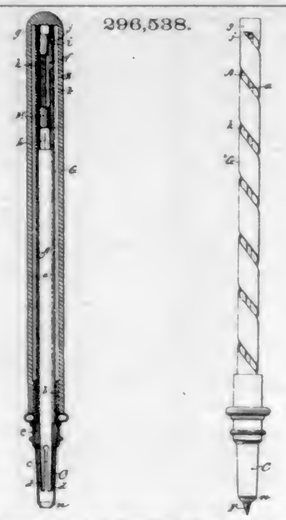
3. The combination of a loaded clacker, pulleys *a' a'*, a disk applied on the spindle of the clacker, and an automaton on the face of the disk, substantially as described.

296,537. CRAYON-HOLDER. ALONZO T. CROSS, Providence, R. I. Filed Aug. 15, 1883. (No model.)

Claim.—1. In a crayon-holder, the combination of the carrier-tube, provided with a split end for frictionally holding the crayon, with means, substantially as described, for imparting an initial movement to the crayon-stub from the carrier-tube, and a spring for forcibly ejecting the same when the frictional grip of the split end of the tube has become less than the resilience of the spring.

2. In a crayon-holder, the combination of the screw mechanism, and a carrier-tube provided with a split end for frictionally holding the crayon, with a forcer and a spring adapted to forcibly eject the stub of the crayon upon the continued movement of the screw after the carrier has reached its stop at the lower end of the holder.

3. In a crayon-holder, the combination of the screw mechanism, and a carrier-tube provided with a split end for frictionally holding the crayon, with a forcer, a ping, and an intervening spring adapted to forcibly eject the crayon, substantially as described.

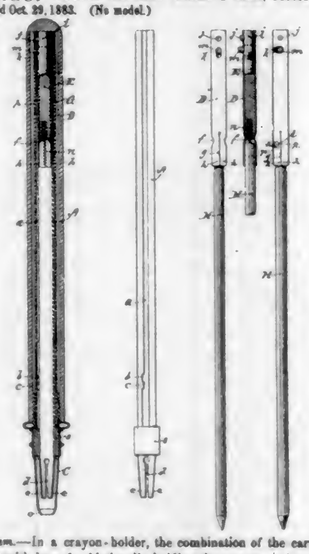


296,538. CRAYON-HOLDER. ALONZO T. CROSS, Providence, R. I. Filed Aug. 15, 1883. (No model.)

Claim.—1. In a crayon-holder, the combination of the hollow screw and screw-holding tube provided with a slot, the lower end of which is enlarged at one side to form a shoulder, with the carrier-tube provided longitudinally with a slot having a pin-holding noteb at its upper end, and the forcer provided with a pin adapted to pass through the slot in the carrier-tube and enter the groove of the hollow screw, for operation substantially as described.

2. In a crayon-holder, the combination of the hollow screw and screw-holding tube provided with a slot, the lower end of which is enlarged at one side to form a shoulder, with the carrier-tube provided longitudinally with a slot having a pin-holding notch at its upper end, and the forcer provided with a pin adapted to pass through the slot of the carrier-tube and enter the groove of the hollow screw, and the spring-jaws arranged within the point-tube and adapted to prevent the rotation of the carrier-tube when the pin of the forcer has arrived at the shoulder in the slot of the screw-holding tube, substantially as described.

3. In a lead or crayon holder, the combination of the carrier-tube, provided longitudinally with a slot having a lateral notch at its upper end, with a forcer arranged within the carrier-tube and provided with a guiding-pin passing through the slot of the carrier-tube and adapted to enter the lateral notch, whereby the carrier-tube will be prevented from

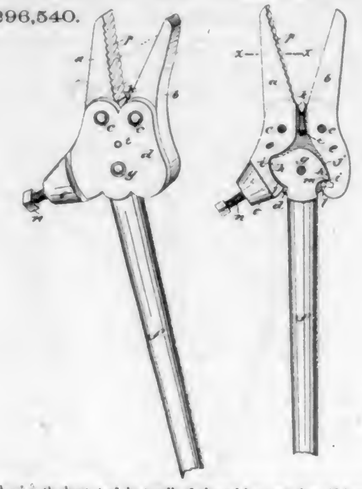


296,538.

backward movement upon the introduction of the lead or crayon, substantially as described

---

296,539. CRAYON-HOLDER. ALONZO T. CROSS, Providence, R. I. Filed Oct. 29, 1883. (No model.)



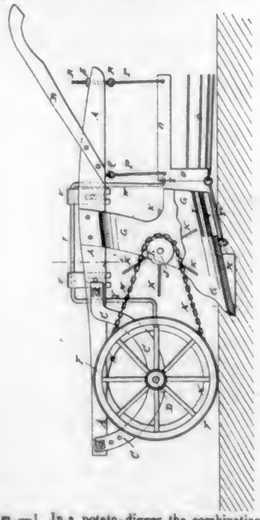
Claim.—In a crayon-holder, the combination of the carrier-tube, provided with jaws for frictionally holding the crayon, and means, substantially as described, for laterally opening the jaws of the carrier-tube, with a spring held within the bore of the carrier-tube and adapted to forcibly eject the crayon-stub upon the lateral spreading of the jaws, substantially as described.

296,540. WRENCH. DWIGHT MORSE DE SILVA, Corning, N. Y. Filed Dec. 4, 1883. (Model.)

Claim.—1. In a wrench, the combination, with the plates *d* and the pivoted and spring-pressed jaws *a b*, having curved arms *e j*, of the handle *f*, pivoted between the said jaws, and provided with cams A, substantially as herein shown and described.

2. In a wrench, the combination, with the plates *d* and the pivoted and spring-pressed jaws *a b*, each having curved arms *e j*, and the jaw

296,540.



b, having the hook *i*, of the handle *f*, pivoted between the said jaws, and provided with the cams A and shoulder *m*, substantially as herein shown and described.

3. In a wrench, a serrated jaw made with a beveled face, substantially as specified.

4. In a wrench, the combination, with the plates *d* and the handle *f*, having cams *k*, and the pivoted jaws *a b*, having curved arms *e j*, of the adjusting-screw *n*, passing through the curved arm of one jaw and resting against one of the cams of the handle, substantially as herein shown and described.

5. In a wrench having gripping-jaws *a b*, the jaw *a* having a beveled and serrated gripping-face, *p*, to form an angle-edge to grip the object to be turned, substantially as described.

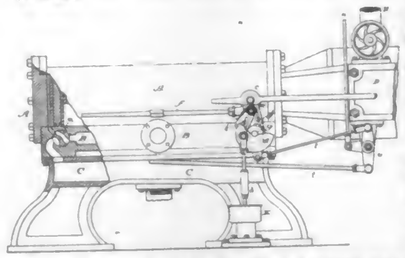
296,541. POTATO-DIGGER. WILLIS DODGE, Presque Isle, Me., assignor of one-half to George M. Lace, same place. Filed Dec. 12, 1883. (No model.)

Claim.—1. In a potato-digger, the combination, with the draft-beam, with its wheels, and the scoop, of the shaker or screen pivotally suspended from said beam, and the approximately U-shaped crank-shaft, with its lower forward end provided with a forward extension engaging a zigzag grooved or cam disk on one of the aforesaid wheels, and with its

lower rear end provided with a rearward extension connected to said screen or shaker, substantially as and for the purpose set forth.

2. In a potato-digger, the combination of the draft-beam, the approximately U-shaped crank-shaft connected to the screen or shaker connected to the scoop, said shaft also connecting with a cam-disk, and the right-angled arms supporting said shaft and adjustably connected to said beam, substantially as and for the purpose set forth.

296,542. WATCH-CHAIN TIP. OSCAR M. DRAPER, North Attleborough, Mass. Filed Dec. 17, 1883. (No model.)



Claim.—1. An improved tip for watch-chains, consisting of a rim provided with a pair of apertures arranged to receive a ring and to hold the same without solder.

2. An improved tip for watch-chains, consisting of a rim provided with a pair of apertures arranged to receive a ring and to hold the same without solder, and provided also with one or more apertures to receive the chain-links.

3. An improved tip provided with a flaring rim having apertures to receive a ring and to receive the chain-links, in combination with a disk secured in the open side of the tip by burnishing, substantially as described.

4. The combination, with a watch-chain, of the tip formed with the flaring rim having the apertures *b b'*, the ring *c*, and the disk C, secured to said tip by the burnished portion *x x*, the said chain being secured within the apertures *b'*, substantially as and for the purposes described.

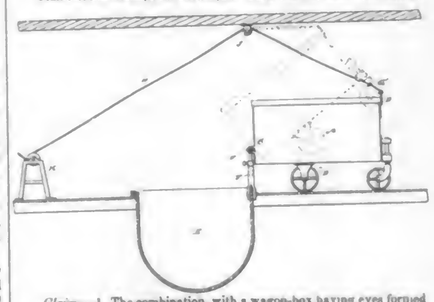
296,543. VALVE AND GEAR FOR STEAM-ENGINES. AUGUST C. DUNKE and AUGUST F. DUNKE, Manitowoc, Wis. Filed May 25, 1883. (No model.)

Claim.—1. The herein-described oscillating valve-operating catch, with a hook, *i'*, for moving the valve in one direction, a stud for moving the valve in the opposite direction, and a finger or projection by which the catch is tripped.

2. The herein-described valve, consisting of an elongated substantially cylindrical valve-body having closed or solid ends, a longitudinal slot through which the steam passes laterally to the cylinder, and an exhaust passage or recess cut in its side.

3. The combination, substantially as set forth, of the cylinder, the steam-chest, the exhaust-chamber, the valve seat or chamber formed at the end of the steam-chest and communicating with the cylinder, the steam-chest, and the exhaust-chamber, the rocking or rotary reciprocating valve seated in said valve-chamber having solid or closed ends and a longitudinal slot, through which the steam passes laterally to the cylinder, and an exhaust recess or passage cut in its side, and mechanism for automatically operating the valve.

4. The combination, substantially as set forth, of the valve-spindle, the disk or crank secured thereto, the rocking crank, its actuating-rod, the oscillating catch-hook pivoted on said crank, the cut-off regulator, mechanism for automatically actuating it from the governor to trip the catch, and the dash-pot with an automatically-compensating rod.



5. The combination, substantially as set forth, of the valve-spindle, a crank, *s*, rocking on the same center as the valve-spindle, its actuating-rod, the disk or crank secured on the end of the valve-spindle, a catch-hook loosely pivoted on the rocking crank *s*, which opens the valve to admit steam to the cylinder, and mechanism for tripping the catch at the desired point of cut-off.

6. The combination, substantially as set forth, of the valve-spindle, the rocking crank *s*, its actuating-rod, the crank or disk secured on the end of the valve-spindle, the catch-hook pivoted on the crank *s*, which opens the valve to admit steam to the cylinder, mechanism for automatically tripping the catch at the desired point of cut-off, and a shoulder on the catch which turns the valve into the exhaust-position on the reverse movement of the crank *s*.

7. The dash-pot rod herein described, consisting of an upper and lower stem, a coupling-socket, and a spring contained in said socket.

8. The combination, substantially as set forth, of the valve-stem, the disk or crank secured thereon, mechanism for rocking the disk or crank in both directions from the normally-closed position of the valve, and a dash-pot having an automatically-compensating rod.

296,544. SUGAR-DUMPING WAGON. JAMES D. EDWARDS and LEON FRANCOIS HAUBTMAN, New Orleans, La. Filed Feb. 13, 1884. (No model.)

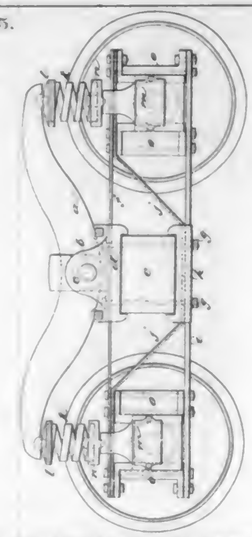
Claim.—1. The combination, with a wagon-box having eyes formed on one end, of standards at the trough into which the contents of the box are to be dumped, which standards have eyes formed on their upper ends, and of a rod passed through the eyes on the end of the box and the eyes on the standards, substantially as herein shown and described.

2. The combination, with a wagon-box, of bars provided with eyes or apertures, which bars are clamped on the end of the box, standards provided with eyes, and of a rod passed through the eyes in the standards and the eyes on the bars clamped on the end of the box, substantially as herein shown and described.

3. The combination, with a wagon-box, of the bars L, having apertured lugs L', and hooks M, the collars N, provided with the prongs O, and means for locking the collars on the bars, substantially as herein shown and described.

4. The combination, with a wagon-box, of the eyes C, secured on one end, and the apertured lugs D on the opposite end, substantially as herein shown and described.

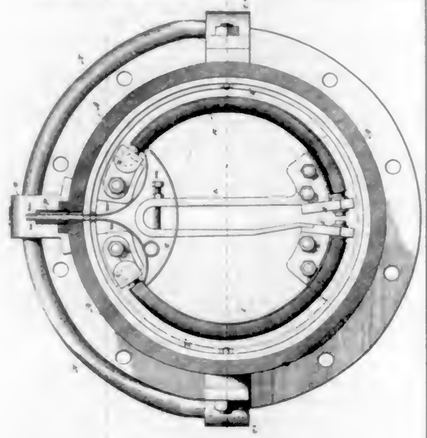
5. The combination, with a wagon-box provided with means for hinging it at one end, of means for securing a lifting-chain at the opposite end, substantially as herein shown and described.



6. The combination, with a wagon-box provided with means for hinging it, of the tongs Q, having a plate on the end of one jaw and a hook on the end of the other jaw, substantially as herein shown and described.

296,545. CAR-TRUCK. JOHN R. FISH, Grand Rapids, Mich. Filed Aug. 11, 1883. (No model.)

Claim.—1. In a car-truck, the combination, with a truck-frame and axle-bearings projecting above the same, of equalizing-bars pivoted at their centers to supports above the truck-frame, and extending longitudinally of the frame, with their ends projecting over the axle-bearings, and springs interposed between the projecting ends of the equalizing-bars and the axle-bearings, substantially as herein shown and described.



2. In a car-truck, the combination, with the truck-frame provided with the plate *d*, having ears c and the axle-bearings *m*, of the equalizing-bars *a*, pivoted between the ears of the said plate, and having their ends projecting over the axle-bearings, and the springs *k*, interposed between the equalizing-bars and axle-bearings, substantially as herein shown and described.

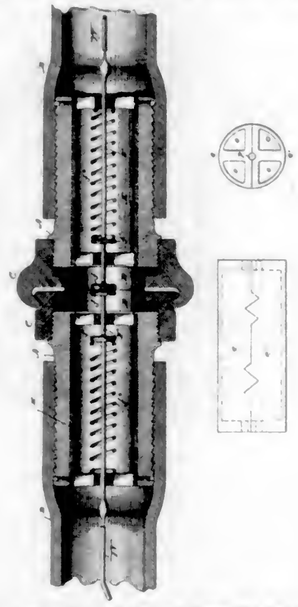
296,545.

3. In a car-truck, the combination, with the truck-frame, the plates *d h*, and the bolster *e*, of the equalizing-bars *a*, pivoted to the plates *d*, the springs *k*, and the axle-bearings *m*, substantially as herein shown and described.

296,546. ELECTRO-MAGNETIC AIR-BRAKE. HENRY FLAD, St. Louis, Mo. Filed June 7, 1883. (No model.)

Claim.—1. The combination, with the main air-pipe of an air-brake system and a series of brake-cylinders arranged on different cars, and having pistons connected with the brakes thereof, respectively, of a series of valves arranged to connect said cylinders through suitable connections alternately with the main pipe and with the external air, and a series of electro-magnets arranged to operate said valves, substantially as described, whereby the brakes of a train may be operated automatically and simultaneously.

2. The combination, with the cylinder having openings or ports, substantially as described, of the annular valve having suitable air-passages, and arranged to open and close said cylinder-ports, an electro-magnet arranged to operate said valve, and means for including said electro-magnet in an electric circuit extending outside of the cylinder, essentially as set forth.



3. The combination, with the cylinder having an annular valve-seat formed therein, and suitable ports or openings leading outward from said seat, and the annular valve fitted to said seat and provided with proper air-passages, of an electro-magnet secured to said valve, and a stationary electro-magnet arranged to co-operate with the said valve-magnet, the helices of said magnet being connected and arranged to be included in a circuit extending outside of the cylinder, substantially as described.

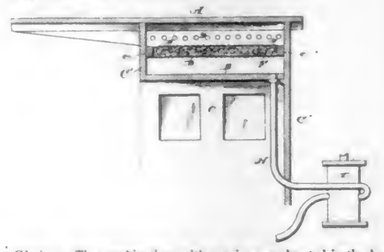
4. The combination, with an air-brake cylinder provided with ports, substantially as described, its piston, and the supply or exhaust pipe and coupling-hose of a railway-car, of an electro-magnetic valve arranged to open said ports, conducting-wires connected with the electro-magnetic devices of said valve, and arranged within the supply or exhaust pipe and coupling-hose, and automatic wire-connecting devices arranged in the hose-couplings, whereby the electric wires may be connected from car to car simultaneously with the coupling of the hose, substantially as described.

5. The combination, with the air-pipes, coupling-hose, conducting-wires arranged within said pipes and hose, and the automatic wire-connecting devices arranged in the hose-couplings, of the stationary couplings, one or more, arranged upon a car, and connected with a wheel or wheels thereof through intermediate electrical conductors, essentially as and for the purpose set forth.

6. In an air-brake system, the combination, with the air-pipes and inclosed conducting-wires, an electric battery, and circuit including said conducting-wires, of the three-way cock arranged in the air-conduit, and provided with circuit closing and breaking devices, and means for operating the same simultaneously with the operation of the said three-way cock, substantially as described.

296,547. ELECTRICAL CONNECTOR IN PIPE-COUPLINGS FOR AIR-BRAKES. HENRY FLAD, St. Louis, Mo. Filed June 7, 1883. (No model.)

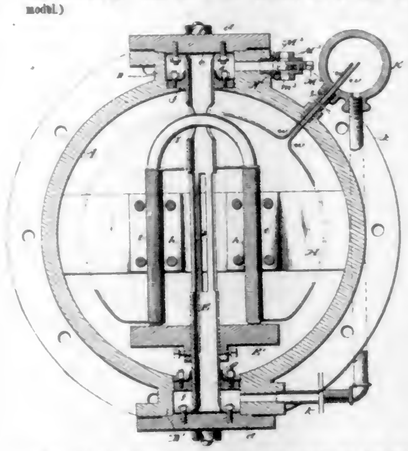
Claim.—1. The combination, with the sections of a pipe-coupling and insulating-casings located within the coupling-sections, said casings provided with skeleton end bearings, of spring-actuated metallic contacts supported in the bearings of the insulated casings, and electrical conductors connected with said contacts, substantially as set forth.



2. The combination, with the sections of a pipe-coupling and insulating-casings, each made in longitudinal sections, and provided with two-part end bearings, of spring-actuated metallic contacts supported in the bearings of the insulated casings, and electrical conductors connected with said contacts, substantially as set forth.

3. The combination, with the pipe-coupling sections and gaskets D D, secured thereto, of the insulated casings E, metallic contacts E *f*, spring *f*², and electrical conductors W, substantially as set forth.

4. The combination, with two sections of a pipe or hose coupling

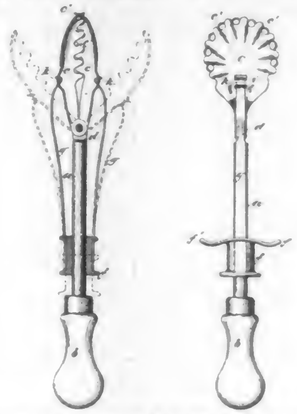


and gaskets of insulating material attached to each section to form an air-tight joint, of insulated casing located within the coupling-sections, and spring-actuated metallic contacts supported in bearings of the insulated casing, and electrical conductors connected with said contacts, substantially as set forth.

296,548. AIR-FILTER. HENRY FLAD, St. Louis, Mo. Filed June 14, 1883. (No model.)

Claim.—The combination, with an air-pump located in the locomotive-cab, of the air-filter arranged in a chamber directly under the roof of the cab, said chamber being provided with openings at one side of said filter, and the suction-pipe leading from said chamber on the opposite side of the filter to the air-pump, substantially as described.

296,549. ELECTRO-MAGNETIC VALVE AND CONNECTION. HENRY FLAD, St. Louis, Mo. Filed June 7, 1883. Renewed Feb. 26, 1884. (No model.)



Claim.—1. The combination, with the cylinder provided with suitable ports, of the tubular diametrically-arranged valve, the armature carried by said valve, and the electro-magnet arranged to attract said armature, substantially as described.

2. The combination, with the main or communicating pipe and the cylinder having diametrically-opposite ports or passages arranged for communication with the said pipe and the external air, respectively, of the tubular valve arranged to open and close said ports, and having its interior in communication with the interior of the cylinder, the armature carried by said valve, and the electro-magnet arranged to attract said armature, and having its helices arranged for connection in an electric circuit outside of the cylinder, substantially as described.

3. The combination, with the cylinder provided with ports arranged for communication with a main pipe and the external air, respectively, and an electro-magnetic valve for controlling said ports, of a supplementary valve for regulating the flow of air from the cylinder when the electro-magnetic valve has opened the passage to the external air, substantially as described.

4. The combination, with the cylinder provided with ports arranged for communication with a supply-pipe and the external air, respectively, and an electro-magnetic valve arranged to open and close said ports alternately, of an automatic regulating-valve arranged to close the communication between the cylinder and external air when the pressure in the cylinder falls to a predetermined point after the electro-magnetic valve has opened the port to the external air, substantially as and for the purpose set forth.

296,550. DISHCLOTH-HOLDER. JOHN T. FOSTER, Arlington, N. J. Filed Dec. 21, 1883. (No model.)

Claim.—1. A grasping-tongs for holding dishcloths or other articles, consisting of a stem or handle, two grasping-jaws on the end thereof, a spring tongue or tongues arranged to constantly hold the said jaws closed by lateral pressure thereon, and a longitudinally-sliding manipulating device for flexing said tongues, and thus opening the jaws, substantially as herein set forth.

2. A device for holding dishcloths, &c., consisting of a stem, *a*, having a suitable handle, in combination with the jaws *c c*, hinged on the end of the stem and formed of sheet metal shaped and corrugated in the form of scallopped shells, with suitable means for opening and closing said shells, substantially as herein set forth.

3. The combination, with the stem *a* and handle *b*, of the hinged jaws *c c*, formed in the shape of corrugated shells, with toothed intermeshing edges, and with suitable means for opening and closing said jaws, substantially as herein set forth.

4. The combination, with the stem *a*, having a suitable handle, of jaws *c c*, hinged on the end thereof, a manipulating sleeve or knob sliding on said stem, and one or more tongues or rods, *g g*, connecting said sleeve with one or both of said jaws, substantially as and for the purpose set forth.

5. In a device for holding cloths, &c., the combination, with a handle and grasping-jaws supported therefrom, of a sliding manipulating sleeve or knob operatively connected with the jaws to open the same, and formed with the laterally-projecting finger-rests *f' f'*, substantially as and for the purpose set forth.

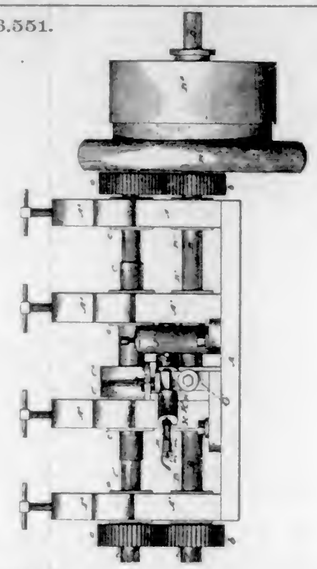
6. The combination, with the stem *a* and handle *b*, of hinged jaws *c c*, sliding sleeve *f*, and connecting-tongues *g g*, arranged and operating substantially as and for the purpose set forth.

7. In a grasping or tongs device, substantially such as set forth, the combination, with the stem or handle, of the grasping jaw or jaws formed with slots *i i* and bar *k*, the tongue or rod *g*, having a hooked end engaging in said slot and bar, and a manipulating device acting on said tongue to operate the jaw, substantially as herein set forth.

296,551. WIRE-COILING MACHINE. ABEL H. FROST and FRED I. BRYANT, Chicago, Ill. Filed Mar. 24, 1883. (No model.)

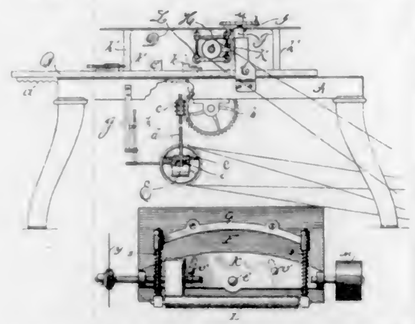
Claim.—1. In a force-feed machine for coiling wire, the combination, with the coiling-spindle and feeding devices, of adjustable means for variably flexing the wire before it passes onto the spindle, substantially as described, and for the purposes set forth.

2. The combination, with the coiling-spindle and feeding devices, of a vertically-adjustable guide for leading the wire to the spindle, substantially as described, and for the purposes set forth.



3. The combination, with the coiling-spindle and feeding devices, of two or more separately and vertically movable guides and adjusting devices therefor, substantially as described.

4. The combination, with the coiling-spindle and feeding devices, of pivoted guide-plates F F, provided with grooves for the several wires, an intermediate plate, I, and means for adjusting the guide-plates, substantially as described.

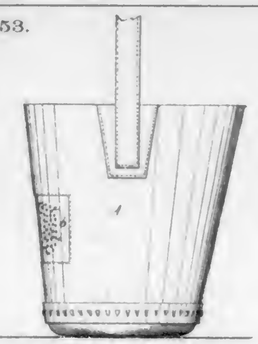


5. In combination with a non-rotating coiling-spindle and force-feeding devices, an outwardly enlarged conical tip, M, arranged in prolongation of the coiling-spindle, substantially as described, and for the purposes set forth.

6. In combination with the non-rotating coiling-spindle, the rotating conical tip M, substantially as described, and for the purposes set forth.

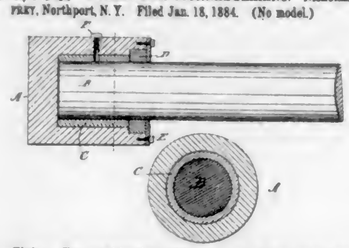
296,551.

296,552. MACHINE FOR TRUING WEAVERS' SHUTTLES, PICKER-STICKS, &c. STEPHEN C. GARDNER, Eagleville, Conn. Filed Sept. 6, 1883. (No model.)



Claim.—1. In the described machine, the combination, with the bed-plate and suitable holding devices for the article to be operated upon, of the carriage F, vertically adjustable, suitable cutting devices secured to said carriage so as to be capable of adjustment in a circular direction, and the roller-frame *o*, constructed substantially as described, and secured to said carriage by means of the bracket G, all the parts operating in the described relation to each other, for the purpose set forth.

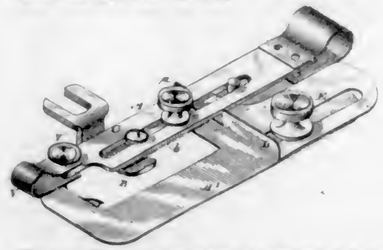
2. In combination with the bracket of the cutter-head, capable of angular adjustment, as described, the driving mechanism therefor, consisting of the counter-shaft I' and pulley T, constructed and arranged substantially as described, whereby the same inclination may be given to the pulley T as that of the cutter-head, for the purpose described.



296,553. FEED-BAG. JAS. W. GEDNEY, New York, N. Y. Filed Oct 18, 1883. (No model.)

Claim.—As an improved manufacture, a canvas feed-bag provided with a leather section inserted in the body of the bag, and having eyeleted perforations, all substantially as set forth.

296,553.

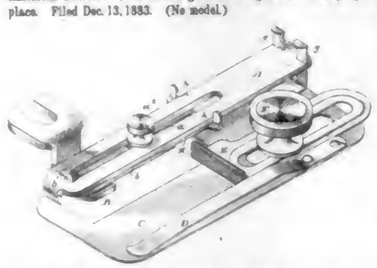


296,554. WATER-PROOF JOURNAL-BEARING. NICHOLAS W. GODFREY, Northport, N. Y. Filed Jan. 18, 1884. (No model.)

Claim.—The combination, with a journal, of the socket-bearing A, having plug F, the lining C, the flexible packing-ring D, closing in said lining, and the washer E, secured to the end of the socket-bearing, substantially as shown and described, and for the purpose set forth.

296,555. TUCK-MARKER FOR SEWING-MACHINES. JULIUS C. GOODWIN and CHARLES W. WARREN, Philadelphia, Pa., assignors to the American Buttonhole, Overseaming and Sewing Machine Company, same place. Filed Oct. 23, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of the presser-foot, its lateral extension, the longitudinally-slotted creaser-bar mounted thereon, and actuated by the presser-foot to crease the cloth, creasing devices, the guide C and set-screw *a* for adjusting the creaser-bar on the presser-foot, the slotted base-plate A' of the tucker, and a set-screw, E, for adjustably securing it to the bed-plate of the machine.



2. The combination, substantially as set forth, of the creaser-bar, the bent or elliptic spring V, the creaser *e*, carried thereby, and the screw V' for adjusting the creaser, which screw is carried by the creaser-bar, and works against the elliptic spring in line with the creasing device.

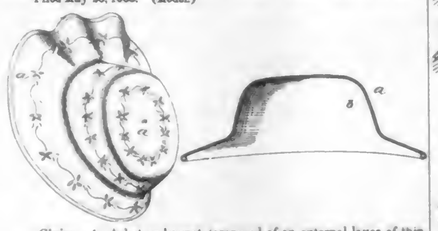
3. The combination, substantially as set forth, of the creaser-bar, an elliptic creaser-spring, V, carried by the creaser-bar, and a screw, V', for adjusting the spring V.

4. The combination, substantially as set forth, of the presser-foot, the creaser-bar mounted on and actuated by the presser-foot, devices for securing the creaser-bar on the presser-foot, and mechanism for imparting an increased vertical motion to the presser-foot.

5. The combination, substantially as set forth, of the presser-foot, creasing devices carried thereby, devices for securing the creaser-bar on the presser-foot, the presser-foot bar, the lever pivoted thereto, a cam-face which acts on the lever, and the adjustable fulcrum of the lever.

296,556. TUCK-MARKER FOR SEWING-MACHINES. JULIUS C. GOODWIN and CHARLES W. WARREN, Philadelphia, Pa., assignors to the American Buttonhole, Overseaming and Sewing Machine Company, same place. Filed Dec. 13, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of the presser-foot, the creaser-bar mounted thereon, so as to move bodily vertically with the presser-foot, the bottom plate, and a loose connection between the bottom plate and a creaser-bar, which permits the vertical movement of the latter.



2. The combination, substantially as set forth, of the presser-foot, the creaser-bar mounted thereon and moving bodily therewith, the bottom plate, and the vertical guide on the bottom plate in which the creaser-bar works vertically.

3. The combination, substantially as set forth, of the presser-foot, the slotted creaser-bar mounted thereon, the wedge-plate which works between the creaser-bar and the presser-foot, and the clamping bolt or nut which serves to clamp the presser-foot, wedge, and bar together.

4. The combination, substantially as set forth, of the presser-foot, the slotted creaser-bar mounted thereon, the sliding wedge-plate, the clamping bolt or nut, the bottom plate, and the loose connection between the creaser-bar and bottom plate.

5. The combination, substantially as set forth, of the presser-foot, the cloth-feed, the enlargement on the sole of the presser-foot, and the creaser-bar carried by the presser-foot.

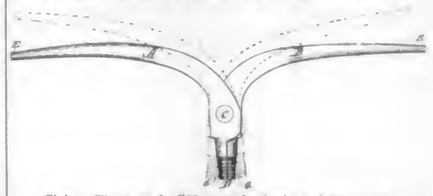
296,557. HAT OR BONNET. JOHANNA HANSEN, New York, N. Y. Filed May 28, 1883. (Model.)

Claim.—1. A hat or bonnet composed of an external layer of thin leather and an internal sustaining-layer of buckram or equivalent fabric, substantially as herein set forth.

2. A hat formed of an external layer of leather and an internal layer of buckram or equivalent fabric, pressed simultaneously by dies into the desired form, substantially as set forth.

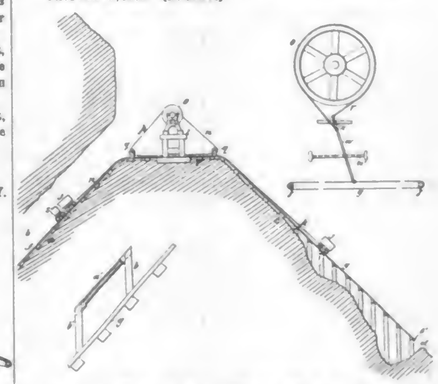
3. The process set forth for manufacturing leather hats, consisting in placing a sheet of leather upon a sheet of buckram or equivalent fabric, with the leather layer outermost, and then pressing the two layers simultaneously, between dies, into the form of the desired hat, substantially as set forth.

296,558. BRACKET FOR INSULATING-SUPPORTS FOR ELECTRICAL CONDUCTORS. DAVID S. HAINES, New York, and STEPHEN D. LAKE, Brooklyn, N. Y. Filed Nov. 30, 1883. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of an insulator-bracket, means for securing the same to a support, a stem for receiving an insulator, and a screw fitting into said stem and serving to bind said insulator upon said stem.

2. The combination, substantially as hereinbefore set forth, of the bracket A, having a stem, E, the screw F, and the insulator G.



3. The combination, substantially as hereinbefore set forth, of an insulator-bracket, means for securing the same to a permanent support, a seat for an insulator raised upon the surface of said bracket, and means, substantially such as described, for securing an insulator upon such seat.

296,559. TONGS FOR LIFTING SPOOLS OF FENCE-WIRE. WM. A. HARDIN, Leavenworth, Kans. Filed Feb. 8, 1884. (No model.)

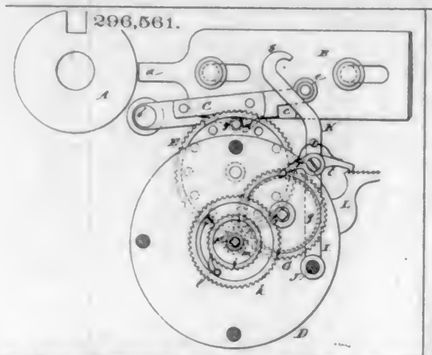
Claim.—The tongs for lifting spools of wire and like objects, consisting of the bent levers A B, pivoted together at C, and having their short ends formed into a nose, D, of approximately cylindrical form, which is adapted to support a spool by frictional contact with the surface of an opening therein, whereby the tongs may be adapted for use on spools of different constructions, and having openings therein of different diameters, substantially as specified.

296,560. ORE-ELEVATOR. WILLIAM ALLEN HARTT, Rochester, N. Y. Filed Feb. 20, 1884. (No model.)

Claim.—1. The combination, with an inclined way, up which the ore or other material is to be raised, and another inclined way, down which the material is to be delivered, and being longer than the first inclined way, and with the cars and operating-ropes therefor, of a dead-weight car and a drum for the rope of the discharging-way, of a larger diameter than the drum for the rope of the hoisting-way, substantially as described.

2. The combination, with the inclined ways *f g*, having parallel overlapping sections on the level *e*, also the connecting-switches *h i*, of the drums *m o*, of different sizes, operating-ropes *n p*, three or more cars, *j*, and a dead-weight car, *s*, substantially as described.

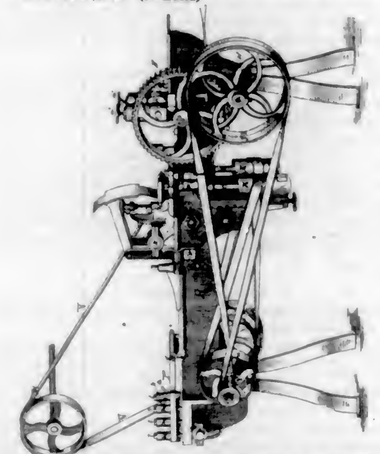
3. In an ore-elevating apparatus consisting of the inclined ways *f g*, having parallel overlapping sections on the level *e*, and switches *h i*, with drums *m o*, hoisting-ropes *n p*, and cars *j*, the guide-pulleys *q*, arranged to extend the ropes of the respective ways past the ends of said level sections from the respective operating-drums, substantially as described.



4. The combination of the brake *v* and lever *w*, having the endless cord *y*, and notched holding-bar *x'*, with the drum *o*, hoisting-ropes *n p*, inclined ways *f g*, and the cars *j s*, substantially as described.

5. The combination, with the inclined ways *f g*, having parallel and overlapping sections, and the connecting-switches *h i* on the level *e*, of spring mechanism located at the lower end of the way *g*, and adapted to be compressed by the descending loaded cars, and to raise the empty cars to slacken the rope and facilitate the pushing of the cars onto the way *f*, substantially as described

296,561. TIME-LOCK. MOSES CHARTEN HAWKINS, Edinburgh, Pa. Filed July 23, 1883. (Model.)



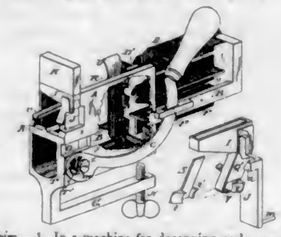
Claim.—1. The combination, with the slide-bolt B, having a side pin, *c*, of the latch C, engaging said pin, turning on a pivot, *b*, and having a downwardly-projecting beveled arm, *d*, and a roller, *e*, on a pin projecting horizontally from the face of the latch, a time-movement having the pin-wheel E, the gear *f* F, and the pin *g*, whereby the latch may be raised and the bolt released at any desired time, as described.

296,561.

2. The combination, with the going-barrel and time-catch, of an accident-lever, two spring-pawls on arms I K, a ratchet on the going-barrel, and a stationary ratchet, said lever having an inclined surface to engage with said time-catch, as and for the purpose specified.

296,562. PLANING-MACHINE. ELI B. HAVEN, Big Rapids, Mich. Filed Dec. 10, 1883. (No model.)

Claim.—1. A blind-slat-planing machine provided with bead edging planers and concave top and bottom side planers, the edging-planers arranged to act in advance of the top and bottom planers, whereby the edging-planers do not become nicked by use, as set forth.



2. The bed-frame A, provided with brackets for the shafts of the top and bottom planing-cylinders, M N, the shaft R and leading-pulley S intermediate said planing-cylinders, and the driving-belt V, led over said pulley S and over the pulleys T U successively, as and for the purpose set forth.

3. The planing-cylinders M N, combined with the pivoted overhanging frame P, jointed to the frame A by pins *g* intermediate the planers, said frame P being provided with the yoke A and the adjustable bed-pieces *q*, substantially as and for the purpose set forth.

4. In a planing-machine fitted with planing-cutters arranged to plane the under side of the stuff as it passes the machine, and in combination with said under-side planer, an overhanging frame, P, pivoted to the main frame, and provided with a planing-bed to hold the stuff against the action of the cutters, said overhanging frame being capable of turning back on its pivots to expose said cutters and make them easily accessible for adjustment or sharpening.

296,563. MACHINE FOR DEPRIMING AND REPRIMING CARTRIDGE-SHELLS. HENRY T. HAZARD, Los Angeles, Cal., assignor of one-half to J. F. Ponder, same place. Filed Apr. 26, 1883. (Model.)

Brief.—One shell is decapped, another recapped, and a third ejected from the machine at each throw of the operating-lever. The shells are fed to the operating-plungers by the action of gravity.

Claim.—1. In a machine for decapping and recapping cartridge-shells, the combination of a frame provided with a clamp, a support adapted to sustain the head of a shell without covering the cap thereon, and a fixed anvil, a slide moving in guides in said frame, and provided with a plunger having a projecting pin in line with the cartridge-support, a second plunger in line with the anvil, and an ejector below said plungers, a lever pivoted to the frame and serving to actuate the slide, and a reservoir, arranged substantially as shown and described, to deliver primers in front of the anvil.

2. In a cartridge-capping implement, the combination of a frame provided with a stationary anvil to sustain the primer against the pressure of a shell moving over it, a yielding device, substantially such as described, for holding the primer in front of said anvil, a plunger adapted to carry a cartridge-shell, and a lever for moving said plunger, whereby the shell may be forced toward the anvil and over the primer sustained thereby.

3. In a decapping and recapping implement, the combination of a frame, A, having a cross-piece to support a cartridge-head while being decapped, and a fixed anvil, K, movable cap-tube Q, provided with spring-jaws S S, adapted and arranged to be separated by said anvil, slide B, provided with decapping-plunger D, recapping-plunger E, and ejector F, and lever C, connected with the slide B, substantially as shown and described.

4. In combination with frame A, adapted to contain three shells superposed one upon another, and provided with an outlet for spent caps, an anvil to sustain a fresh cap, and an outlet for recapped shells, a slide mounted and arranged to move within said frame, and carrying a decapping-plunger in line with the outlet for spent caps, a second plunger in line with the anvil, and an ejector in line with the shell-outlet, all substantially as shown, whereby a single movement of the slide is caused to decap one shell, cap a second, and expel a third.

5. In a recapping implement, the combination of a fixed anvil, a swinging cap-tube, and beveled spring retaining-jaws at opposite sides of said tube, adapted to be pressed against and separated by the anvil through the pressure against them of the shell to be recapped.

6. In combination with frame A, having stationary anvil K, movable cap-tube Q, closed at its lower extremity, and provided with laterally-moving spring-jaws S S, beveled at their inner edges opposite the end of the anvil, substantially as and for the purpose set forth.

7. In a decapping and recapping machine, the combination of a fixed reservoir, I, and a detachable reservoir, H, provided with parallel teats or projections *n n*, whereby the primers may be directed into the upper reservoir and the said reservoir secured to the lower swinging reservoir, substantially as described.

8. In a decapping and recapping implement, the combination of a frame, a cap-reservoir, a movable feed-tube communicating with said reservoir, a slide provided with plungers to effect the decapping and recapping of the shells, and an agitator independent of the feed-tube, actuated through the movement of said lever, and arranged, substantially as shown, to enter the reservoir and raise the caps therein, and then to retreat and permit the caps to fall, substantially as shown and described.

9. In a decapping and recapping implement, the combination, with a frame, and with a slide moving therein and carrying decapping and recapping plungers, of a cap-reservoir, an agitator having its end arranged within said reservoir, and an operating-lever connected with the slide and with the agitator, substantially as and for the purpose set forth.

10. In a repriming implement, the combination of a frame provided with a stationary anvil, a yielding device, substantially such as described, for holding a primer in front of said anvil, slide B, having plunger E, and lever C, adapted to move said slide, substantially as shown.

11. In a repriming device substantially such as described, the combination of a frame provided with fixed anvil K, a movable cap-tube, an agitator provided with beveled shoulder *a*, adapted, substantially as described, to force the tube back as the agitator rises, a slide, B, provided with plunger E, and an operating-lever, C, connected with the slide and agitator, substantially as shown and described.

12. The herein-described implement, consisting of frame A, provided with a clamp, a stationary support for a cartridge-head, and a fixed

anvil, a cap-reservoir arranged, substantially as shown, to deliver caps directly in front of the anvil, and provided with beveled spring retaining-jaws adapted to be separated by said anvil, a slide carrying a plunger adapted to enter a shell, and provided with a projecting pin to remove primers, a second plunger adapted to enter a shell and force it toward the anvil, and an ejector to expel shells from the implement, and a lever connected with the slide and serving to impart motion thereto, substantially as set forth.

13. In an implement for recapping cartridge-shells, a cap-tube provided with a loop or bar at its lower end, to prevent the fall of caps therefrom, and with laterally-movable spring-jaws projecting over openings in the front and rear faces of the tube, to prevent the escape of caps except when the jaws are pressed apart, and mechanism, substantially as described, to force apart the spring-jaws.

14. In a machine for decapping and recapping cartridge-shells, a frame adapted to receive the shells in a single row, one resting upon or against another, and a slide arranged to move in said frame, and provided with an ejector opposite the innermost or bottom shell, a recapping-plunger in line with the next shell, and a decapping-plunger in line with the third shell, substantially as shown and described, whereby the shells are adapted to fall by gravity to the respective plungers and the ejector in proper succession.

15. In an implement for decapping and recapping cartridges, the combination of a swinging cap-tube provided with beveled spring-jaws, an anvil to separate said jaws, and an agitator arranged to enter the cap-tube, and provided with a beveled lug to act against the cap-tube and release it from the anvil, to which it is held by the spring-jaws.

296,564. METALLIC BUSHING. CHARLES HEBLE, Washington, D. C. Filed Jan. 4, 1884. (No model.)

Claim.—1. A bushing for barrels, kegs, or other vessels, having an increasing inside taper, and at its lower end a circumferential recess, substantially as shown and described.

2. The combination of a bushing having an increasing inside taper and a circumferential recess at its lower end with a plug or bung having a central cavity inserted therein, substantially as shown and described.

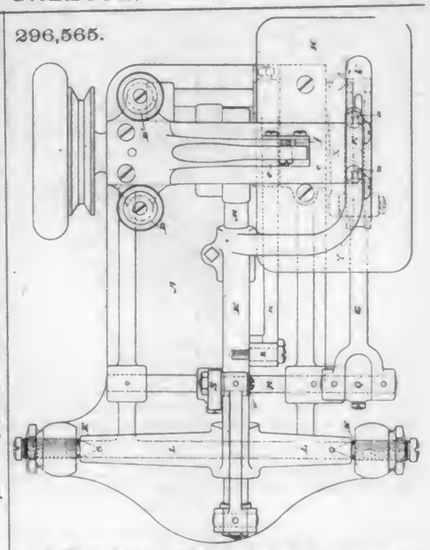
296,565. MACHINE FOR SEWING BAGS AND OTHER ARTICLES. CHARLES M. HINE, St. Louis, Mo., assignor to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed Aug. 4, 1883. (No model.)

Brief.—The driving-shaft imparts motion to the needle-lever by means of an eccentric and connecting-rod, the latter sliding in bearings in the needle-lever. The sliding rod serves also, by means of lever-connections, to produce reciprocating movements of the feed-bar. A spring-leaf carries a presser-foot, which latter may be raised by means of a sliding rod and cam, the latter resting upon a separate fixed arm. The needle-lever is deflected at its front end. The goods are fed in a line transverse to that of the driving-shaft.

Claim.—1. The combination of a shaft, a rotary hook or looper carried thereby, a needle-lever provided at its end with means for holding a needle or needles, and fulcrumed behind the needle, with its axis of oscillation transverse to the line of feed, and mechanism for operating said lever, substantially as described.

2. The combination, with a needle-lever, of an eccentric-rod supported and sliding in bearings in said lever, and an eccentric for operating said parts, substantially as described.

3. The combination of the needle-lever provided with means for attaching a needle or needles directly thereto, the sliding eccentric-rod and the eccentric, substantially as described.



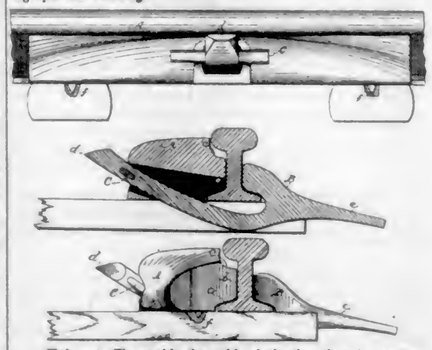
4. The combination, with duplicate hooks or loopers and the needle-lever provided with devices for attaching the needles directly thereto, of the bearings for supporting the said lever, with its axis of oscillation parallel with the axis of rotation of said hooks or loopers, and the duplicate needles for co-operating with said hooks or loopers, said needles being attached to said lever and moving in curved paths, substantially as described.

5. The combination, with the work-plate and machine-frame, of the presser-foot carried by a leaf-spring, the sliding pin, the cam connected with said pin for raising and lowering said foot, and the bearing for said cam, the elasticity of the spring tending to press said presser-foot toward the said work-plate, substantially as described.

6. The combination, with the needle-lever and feed-bar of a sewing-machine, of an eccentric, eccentric-rod, and connections for rocking said lever and for imparting back-and-forth movements to said feed-bar from the said eccentric through the strap which encircles the same, substantially as described.

7. The combination, with the needle-lever, the eccentric, and the sliding eccentric-rod, of the feed-bar, the rock-shaft, and the link, the latter connected with the said eccentric-rod, substantially as described.

296,565.



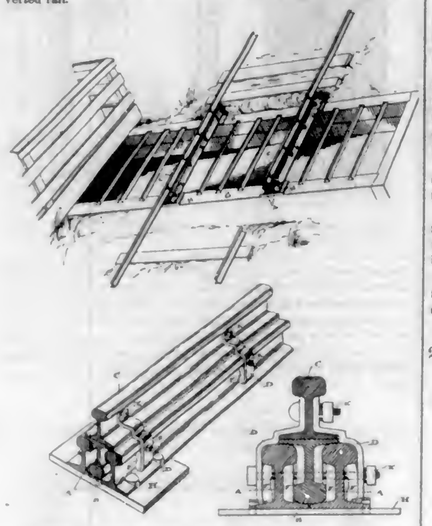
8. The combination, with the needle-lever of a sewing-machine and the feed-bar arranged under the work-plate of said machine, of connections for imparting the rising and falling motions to the feed-bar from the needle-lever, substantially as described.

9. The combination, with the needle-lever and feed-bar, of an eccentric and eccentric-rod and connections for imparting a rocking motion to the needle, and the rising and falling and back and forth motions to the feed-bar, all from said eccentric through the strap which encircles the same, substantially as described.

10. The combination, in a sewing-machine, of the revolving shaft, one or more hooks or loopers operated thereby, the eccentric on said shaft, the bent needle-lever fulcrumed behind the needle, and provided with fastening devices for attaching one or more needles directly thereto, the eccentric-rod sliding in bearings in said needle-lever, the feed-bar, the rock-shaft, the connections between the needle-lever and feed-bar, and connections between the eccentric-rod and rock-shaft, substantially as described.

296,566. CAR-REPLACER. JOS. A. HOOEL, Cumberland, Md. Filed Dec. 14, 1883. (No model.)

Brief.—The double-inclined replacing-block having a hopper-shaped opening through it, and formed on one side to fit upon the rail-flange and against the web thereof, is secured to said rail by a hook-lever, one arm of which passes through the opening in the block, the other arm resting upon the rail-flange.



Claim.—1. The combination, with a body-piece shaped on one vertical face to fit the web of a low rail, shaped on its bottom to fit the base-flange of the rail and the ties on which the rail rests, having a hopper-shaped hole through it and grooved longitudinally across the small end of said hole, of a hook having a hole through its body near the end, and

a wedge-shaped key shaped to engage said hole and the groove aforesaid, as and for the purpose specified.

2. The combination, with the block having the hopper-shaped aperture described, of a hook having a handle at one end and pointed at the other end, and means for securing said hook to the block, as shown and described.

296,567. RAIL-STRINGER. HENRY HOLGATE, Toronto, and ROBERT RAGNALL, Hamilton, Ontario, Canada. Filed Dec. 15, 1883. (No model.) Patented in Canada Dec. 19, 1883, No. 18,332.

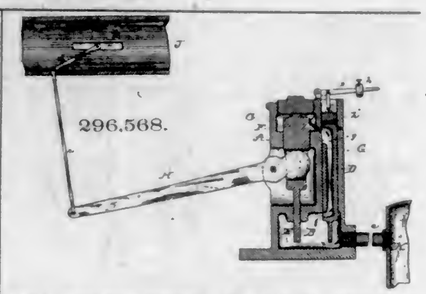
Brief.—Rail-stringers for open culverts, cattle-guards, &c., consisting of two T-rails side by side, their bases touching, or nearly so, a center T-rail inverted between the side rails, the flanges thereof resting on the heads of the side rails, and all being held together by clips, filling-plates, and bolts, the track-rails resting upon the base of the central inverted rail.

Claim.—1. As an improved rail-stringer, two T-rails, A, laid on their bases side by side, the inner edges of their bases touching each other, or nearly so, a similarly-shaped center rail, B, inverted and slipped between the two rails A, the flanges of its base resting on the heads of the side rails, and the bottom of its base presenting a level support for the running rail C, in combination with clips arranged to combine the rails together, substantially as and for the purpose specified.

2. The rails A and B, arranged as described, so as to form a support for the running rail C, the clip-plates D, and bolts E, arranged to combine the rails together, in combination with packing-pieces F, inserted between the rails A and B, and between the rails A and clip-plates D, substantially as and for the purpose specified.

3. In combination with a rail-stringer composed of the rails A and B, arranged and combined together as described, a plate, H, placed on the timber G, and held there by spikes driven into the timbers through holes in the plate, and notches cut in the outer edges of the flanges of the rails A, substantially as and for the purpose specified.

296,568. STEAM-DAMPER REGULATOR. JULIUS L. HORNIG, Jersey City, N. J. Filed Aug. 16, 1883. (No model.)



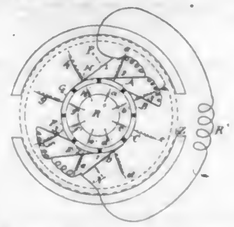
Claim.—1. In a steam-damper regulator, the combination, with damper-connections, of a steam-motor working the damper and moved in both directions by steam-pressure, and a valve controlling the motor and acted upon directly by the steam-pressure, substantially as set forth.

2. In a steam-damper regulator, the combination, with damper-connections, of a steam-motor working the damper and moved in both directions by steam-pressure, a valve controlling the motor and acted upon directly by the steam-pressure, and a counter-balance, substantially as set forth.

3. In a steam-damper regulator, the combination, with damper-connections, of a steam-motor working the damper and moved in both directions by steam-pressure, a valve controlling the motor and acted upon directly by the steam-pressure, and an adjustable counter-balance, substantially as set forth.

4. The combination, with a steam-boiler-furnace damper, of a differential steam-motor connected with the boiler, and connections between them whereby said damper is operated by variations in the steam-pressure, substantially as set forth.

296,568.



5. In a steam-damper regulator, the combination, with damper-connections, of the opposing plungers of different areas, the steam-chambers containing said plungers, a constant steam-connection with the chamber having smaller plunger, and means for opening and closing a steam-connection with the chamber having larger plunger, controlled by variations in steam-pressure, substantially as set forth.

6. In a steam-damper regulator, the combination, with damper-connections, of opposing plungers of different areas and the valve controlling the admission of steam to the plungers, substantially as set forth.

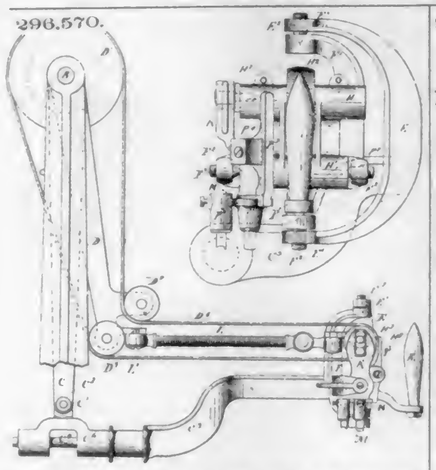
7. In a steam-damper regulator, the combination, with damper-connections, of the opposing plungers of different areas, a steam-connection with the chamber having smaller plunger, and a valve opening and closing a connection between the chambers, substantially as set forth.

8. In a steam-damper regulator, the combination, with damper-connections, of differential motor, the valve, and the snifting-passage, substantially as set forth.

296,569. DYNAMO-ELECTRIC MACHINE. EDWIN J. HOUSTON and ELIHU THOMSON, Philadelphia, Pa., assignors to the Thomson-Houston Electric Company. Filed Nov. 30, 1878.

Claim.—1. In a dynamo-electric machine, the combination, with two field-poles of opposite polarity, of a plurality of armature bobbins or coils simultaneously exposed to the inducing action of said poles, half of the terminals of which bobbins are joined together or to a common conductor, while the remaining terminals are connected to separate segments of a commutator.

2. The combination, with two diametrically-opposite inducing-poles in a dynamo-electric machine, of a plurality of armature coils or bobbins, the similar ends of which coils are joined separately to the separate plates of a commutator, while their opposite ends are united in a common electrical joint or connection, and two collecting-brushes or sets of brushes applied to said commutator, and forming, respectively, the positive and the negative collector of the machine.



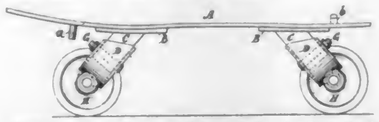
3. The combination, in a dynamo-electric machine, of two diametrically-opposite field-of-force poles, a plurality of armature-coil terminals joined *seriatim* to the plates of a commutator, a common joint or connection for the opposite terminals of the coils, and a positive and negative collector applied to said commutator, and each arranged to collect the current in multiple arc from those terminals which are for the time being on the same side of the shaft and are of the same polarity.

4. In a commutator for a dynamo-electric machine, the combination of an adjustable plate or spring, M, and a flexible band or strip, S, of conducting material, substantially as described.

296,570. SOLE-EDGE-BURNISHING MACHINE. JAMES HOWARD, Boston, Mass. Filed Dec. 26, 1883. (No model.)

Claim.—1. In a sole-edge-burnishing machine, the combination of the swinging frame D, arm C^3, resilient connection L, and working-head

296,570.



with the belt D^4, pulleys D^2 D^3, and driving-pulley D', all operating together substantially as described, and for the purpose set forth.

2. In a sole-edge-burnishing machine, the combination of the swinging frames D and C, the housings C^2 and C^3, spindles C^4 and arms C^5, and working-head of machine, all operating together substantially as described, and for the purpose set forth.

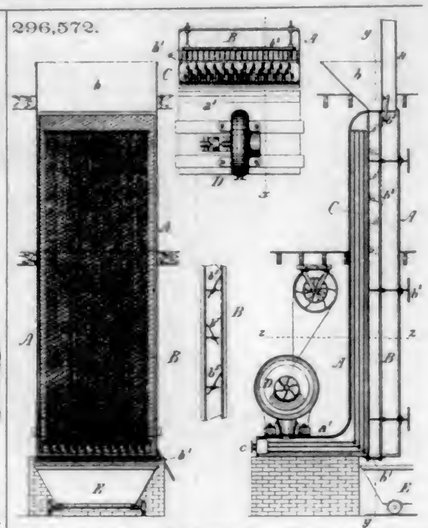
3. In a sole-edge-burnishing machine, the combination of the working-head having a crank-shaft, H^3, lever K, tool-holder N, and locking-lever I^2, all operating together substantially as described, and for the purpose set forth.

296,571. ROLLER-SKATE. CHARLES HUCKINS and GEORGE N. PARKER, Boston, Mass. Filed June 25, 1883. (No model.)

Claim.—1. In a roller-skate, the socket or casing D, open only at the top, and containing the elastic material F, in combination with the hanger C and foot-plate A, substantially as and for the purpose set forth.

2. The combination of the foot-plate A, the plate B, hanger C, socket D, and inclosed elastic material F, secured to the hanger by a bolt, G, and the axle-bearing E, forming a part of the socket F, substantially as and for the purpose set forth.

296,572. DRIER. GEORGE H. INDENDORF, Philadelphia, Pa., assignor to Henry G. Morris, same place. Filed Apr. 10, 1883. (No model.)

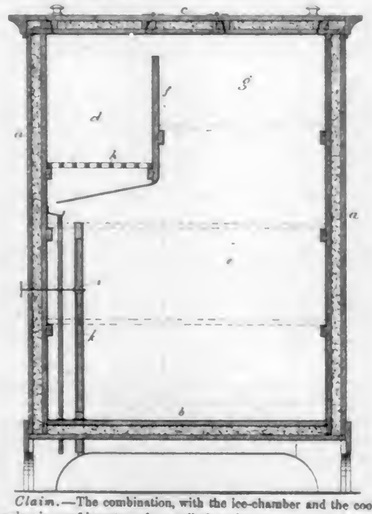


Claim.—1. The combination, substantially as set forth, of a closed casing having an air-discharge pipe at one of its sides, a cooling or heating supply trunk or nozzle located on the opposite side, a grated or perforated grain chute or channel provided with a supply-hopper, and passing through the casing, and a fan or blower for effecting the passage of a current of air from the said supply trunk or nozzle through the grain-chute to the said air-discharge pipe.

2. The combination, substantially as set forth, of a closed casing having an air-discharge pipe on one of its sides, a cooling or heating supply trunk or nozzle located on the opposite side, a grated or perforated grain chute or channel provided with a supply-hopper, and passing through the casing, a series of pipes connecting with said supply trunk or nozzle for circulating the heating or cooling medium, and located between said supply trunk or nozzle and the grain-chute, and a fan or blower for effecting a current of air from the said supply-trunk between the circulating-pipes and through the grain-chute to the air-discharge pipe.

3. The combination, substantially as set forth, of a casing, a fan or blower for effecting the passage of a current of air through said casing, and a grated or perforated chute or channel passing through the casing, and having one or more of its sides made movable and adjustable, so as to increase or diminish its transverse area and volume at pleasure.

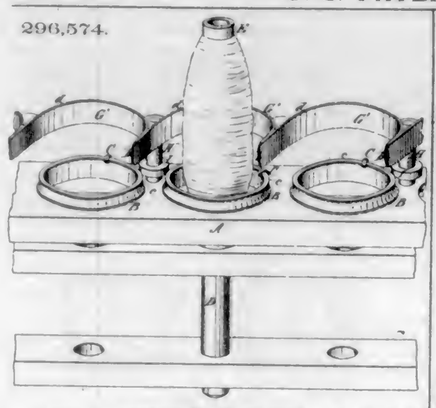
4. The combination, substantially as set forth, of a casing having a series of heater-pipes therein, a fan or blower for effecting the passage



296,572.

of a current of air through the casing, a grated or perforated chute or channel passing through the casing, and a series of inclined deflecting-plates adjustable, as described, located within said chute or channel.

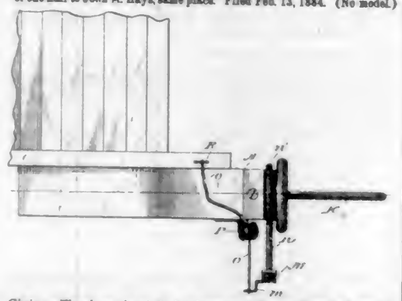
5. The combination, substantially as set forth, of a casing having a series of heater-pipes therein, a fan or blower for effecting the passage of a current of air through the casing and through a grated or perforated chute or channel passing through said casing, and a cooling-chamber formed by an extension of the casing beyond the ends of the heater-pipes.



296,573. REFRIGERATOR. JAMES JACKSON, New York, N. Y. Filed Dec. 17, 1883. (No model.)

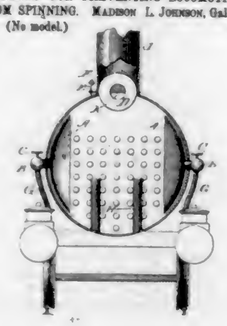
Claim.—The combination, with the ice-chamber and the cooling-chamber in a refrigerator, of a ventilating-pipe opening at its lower end to the exterior atmosphere, and rising within the cooling-chamber to about the middle of the same for confining the cold air and for allowing the escape by a downward circulation of a portion of the air within the refrigerator, for the purposes, and substantially as set forth.

296,574. THREAD-SEPARATOR FOR RING-SPINNING FRAMES. GILMAN JAQUITH, Maysville, Ky., assignor to himself and JAMES J. WOOD, same place. Filed July 8, 1882. (No model.)



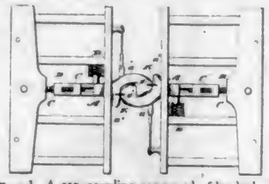
296,574.

Claim.—1. The combination, with the ring-rail A, the rings B, and supports H, of a series of united separators, G', provided with points *b*, each separator being curved from the said points concentric with and about one-half of the circumference of the rings, and thence diverging to the point of the adjacent separator, and secured thereto, substantially as herein shown and described.



2. The combination, with the ring-rail, the rings, and travelers, of the united curved separators G', the supports H, arranged between alternate pairs of rings in proximity to the backs thereof, and the clearers I, formed or arranged upon said supports on a level with the paths of the travelers, substantially as herein shown and described, whereby the supports serve to support both the separators and clearers, as set forth.

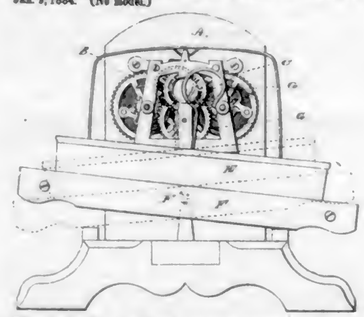
296,575. CAR-COUPLING. GILES T. JOBSON, Augusta, Ga., assignor of one-half to John M. Hays, same place. Filed Feb. 13, 1884. (No model.)



Claim.—The draw-head A, having recess C, slot D, pin E, strap-guides N N, and pulley P, in combination with the rods *n n* and *n'*, coupling-pin S, cross-bar M, and cord or chain O, and the slide B, having recess H, grooves I, and tongue *a*, having slot *e*, and the springs G G, substantially as shown and described.

296,576. MEANS FOR PREVENTING LOCOMOTIVE DRIVING-WHEELS FROM SPINNING. MADISON L. JOHNSON, Galena, Ill. Filed Aug. 17, 1883. (No model.)

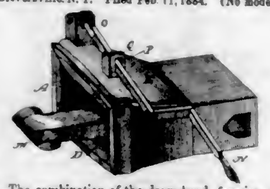
Claim.—The combination, with the wire-gauze-covered pans, arranged within the smoke-box of a locomotive, having their lateral tubes provided with valves, the pipes G G, leading therefrom to the track-rails, the damper D, provided with a central annular opening, its bearing-shaft having crank-arm connecting with the controlling-rod F, and the blast-pipes H H, arranged within the smoke-box, all adapted to operate substantially as shown and described.



296,577. CAR-COUPLING. HENRY L. JOHNSTONE, Palmetto, Ga. Filed Nov. 10, 1883. (No model.)

Claim.—1. A car-coupling composed of hooked-end draw-bars which are adapted to engage with each other by lateral horizontal movements, and are held in such engagement by means of a lock or locks that is or are connected with one draw-head and adapted to engage with contiguous portions of the other draw-head, substantially as and for the purpose specified.

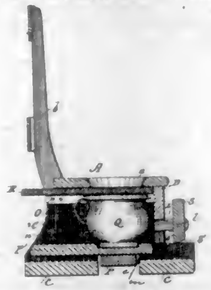
2. The hereinbefore-described draw-bar A, provided with the rounded front end, the notch *a*, having the curved engaging face *a'* and the shoulder a^2, the spring-bar B, the springs C and D, and the latch or lock E, all combined to operate substantially as and for the purpose set forth.



296,578. APPARATUS FOR CLEANING PHOTOGRAPHS. ROBERT H. JONES, MARCUS B. SMITH, and LARS J. A. ROSWALL, Clarence, Mo. Filed Jan. 9, 1884. (No model.)

Claim.—1. In a machine for washing photographs, the combination of a pan or tank for liquid supported on pivotal bearings, and having attached an arm provided with a yoke, in which an armed crank or cam-wheel operates, so as to swing the tank back and forward, substantially as and for the purpose set forth.

2. The machine for washing photographs herein described, composed of the standard A, mounted on a suitable base, the tray pivoted thereto and provided with an arm, G, having a yoke, G', at its upper end, and the motor secured on the standard and having one of its shafts provided with a crank operating in the yoke G', substantially as and for the purposes specified.



296,579. CAR-COUPLING. LANSING JORALEMON and NELSON R. MABEY, Gloversville, N. Y. Filed Feb 11, 1884. (No model.)

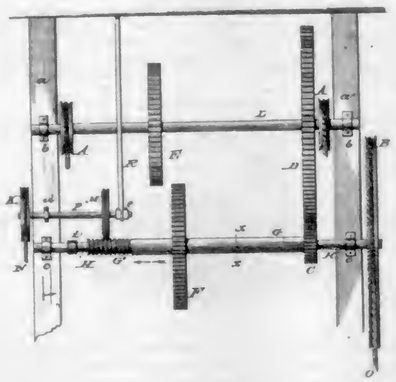
Claim.—The combination of the draw-head, forming a vertical recess, forming vertical ways at its forward corners, closed at their lower ends by a cross-piece, with a top plate resting upon the edges of the recess, and forming a forward sliding plate having a recess at its lower

end, forming forwardly-beveled lugs at its sides, and forming a longitudinal rib upon its under side and a vertical guide-bar at the rear end of the rib bearing against the rear side of the recess, as and for the purpose shown and set forth.

296,580. ODORLESS PRIVY SEAT OR CHAIR. FRANKLIN B. KENDALL, Tumwater, Wash. Filed May 25, 1883. (No model.)

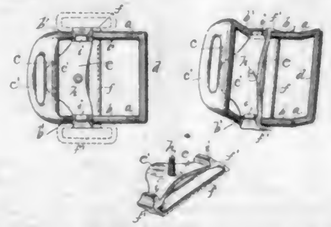
Claim.—1. In an odorless privy seat or chair, the combination, with a vertically-reciprocating platform supporting an excrement-vessel, of levers pivoted to the supporting-frame and connected to the platform, and a step pivoted to and between the forward ends of the levers and adapted to engage with shoulders on the chair, substantially as herein shown and described, whereby the excrement-vessel is raised and lowered, as set forth.

2. The combination, with a box, O, provided with shoulders *b'*, slots *o*, and recesses *m*, of the pivoted levers L, rods B, carrying the platform P, and pivoted step S, substantially as described, and for the purpose set forth.



296,581. WOOD PAVEMENT. JAS. KERR, London, England. Filed Dec. 18, 1883. (No model.) Patented in England Feb. 15, 1877, No. 627; in France Nov. 30, 1881, No. 146,143; in Belgium Dec. 12, 1882, No. 59,839, and in Italy July 16, 1883.

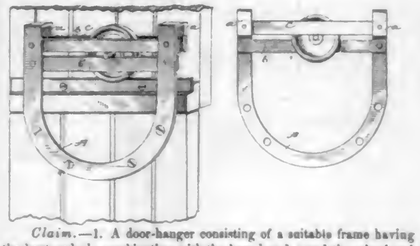
Claim.—1. The art of laying wooden pavements consisting in setting wooden blocks directly upon a solid concrete foundation or bed, running liquid asphalt or bitumen into the interstices or joints between the blocks for partly filling said interstices or joints, and then completely filling the latter by a cement grouting, as and for the purpose set forth.



2. A pavement consisting of a concrete foundation or bed, wooden blocks placed directly thereon, asphalt or bitumen clamping-shoes uniting the blocks at their bases, and a cement grouting filling the spaces between the blocks above said asphalt clamping-shoe, substantially as described.

296,582. LIFT OR ELEVATOR. EARNEST KRAUSE, El Paso, Tex. Filed Feb. 27, 1884. (No model.)

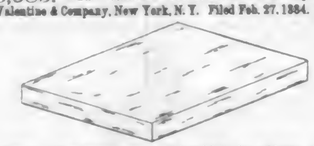
Claim.—The combination, in the hoisting mechanism of a lift or elevator, of shaft L, having the pulleys A A, carrying the ropes or chains to which the platform and its counterpoise are attached, and the gear-wheels D and E, of different diameters, shaft H, having spline *h*, and pulley B, carrying the hoisting-rope which operates the mechanism, sliding sleeve G, provided with pinion C and cog-wheel F, and having the worm G', shaft P, having worm-wheel M, engaging the worm G', and means for rotating shaft P, the whole constructed and combined to operate substantially as and for the purpose shown and set forth.



296,583. TRACE-BUCKLE. JAS. LALLY, Des Moines, Iowa, assignor of one-half to Thomas G. Orwig, same place. Filed July 31, 1882. (No model.)

Claim.—1. In a buckle, the combination of a frame having inclined planes *b* on its parallel side bars and upwardly or outwardly bent portions *b'* at the rear ends of said inclined planes, and a sliding detachable loop or frame, *e f f*, having a wedge, *d'*, and a tongue, *h*, substantially as shown and described, to operate in the manner set forth, for the purpose specified.

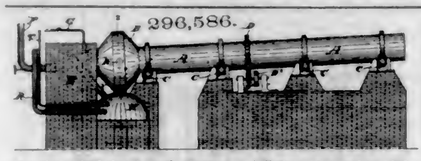
2. The improved two-part buckle composed of the frame *a b b' c d*, and the combined sliding and detachable wedge and loop, and guards *e e' f f' i i*, constructed in the manner shown and described, for the purposes specified.



296,584. DOOR-HANGER. WILLIAM J. LANE, Poughkeepsie, N. Y. Filed Jan. 21, 1884. (No model.)

Claim.—1. A door-hanger consisting of a suitable frame having the bent ends, in combination with the bars *b* and *c*, and the wheel and axle, substantially as described.

2. In a door-hanger having a suitable frame and the bent ends, the bars *b*, *b'*, and *c*, combined with the wheel and axle, substantially as described.

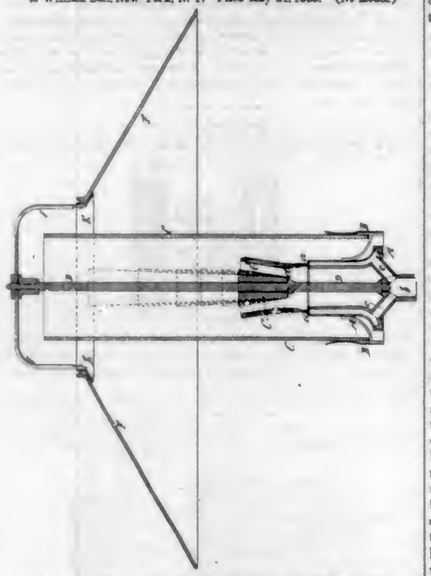


296,585. FELT RUBBER. JOS. B. LAUGHTON, Brooklyn, assignor to Valentine & Company, New York, N. Y. Filed Feb. 27, 1884. (No model.)

Claim.—The improvement in felt rubbers for rubbing, cleaning, and smoothing varnish and other surfaces, consisting of the pumice or other rubbing, smoothing, and polishing agent used therewith, combined and incorporated with the fibers of the felt by intermixture in the texture of the fabric, substantially as described.

296,586. ATTACHMENT FOR SMELTING-FURNACES. GILBERT M. LEVERTT, Indianapolis, Ind. Filed Nov. 17, 1883. (No model.)

Claim.—1. The combination, with a smelting-furnace, of an independent covered receptacle containing a lead bath and adapted to re-



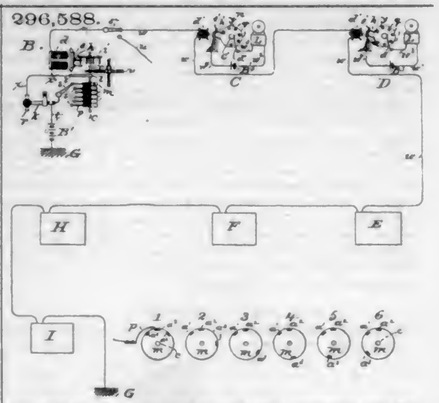
296,586.

ceive the melted slag from the furnace, and distinct means of supplying fuel and a blast of air to said receptacle, whereby when said air-blast and fuel-supply are in operation the slag in said receptacle is kept in a melted condition, thereby permitting the valuable metals therein to be precipitated into said lead bath, substantially as set forth.

2. The combination of the substantially horizontal revolving furnace A, having enlarged portion or bosh B, the covered receptacle H, having orifice N, and containing a lead bath, the blast-pipe R, and fuel-supply pipe T, substantially as set forth.

3. The combination of the furnace A, the covered receptacle H, containing a lead bath, the fuel-supply T, the air-supply R, the escape V for the products of combustion, the escape P for the slag, and the well M for removing the molten metal as the same accumulates, substantially as set forth.

296,587. BURNER. ANDREW B. LIPSEY, West Hoboken, N. J., assignor to William Ball, New York, N. Y. Filed May 21, 1883. (No model.)



Claim.—1. The combination, with a burner, of a deflector destitute of any air-passage, extending approximately the same height as the flame to be produced by the burner, having its largest portion approximately the same size as the inner wall of the burner-tube, and adapted to direct air toward the flame through its entire length, substantially as and for the purpose described.

2. The combination, with a burner, of a deflector destitute of any air-passage, extending approximately the same height as the flame to be produced by the burner, flaring upward, and having its largest portion approximately the same size as the inner wall of the burner-tube, and adapted to direct air toward the flame through its entire length, substantially as and for the purpose described.

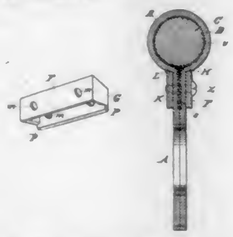
296,588. INDIVIDUAL SIGNALING APPARATUS. THOMAS D. LOCKWOOD, Malden, Mass. Filed Dec. 22, 1883. (No model.)

Claim.—1. The hereinbefore-described system of electric signaling circuits and apparatus, consisting of an automatic circuit-controlling device at a central station, said device comprising a series of movable circuit-controllers adapted to break the circuit at a time different for each, a main battery or equivalent source of electricity, and a series of substation signaling-instruments each in a local circuit or in a branch or de-

296,588.

rived main-line circuit, and each provided with a commutator controlled by an electro-magnet in the main circuit, adapted to respond to the circuit changes effected by the central-office circuit-controlling device, whereby the several signaling-instruments, each at a time differing from the others, may be energized and caused to give the signal, or brought into position to give the signal, substantially as described.

2. The combination, with an electric signaling-circuit, of a series of clock-work motors each controlled by an electro-magnet included in the said circuit, a series of rotary circuit-controllers, such as described, attached to and adapted to be rotated by one of the motors, and means, as indicated, whereby a battery may be momentarily connected with the main circuit independent of the circuit-controllers, to energize all of the electro-magnets included therein, and to start the motors and immediately thereafter to connect the battery to line through any desired one of the circuit-controllers, so that as soon as the said circuit-controller in its rotation opens the circuit all the electro-magnets in circuit will be automatically arrested, substantially as and for the purposes described.

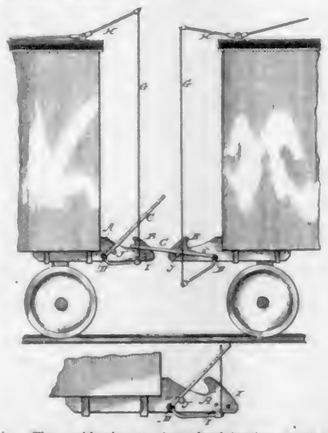


3. The combination, substantially as hereinbefore described, in an electric signaling-circuit connecting a central station and a series of substations, of a central-station signaling-instrument consisting of a motor, a controlling electro-magnet, a number of circuit-controllers actuated by said motor, means, as indicated, whereby a battery may be directed to line through either of the said circuit-controllers, and other means whereby any one of the circuit-controllers can be placed in the line-circuit and made operative to the exclusion of the others, with a series of sub-station signaling-instruments each corresponding to one of the central-station circuit-controllers, and each consisting of an alarm-bell in a normally incomplete or inoperative shunt, branch, or local circuit, a motor similar to that of the central-office instruments, a commutator or circuit-changer actuated thereby for completing or making operative the bell-circuit, and an electro-magnet in the main-line circuit adapted to respond to changes in the current traversing the same, and to control the motor, the central and sub-station instruments being adapted to be simultaneously set in motion by a single electric impulse, and to be stopped at the ringing-point of the station desired by the automatic action of the central-office instrument in opening the battery-circuit after a lapse of time, depending in length upon the circuit-controller employed, whereby the bell at the sub-station corresponding to the circuit-controller employed may be rung, the bells at the other stations remaining quiescent, for the purpose specified.

4. A signal-transmitting instrument consisting of a clock-work and actuating-motor therefor, an electro-magnet in an electric circuit controlling the said motor, a series of circuit wheels or controllers driven by said clock-work, any one of which may be manually included in the said electric circuit, and each of which is provided with a non-conducting unison-point located in the same position in each one of the series, a non-conducting point differing in position for each wheel, and adapted to break the circuit at a definite point in the revolution of the wheels, and a third non-conducting point identical in position for each wheel, adapted to break the main-line circuit when the revolution is nearly completed, to serve as a visual signal, and a key circuit-closer to close the battery through the electro-magnet independent of the circuit-wheels, all in combination, whereby the said transmitter is adapted to energize its own electro-magnet, and any others which may be in circuit therewith, and thus to release the motor and clock-work and actuate the circuit-controlling wheels by closing the circuit with the key, to open the circuit again, discharging the electro-magnets, and automatically stop the motor at a definite period in the revolution of said wheels, and when the said motors are again manually started by means of the key to open the circuit a second time at a point near the completion of the revolu-

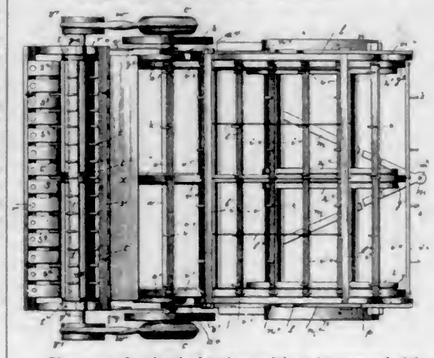
tion, substantially as and for the purposes described.

5. The combination of a signal-transmitting instrument consisting of a clock-work and motor therefor, an electro-magnet controlling the said motor, a series of circuit-wheels driven by said clock-work, a switch for connecting any of the said circuit-wheels in the main-line, and a key for closing the circuit of a battery onto the line independent of the route through the circuit-wheel, and a main battery with two or more alarm-instruments, each consisting of a clock-work and motor, a controlling electro-magnet therefor in the main-line circuit, an electro-magnetic bell in a normally-inactive independent or branch circuit, and a commutator actuated by the clock-train and motor, the said commutator at each alarm-instrument being adapted to correspond with any one of the signal-transmitter circuit-wheels, as described, and to close or make operative its own bell-circuit at a time differing from all the others, all arranged as described, whereby the transmitting and signal-receiving motors may be simultaneously released and automatically stopped by the action of the circuit-wheel corresponding to the alarm-instrument to be rung, substantially as and for the purposes specified.



296,589. NECK-YOKE. MIRON V. LONGWORTH, Delphos, Ohio. Filed Feb. 4, 1884. (No model.)

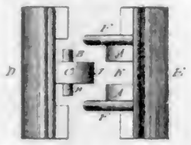
Claim.—1. The combination, with a leather neck-yoke center, of the rectangular elongated clamping-plate F, having end flanges, G, the plate K, having lugs P, with perforations *m*, and bolts or screws, substantially as specified.



2. The combination, with the elongated clamping-plate F, having its inner edge beveled, as shown, and provided with the end flanges, G, having their inner edges beveled, the plate K, having its inner edge beveled, and the respective plates, having vertical perforations, the yoke-bar C, having its central portion recessed and provided with angular shoulders E, the leather center, and bolts or screws, substantially as specified.

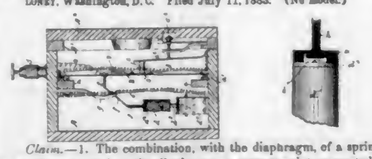
296,590. CAR-COUPLING. SIDNEY LYONS, Brockston, Tex. Filed Feb. 28, 1884. (No model.)

Claim.—The combination of a draw-head forming a hook or horn upon its upper side, and having a series of transverse perforations near its under side, a pin fitting into the said perforations, and a link hinged at the inner end of the draw-head, having means for raising its outer end and resting upon the ends of the pin, as and for the purpose shown and set forth.



296,591. HAY-LOADER. JASON W. MACY and VOLNEY W. MACY, Searsborough, Iowa. Filed Oct. 16, 1883. (No model.)

Claim.—1. In a hay-loader, the revolving rake composed of the recessed circular middle and end disks, and the rake-heads let into said recesses and held in place by iron bands shrunk over them and around the middle and end disks, substantially as specified.



2. In a hay-loader, the combination of the elevator, the elevator-frame, the side rails, the tenoned cross-bars keyed in mortises in said side rails, the longitudinal parallel strips secured to the upper and middle cross-bars between said side rails, and the upper and middle pulleys for carrying the elevator-belts journaled in said strips and side rails, substantially as specified.

296,592. NECK-YOKE ATTACHMENT. THOMAS COPELAND MAGGS, Detroit, Mich. Filed Oct. 9, 1883. (No model.)

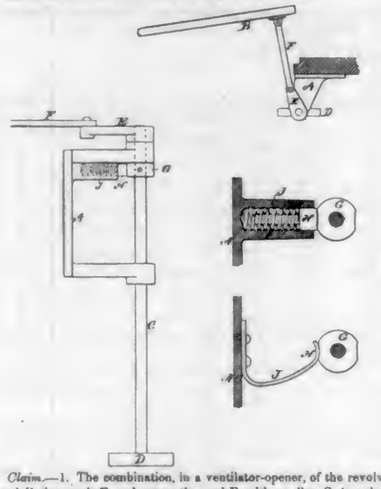
Claim.—The lug C, with bolts B and B molded on it, the projection J, and the notch K between two grooved lugs molded on clamp D, all taken in combination to form the adjustable hinge A, substantially as shown, and for the purposes set forth.

296,593. ELECTRIC TELEPHONE-TRANSMITTER. JAMES A. MALONEY, Washington, D.C. Filed July 11, 1883. (No model.)

Claim.—1. The combination, with the diaphragm, of a spring-acting carrier mounted on the diaphragm, a contact-point connected or attached to said carrier, and a stirrup for controlling the movements of the carrier, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the diaphragm, the spring-acting carrier, and its contact-point, of a stirrup adjustable with relation to said carrier, substantially as and for the purposes hereinbefore set forth.

3. The diaphragm, the bent spring-acting carrier, and its contact-point, in combination with a stationary contact-point to operate in connection with the carrier contact-point, and a stirrup which controls and directs the movement of the carrier to and from the stationary contact-point, substantially as hereinbefore set forth.

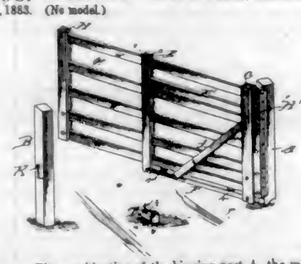


4. The combination, with the diaphragm and the spring-acting carrier, of a contact disk or button loosely mounted on or suspended from said carrier, substantially as and for the purposes hereinbefore set forth.

5. The combination of the diaphragm, the spring-acting carrier, the contact disk or button suspended from or loosely mounted on said carrier, the stirrup for controlling the movements of the carrier, and the stationary contact-point, substantially as and for the purposes hereinbefore set forth.

6. The combination of the diaphragm, the bent spring-acting carrier, the contact disk or button suspended from or loosely mounted on the lower end of the same, so as to be capable of independent vertical movement without rotation, the carrier-controlling stirrup, and the stationary contact-point, substantially as and for the purposes hereinbefore set forth.

7. The combination of the diaphragm, the carrier-stem *f*, secured thereto, and provided with a slanting spring portion, *f''*, intermediate between its upper horizontal and lower vertical ends, the contact button or disk loosely mounted on the lower end of said carrier-stem, the controlling-stirrup *g*, adapted to operate against or in connection with the spring portion *f''*, and the stationary contact-point, for joint operation substantially as hereinbefore set forth.

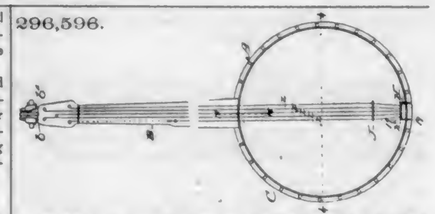


296,594. SASH-ADJUSTER FOR RAILROAD-CARS. ALBERT K. MANSFIELD, Boston, Mass. Filed Dec. 5, 1883. (No model.)

Claim.—1. The combination, in a ventilator-opener, of the revolving rod C, the crank E, and connecting-rod F, with a collar, G, (or other revolving part,) provided with depressions to engage with a follower, H, forced against the collar, all substantially as set forth.

2. In a ventilator-opener, the combination of the spring J, follower H, and the revolving collar G, with depressions, substantially as described.

296,595. SLIDING GATE. JOHN S. MCCLASKEY, Graham, Mo. Filed Oct. 6, 1883. (No model.)



Claim.—The combination of the hinging-post A, the main frame having double uprights hinged to stand to one side of said post, the sliding wicket W, having its horizontal bars between the two parts of the uprights, the rollers supporting the bottom bars of the wicket, the sill-post having the shoulder and beveled portion, and located in the center of the gateway to support the end of the main frame, its beveled portion extending and facing in the direction in which the gate is swung, and the shutting-post B, provided with devices for engaging the wicket, substantially as described.

296,596. BANJO. HERCULES MCCORD, St. Louis, Mo. Filed May 19, 1883. (No model.)

Claim.—1. The straining-hoop D, provided with the slotted projections *d d* and the slotted and perforated heads E' E', in combination with the wires E and straining mechanism, substantially as described.

296,596.

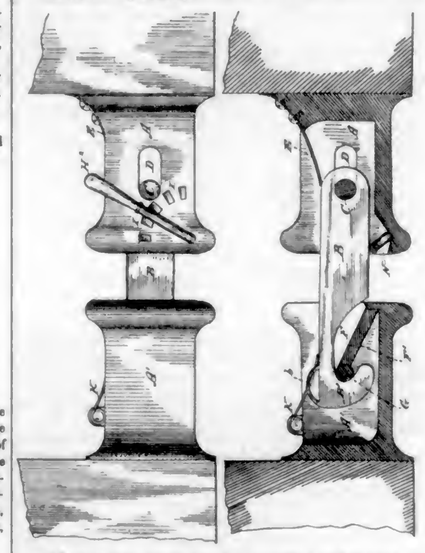
2. The body C, provided with the guides a^2 a^3, formed as described, and the indentations *a*, in combination with the wires E and an internal stretching mechanism, substantially as described.

3. In a banjo, the combination of the body C, having the part *c*, and the guides a^2, with the wires E and the central tightening device for these wires, substantially as described.

4. In a banjo, the combination, with the shell, of the wires E, the nuts *f f'*, and the bolt f^2, said bolt being secured to the nut *f'*, substantially as described.

5. The combination of the body C, the hoop D, having the slotted projections *d d*, and the slotted and perforated heads E' E', with the tightening device F, substantially as described.

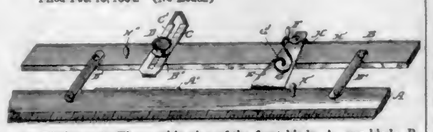
6. The U-shaped tail-piece H, having an upper depressed portion, h^2, and rigidly secured to the body C, substantially as described.



7. The combination of the U-shaped tail-piece H, having the upper part, h^3, bent downward, as described, and provided with diametrical perforations, substantially as specified, with the body C, the parchment I, and the bridge J, substantially as described.

8. The U-shaped tail-piece having a depressed upper portion and a cross-bar diametrically perforated, as a new and improved article of manufacture.

9. The combination of the U-shaped tail-piece H, having a perforated cross-bar, with the body C, having the perforation *h*, substantially as described.

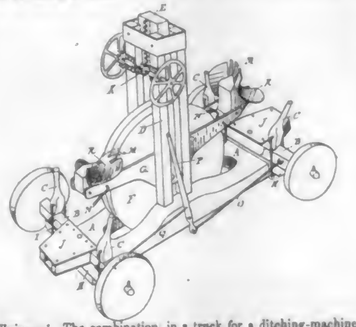


10. A U-shaped tail-piece having an upper portion provided with a rounded extended bearing for the strings, and rigidly connected with the banjo-body, substantially as described.

296,597. CAR-COUPLING. THOMAS L. MCKEEN, Easton, Pa. Filed Jan. 28, 1884. (No model.)

Claim.—The improved automatic car-coupling or self-coupler herein shown and described, consisting of the draw-head A, having side slots, D, spring E, transverse bolt C, playing in the slots D, coupling-hook B, recessed at F, cross-bar N H, having handle H^9, and means for holding the same in its adjustable position, and draw-head A', provided with the transverse bolt F and inclined plane F', the whole constructed and combined to operate substantially as and for the purpose shown and set forth.

296,598. PARALLEL-RULER. JOHN CALVIN MILLER, Ickesburg, Pa. Filed Feb. 13, 1884. (No model.)



Claim.—1. The combination of the front blade, A, rear blade, B, provided with a transverse recess, B″, and having a nick, H, in its rear side or edge, connecting-plates B′ B′, metal spacer C, provided with a longitudinal slot, and having its forward end bent down to form a head and its rear end turned up to form a convenient handle, and provided on one of its sides with a suitable scale, thumb-screw D, metal plate E, rigidly secured at its bent forward end to the front blade, A, and provided with a catch, F, near its rear end, adapted to engage with the nick H, and spring G, all constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

2. The combination of the front blade, A, rear blade, B, provided with a nick, H, in its rear side or edge, connecting-plates B′ B′, metal plate E, rigidly secured at its bent forward end to the front blade, A, and provided with a catch, F, near its rear end, adapted to engage with the nick H, and spring G, as and for the purpose shown and described.

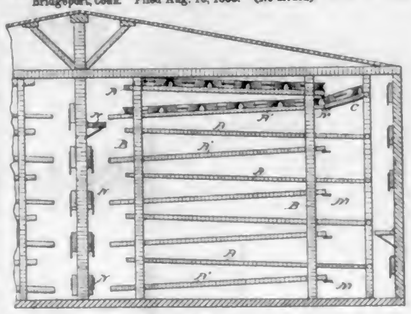
3. The combination, with the front blade, A, and rear blade, B, hinged together by the connecting-plates B′, of the spacer C, formed of a single piece of metal, provided with a longitudinal slot, and having its forward end bent down to form a head and its rear end bent up to form a convenient handle, and adapted to be secured adjustably in the transverse recess B″ of the rear blade, B, by means of a suitable thumb-screw, D, as set forth.

296,599. DITCHING-MACHINE. RUSSELL H. NOGAR, Dundee, Mich. Filed Dec. 26, 1883. (No model.)

Brief.—A vertically-adjustable sash carries the cutter and interposed disks of an excavator-wheel. A frame thereon and transverse thereto carries two cleaner-plates, intended to be caused, by cams, to alternately (as the one or the other end of the machine runs foremost) clear the wheel, wholly or partially determining the effective penetration of the cutter-disks. Each axle (both being pivoted) may be locked by U-links embracing such axle and its bolster, and having cam-bearing levers. From each axle a detachable rod leading to a common lever enables both axles to be turned at once.

Claim.—1. The combination, in a truck for a ditching-machine, of the front and rear axles secured to the bed, each by a proper king-bolt, with locking-cams for locking said axles in position, said axles being each provided with suitable bounds, or other known appliances for securing a tongue thereto, whereby the device may be run in either direction, substantially as and for the purposes described.

2. In a ditching-machine, a cutting-wheel, constructed as described, journaled in the lower end of a sash, having a vertically-reciprocating movement within a frame, in combination with cleaning devices or plates, constructed substantially as described, and adapted to clear the earth from the cutting-wheel in advance of its cut in either direction, whereby the depth of the cut may be regulated, substantially as specified.



3. In a ditching-machine, and in combination with the cutting-wheel journaled in the lower end of a sash, such sash being provided with means for elevating or lowering the same, a frame secured longitudinally to said sash, and pivotally carrying at each end thereof cleaners, constructed substantially as described, and the cams N, arranged to throw such cleaners alternately into or out of action, as circumstances may require, substantially as set forth.

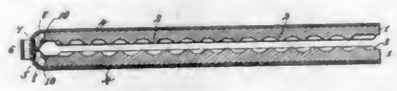
4. In a ditching-machine, and in combination with the bed and axles thereof, each of said axles being pivotally secured one at each end of said bed, a lever centrally pivoted to said bed and suitably connected with each of said axles, substantially as and for the purposes described.

5. As an improved lock in ditching-machines, constructed to embrace and bind together both the axle and bolster thereof, the U-shaped link I and cam C, constructed substantially as described.

6. A ditching-machine consisting of the bed A, to which are pivotally secured the axles B, locking devices C, by which such axles are secured as required, frame D, centrally supported upon the bed A, sash E, to which is journaled the cutting-wheel F, with means for elevating or lowering said sash, frame G, secured to said sash, and carrying upon its end the fingered cleaners H, provided with means for being alternately thrown out of action, the parts being arranged, constructed, combined, and operating substantially as and for the purposes described.

296,600. MANUFACTURING AND STORING ICE. GEO. NORWOOD, Bridgeport, Conn. Filed Aug. 10, 1883. (No model.)

Claim.—1. The shelves constructed, as described, with hinged or pivoted sections and inclined, whereby the ice cakes may slide automatically toward the platforms, substantially as set forth.



2. A building for the manufacture of ice, constructed with shelves sectioned and inclined, as described, and platforms inclined toward the storing devices, substantially as set forth.

3. The shelves A, inclined, as shown, and having sections C, adapted to be dropped down upon the shoulder M, substantially as shown.

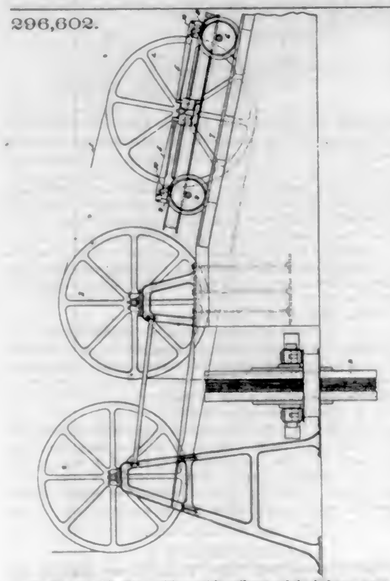
4. The section C, hinged at H, and adapted to be secured to the shelf A by means of bolt E, connected by rod G to lever D, the latter pivoted below the section, substantially as set forth.

5. The shelf A, having bar J, pivoted on the under side of said shelf and provided with upwardly-projecting lug K, in combination with the section C, having arm R, substantially as set forth and described.

296,601. OIL-PRESS MAT. ADELBERT E. OSBORN, Waco, Tex., assignor to the Model Machine Company, same place. Filed Dec. 31, 1883. (No model.)

Claim.—1. An oil-press mat composed of molded paper-pulp leaves hinged or jointed together, each leaf being provided with an attached leather back, substantially as described.

2. An oil-press mat composed of molded paper-pulp leaves having a backing composed of a continuous piece of leather, a leather handle secured to the backing, the leaves having their knuckle-joint secured to the handle, and the plates jointed to the hinge-leaves and rigidly attached to the mat-leaves, substantially as described.

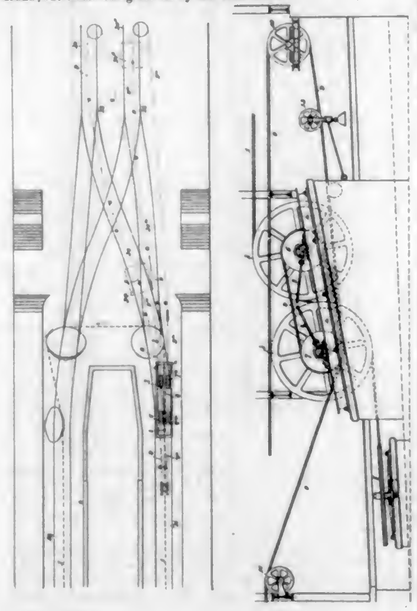


3. An oil-press mat composed of leaves provided with a backing connecting one of their ends, a handle-strip secured to the backing between the leaves, the hinge-leaves having their knuckle-joint carried by the handle-strip, and the plates jointed to the hinge-leaves and rigidly attached to the mat-leaves, substantially as described.

296,602. CABLE-RAILWAY APPLIANCE. WILLIAM H. PAINE, Brooklyn, N. Y. Filed Aug. 31, 1883. (No model.)

Brief.—A gravity cable-tension car having automatic brake mechanism.

Claim.—1. The combination, with a cable railway, of a gravitating balance-car provided with an automatic braking device, as and for the purpose set forth.



296,602.

2. The combination, with a cable railway, of the balance-car 4 5 6, and automatic brakes 9, adapted to resist the movement of the balance-car in one direction.

296,603. AUXILIARY SWITCHING APPARATUS FOR CABLE RAILWAYS. WILLIAM H. PAINE, Brooklyn, N. Y. Filed Aug. 31, 1883. (No model.)

Brief.—At the end of a line the cars are transferred to the return-line through auxiliary cables and tracks and switches, said cables being driven in either direction, at the will of the operator, through clutches and drums, the latter being driven by the main cable.

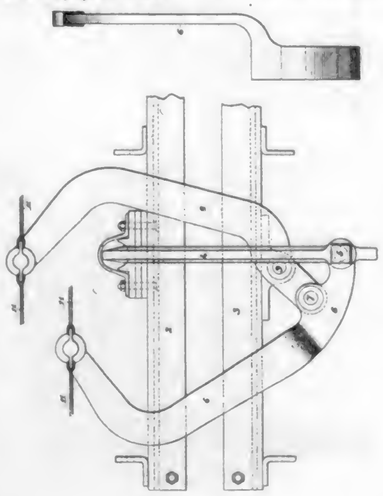
Claim.—1. The combination of a main driving-rope, a pair of sheaves between which said rope is passed, so as to rotate them in opposite directions, an auxiliary rope, and a pair of clutch-drums for driving said auxiliary rope, placed in connection with either of the main driving-sheaves at will for running the auxiliary rope in either direction, substantially as described.

2. A double-track cable railway provided with divergent shunting-tracks, suitable switches connected therewith, and divergent auxiliary or supplemental cables for the said divergent shunting-tracks, whereby incoming cars may be run from one of the main tracks upon divergent shunting-tracks alternately and from them transferred in succession to the opposite main track for the return trip, substantially as described.

3. The combination of a main driving-rope, a pair of auxiliary switching-ropes, and alternately-moving dummies connected with the said switching-ropes, so as to pass the incoming cars alternately to the two switching-tracks, for successive transfer to the opposite track of the main railway, substantially as set forth.

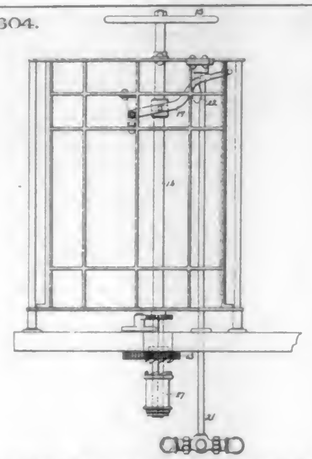
4. The combination, with the main rope of a cable railway, of a pair of drums constantly driven thereby in opposite directions, two pairs of drums driving auxiliary ropes and connected at the will of the operator with either of the main driving-drums, so as to run the respective auxiliary ropes in either direction required, a pair of divergent tracks carrying dummy-cars driven by the respective auxiliary ropes, and suitable switches for transferring the main-lines cars from the auxiliary tracks to the return-track of the main road, substantially as set forth.

5. The combination, with the main driving-rope of a cable railway, of a pair of sheaves driven thereby in opposite directions, two pairs of clutch-drums carrying auxiliary shunting-ropes and connected with the constantly-moving driving-sheaves at the will of the operator, for running said auxiliary shunting-ropes in opposite directions, dummy-cars moved by the auxiliary shunting-ropes upon separate tracks, and a switching mechanism operating to transfer the main-line cars from the auxiliary switching-tracks to the main return-track, and retain the dummy-cars on the switching-tracks, as explained.



296,604. GRIPPING AND BRAKE MECHANISM FOR CABLE RAILWAYS. WILLIAM H. PAINE, Brooklyn, N. Y. Filed Aug. 31, 1883. (No model.)

Brief.—The grip-jaws are carried by double levers fulcrumed one upon the other, so as to first give them a quick movement and then a more forcible one. The operating-shaft which controls brake and grip is vertically adjustable through a lever.



Claim.—1. A gripping device for cable railways, consisting of double levers and suitable jaws mounted thereon, said levers being fulcrumed one on the other, and operating, substantially as herein described, so as to bring the jaws in contact with the rope by a quick movement and grip it by a more forcible movement.

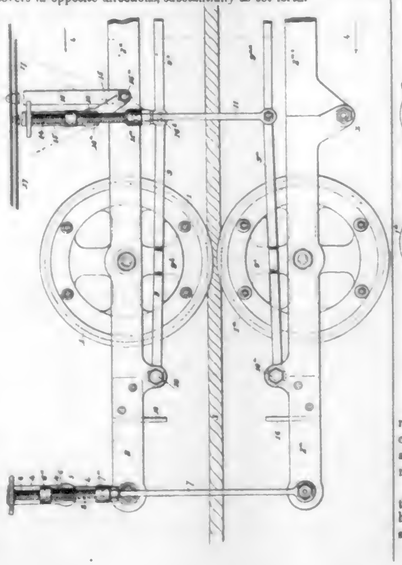
2. A grip for cable-railway cars, operated by double levers through the medium of an endless chain or rope traveling in opposite directions, as set forth.

3. A grip for cable-railway cars, operated by double levers fulcrumed one on the other and coacting on the gripping-jaws, substantially as and for the purpose set forth.

296,604.

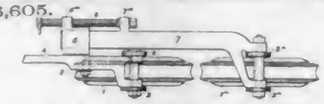
4. A grip for cable-railway cars, operated by double levers through the medium of an endless rope or chain passing over drums at either end of the car, said drums deriving rotation from the hand-brake windlass, as set forth.

5. The combination, with the grip mechanism and the brake mechanism, of a hand-shaft movable vertically, so as to engage with either, substantially as described.



6. The combination of a grip mechanism, a brake mechanism, and a vertically-moving shaft having a lever for adjusting it, as and for the purpose set forth.

296,605. ROLLER-GRIP FOR CABLE RAILWAYS. WILLIAM H. PAINE, Brooklyn, N. Y. Filed Aug. 31, 1883. (No model.)



Brief.—Grip-roller levers fulcrumed to each other are adjustable to compensate for wear. Brake-shoes bear outward against the interior of the rim of the grip-rollers, and are carried by adjustable levers pivoted to the grip-roller levers.

Claim.—1. The combination, with a roller-grip for cable railways, of locking-shoes mounted on suitable beams, and bearing outward against the interior of the rim, of the grip-roller, substantially as described.

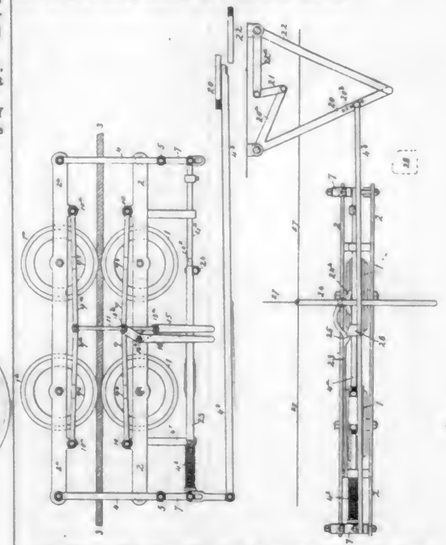
2. In a roller-grip for cable railways, the combination of a pair of levers —one fulcrumed on the other—and locking-shoes moved by the said levers in opposite directions, substantially as set forth.

296,605.

3. In a roller-grip for cable railways, the combination, with the locking-shoes mounted on suitable levers, of a system of levers flexibly connecting said locking-levers, and having means for adjustment, as described.

4. In a grip for cable railways, the combination, with the gripping-rolls mounted in a pair of levers fulcrumed to the bottom of the car, of a pair of levers fulcrumed to the ends of the aforesaid levers, and flexibly connected to each other, as and for the purpose set forth.

5. In a grip for cable railways, the combination, with a pair of levers carrying a pair of gripping-rollers, and flexibly connected together by a second pair of levers, of mechanism, substantially as described, for adjusting the levers carrying the rollers to and from each other, for the purposes set forth.



6. In a roller-grip for cable railways, the combination, with a pair of gripping-rolls mounted in a pair of levers, of a pair of levers fulcrumed to the ends of the aforesaid levers, and connected together through the medium of a sliding block mounted on one of the levers, and carrying an adjusting-screw having a fixed bearing in a lug on the other one of said levers, as and for the purpose specified.

7. In a device for gripping a moving rope or cable, a pair of gripping rolls or sheaves, and a locking device applied to one or more of the said gripping rolls or sheaves at a point or points nearer the moving rope or cable than the axles of the said gripping rolls or sheaves.

8. In a roller-grip for cable railways, means for applying locking-pressure to one or more of a pair of gripping rolls or sheaves at a point or points nearer their opposing surfaces than are their axles.

296,606. AUTOMATIC CONNECTOR AND DISCONNECTOR FOR GRIPS OF CABLE RAILWAYS. WILLIAM H. PAINE, Brooklyn, N. Y. Filed Nov. 12, 1883. (No model.)

Brief.—Vertical pivoted levers connected by a toggle-connection actuate the grip-pulleys when said levers are actuated by fixed stops upon the track. A pivoted lever upon a spring-actuated locking-box trips the grip through contact with inclines upon the track.

Claim.—1. The combination, with the gripping device of a cable railway, of suitable levers for opening and closing said grip, and suitable contact blocks or posts placed at desired points along the route and adapted to engage with and operate the respectivn levers, in the manner and for the purposes set forth.

2. In combination with the gripping mechanism of a cable railway, the vertical levers suspended from the car, pivoted to each other, and having means of connection with the grip and adapted to operate, substantially as described, when the car is given a preliminary movement.

3. In combination with the gripping mechanism of a cable railway

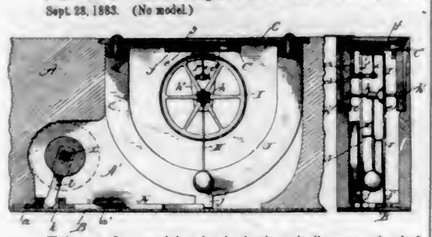
and means for automatically drawing the sheaves of the grip together, a locking device adapted to hold them in contact with the cable, substantially as described.

4. In combination with the gripping mechanism and means for automatically applying and locking the same, the tripping device for liberating the grip, substantially as set forth.

5. In combination with the gripping mechanism and means for automatically applying the same, the arm 23, having a shoulder, 25, adapted to drop behind the stop 26 of the bar 4* and to lock the sheaves in position, as described.

6. In combination with the gripping mechanism and means for automatically applying and locking the same, the tripping-lever 24, pivoted to the locking-arm 23, and having a cross-piece, 24*, and lugs 24*, the whole adapted to trip and disconnect the locking mechanism and release the grip, substantially as described.

296,607. SNAP-HOOK. JAMES A. PARK, Lansing, Mich. Filed Feb. 2, 1884. (No model.)



Claim.—1. A snap-hook whose end loop is provided with a beaded pin or stud, substantially as set forth.

2. A snap-hook formed with the usual end loop and an additional loop and a headed stud or pin, substantially as set forth.

3. A snap-hook whose end loop is formed with an inclined integral headed stud and an inclined integral loop, substantially as set forth.

4. A snap-hook formed with the usual end loop, a downwardly-projecting inclined stud having an elongated head, and an upwardly-projecting inclined loop, substantially as set forth.

296,608. PENDULUM-LEVEL, PLUMB, AND INCLINOMETER. CHARLES J. PARKHURST and ALBERT W. PARKHURST, North Adams, Mass.; said Albert W. Parkhurst assignor to said Charles J. Parkhurst. Filed Sept. 28, 1883. (No model.)

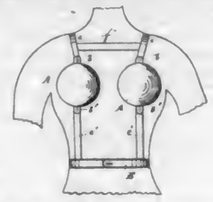
Claim.—1. In a pendulum-level, plumb, or inclinometer, the shaft or pivot of the index-hand connected with the pendulum shaft or pivot by multiplying bevel-gears, for the purpose and substantially as described.

2. In a pendulum-level, the combination of the index-hand, the pendulum, and multiplying bevel-gears connecting said pendulum and index-hand, and adapting said index-hand to be moved over a greater distance than the pendulum, substantially as described.

3. In a pendulum-level, the pendulum and the index-hand arranged on axes at right angles one with the other, and combined substantially as described, whereby the index-hand is made to move through an entire circle in the movement of the pendulum through an arc of ninety degrees.

4. In a pendulum-level, plumb, or inclinometer, the pendulum suspended between elastic plates or springs adapted to grasp and hold said pendulum at any desired point.

5. The pendulum actuating the index-hand, pivoted between elastic plates or frames adapted to hold said pendulum in any desired position, in combination with means for forcing said plates apart and freeing the pendulum, substantially as described.

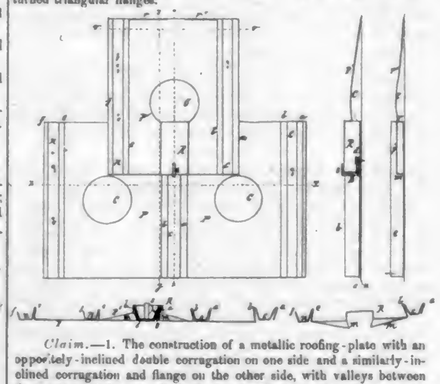


6. In a pendulum-level, plumb, or inclinometer, the pendulum supported between yielding side plates, in combination with the slide for separating said plates, and the thumb-shaft and lever for operating said slide, substantially as described.

7. The combination, in a pendulum-level, plumb, or inclinometer, of the pendulum, the index-hand with its pivot at right angles to the pendulum-shaft and geared thereto, the elastic plates or springs for holding said pendulum at any desired point, and means for adjusting said plates, all substantially as described.

296,609. MILK-CATCHER FOR NURSING-WOMEN. LYDIA E. PATTEE, Smith Centre, Kans. Filed July 20, 1883. (No model.)

Claim.—In a milk-catcher for nursing-women, the protector A, having concave side B, orifice a, and orifice C, made of flexible material,



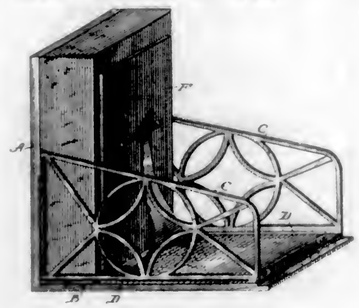
296,609.

and provided with short button-hole straps *b b'*, in combination with elastic straps *c c*, having cross-strap *f*, and straps *c'*, attached to the belt E, as shown and described, and for the purposes set forth.

296,610. METALLIC ROOFING-PLATE. GEORGE PATTEN, Washington, D. C. Filed Dec. 28, 1883. (No model.)

Brief.—A roof-plate is formed with an oppositely-inclined double corrugation on one side and a similarly-inclined corrugation and flange on the other side, with valleys between them. It is further provided with a hood, a hook-shaped securer, pendent triangular flanges, and upturned triangular flanges.

Claim.—1. The construction of a metallic roofing-plate with an oppositely-inclined double corrugation on one side and a similarly-inclined corrugation and flange on the other side, with valleys between them, substantially as set forth, for forming the lateral joint between adjacent plates.

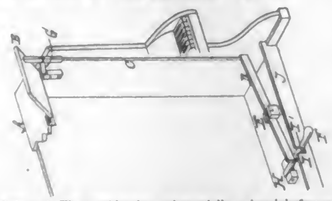


2. The hood R, in combination with the securer B, substantially as described, whereby the upper tier of plates is firmly attached to those beneath and the joint-valleys closed.

3. In combination with the hood R and the securer B, the pendent triangular flanges *m*, for forming the transverse joint, substantially as described.

4. The combination of the upturned triangular flanges *r r'*, pendent triangular flanges *m*, and securer B with the lateral joints, substantially as and for the purposes set forth.

5. The combination of the chamber C and hood R with the two sets of triangular flanges and the plate-surfaces, substantially as and for the purposes set forth.



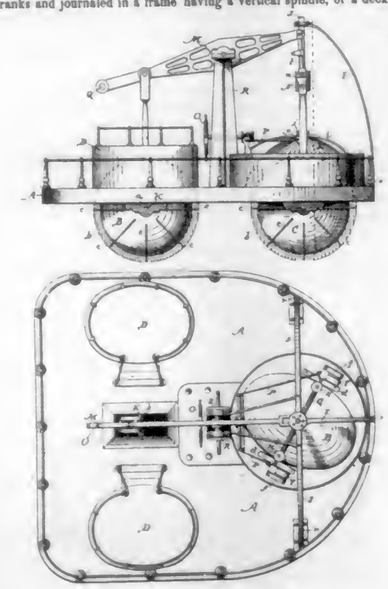
296,611. FILE-HOLDER AND CASE. EDWARD THOMAS PEARSON, Washington, D. C. Filed Jan. 24, 1884. (No model.)

Claim.—1. In a file-holder, the sides C, having recessed slots D, in combination with the standard E, having forwardly and laterally projecting arms G G, as and for the purpose set forth.

2. The combination, with the wooden case K, provided with metallic rails N, having bosses *n* and the cross-rod *n'*, of the holder consisting of the base A, front B, and sides C C, having hooks *c c*, and standard E, having follower F, as and for the purposes set forth.

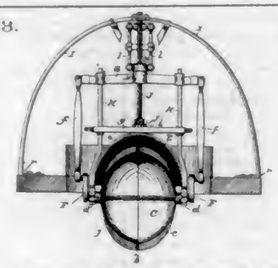
296,612. LID-RAISING ATTACHMENT FOR PIANOS. GEORGE W. PEEK, New York, N. Y. Filed Sept. 29, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with the hinged lid of a piano-forte, of the lid-supporting rod, the vertically and horizontally oscillating pedal, the lever connecting the supporting-rod to the pedal, and a stop adapted to engage the pedal when it is shifted laterally in the depressed position thereof.



2. The combination, substantially as hereinbefore set forth, with the hinged lid of a piano-forte, of the lid-supporting rod, the vertically and horizontally oscillating pedal, the lever connecting the supporting-rod to the pedal, and the guide-slot for the pedal having an offset to receive the pedal when it is shifted laterally in the depressed position thereof.

296,613. BUOYANT PROPELLER FOR VESSELS. NICOLAI PETERSEN, Charleston, S. C. Filed Dec. 10, 1883. (No model.)



Claim.—1. The combination, with the deck A, having a circular hole in it, of the yoke I, spanning said hole and secured to the deck, and the yoke *i*, also secured to the deck and spanning the hole at right angles to yoke I, the yoke *i* being some distance below yoke I, and a vertical spindle, J, of a wheel, C, journaled in said yokes, whereby the said deck is partly supported by the said wheel, and the stem of the wheel is supported at its upper and lower ends in a fixed position relative to the deck.

2. The combination, with the wheel C and the spindle J, of the hood E, covering the wheel and supported by said spindle, to revolve with the wheel thereon, as shown and described.

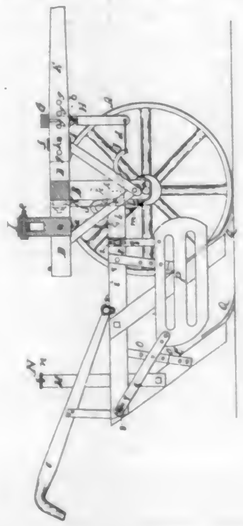
3. The combination, with the floating paddle-wheel provided with cranks and journaled in a frame having a vertical spindle, of a deck, a

296,613.

walking-beam journaled in a post or bearings mounted thereon, arched yokes secured to the deck and having bearings for said vertical spindle and the attached wheel-frame to rotate in, vertical guide-rods secured to said frame, a cross-head mounted to reciprocate on said rods, pitmen connecting the cross-head with the aforesaid cranks, and means for connecting said cross-head with said walking-beam, as shown and described.

4. The combination, with a cranked paddle-wheel having a vertically-reciprocating cross-head connected with said cranks, all pivoted to rotate horizontally, of a walking-beam connection consisting of a collar having trunnions on it, journaled between shoulders of said cross-head, and two pitmen, each hung at one end upon the walking-beam, and at the other end to one of said trunnions, as shown and described.

5. The combination, with three floating cranked paddle-wheels, one of which is a rudder, and a deck supported on the journals thereof, of a post mounted on the deck, a walking-beam journaled in said post, a pitman connecting the crank of two of the wheels with the walking-beam, and a swiveling connection between the other end of said beam and the cranks of the rudder-wheel, substantially as and for the purpose specified.



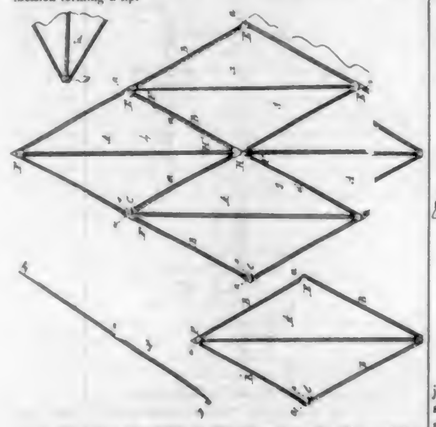
296,614. SALT FOR CATTLE. HENRY G. PUFFARD, New York, N. Y. Filed Mar. 5, 1884. (No specimens.)

Claim.—1. A cattle-salt compounded of common salt and an oxide or salt of phosphorus, in the proportions and as and for the purposes described.

2. As a new article of manufacture, cattle-salt compressed or formed into solid hard tablets or blocks of any desired size and shape, as and for the purpose described.

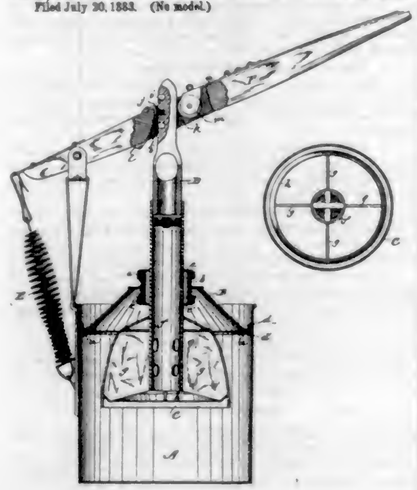
296,615. CULTIVATOR. CHAUNCEY M. PINCHNEY, Aledo, Ill., assignor of one-half to Aaron W. Cole and Mary A. Cole, both of same place. Filed Nov. 18, 1882. (No model.)

Brief.—A vertically-balancing evener, side bell-cranks, depending draft-hangers, and connecting draft chains or rods. The plow-beams connected to swiveled posts adjustable laterally.



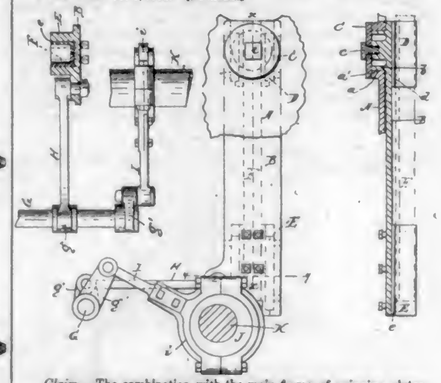
Claim.—1. In a draft and weight equalizer for cultivators, the combination of the suspended draft-bars H H, situated forward of the axle of the machine, vertically-swinging cross-lever I, situated back of the axle, bell-crank levers J J, horizontal rods *d d*, connecting the said hanging bars and the bell-crank levers, and vertical rods *e e*, connecting the cross-lever with the bell-crank levers, substantially as and for the purpose herein specified.

2. The combination of the plows C C, rock-shafts K K, provided with adjusting pivot-holes *k k*, bearings L L, provided with adjusting-slots *l l*, and bolts *m m*, with arched frame B, substantially as and for the purpose herein specified.



296,616. ROOFING-TILE. BENJAMIN F. POWERS, GEORGE E. NEEDHAM, and JAMES HAYES, Cleveland, Ohio; said Hayes assignor to said Powers and Needham. Filed Jan. 2, 1884. (No model.)

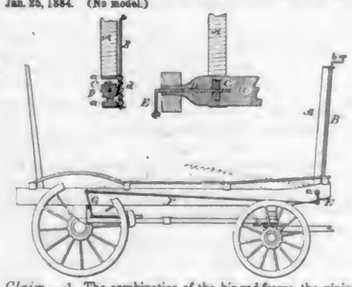
Brief.—The edges of a rhomb-shaped tile are formed with a rib, and one acute angle terminates in a hook, while one obtuse angle has an incision forming a lip.



Claim.—As a new article of manufacture, a roofing-tile consisting of a rhomb-shaped or a square metal plate, having the edges thereof corrugated, forming a groove on one side thereof and a corresponding swell or rib on the opposite side, and having one acute angle of the tile terminating in a hook, and in one of the obtuse angles thereof an incision forming a lip, substantially as herein set forth, and for the purpose specified.

296,617. WASHING-MACHINE. FRANCIS G. POWERS, Champaign, Ill. Filed July 30, 1883. (No model.)

296,618. GANG-SAW MILL. DE WITT CLINTON PRESCOTT, Marinette, Wis. Filed Oct. 1, 1883. (No model.)

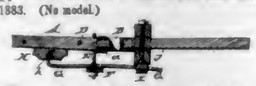


Claim.—The combination, with the main frame, of swinging plates journaled in said frame, guide-boxes D E, placed in line upon said plates, stiles F, sliding directly in both of such guides, and operating mechanism, substantially as described.

296,619. NECKTIE OR CRAVAT FASTENER. JULIUS N. PROESCHEL, Milwaukee, Wis. Filed Nov. 5, 1883. (No model.)

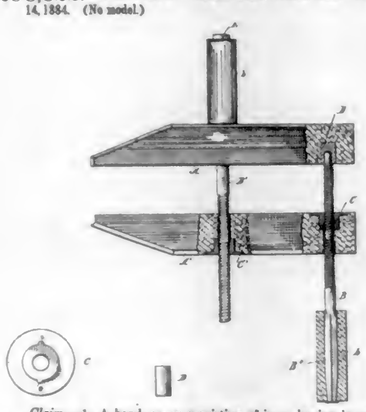
Claim.—A necktie-fastener consisting of a body, A, arms *a' a'*, and tongue B, as set forth.

296,620. BRAKE FOR HAY-WAGONS. JOSEPH A. PUTT, Marlborough, Ohio, assignor of one-half to Isaiah S. France, same place. Filed Jan. 25, 1884. (No model.)



Claim.—1. The combination of the hinged frame, the pinion, and revolving shaft connected with the lower end of the frame, the rod sup-

ported by said frame, and provided at its lower end with a screw meshing with said pinion, the brakes, and means connecting the same with the revolving shaft carrying the pinion, substantially as described.



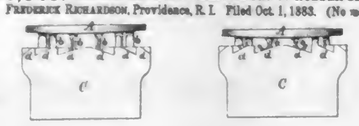
2. The combination of the frame connected to the wagon at its lower end by a rock-bar, a revolving shaft journaled in said rock-bar, and provided with a pinion fitting in an opening made in said bar, a rod journaled in suitable bearings on said frame, and provided with a screw at its lower end, meshing with said pinion, the brakes, and the rod connecting them with the pinion-shaft, substantially as described.

296,621. TONGUE-SUPPORT. DANIEL READ, New Salem, KANS. Filed Nov. 22, 1883. (No model.)

Claim.—The combination, in a tongue-support for vehicles, of the axle having the guard plate or strip secured to its under side, the tongue having the block secured to its under side, formed with the curved or segmental recess, the flat spring having its front end curved to correspond to said recess, and received and protected thereby, and having its rear end acting against and retained by the said guard-plate, the approximately U-shaped yoke embracing the rear end of the tongue, and cross-plate adjustable on the ends of the yoke and pivotally connected with the spring, all arranged and operating substantially as set forth.

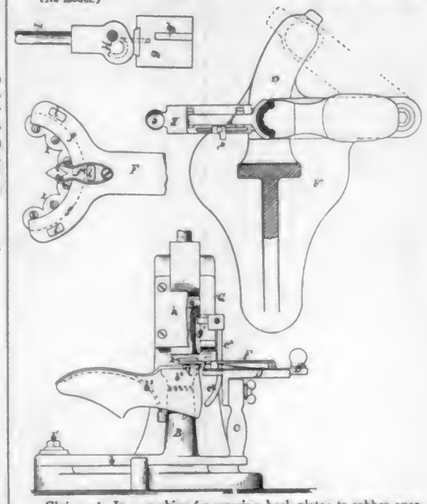
296,622. HAND-SCREW. THOMAS RENO, Detroit, Mich. Filed Jan. 14, 1884. (No model.)

Claim.—1. A hand-screw consisting of jaws, having in combination therewith suitable metallic screws, one of said jaws being provided with metallic nuts inserted therein from opposite faces of said jaw, substantially as described.



2. A hand-screw consisting of the combination, with the jaws, of metallic screws, one of said jaws being provided with metallic nuts C C', inserted therein from opposite faces of said jaw, and the other jaw provided with a suitable thimble, substantially as described.

3. A hand-screw consisting of the combination, with the jaws, of suitable metallic screws, B B', one of said jaws being provided with metallic nuts inserted from opposite faces of the jaw, to receive said screws, the screw B' being provided with a suitable handle, and a nut, E, to prevent the screw from being withdrawn from the handle, substantially as described.



4. In a hand-screw, the combination of the two jaws, one of them being provided with metallic nuts inserted therein from opposite faces of the jaw, and the other provided with a metallic thimble inserted from the inner face of the jaw, the metallic screws B B', provided with suitable handles, and a nut, E, to the screw B', to hold the handle thereon, substantially as described.

5. In a hand-screw, the combination of the jaws A A', metallic nuts C C', provided with ribs and inserted in jaw A' from opposite faces of the jaw, and the metallic screws B B', substantially as described.

296,623. DIE FOR SECURING HEEL-PLATES TO RUBBER SHOES. FREDERICK RICHARDSON, Providence, R. I. Filed Oct. 1, 1883. (No model.)

296,624. MACHINE FOR SECURING HEEL-PLATES TO RUBBER SHOES. FREDERICK RICHARDSON, Providence, R. I. Filed Oct. 1, 1883. (No model.)

Claim.—1. In a machine for securing heel-plates to rubber overshoes, the combination, with a support for the shoe, of a guide and holder, substantially as described, by which the heel-plate is held in the proper position on the shoe, and means, substantially as described, by which the heel-plate is forced onto the shoe, and the nails or pins through the same and secured by clinching, as described.

2. The combination, with the support for the shoe, and the plunger for securing the heel-plate by forcing the pins of the heel-plate simultaneously through the shoe and clinching the same, of the guide F, constructed to support the heel-plate, and provided with projections arranged to bear against the shoe, as described.

3. The combination, with the pivoted swinging post or horn B, constructed to support the shoe, of the guide F, constructed to support and guide the heel-plate, and the plunger *g*, arranged to force the heel-plate onto the shoe and secure the same, substantially as described.

4. The combination, with the die b^2, supported on the post B, and the plunger *g*, of the slide E, the holder-guide F, constructed to support and guide the heel-plate, and means, substantially as described, by which the holder-guide is withdrawn automatically as the plunger descends, as described.

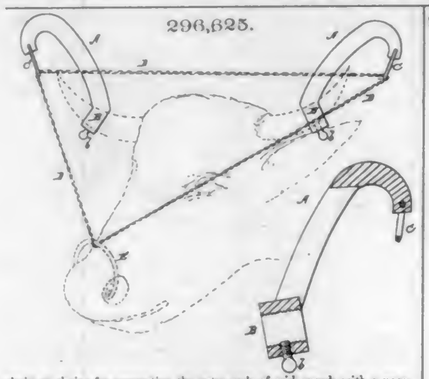
5. A machine for applying heel-plates to rubber overshoes, consisting of devices for attaching the same, provided with the holder F, and means, substantially as described, for bringing the same in contact with the rear portion of the shoe, as described.

6. The combination, with the support for the shoe, and means for forcing the heel-plate onto the shoe, of the holder and guide F, provided with the centering-guide *f'*, and the projections *l l*, constructed to guide and support the heel-plate while the same is being secured, as described.

7. The combination, with the post B, the die b^2, and plunger *g*, of the slide E, provided with the adjustable arm *e'*, and the guide and holder F, of the bell-crank lever e^2, constructed to be operated by the plunger and withdraw the holder-guide F from the heel-plate, as described.

8. The combination, with the swinging support for the shoe, and the plunger moving in fixed guides operated by a hand-lever and cam, as described, of the segmental bearing *a*, constructed to support the post and shoe and resist the pressure of the plunger, as described.

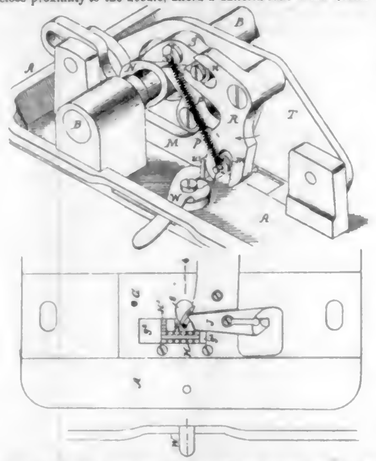
296,625. SAFETY ATTACHMENT FOR HORNED ANIMALS. GEO. W. RITCHIE, Arrowsmith, Ill. Filed Dec. 21, 1883. (No model.)



Claim.—1. A safety attachment for horned animals, consisting of the guards constructed to be secured to the horns of an animal, and a chain or chains for connecting the outer ends of said guards with a nose-ring.

2. The combination, substantially as before set forth, of the guards provided at the base with a collar and at their upper curved ends with a ring or loop, means for locking said collars to the horns of an animal, and chains for connecting the curved ends of the guards with a nose-ring.

3. The combination, substantially as described, of the guards provided at the base with a threaded collar, means for locking said collar to the horns of an animal, and chains for connecting the upper ends of the guards with a nose-ring.

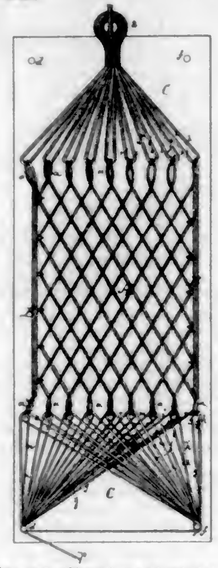


4. The combination, substantially as described, of the guards constructed to be secured to the horns of an animal, and a chain for connecting the outer ends of the guards with each other and with a nose-ring.

296,625.

296,626. BUTTON-HOLE SEWING-MACHINE. GEORGE S. ROBINSON, Philadelphia, Pa., assignor to the American Buttonhole, Overseaming and Sewing Machine Company, same place. Filed Dec. 18, 1882. (No model.)

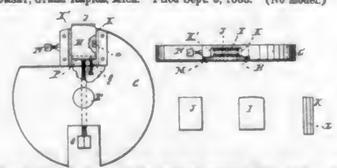
Brief.—The side projection on the feed-dog insures a straight pull of the fabric through the feed-guide, while the guide and edge-turner, by close proximity to the needle, afford a uniform feed of the fabric.



Claim.—1. The combination of sewing mechanism and the feed-plate H, having a projection, H', extending laterally beyond the needle, with the edge guide and turner J, as set forth.

2. The combination of the needle and looper of an overseam-sewing machine, the feed-plate extending laterally beyond the needle, the presser-foot having a projection, K', and the edge guide and turner J, as set forth.

3. The combination of the shaft B, having a cam, N, with the feed-bar M and the levers R, S, and P, as set forth.



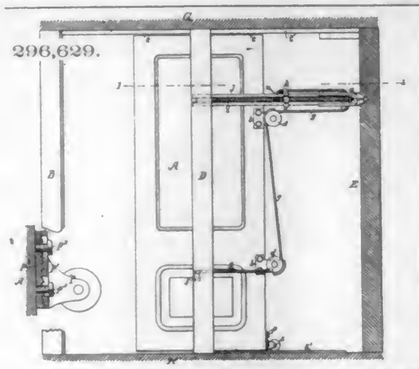
4. The combination of the shaft B, having a cam, N, the feed-bar M, the levers R and S, and the regulating-lever W, having a stop, *w*, as specified.

296,627. ART OF MAKING HAMMOCKS. ALBERT O. ROOD, New York, N. Y., assignor to Vincent P. Travers, same place. Filed Oct. 31, 1883. (No model.)

Claim.—The art of making a hammock, which consists in forming the body with the eyes *a* in the ends thereof in any known manner, then forming each end of the hammock by doubling a cord and passing and drawing it through one of the eyes *a* of the hammock-body, then forming the loop *g*, then doubling the cord again and introducing it through another eye *a* of the hammock-body, then forming the loop *m*, then passing said loop *m* through the third eye *a* of the hammock-body, and continuing in this manner until all the eyes *a* at the end of the hammock-body have been engaged with the loops formed by the doubled cord, tying the ends of the cord, and, finally, binding the outer ends of this looped structure and forming the terminal eye *s*, substantially as described.

296,628. MACHINE FOR MAKING BARBED STAPLES. GEORGE RUMSEY, Grand Rapids, Mich. Filed Sept. 5, 1883. (No model.)

Claim.—In a machine for making staples, the wheel or disk G, having in the side thereof a recess, in which are fitted barbing plates or dies secured therein by clamps and set-screws N O, plate P, and binding-plate M, and interposed between the said barbing-dies, a bending-slide having a reciprocal radial movement between said plates or dies, and retained therein by a notch and pin and in a projected position for bending a staple-blank by a spring, Q, substantially in the manner as described, and for the purpose specified.



296,629. GUIDING AND SUPPORTING DEVICE FOR DOORS. AMOS SANDERS and ROGER S. HENDERSON, Philadelphia, Pa. Filed Feb. 6, 1884. (No model.)

Brief.—Sliding doors supported by a fixed wire or other rope through sheaves upon door. The rope may be adjusted to take up slack by securing one end to a slide upon a screw-rod on a bar secured in the house-framing. One edge of the door is supported by a vertically-adjustable roller, to permit the lowering of the door for removal.

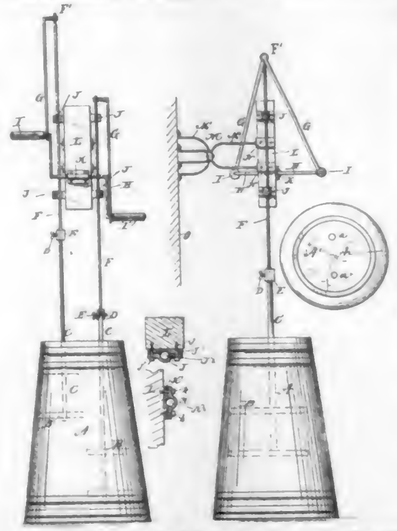
Claim.—1. The combination of a door, A, with a rope, *g*, secured at its opposite ends, and passing over pulleys *d* at the rear of the door, as set forth.

2. The combination of the door and its pulleys with the rope *g*, secured at one of its ends to an adjustable fastening, as set forth.

296,629.

3. The combination of the door and its pulleys, the rope *g*, the fastening for one end of the same, and a bar, J, having an adjustable slide, *h*, for the opposite end of the rope, as set forth.

4. The combination of the door and its pulleys, the rope *g*, the bar J, having an adjustable slide, *h*, and the adjustable plate *a*, as set forth.



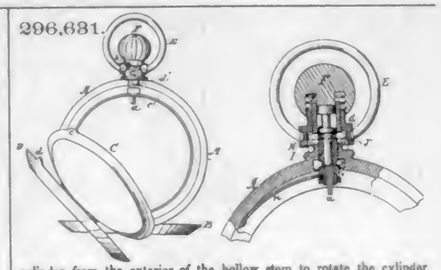
5. The combination of the door and its pulleys, the rope *g*, the bar J, having a bearing for said rope, and an adjustable slide, *h*, as set forth.

6. The combination of the door and its pulleys, the rope *g*, the bar J, the screw-rod *i*, longitudinally confined thereto, and the slide *h*, having a nut, *n*, adapted to said screw-rod, as set forth.

7. The combination of the door A and its pulleys, the rope *g*, and a guide-wheel and rail for supporting the rear of the door, as set forth.

8. The combination of the door A and its pulleys, the rope *g*, the guide-rail *s'*, and the wheel *s*, carried by an adjustable bracket, *p*, as set forth.

296,630. CHURN. JAMES BAILEY SCHOOLEY, Mountain Home, Ark. Filed Jan. 11, 1883. (No model.)

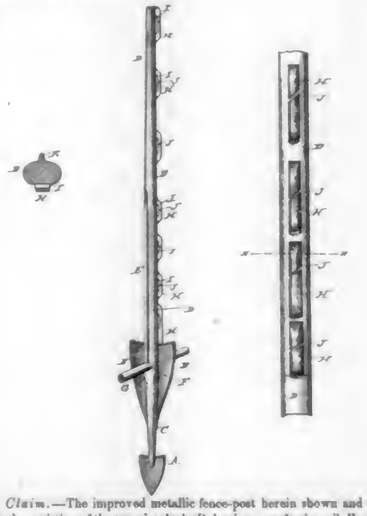


Claim.—The combination of the mechanism herein described with the block I, having the stay M, composed of the arms M' M², for attaching the mechanism to any suitable place, whereby the churning-vessel and its dashers are adapted to be removed therefrom, as shown and described.

296,631. WATCH-CASE. CHARLES SCHUETZ, Newark, N. J. Filed Dec. 6, 1883. (No model.)

Claim.—1. The combination, with the watch-case, of the attached tubular stem, the cylinder arranged to rotate within said stem, and having at its inner extremity a cam or cams, and means connecting with the

296,631.



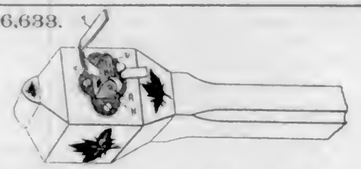
cylinder from the exterior of the hollow stem to rotate the cylinder within the stem, substantially as described.

2. The combination, with the watch-case, of the attached tubular stem, the hollow cylinder arranged to rotate within said stem, and having at its inner extremity a cam, a shank extending through the cylinder and carrying the knob or ball, and means connecting with the cylinder from the exterior of the hollow stem to rotate the cylinder within the stem, substantially as described.

3. The combination of the body of a watch-case with one or more covers and with a hollow stem, a cylinder located within the hollow stem, and provided with one or more cams which act against a surface or against surfaces of the cover or covers, a sleeve placed upon the stem and connected with the cylinder, and means for retaining the cylinder and the sleeve in place, while allowing them to be turned for bringing the cams into operation, substantially as and for the purpose specified.

4. The combination of the body A of a watch-case with one or more covers and with a hollow stem, H, a cylinder, I, located within the hollow stem H, and provided with one or more cams, *k i*, which act against suitable surfaces of the cover or covers, a ring, J, with projecting arms, and with notches for the lugs *l* of the cylinder I, a sleeve, G, with notches *h* to receive the projecting arms of the ring J, and with a slot, *m*, a knob, F, shank *a*, and screw *b*, constructed and operating substantially as specified.

296,632. FENCE-POST. LEGRAND SCOTT, Nashville, Tenn. Filed Dec. 3, 1883. (No model.)

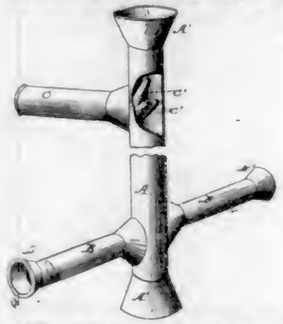


Claim.—The improved metallic fence-post herein shown and described, consisting of the tapering body D, having re-enforcing rib E, projections H, slotted at I and cut across obliquely at J, wings B, aperture F, tapering stem C, and arrow-head A, all in one piece, and cross-bar G, adapted to be inserted through the aperture F, substantially as and for the purpose shown and set forth.

296,633. FRICTION-CLAMP. HUGH SELLA, Toronto, Ontario, Canada. Filed Feb. 14, 1884. (No model.)

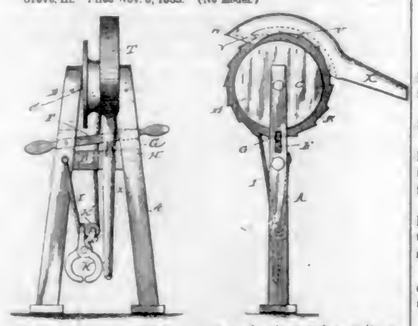
Claim.—1. In combination with a strap or its equivalent, a roller, C, provided with a handle, *b*, and eccentrically pivoted between the jaws

296,633.



of the bracket E, substantially as and for the purpose specified.

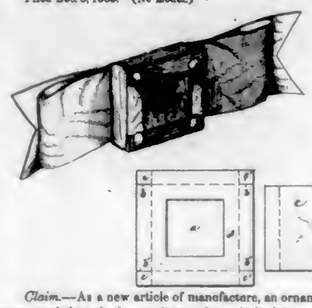
2. In combination with a strap or its equivalent, a roller, C, eccentrically pivoted between the jaws of a bracket, E, having a curved projection, *a*, arranged substantially as and for the purpose specified.



3. In combination with a strap or its equivalent, a roller, C, provided with a handle, *b*, and eccentrically pivoted between the jaws of a bracket, E, having a curved projection, *a*, substantially as and for the purpose specified.

296,634. VENTILATING APPARATUS. JOSEPH SELLWOOD and SIMON JAMES HARRY, Ishpeming, Mich. Filed Oct. 8, 1883. (No model.)

Claim.—The ventilating apparatus herein shown and described, consisting of the main pipe A, branch pipes B B, and exhaust-pipe C, having upwardly-curved air-tubes C', all constructed and arranged to operate substantially in the manner and for the purpose shown and described.



296,635. RAILWAY-TRACK LIFTER. ISRAEL SHOUDY, Paw Paw Grove, Ill. Filed Nov. 3, 1883. (No model.)

Claim.—1. The combination of a frame forming bearings at its upper end, a drum having a ratchet-flange, a flat bar pivoted at one end in a vertical slot in the frame, sliding with its other end in a similar slot, bearing with its upper edge in between the ratchet-teeth of the drum, and bearing with its lower edge near its free end against a spring, a rope or chain secured at one end to the upper portion of the frame and at its other end to the drum, a tong or grapple having hooked lower ends and eyed upper ends, through which the rope or chain passes, and a lip-lever having a pawl engaging the ratchet-wheel, as and for the purpose shown and set forth.

2. The combination of two convergent uprights connected by a cross-piece and forming bearings at their upper ends, a wheel or drum having a ratchet-flange and journaled in the bearings in the frame, a flat bar having handles at both ends, pivoted in a slot in one of the uprights, sliding with its free end in a slot in the other upright, engaging the ratchet-flange with its upper edge, and bearing with its lower edge against a spring near its outer free end, a rope or chain fastened at one end to the upper portion of the frame and at the other end to the drum, a tong or grapple having hooked lower ends and eyed shanks provided with rollers or pulleys in their upper ends, over which the chain or rope passes, and a lever consisting of a curved portion having a notched outer end and inwardly-pointing lip, and provided with a handle, all constructed to operate as and for the purpose shown and set forth.

296,636. ORNAMENT FOR PERSONAL WEAR. WALTON DUANE SMITH, Prophetstown, Ill., assignor of one-half to Cyrus Emery, same place. Filed Dec. 3, 1883. (No model.)

Claim.—As a new article of manufacture, an ornament for personal wear, consisting of a box or frame of any desired form, and constructed of pasteboard, thick paper, or thin sheet metal, and having an opening preferably of the same form as the box, the sides of said box being formed with slits, the ends of said sides being bent and secured upon themselves, and a strip of the same material, having its ends bent and adapted to be inserted in said frame or box to form the bottom thereof, said box being trimmed or ornamented, substantially as described.

296,637. SEWING-MACHINE. JAMES F. SWEMKER, Philadelphia, Pa., assignor to the National Sewing Machine Company, (Limited,) same place. Filed Nov. 8, 1883. (No model.)

Brief.—The horn that serves to guide the clamp and its contained fabric may be depressed below the top of the bed-plate to facilitate the application of the fabric to or removal from the clamp-plates. Provision is made for operating it by hand or automatically.

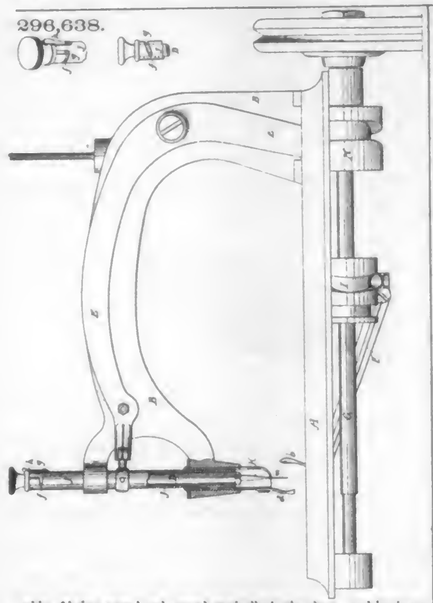
Claim.—1. The combination of the sewing mechanism of a button-hole sewing-machine with a horn, *x*, having a yielding support, and with mechanism whereby said horn can be elevated or depressed, as set forth.

2. The combination of the sewing mechanism, the table or bed, the horn *x*, and the lever *a*, carrying said horn, as set forth.

3. The combination of the sewing mechanism, the table or bed, the horn *x*, the lever *a*, carrying the same, the slide B, and means, substantially as described, whereby the reciprocation of the slide is caused to effect the vibration of the lever, as set forth.

4. The combination of the sewing mechanism, the table or bed, the horn *x*, the lever *a*, carrying the same, and having an inclined slot, *m*, the slide B, and the bell-crank lever G, having a pin, *i*, adapted to the slot *m*, as set forth.

5. The combination of the table or bed having an opening, *y'*, lever *a*, and the horn *x*, forming part of a lever, *x'*, hung to the lever *a*, and acted upon by a spring, x^3, as set forth.

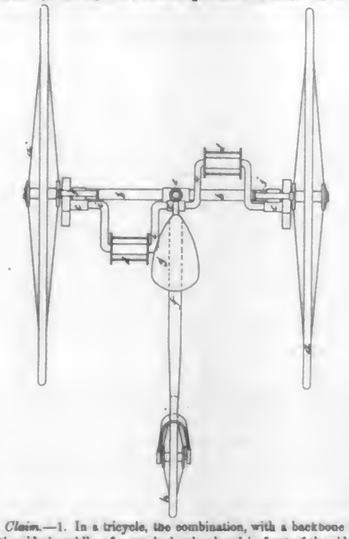


296,638. SEWING-MACHINE. JAMES F. SWEDIKER, Philadelphia, Pa., assignor to the National Sewing Machine Company, (Limited,) same place. Filed Nov. 26, 1883. (No model.)

Brief.—The needle-bar, with the needle, can be detached from its surrounding and guiding sleeve, and then be removed. This is done when the looper is entirely below the bed-plate, thereby allowing the fabric operated upon to be readily removed.

Claim.—1. The combination of the sleeve J, having a slot, *g*, means for guiding and for reciprocating said sleeve, and a needle-bar, D, capable of being turned and moved vertically in the sleeve, and having a pin, *f*, adapted to the slot *g*, as set forth.

2. The combination of the sleeve J, having a right-angled slot, *g*, means for reciprocating and for guiding said sleeve, a needle-bar, D, ca-

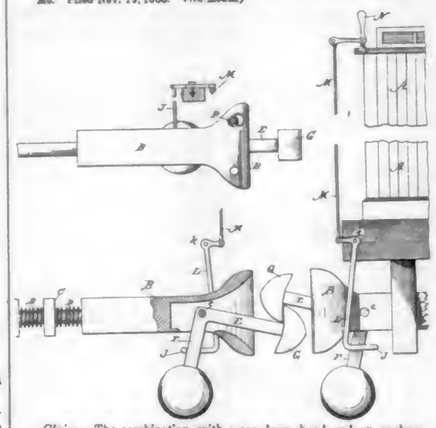


296,638.

pable of being turned and moved vertically in the sleeve, and having a pin, *f*, adapted to the slot *g*, and the retainer *h*, as set forth.

3. The combination of the lower looping-needle, *b*, and its operating mechanism, the upper sewing-needle, *a*, and its bar D, the sleeve J, in which the said bar D can be moved vertically, and means for guiding and for reciprocating said sleeve, as set forth.

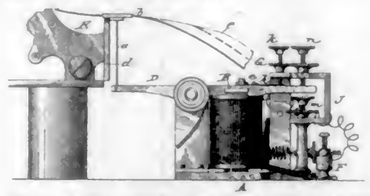
296,639. TRICYCLE. WILLIAM SPENCE, Surbiton, and RICHARD COCKBURN THOMPSON, Brixton Rise, County of Surrey, England. Filed Feb. 27, 1884. (No model.) Patented in England Jan. 23, 1884, No. 1,971.



Claim.—1. In a tricycle, the combination, with a backbone carrying the rider's saddle, of a cranked axle placed in front of the rider and open at its front, and extending below the bearings of the pedals, substantially as shown, and for the purposes set forth.

2. In a tricycle, the combination of the cranked axle *b* for the main or driving wheels, with the steering-handles *j j*, and with the central stem or upright, *e*, extending upward from the cranked axle, the combination being and operating substantially as and for the purposes set forth.

3. In a tricycle, the arrangement, in connection with the central stem or upright, *e*, extending upward centrally from the cranked axle *b*, of the steering-handles *j j*, formed on or connected to such stem, substantially as herein shown and described.

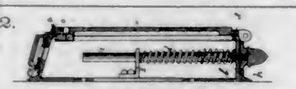


4. In a tricycle, the combination of the cranked axle *b*, central stem or upright, *e*, steering-handles *j j*, and pivoted backbone *f*, all substantially as described and shown.

296,640. CAR-COUPLING. CHARLES WILLIAM SPENCER, Richmond, Mo. Filed Nov. 19, 1883. (No model.)

Claim.—The combination, with a car draw-head and an anchor-shaped link pivoted thereto, said link having upwardly and downwardly projecting hooks and a balance-weight, of a bar, J, extending horizontally laterally from the rear side of the said balance-weight to the side of the car, thence extending upward and pivoted to the car at *k*, and thence horizontally as a lever-arm, the connecting-rod M, and the elbow-lever handle N, substantially as shown and described, whereby a link may be raised to disconnect it from another link either by a person on the ground beside the car or by a person on top of the car.

296,641. MORSE REGISTER AND PERFORATOR. LORIN C. SPRINGER, Hyde Park, assignor of eleven-twentieths to Chancy G. Wright, Chicago, Ill. Filed Mar. 3, 1883. (No model.)



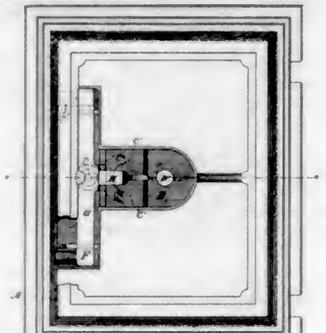
Claim.—1. The combination, with the perforating-needle and a guide for the ribbon, of the lever D, the coil A A', and the vibrating arm *h*, said coil being intermittently electrically connected with the vibrating arm, the line-wire, the battery, and a suitable key, substantially as described.

2. The combination, with the rocking-lever D and its central pivot, the armature B, and magnet C, of a perforating-needle directly attached to and actuated by the lever, said lever being actuated by making and breaking an electric circuit connected therewith, substantially as described.

3. The combination, with suitable guides for the ribbon, and the lever D, having pivoted thereto the perforating-needle, of the armature, the coil A A', and the vibrating arm *h*, said coil being intermittently electrically connected with the vibrating arm, the line-wire, the battery, and a suitable key, all substantially as described.

296,642. LETTER-BOX. CHARLES A. STEBBINS, Chelsea, Mass. Filed Apr. 28, 1883. (No model.)

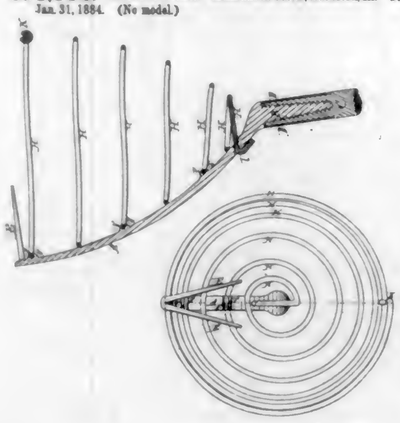
296,642.



Claim.—1. In combination with the bottom of a letter-box, an outside plate adapted, by means of its attachments to the box, to clamp and retain packages against the bottom of the box, substantially as described.

2. A letter-box the bottom of which is provided with holes to admit the passage of standards or rods, in combination with an outside plate having secured therein standards or rods adapted to pass through the holes in the bottom of the box, and provided with retaining-springs, substantially as and for the purpose set forth.

3. A letter-box consisting, essentially, of the box having its bottom provided with holes to admit the passage of standards or rods, and provided with the slanting top formed with the shoulder *a* in its inner front edge, the door hinged to the bottom of the box, and having the rib *d*, and the plate *h*, having rods *i* and springs *l*, substantially as and for the purpose set forth.

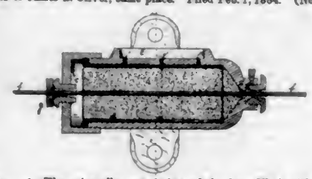


296,643. SAFE-DOOR. EMORY STOCKWELL, Stamford, Conn., assignor to the Yale & Towne Manufacturing Company, same place. Filed Feb. 27, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of the door-flanges and the plate cast in one piece therewith, the plate being provided with a lock-curb and stops, and guides for the bolt-work, the whole being so arranged that the filling of the door may be flush with the inside of said plate and curb.

2. The combination, substantially as set forth, of the frame or flanges, the plate cast in one piece therewith, and provided with a curb or recess for the reception of the lock and bolt-work, and the brace or reduced portion of the casting *b*, which extends from the curb to the opposite flange of the door-frame.

296,644. FRUIT-PICKER. HIALMER H. STONE, Rockford, Ill. Filed Jan. 31, 1884. (No model.)

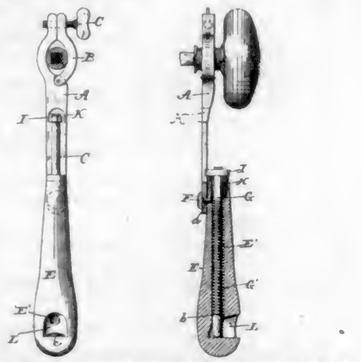


Claim.—1. The herein-described fruit-picker, consisting, essentially, of a spirally-coiled wire receptacle and a supporting-rib, when constructed and arranged substantially as and for the purpose set forth.

2. The herein-described fruit-picker, consisting, essentially, of a spirally-coiled wire receptacle, a curved supporting-rib, and a rod handle, said picker having a detachable connection with the handle, substantially as and for the purpose set forth.

3. The combination, with a supporting-rib having a detachable screw-threaded connection with a rod handle, picking-arms projecting laterally from its upper end in V form, and clinch-points projecting from its inner face, of a spirally-wound receptacle fixed to the supporting-rib, substantially as and for the purpose set forth.

296,645. WIRE-OILING DEVICE. JOHN STUBBS, Pittsburg, Pa., assignor to James B. Oliver, same place. Filed Feb. 1, 1884. (No model.)

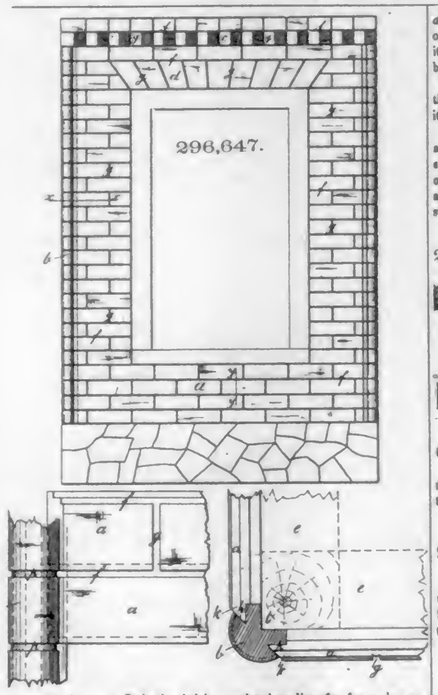


Claim.—1. The wire-oiler consisting of the box filled with an oil-absorbent material, having perforated ends for the passage of the wires, and an oil-cup communicating therewith, substantially as and for the purpose described.

2. A wire-oiler consisting of a suitable box, a removable perforated inner case suitable for containing oil-saturated material, and an oil-cup communicating with the interior of the box, substantially as and for the purpose described.

3. The combination of the die *g* with the wire-oiling device, substantially as and for the purposes described.

296,646. BURGLAR-ALARM. GEO. W. TALLMAN, New York, N. Y. Filed Jan. 16, 1884. (No model.)



Claim.—1. A burglar-alarm consisting of a plate adapted to be attached to the shank of the door-knob, a gravitating pendant enlarged at its lower end, as described, and provided with a spring-actuated hammer, said pendant being pivoted to said plate, as set forth.

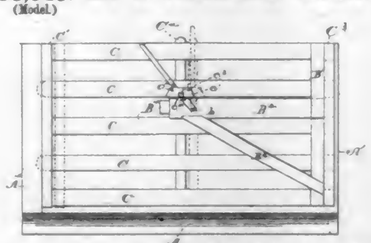
2. A burglar-alarm consisting of a gravitating pendant in which are located a spring and spring-actuated rod or hammer, said spring being held in an elevated position by a button adapted to rest in a notch or opening in the arm, by which the device is secured to the shank of the door-knob, as described, whereby the partial rotation of the door-knob will release the button, and the rod or hammer will be forced downward on the cap or other fulminate, as set forth.

3. In a burglar-alarm, a plate, A, adapted to be secured to the shank of a door-knob, and furnished with an opening, K, in combination with the gravitating pendant E, spring G', rod G, nut H, and button I, as set forth.

296,647. IMITATION-BRICK WEATHER-BOARDING FOR FRAME HOUSES. PETER TOOLIS, Charleston, S. C. Filed Feb. 5, 1884. (No model.)

Brief.—Tongued and grooved weather-boarding and corner-strips prepared in imitation of brick. The corner-strips are grooved to receive the ends of the weather-boarding, and also the framing of the structure.

Claim.—1. Imitation-brick weather-boarding for frame houses, made with grooves on its surface, treated in the manner described, substantially as shown, and for the purpose set forth.



2. In connection with a tongued and grooved weather-boarding strip, the additional grooves *f f* and *g g*, treated in the manner described and shown, and for the purpose set forth.

3. Corner-strips for imitation-brick weather-boarding, made with grooves on their surfaces, treated as hereinbefore described, shown, and set forth.

4. In connection with the corner-strip *b*, the grooves *h h*, in combination with the ends *k k* of the weather-boarding strips *a*, substantially as shown and described.

5. The recess *i*, in combination with the grooves *h h* of the corner-strip *b*, for the purpose described and set forth.

296,648. GATE. EZRA E. TOPE, Leesville, Ohio. Filed Sept. 6, 1883. (Model.)

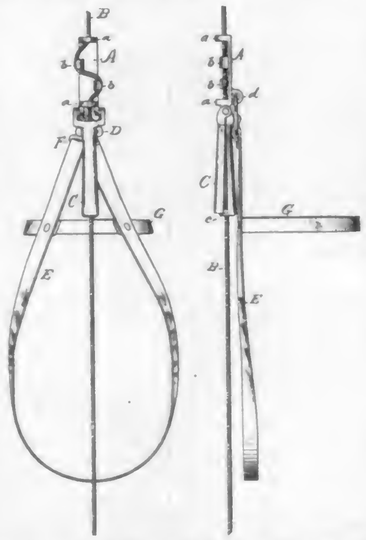
Claim.—1. The combination of a suitable crane or support provided with a stud or bearing-point, a gate placed on said crane, and provided also with a projection or bearing-point above the bearing on the crane, and a lever pivotally secured on the gate, and adapted at its lower end to engage the bearing on the crane, and having formed on it a hook or shoulder arranged in position to engage the bearing on the gate, all arranged and operating substantially as specified.

2. The farm-gate, substantially as described, composed of the gate, the crane hinged to the swing-post and supporting the gate, the pin or stud secured on the crane, the boxing secured on the gate by bolts c^2 c^2 and incasing the roller, and the lever provided with widened end notch, *d*, adapted to engage the pin or stud on the crane, and having elongated opening d', whereby it is pivoted on the roller-shaft, and constructed on its edge next the bolt c^2 with a hook or shoulder arranged to engage said bolt, all as and for the purposes specified.

3. The combination, with the crane having a stud or bearing, and the gate proper, of a lever pivotally secured to the gate, and adapted at its lower end to engage the stud on the crane, substantially as set forth.

4. The combination of the crane provided at its swinging end with a lug or projection, B^1, and having a stud or bearing-point, *b*, near said swinging end, the gate having end battens, C', and placed and movable on said crane, the lever pivoted on the gate above the crane, and adapted at its lower end to engage the stud *b*, and suitable locking devices, substantially as specified.

296,649. WINDOW-CURTAIN BAR. IRA B. TRIPP, Aurora, Ill. Filed Feb. 23, 1884. (No model.)

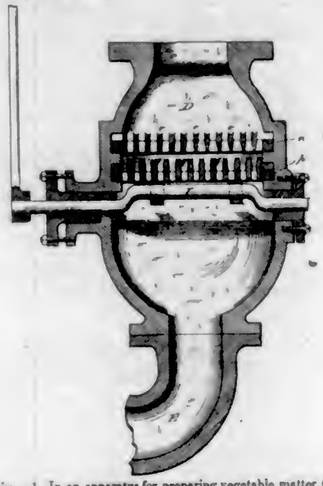


Claim.—1. A window-curtain bar composed of one or more slotted metallic tubes, substantially as described.

2. In combination with a window-curtain bar composed of one or more slotted metallic tubes, the spirals B B or equivalent means attached to the edges of a curtain, substantially as and for the purpose set forth.

296,650. FIRE-ESCAPE. ANDREW TURNBULL, New Britain, Conn. Filed Apr. 16, 1883. (No model.)

Brief.—A friction fire-escape consisting of a plate having perforated lugs at each end and hooked frictional pins, through and over which the escape-rope is passed. A hand-clamp made in two parts, both hinged to the lower part of the plate, is provided.



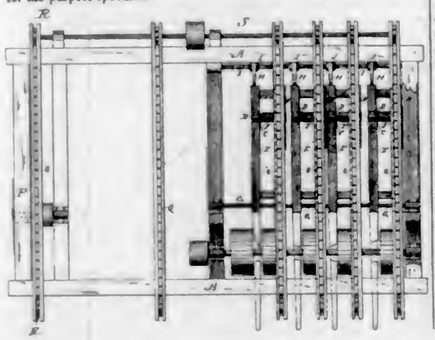
Claim.—1. In a frictional device for a fire-escape, a suitable frame bearing lugs at each end, with an orifice through said lugs for the passage of the rope, and between said lugs and out of alignment therewith hooked frictional pins which are left unobstructed at their outer ends, substantially as described, and for the purpose specified.

2. A frictional fire-escape consisting of the plate A, lugs *a a*, having each an orifice through them, and the outwardly-curved hooked lugs *b b*, which project forward from near the side edges of the plate, substantially as described, and for the purpose specified.

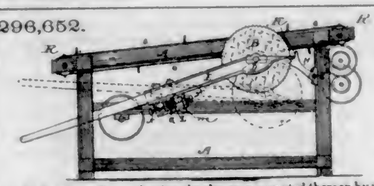
3. The combination of the plate A, bearing lugs *a a* and *b b*, and the divided handle, both parts of which are hinged to the lower end of said plate, substantially as described, and for the purpose specified.

4. The combination of a frictional rope-deflecting device and the divided handle, both parts of which are hinged thereto by means of suitable pintles, and provided with the rectangular groove, while one part has the eye-bridge at its lower end, substantially as described, and for the purpose specified.

296,651. APPARATUS FOR PREPARING VEGETABLE SUBSTANCES FOR FERMENTATION. CHAS. UNGER, Pittsburg, Pa. Filed Oct. 31, 1883. (No model.)



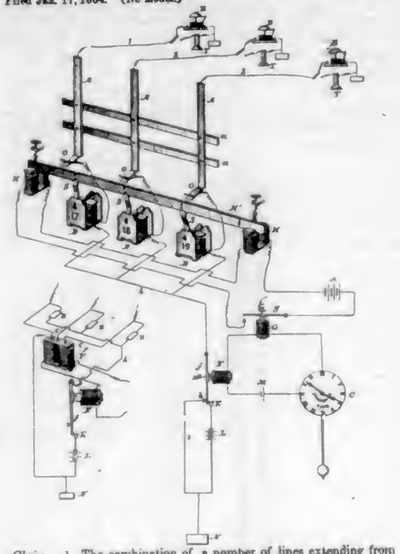
Claim.—1. In an apparatus for preparing vegetable matter for fermentation, the combination, with boiler A, adapted to receive steam under pressure at its upper end, of a drum, D, communicating with the lower end thereof, and having one or more horizontal series of vertically-reciprocating sharpened cutters, substantially as described.



2. In combination with drum D, the series of stationary cutters *o*, having downwardly-tapered sides, and the vertically-movable series of sharpened cutters *q*, having upwardly-tapered sides, substantially as described.

3. The combination, in drum D, of the stationary cutters *o*, the vertically-movable cutters *q*, registering with the spaces between said cutters *o*, and means for moving said cutters *q* from outside the drum, substantially as described.

296,652. CIRCULAR SAWING MACHINE. JOHN VAN PATTEN, East Tawas, Mich. Filed Sept. 21, 1883. (No model.)



Claim.—1. The combination, with a series of circular-saw frames hung at one end to swing vertically, of a corresponding series of bracing-latches adapted to engage and hold said said frames raised, one rock-shaft supporting all of said latches, set-screws in said latches for adjusting them on said shaft, and the front of each latch provided with a face, K, as and for the purpose specified.

2. A series of frames having circular saws mounted thereon by means of bearings fixed on said frames, in combination with box-bearings adjustably secured to said frames, and a rod or rods for the same to swing on, and means for adjusting said box-bearings on said swinging frames, whereby the several saws may be aligned relative to each other, as described.

296,653. APPARATUS FOR DISTRIBUTING TIME-SIGNALS OVER LINES EMPLOYED FOR OTHER PURPOSES. FRANK WALDO, Washington, D.C., assignor of one-half to Leonard Waldo, New Haven, Conn. Filed Jan. 17, 1884. (No model.)

Claim.—1. The combination of a number of lines extending from a central office, said lines being normally connected to a common conductor at the central office, a generator and a circuit controller or transmitter common to said lines, a standard-time keeper, means for actuating said circuit-controller in correspondence with said time-keeper, apparatus on each line adapted to receive time-signals, and electrical communicating apparatus on the lines additional to said time-signal-receiving apparatus.

2. The combination of a number of lines extending from a central office, said lines being normally connected to a common ground at the central office, and containing electrical communicating or signaling apparatus, a common transmitting device for simultaneously sending electrical impulses over said lines to actuate said signaling apparatus, and a standard-time keeper controlling the transmitting device.

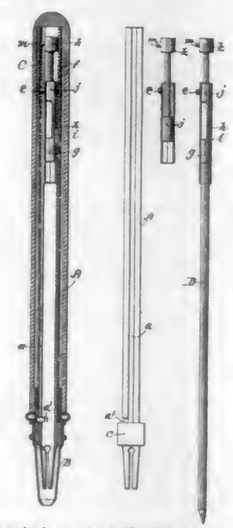
3. The combination of a number of telephone-lines extending from a central office, a common transmitting device for simultaneously sending electric impulses over said lines, a standard-time keeper controlling said transmitting device, and ordinary receiving-instruments at the subscriber's station responding to said impulses.

4. The combination of a number of lines extending from a central office, a common ground therefor at the central office, a common generator and transmitting device, and means controlled by a standard-time keeper for simultaneously connecting all of said lines with said generator and transmitter.

5. The combination of a number of lines extending from a central office, a common ground-connection therefor at said central office, a common transmitting device, and means for breaking said normal ground-connection and establishing a common ground-connection through said transmitting device.

6. The combination of a number of lines extending from a central

office, a common ground-connection therefor at said central office, a common transmitting device, and means controlled by a standard-time keeper for breaking said normal ground-connection and establishing a common ground-connection through said transmitting device.

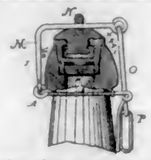


7. The combination of a number of lines extending from a central office, a common ground-connection therefor at said central office, a common generator and transmitter, a switch for including the generator and transmitter in said common ground-connection, an electro-magnet controlling said switch, and a standard-time keeper controlling the circuit of said electro-magnet.

8. The combination of a number of lines extending from a central office, each including an annunciator, means for simultaneously sending an electrical impulse over said lines, and a mechanical stop for preventing the fall of the annunciator-drop under the influence of said impulses.

9. The combination of a number of lines extending from a central office and including different resistances, means for sending an electrical impulse over said lines from a common connecting-line, and adjusting-resistances adapted to be included in said lines during the transmission of said impulse.

10. The combination of a number of lines extending from a central office, a common ground therefor at said central office, means for breaking the individual ground-connection of the lines, branch lines containing resistances complementary to the resistances of the main lines, respectively, a common connecting-line for said branch lines, and means for completing said connecting-line to ground through a generator and transmitter.

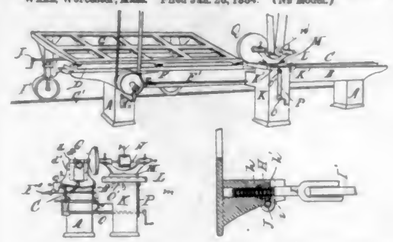


296,654. LEAD AND CRAYON HOLDER. WALTER H. WALES, Providence, R. I., assignor to Alonzo T. Cross, same place. Filed Nov. 20, 1883. (No model.)

Claim.—1. In a lead or crayon holder, the combination of the carrier-tube *d*, provided with the pin *e*, and the forcer *j*, provided with the pin *m*, with the tube A, provided with the slot *a*, having a lateral extension, *a'*, and the hollow screw C, provided at its forward end with the shoulder *n*, whereby, upon the arrival of the carrier-tube at its lower stop, provision is made for the lateral movement of the pin *e* during the subsequent forward movement of the forcer by the continued movement of the screw, substantially as described.

2. In a lead or crayon holder, the combination of the carrier-tube *d*, provided with the pin *e*, the plug *g*, adapted for a limited movement within the tube *d*, and having its rear end cut away at one side, and the forcer *j*, having its forward end made to correspond with the rearward end of the plug *g*, and provided with the pin *m*, all arranged and operating substantially as described.

296,655. BOTTLE-STOPPER. JAMES T. WALKER, Baltimore, Md. Filed Jan. 17, 1884. (Model.)



Claim.—1. A bottle-stopper having a cavity in its lower end, in which is fitted a slightly protruding plug, and a diaphragm which acts to transmit the pressure of the stopper upon the plug, and to prevent the stopper from collapsing while undergoing extreme pressure.

2. A bottle-stopper having a cavity in its lower end, in which is fitted a slightly protruding plug, and having a diaphragm forming the upper wall of said cavity, with a stud projecting therefrom arranged to bear upon the plug, and provided with an upper pressure-disk.

3. In a bottle-stopper, the combination, with a bottle having a shoulder formed in its mouth, and a stopper having a cavity in its lower end, in which is fitted a slightly protruding plug, the stopper and the plug arranged to bear upon the shoulder, and the stopper to move downward independently of the plug until it is solidly resisted by the shoulder, of fastening devices whereby the stopper and plug are forced and held upon the shoulder.

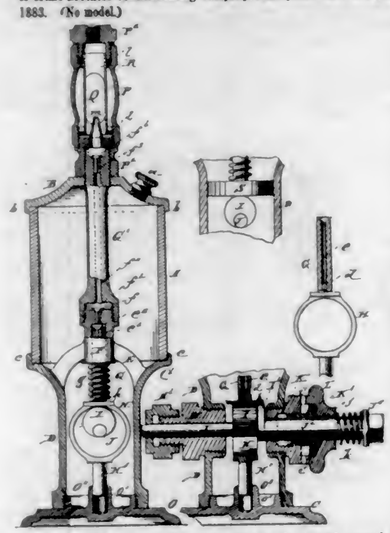
4. In a bottle-stopper, the combination, with a bottle having a shoulder formed in its mouth, and a stopper having a cavity in its lower end, in which is fitted a slightly protruding plug, and having a diaphragm with a projecting stud which acts to press upon the plug and prevent the stopper from collapsing, of fastening devices whereby the stopper is forced and held against the shoulder.

296,656. GRINDING AND POLISHING MACHINE. EDMUND R. WARE, Worcester, Mass. Filed Jan. 26, 1884. (No model.)

Claim.—1. In a grinding and polishing machine, the combination, with the horizontal supporting-bed, of the traveling bed-plate, a carrier pivoted at one side to the traveling bed-plate, means for supporting the opposite side of the carrier independently of the horizontal supporting-bed, a grinding-wheel, and means for adjusting the grinding-wheel toward and from the path of the traveling plate, substantially as set forth.

2. In a grinding and polishing machine, the combination, with the horizontal supporting-bed, of the traveling bed-plate, the carrier pivoted at one side to the bed-plate, means for supporting the opposite side of the carrier independently of the horizontal supporting-bed and for adjusting the edge of the carrier vertically, a grinding-wheel, and means for adjusting the grinding-wheel toward and from the path of the traveling bed-plate, substantially as set forth.

3. In a grinding and polishing machine, the combination of the horizontal supporting-bed, the traveling bed-plate, a carrier pivoted at one side to the traveling bed-plate, means for supporting the opposite side of the carrier independently of the horizontal supporting-bed, a grinding-wheel, the shaft of which is supported wholly at one side of the traveling bed-plate, and means for adjusting the grinding-wheel toward and from the path of the traveling bed-plate, substantially as set forth.



4. In a grinding and polishing machine, the combination of the horizontal supporting-bed, the traveling bed-plate, a carrier attached at one edge to the traveling bed-plate, and a carrying-wheel adjustably connected to the opposite edge of the carrier, substantially as set forth.

5. In a grinding and polishing machine, the combination of the horizontal supporting-frame, the traveling bed-plate, a grinding-wheel supported wholly upon one side of the traveling bed-plate, a carrier supported at one side upon the traveling bed-plate, and means for supporting the opposite side of the carrier independently of the traveling bed-plate, substantially as set forth.

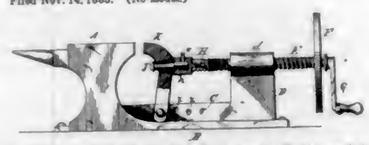
6. In a grinding and polishing machine, the combination, with the outer edge of the carrier, of the leg H, the standard I, supported in said leg and extensible relative thereto, and the supporting-wheel I', substantially as set forth.

7. In a grinding and polishing machine, the combination, with the outer side or edge of the carrier, of the legs H, the screw-threaded standards I, the nuts *i*, seated in the legs H, and the adjusting-shaft J, for simultaneously raising and lowering both ends of the carrier, substantially as set forth.

296,657. LUBRICATOR. WILLIAM O. WAYMAN, Chicago, Ill., assignor to Crane Brothers Manufacturing Company, same place. Filed Aug. 13, 1883. (No model.)

Claim.—1. The combination, with a receptacle, A, and a stand, D, of a hollow lifting-plunger, G, and devices for operating the same, located and operating within the receptacle and its base, for passing oil or lubricant from the receptacle, substantially as and for the purpose specified.

2. The receptacle A and stand D, in combination with a hollow lifting-plunger, G, eccentric I, and shaft J, located and operating within the oil-receptacle and its base, for reciprocating the plunger to raise and pass the oil from the receptacle, substantially as specified.



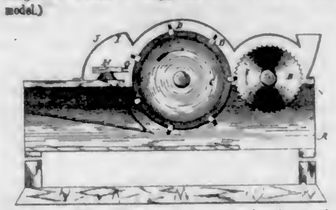
3. The receptacle A, stand D, hollow plunger G, eccentric I, and shaft J, in combination with a plug, F, tube G', and suitable valves for lifting and controlling the oil, substantially as and for the purpose specified.

4. The receptacle A, stand D, plug F, hollow plunger G, spring *g*, eccentric I, and shaft J, in combination with the tube G', valve for controlling the passage of the oil, and chamber P, substantially as and for the purposes specified.

5. The chamber A, stand D, plug F, hollow plunger G, spring *g*, eccentric I, and shaft J, in combination with the tube G', valve for controlling the passage of the oil, nozzle *m*, chamber P, and pipe R, substantially as and for the purposes specified.

6. The receptacle A, stand D, plug F, and plunger G, in combination with the eccentric I I', shaft J, and sleeve J', substantially as and for the purpose specified.

296,658. COMBINED ANVIL, VISE, AND DRILL. JAS. WEATHERS, Indianapolis, Ind., assignor of one-half to John A. Robbins, same place. Filed Nov. 14, 1883. (No model.)



Claim.—1. In a combined anvil, vise, and drill, the anvil A, extended base B, perforated rib C, and standard D, which is provided with a female screw, all being cast in one piece, substantially as described.

2. The combination, with an anvil having the rib C and standard D, of the jaw K, the shaft E, and rod H, passing through the shaft, and connected to the jaw by the headed bolt J, passing through a hole in the same and fastened in the drill-holder on the end of the rod, all arranged to operate substantially as described.

3. The combination, with an anvil having the rib C and standard D, of the screw-shaft E and rod H, which passes through it and carries the drill-holder, all arranged as and for the purpose set forth.

4. The combination, with the anvil having the rib C and standard D, which carries the screw-shaft E and drill-rod H, of the removable bed I, adapted to fit against the back of the anvil, as and for the purpose set forth.

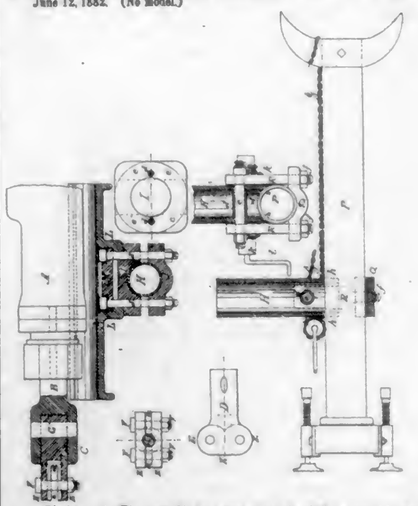
296,659. COTTON-GIN. SAMUEL DILLARD WEBB, Washington, D. C., assignor to William W. Brigg, same place. Filed Oct. 23, 1883. (No model.)

Claim.—1. The combination, in a cotton-gin, of a set of saws with a series of brushes constructed to be turned on their axes to bring different sides to bear on the saws, substantially as described.

2. The combination, in a cotton-gin, of a set of saws with a cylinder provided with a series of adjustable brushes having their acting fibers arranged substantially at right angles to the sides of the saws, substantially as described.

3. The combination, in a cotton-gin, of a set of saws with a series of cylindrical brushes having their acting fibers arranged at right angles to the sides of the saws, substantially as described.

4. In a cotton-gin, a series of saws and a series of brushes having their acting fibers arranged substantially parallel with the rotating shaft carrying the brushes, in combination with a series of pins pointing substantially toward said brush-carrying shaft, and arranged to be struck by the fibers of the brushes substantially at right angles to their length, whereby the fibers are first jarred and then caused to flirt rapidly back to their original position, as set forth.



5. The combination, in a cotton-gin, and with the saws thereof, of a series of cylindrical brushes having their acting fibers arranged substantially at right angles to the sides of the saws, and a series of combing-wires set in different planes, and also arranged substantially at right angles to the acting fibers of the brushes, as and for the purposes set forth.

6. The combination, in a cotton-gin, and with the saws and brushes thereof, of the mote-box I and the comb G H, arranged in said mote-box, substantially as described.

7. The combination, in a cotton-gin, of a brush-cylinder, a device, substantially as described, for cleaning the brushes, and a mote-box arranged to receive the refuse removed from the brushes by the cleaning device, as set forth.

8. The combination, in a cotton-gin, of a brush-cylinder, the pins, a flue to carry away the lint, and a mote-box arranged above the flue, to receive the refuse knocked off the brushes by the pins, substantially as described.

296,660. ROCK-DRILL. DE VOLSON WOOD, Boonton, N. J. Filed June 12, 1882. (No model.)

Claim.—1. The arm H, for supporting the drill, in combination with the column I', the inner end of the arm being fitted to the column

and thereto secured by the straps R R, bolt *e*, and clamp Q, substantially as set forth.

2. The combination and arrangement of the clamp J I, having an annular seat, *c c*, for receiving a projection, L L, on the slide N of a rock-drill, with the cross-bar or plate M, and through-bolts *d d*, as and for the purposes set forth.

3. In a rock-drill, the combination, substantially as hereinbefore described, of the column P, arm H, having one end fitted thereto, and secured in position by the straps R R and brace Q, the shaft *k*, provided with means of rotation, and the chain *g*, arranged to be wound upon or from off the shaft, and thus raise or lower it and the arm H, substantially as shown and described.

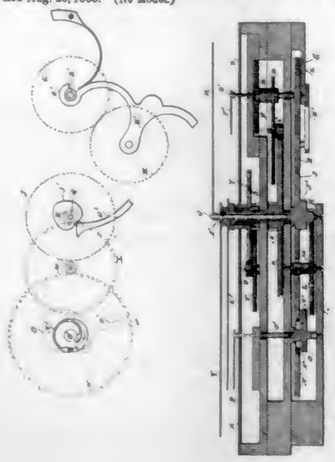
296,661. COMBINED CORKSCREW AND KEY-RING. WILBER B. WOODMAN, Newark, N. J. Filed Nov. 24, 1883. (No model.)

Claim.—1. A corkscrew the handle of which constitutes a key-ring, substantially as set forth.

2. A corkscrew the handle of which consists of two semicircular parts, which may be sprung apart sufficiently to admit or permit the withdrawal of a key, substantially as set forth.

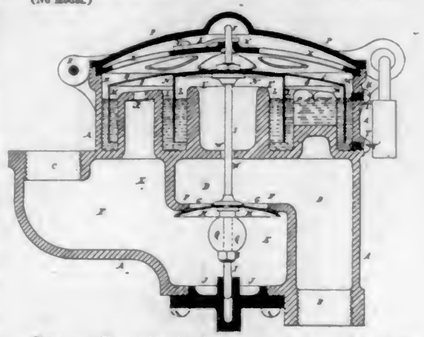
3. The screw A, having a handle composed of the parts B D, as described, the whole being formed from a single piece of wire, substantially as described.

4. A screw, A, having a handle composed of the folded parts B D, the free ends of which are turned from each other, the whole being formed, substantially as described, from a single piece of wire.



296,662. BUCKLE. WILBER B. WOODMAN, Newark, N. J. Filed Nov. 24, 1883. (No model.)

Claim.—1. A buckle consisting of the frame divided into two loops by a cross-bar which carries a tongue, the frame being formed from a single piece of wire, the ends of which are manipulated to close the frame and form the cross-bar, substantially as set forth.



2. A buckle consisting of the frame, a cross-bar dividing the frame into two loops, and a tongue, the whole being formed from a single piece of wire by bending the central parts of same to form the frame, the extremities of the piece of wire being manipulated to close the frame, and one extremity constituting the cross-bar, the other the tongue, substantially as set forth.

296,663. STOP-WATCH. ADRIEN AUBERT, Sentier, Switzerland. Filed Aug. 20, 1883. (No model.)

Claim.—The combination, in a stop-watch, of the arbor Q, independent second-hand R, and heart-cam J', with the arbor O', independent minute-hand P, heart-cam O, wheel N, pinions K M and wheels J L, a frictional connection between the shaft O' and wheel N, and the levers O^a O^a, substantially as and for the purposes specified.

296,664. MERCURY GAS-GOVERNOR. JOHN D. AVERELL, New York, assignor to William Carry, Brooklyn, N. Y. Filed Feb. 2, 1884. (No model.)

Claim.—1. The combination, in a pressure-regulator, of the valve H, its guide-rod I, the cups N and O, with removable ballast or weight Q, arranged on the rod below the valve, whereby its center of gravity is lowered, and the apparatus is thereby rendered more steady, substantially as set forth.

2. The combination, in a pressure-regulator, of the spider guide-plate K, having the stop Z, the lower guide-nut, J, the weighted valve-rod I, with the interposing valve and cups, whereby the mercury-cups and valve are more securely held in a vertical central position when lowered, substantially as described.

3. The combination of the top guide-plate, K, with the stop Z and its pivot Y, arranged to stop the rod I, substantially as and for the purpose herein stated.

296,665. CAR-COUPLING. GEORGE BLYTHE, Chillicothe, Mo. Filed Jan. 30, 1884. (No model.)

Claim.—1. The combination of the inclined table A, having the lever-arms B, the suspenders C, attached to the bail D, and the pin F, substantially as and for the purpose set forth and described.

2. The chain K and pendants K' K', for the purpose substantially as set forth.

3. The pin F, set in the guide-bar E, which moves in frame L, substantially as and for the purpose described.

4. The combination of the inclined table A, lever-arms B B, suspenders C C, coupling-pin F, chain K, and pendants K' K', substantially as set forth.

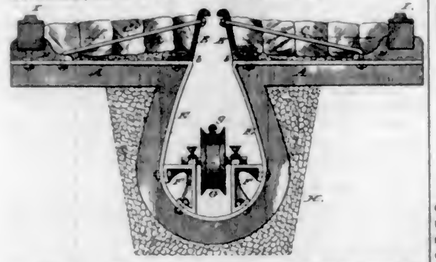
5. The bail D, having downward-pending eyelets on either side, and an upward-pending one on the rear side, provided in front with a set-screw, substantially as and for the purpose set forth and described.

6. The combination of the pin F, bar E, bail D, pendants K' and K', pulleys I I, with table A, lever-arms B, and suspenders C, substantially as and for the purpose set forth and described.

296,666. GRAPPLE. FRANK BOWDEN, Lowell, Mass., assignor of one-half to Arthur P. Brown, same place. Filed Feb. 23, 1884. (No model.)

Claim.—1. A grapple consisting of two bands or loops provided with handles, and arranged to surround and clasp a package upon being raised by said handle, as and for the purpose specified.

296,666.



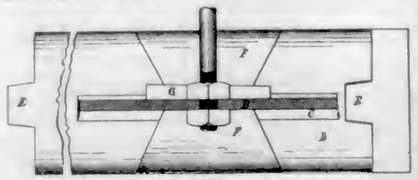
2. A grapple consisting of two bands or loops provided with handles, the inner surfaces of said loops having points or projections, and arranged to surround and clasp a package upon being raised by such handles, as and for the purpose specified.

3. A grapple consisting of two bands or loops, connected to each other by staples, and provided with handles, and arranged to surround and clasp a package upon being raised by said handles, as and for the purpose specified.

4. A grapple consisting of two bands or loops, connected to each other by staples, the inner surfaces of said bands having points or projections, and being provided with handles, and arranged to surround and clasp a package upon being raised by such handles, as and for the purpose specified.

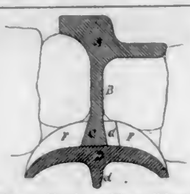
296,667. CONDUIT FOR TRACTION-ROPE RAILWAYS. ZACCUR PRALL BOYER, Philadelphia, Pa., assignor to the United States Cable Motor Construction Company, of New Jersey. Filed Feb. 25, 1884. (No model.)

Brief.—A traction-cable-conduit girder of rolled iron or steel having the horseshoe configuration at its center, and the horizontal wings formed at an acute angle to said central portion, whereupon are supported the slot-irons, and at the outer ends of said wings the track-rails.



Claim.—1. In a conduit for a traction-rope or endless-cable railway, the iron or steel yoke A, of the form approximately of a horseshoe, and having wings extending horizontally therefrom at nearly a right angle, forming level bearings, as at *b*, adapted to receive and support the metallic beams B B, said yoke being rigidly held in position by means of concrete, H, all constructed substantially as set forth and described.

2. In conduits for traction-rope or endless-cable railways, yoke A, formed of a single T-rail, or any single rail of iron or steel of the shape shown, bent into the form described, for the purpose of encompassing the walls or sides of the conduit or tubing, and also to serve for rigidly holding in position beams B B, chairs D D, and supports F F, constructed and arranged substantially as specified.

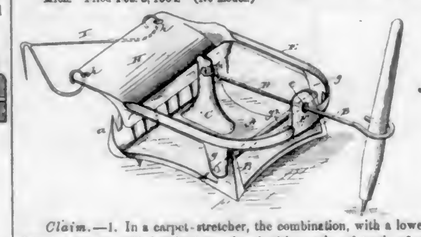


3. In a conduit for a traction-rope or endless railway, the combination and arrangement of yoke A, constructed of wrought metal, as described, with wings extending horizontally therefrom at nearly a right angle, and forming bearings *b*, beams B B, connecting-rods C C, and chairs D D, all operating substantially as set forth and described.

296,668. TRACK FOR STREET-RAILWAYS. LODOWICK BRATTON, Providence, R. I., assignor of one-half to Daniel F. Longstreet, same place. Filed Sept. 3, 1883. (No model.)

Brief.—The dovetail-shaped base of the rail is secured to a metal sill by lugs on the latter, and a wedge-shaped key. The under side of the sill is formed with a rib.

296,668.



Claim.—1. The combination, with a rail having the head A, the web B, and the dovetail-shaped base C, of the cast-metal sill D, provided with the lugs F F, and the wedge-shaped key G, constructed to secure the rail to the sill and secure a continuous bearing for the rail, as described.

2. A permanent way for street-railways, consisting of rails provided with suitable heads, deep webs, and dovetail-shaped bases, substantially as described, secured to sills made of cast metal, and provided with lugs constructed to secure the rail at intervals by wedges, and support the same continuously, and tie-rods provided at each end with two nuts, as described.

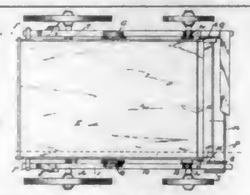
3. The combination, with the continuous sill D, provided with the rib *d*, and the lugs F, of the rails having each the head A, web B, and dovetail-shaped base C, and the wedge-shaped keys G, substantially as and for the purposes set forth.

296,669. CARPET-STRETCHER. JOSEPH HILLARY BRIGGS, St. Clair, Mich. Filed Feb. 8, 1884. (No model.)

Claim.—1. In a carpet-stretcher, the combination, with a lower clamping-plate provided at its forward end with a series of teeth, of an upper clamping-plate provided on its under side with a series of teeth, said plates being pivoted at their rear ends, and a rod secured to the under clamping-plate, substantially as set forth.

2. In a carpet-stretcher, the combination, with a lower clamping-plate provided with a series of teeth and with an upwardly-projecting post, of an upper clamping-plate pivoted to the lower clamping-plate, and provided upon its under side with a series of teeth, and a rod hinged to said post and passing through a perforation formed in an upwardly-projecting lug at the rear end of the upper clamping-plate, substantially as set forth.

3. In a carpet-stretcher, the combination, with a lower clamping-plate provided with a series of teeth at its forward end, and having upwardly-projecting perforated lugs at its rear corners, and provided at about its center with an upwardly-projecting post, of an upper clamping-plate provided upon its under side with a series of teeth and at its rear end and upon the under side thereof with downwardly-projecting lugs provided with perforations, a shaft pivoting the said upper section to the lower section, and a rod connected to the upwardly-projecting post of the lower plate, and passing through a perforated lug projecting upwardly from the rear end of the upper clamping-plate, substantially as set forth.



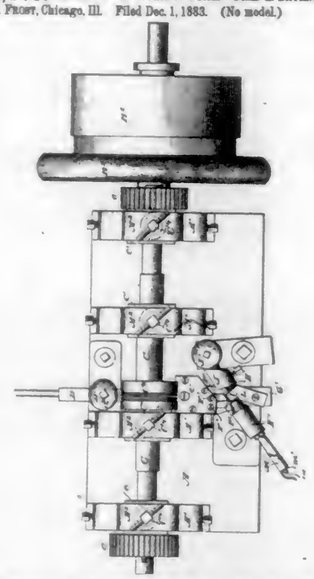
4. In a carpet-stretcher, the combination, with two clamping-plates pivoted together, of a bifurcated rod pivoted to the upper clamping-plate, the ends of said rod converging and terminating in a bent hook, substantially as and for the purpose set forth.

5. In a carpet-stretcher, the combination, with two clamping-sections pivotally secured together, of a post secured to the lower clamping-section and provided at its upper end with a perforation, and a rod pivoted to said post, the opposite end of which is provided with a loop and a lever, substantially as set forth.

296,670. DUMPING-WAGON. WILLIAM C. BRYAN, Nashville, Tenn. Filed Nov. 15, 1883. (No model.)

Claim.—1. In a dumping-wagon, the combination, with the inclined frame, of the body provided with the rollers at or near its middle, and also near its forward end, and the cross-bar at its rear end, and the stops or guards upon the inclined frame, whereby the middle rollers, coming in contact with the said stops or guards, permit the body to be tilted upon the axles of said rollers, substantially as described.

296,670.

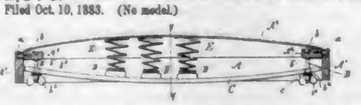


2. The combination of the inclined frame with the body, the hooked arms pivoted to the body, the incline for automatically raising the hooked arms, and the rod with which the hooked arms engage, substantially as described.

3. The combination, with the inclined frame, of the body, the pivoted hooked arms, the rod with which they engage, and the U-shaped arms mounted on the rock-shaft, substantially as described.

4. The combination, with the inclined frame, of the body, the pivoted hooked arms, the inclined guides for raising said arms, the rod with which the arms engage, the rock-shaft and its U-shaped arms, and the spring upon the rock-shaft, substantially as described.

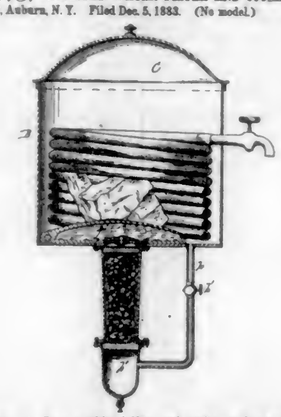
296,671. METHOD OF COILING WIRE. FRED L. BRYANT and ABEL H. FROST, Chicago, Ill. Filed Dec. 1, 1883. (No model.)



Claim.—1. The method of making spiral coils of wire which consists in first bending the wire otherwise than to form the coil, and thereafter imparting to the wire the flexure by which the coil is produced, substantially as described.

2. The method of making spiral coils composed of two or more wires side by side which consists in first bending one of said wires otherwise than to form the coil, and thereafter imparting to both wires the flexure by which the coil is produced, substantially as described.

3. The method of coiling several wires side by side which consists in first unequally bending two or more of said wires otherwise than to form the coils therein, and thereafter imparting to said wires the flexure by which the coil form is produced.

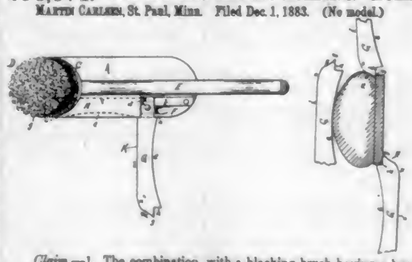


296,672. SPRING BED-BOTTOM. SANFORD S. BURR, Winnetka, Ill. Filed Oct. 10, 1883. (No model.)

Claim.—1. In a spring bed-bottom, the combination, with the frame and the cover, of the springs located beneath said cover, the longitudinal sustaining-slats for said springs, and adjusting mechanism, arranged substantially as set forth, whereby said sustaining-slats can be lifted vertically in order to vary the tension of the springs, substantially as described.

2. In a spring bed-bottom, the combination, with the frame and the cover, of the springs located beneath said cover, the transverse slats for said springs, the longitudinal slats, and means, substantially as described, for adjusting said spring-sustaining slats vertically, whereby the tension of the springs can be varied, substantially as described.

296,673. COMBINED WATER FILTER AND COOLER. FRANK E. CADY, Auburn, N. Y. Filed Dec. 5, 1883. (No model.)

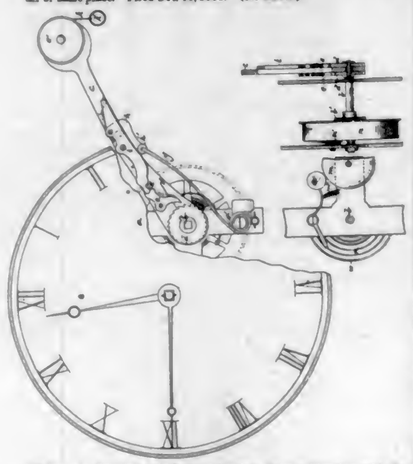


Claim.—1. In a combined filter and cooler, an ice-tank or cooling-reservoir for holding the unfiltered water, a cooling chamber or coil located within or surrounding the same, and a filter connected to the cooling-chamber and located outside the chamber, in combination with a pipe for conveying the water from the ice-tank to the filter, substantially as and for the purpose described.

2. In a combined filter and cooler, an ice-tank or cooling-reservoir for holding the ice and unfiltered water, and a cooling chamber or coil for receiving and holding the filtered water, in combination with a filter connected to the chamber or coil, and a pipe for conveying the unfiltered water from the tank to the lower end of the filter, substantially as and for the purpose described.

3. In a combined filter and cooler, an ice-tank or cooling-reservoir and a filter and sediment-chamber, in combination with a cooling chamber or coil for holding the filtered water, connected to and supplied from the ice-tank or cooling-reservoir, substantially as and for the purpose described.

4. In a combined cooler and filter, the ice tank or coil for holding the ice and unfiltered water, and a cooling-receptacle, in combination with a sediment-chamber and filter connected to the cooling-chamber, and a pipe for conveying the water from the tank to the cooling-chamber through the sediment-chamber and filter, substantially as and for the purpose set forth.

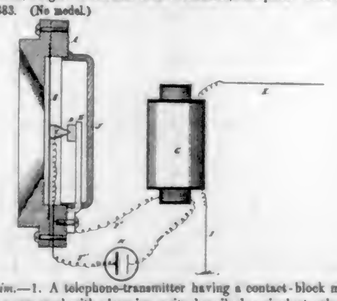


296,674. BOOT AND SHOE CLEANING IMPLEMENT. ANDREAS MARTIN CARLSEN, St. Paul, Minn. Filed Dec. 1, 1883. (No model.)

Claim.—1. The combination, with a blacking-brush having a handle, E, of a scraper, G, provided with the concave edge *e*, point *g*, notch *h*, and partly straight and partly curved back, substantially as and for the purpose herein specified.

2. The scraper having the curved front edge, *e*, straight back edge, *i*, point *g*, and small curves *m n*, substantially as and for the purpose specified.

296,675. WINDING DEVICE FOR CLOCKS. PETER B. CASSIDY, Pittsburg, Pa., assignor to himself, Thomas Delaney, and G. Frank Kierson, all of same place. Filed Dec. 10, 1883. (No model.)



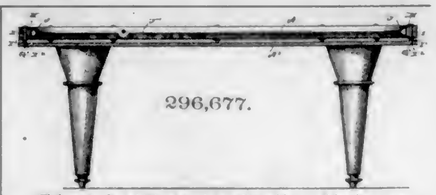
Claim.—1. In clock-winding mechanism, the combination, with the winding-arbor having a ratchet-wheel secured thereto, of a winding-lever pivoted on the arbor, a pawl pivoted on the winding-lever, and adapted to engage with the ratchet, a pawl-lever pivoted on the winding-lever for actuating the pawl, and a spring connected with the pawl-lever by an intermediate link for actuating the pawl-lever and the return-throw of the winding-lever, substantially as and for the purposes specified.

2. The combination of the winding-arbor, ratchet, self-retracting lever, releasing-pawl, cord, and spring-barrel *c'*, substantially as and for the purposes described.

3. In a clock-movement, the mainspring having a tappet projection, in combination with a bell-clapper adapted to be actuated by the projection on the mainspring, and a bell arranged in such position as to be sounded through the medium of said devices when the movement is wound up, substantially as and for the purposes described.

296,676. TELEPHONE-TRANSMITTER. SAGER CHADWICK, Philadelphia, Pa., assignor of one-half to E. V. Machetta, same place. Filed June 9, 1883. (No model.)

Claim.—1. A telephone-transmitter having a contact-block made of gelatine prepared with glycerine or its described equivalent, substantially as described.



2. The combination of diaphragm B, conical contact C, gelatinous composition block D, substantially as described, and metal support E, substantially as and for the purpose specified.

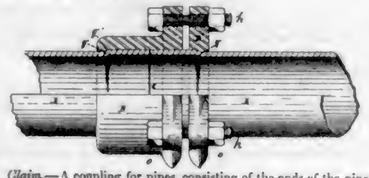
3. The combination of diaphragm B, conical contact C, gelatinous composition block D, substantially as described, metal support E, and case J, substantially as and for the purpose specified.

4. A telephone-transmitter provided with a diaphragm made of gelatine, substantially as described.

5. The combination of gelatine diaphragm B, contact-point C, prepared gelatine block D, substantially as described, metal support E, and case J.

296,677. BILLIARD AND POOL-TABLE. GEO. A. CHARLEY, Washington, D. C. Filed Dec. 26, 1883. (No model.)

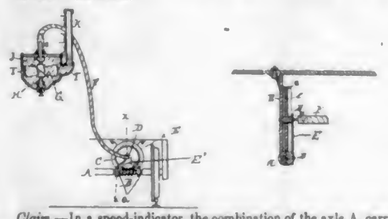
296,677.



Claim.—1. In a billiard, pool, or other table, a rail having a cushion suitably secured thereto, and means whereby said rail and cushion may be raised or lowered, so as to conform to various sizes of balls, and at the same time to admit accumulated dirt on the surface of the table to be brushed under said cushion, substantially as described and set forth.

2. A rail having a cushion secured thereto, in combination with the bed of the table, and a threaded bolt connecting said rail and bed, whereby the rail and cushion may be vertically adjustable with relation to the bed of the table, substantially as described and set forth.

3. In a billiard, pool, or other table, a rail provided with a cushion and bolt secured thereto, said bolt being provided with a lower threaded end, in combination with the bed of the table provided with an opening adapted to receive the threaded end of the bolt, as set forth.

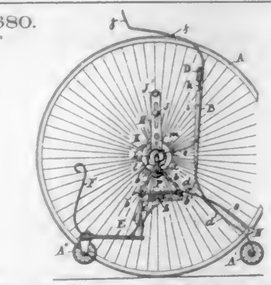


4. In a billiard, pool, or other table, the combination of the rail H, cushion J, bolt I, tap-nut I', body A^3, and the plate G, the rail, table, and plate G being provided with openings for the reception of the bolt, substantially as described, and for the purposes set forth.

296,678. PIPE-COUPLING. JOSEPH CONNOR, Philadelphia, Pa. Filed May 12, 1883. (No model.)

Claim.—A coupling for pipes, consisting of the ends of the pipes to be joined, enlarged for a short distance, so as to form the shoulders *g*, and plane enlarged portions between said shoulders and the ends of the pipes, and the coupling-pieces B and B', and means for uniting them, said couplings being provided with interior shoulders to take hold of the shoulders *g*, and one of said portions of coupling being of sufficient length to cover the joint at the meeting ends of the pipes, substantially as set forth.

296,679. SPEED-INDICATOR. EDWD. R. E. COWELL, Detroit, Mich., assignor of three-fourths to William De Waggstaff, of Russia. Filed Dec. 12, 1883. (No model.)



Claim.—In a speed-indicator, the combination of the axle A, carrying the worm B, the pendent bracket E, secured to the under side of the truck and supporting said axle and strengthening the same at *a*, the shaft D, supported at one end by the bracket E, and at the other by the part E', attached to the bracket E, which has the shield *e* cast integral therewith, pinion C, carried by said shaft D, and inclosed within the casing E E', and meshing with the worm B, and the flexible shaft F, attached at one end to the shaft D, and at its other end to the indicator, substantially as and for the purpose described.

296,680. VELOCIPEDE. DANIEL CROWLEY, Boston, Mass. Filed Oct. 3, 1883. (No model.)

Claim.—1. In a velocipede, the removable bar C, in combination with the double-crank-axle shaft *a b*, as shown and described.

2. The adjustable head-rest D, rods *h h*, and tubes *i i*, in combination with the back of a hanging chair, as and for the purpose set forth.

296,680.

3. In a velocipede substantially such as described, the wheels A' A'', having the lower portion of their peripheries above the level of the lower portion of the peripheries of the main wheels A A, and attached the one to the rear of the seat by a bar, *d''*, and the other to the front of the foot-rest E, as and for the purpose specified.

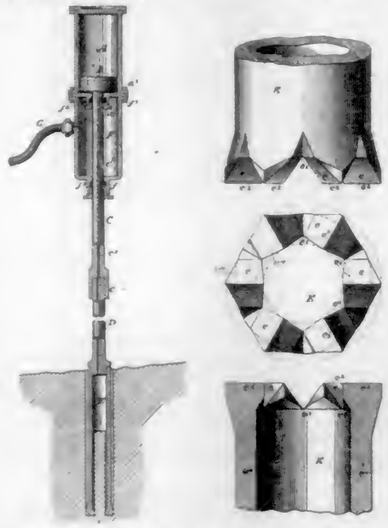
4. The combination of the adjustable foot-rest E, the dasher F, and the hanging seat, as shown and described.

5. The combination, with the driving-levers H, of the adjustable handle J and a fixed handle, J', substantially as and for the purpose specified.

6. The brakes L, in combination with the friction-pulley I, driving-levers H, and the pins *m*, as and for the purpose specified.

7. The ratchet-wheel cover M, provided with an opening, *n*, and projecting portion *m'*, in combination with the ratchet-wheel G, levers H, and pawls K, substantially as shown and described.

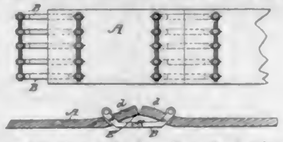
8. The scrapers N, attached to the seat by rods *o*, in combination with the wheels A, as shown and described.



9. In combination with the seat, an adjustable weight, S, supported on cleats underneath the seat, for the purpose of adjusting the seat to persons of different weights, as set forth.

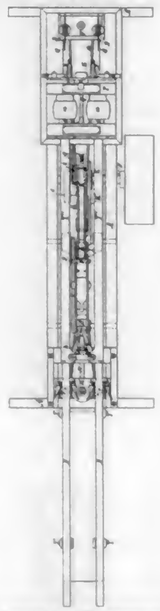
10. A stand, T T, provided with bearings on the upper ends for the reception of axles *a a*, attached to the swinging seat, so as to support the latter, as and for the purpose set forth.

11. The back B, curved at *d*, and provided with arms *e*, in combination with the crank-axle *a b b'*, substantially as shown and described.



296,681. ROCK-DRILL. GEORGE McC. DERBY, Astoria, N. Y. Filed June 20, 1883. (No model.)

Brief.—A reciprocating tubular drill is supplied with water internally by the devices shown.



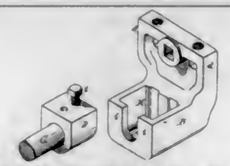
Claim.—The combination, with the tubular rock-drill, of a tubular shank to which said drill is attached, mechanism for communicating a positive to-and-fro motion to said drill, and means for forcing a stream of air, steam, or water through said drill, its tubular support, and bit.

296,682. BELT-FASTENER. WILLIAM R. DUNN, Alton, and TEMPLE H. DUNN, Crawfordsville, Ind. Filed Sept. 26, 1883. (No model.)

Claim.—As an improved article of manufacture, the belt-fastener herein described, consisting of the bars B, having the horizontal portion M and arms *a a*, projecting upward from the portion M at opposite ends on the angle specified, and provided with eyes for the reception of the locking-rods C C, the fasteners adapted, when applied to a belt under pressure, to bulge its adjacent ends outward by frictional engagement and occupy the space on the line of resistance formed thereby, so that the inner surface of the belt and the horizontal portion of the fasteners will be in line and run smoothly over the pulleys, substantially as and for the purposes set forth.

296,683. MACHINE FOR MANUFACTURING MOUTH-PIECES FOR CIGARS. ERNST EHLIS, San Francisco, Cal. Filed Nov. 9, 1883. (No model.)

Claim.—1. In a machine for the manufacture of mouth-pieces, provided with the supporting-mandrels, the carriage E, carrying the cutters *a b c*, for hollowing, rounding, and separating the mouth-pieces, in combination with the slide O, which is fixed to the carriage, the lever Q, connected with the slide at one end and having the weight *s* at the other, and the cam H, provided with the ear *t*, the latter being under the rear end of the lever Q and to engage therewith, as set forth.

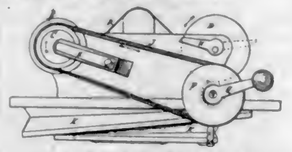


2. In a machine for forming mouth-pieces, the combination of the carriage M, spring-acted advancing-jaws *i*, located on said carriage, retaining-jaws *k* in front of said carriage, lever N, provided with the separating-wedge *m*, which enters between the free ends of jaws *k*, and means, substantially as described, for operating said lever N, as set forth.

296,684. SHAFT-BEARING. MERRILL A. FURBUSH, Philadelphia, Pa. Filed Mar. 3, 1884. (No model.)

Claim.—1. The combination of a hanger having a pocket, H, with the bearing-block D, adapted to but removable from said pocket, and the shaft G, the end of which has its bearing in the block, as set forth.

2. The combination of a hanger having a pocket, H, with the bearing-block D, adapted to but removable from said pocket, the shaft G, having a spherical end adapted to a bearing in the block, and the follower *q*, whereby the shaft is confined to the block, as set forth.

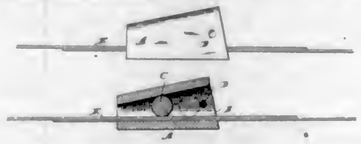


296,684.

3. The combination of the hanger having a pocket, H, and set-screw *w* with the shaft G, having a spherical end, *p*, the bearing-block D, adapted to but removable from the said pocket, the follower *q*, and means for confining the same to the block, substantially as set forth.

4. The combination of a frame, A, having flanges *a* and *b*, the hanger having a portion, *d*, bearing against the flange *b*, the set-screws *n*, *n'*, and *m*, whereby the hanger is confined to the flange *a*, and the bolt *f*, whereby the hanger is confined to the flange *b*, as set forth.

296,685. MECHANICAL MUSICAL INSTRUMENT. MERRITT GALLY, New York, N. Y. Filed Jan. 16, 1884. (No model.)



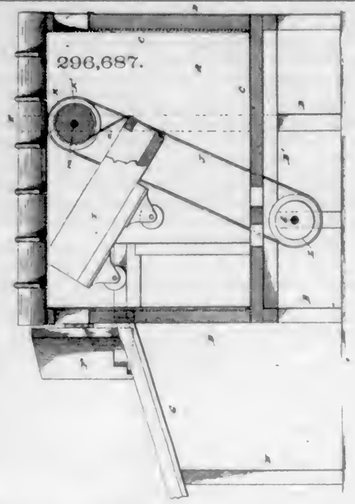
Claim.—1. In a mechanical musical instrument, the combination, with a sheet-winding device operating on the take-up roll, of an oppositely-acting friction sheet-winding device of less power, substantially as described, simultaneously operating on the delivery-roll, as set forth.

2. In a mechanical musical instrument, the combination, with a sheet-winding device operating on the take-up roll, of an oppositely-acting friction sheet-winding device of less power, simultaneously operating on the delivery-roll, and mechanism, substantially as described, connecting the same with the motor of the take-up roll, all substantially as shown and set forth.

3. The combination, with the take-up roll and its power mechanism, constructed substantially as described, of the motor-shaft, a belt leading therefrom, and the oppositely-acting friction retarding and rewinding device, constructed substantially as described, and arranged to be driven by the belt and operate on the delivery-roll, as set forth.

296,686. BALE-TIE. JOB A. GRESHAM, Waynesborough, Ga. Filed Jan. 23, 1884. (No model.)

Claim.—1. The within-described bale-tie having a single wedge-shaped opening therein for the passage of both ends of the band, an automatic fastening, C, in said opening, and the rod or pin D, passed transversely through the enlarged end of the tie and located within the said wedge-shaped opening, substantially as and for the purpose set forth.



2. The within-described bale-tie having a single wedge-shaped opening therein for the passage of both ends of the band, the roller C in said opening, and the rod or pin D, passed transversely through the enlarged end of the tie within the said wedge-shaped opening, and having its ends upset against the sides of the tie, substantially as and for the purpose set forth.

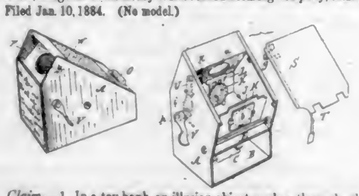
296,687. COTTON-GIN HOUSE. WILLIAM F. GROVES, Marietta, Ga. Filed Feb. 23, 1884. (No model.)

Claim.—1. A gin-house frame constructed substantially as described, lined with sheet metal, and having metal doors and metal top to make the same fire-proof, in combination with a tramway both within and without the house, and passing through one of the doors of the same, and adapted to carry a car operated by mechanism within the said gin-house, substantially as described.

2. Windlass *k'*, located within the gin-house, and provided with a cord or chain, *a*, in combination with the tram I and its way G, constructed and operating substantially as and for the purpose set forth.

296,687.

296,688. INSULATING-SUPPORT FOR ELECTRIC CONDUCTORS. DAVID S. HAINES, New York, and STEPHEN D. LAKE, Brooklyn, N. Y. Filed Nov. 30, 1883. (No model.)



Claim.—1. An insulator for electric conductors, made of porcelain, glass, or other suitable material, in two or more sections, and secured together and to a support by a single screw passing therethrough, substantially as described.

2. An insulating-support made in two or more sections, having parallel grooves across their faces, and adapted to be held upon a single screw, substantially as and for the purpose described.

3. An insulating-support made in two sections, and having an annular semicircular groove formed upon its exterior along the contiguous edges of said sections, substantially as described.

4. An insulating-support consisting of the two sections *a* and *a'*, having the angular grooves *b'* and *b²*, the raised projections *d'* and *d²*, and the annular semicircular groove *f*, substantially as described.

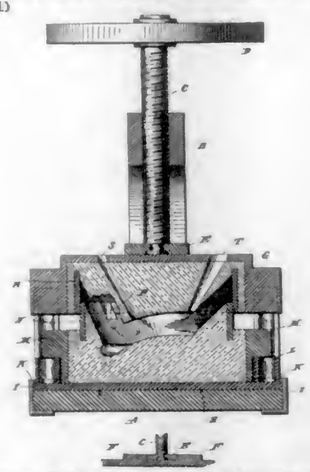
296,689. TOY BANK. HENRY C. HART and JAMES W. CROSS, Detroit, Mich., assignors to the Henry C. Hart Manufacturing Company, same place. Filed Jan. 10, 1884. (No model.)

Claim.—1. In a toy bank, an illusion object, a glass through which a coin deposited may be observed, and means for converting said glass into a mirror adapted to reflect an image of the illusion object, substantially as and for the purposes set forth.

2. In a toy bank, a sight-opening through which a coin deposited may be observed, an illusion object, a glass placed between the illusion object and the deposited coin, and means for alternately admitting light on either side of said glass, while excluding it from the other side thereof, substantially as and for the purposes specified.

3. A toy bank having a translucent top, a darkening-slide shorter than said top, provided with mechanism for actuating the same, a coin-support adapted to hold a coin in line with a sight-opening, and a glass between the sight-opening and coin-support placed at such an angle with the sight-opening and with an illusion object contained in the bank that the image of such illusion object will be reflected by said glass in said sight-opening when light is excluded from behind and admitted in front of said glass, substantially as shown and described.

4. A toy bank having a translucent top, a coin-support at the rear end, a sight-opening at the front end through which the coin-support is visible, a partition wholly or partly transparent between said sight-opening and coin-support, an illusion object at the front end of said bank, and mechanism adapted to admit light through the translucent top on either side of said glass, while excluding light from the other side thereof, substantially as shown and described.



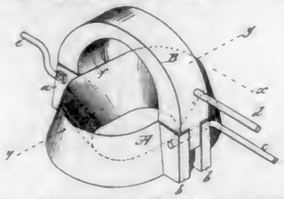
5. In a toy bank having a glass top, W, coin-support N, and illusion object K, the darkening-slide S, operated by suitable mechanism, and adapted to darken that part of the interior of the bank in which is situated the coin-support, and simultaneously admit light to that part of the bank in which is situated the illusion object, and vice versa, substantially as and for the purposes specified.

6. In a toy bank, a coin-support located in the rear end of the bank, a sight-opening and illusion object in the front end, and a glass interposed between the sight-opening and coin-support, and adapted, when light is excluded from the rear end and admitted to the front end of the bank, to reflect the image of the illusion object to the sight-opening, substantially as shown and described.

7. In a toy bank, the combination of the glass top W, darkening-slide S, operated by suitable mechanism, partition H, having glass J over an opening, *b*, therein, sight-opening *a*, and the imitation coin and support K L, substantially as shown and described.

8. The combination of the coin-support N, rock-shaft P, carrying arm Q, having ends *g e*, and lever R, spring *f*, and slide S, carrying arm T, and operated by mechanism substantially as described, as and for the purposes set forth.

296,690. DENTAL MOLD. JAS. W. HAYFORD, Tiffin, Ohio, assignor of one-half to George S. Yingling, same place. Filed Nov. 2, 1883. (No model.)

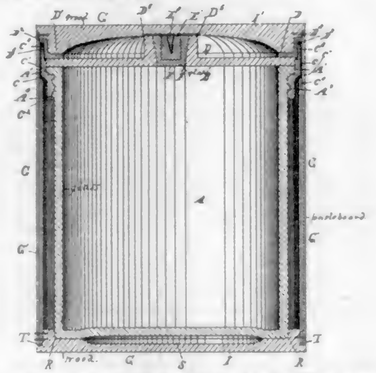


Claim.—1. The combination, with the base-plate and frame of the device, of the bottom plate and shell forming the lower section of the mold, the lateral lugs on said bottom plate having slotted guide-standards for the sections of the mold and the slotted clamps, whereby the bottom plate is clamped to the base of the mold, substantially as specified.

2. In combination with the upper and lower sections of the mold and the frame, and bottom plate guide-standards and pressure-screw, the internal rings adapted to fit one within the other and be embedded in the respective matrices of the mold, one of the rings being slotted at its edges for the initial escape of gas or confined air, substantially as specified.

3. The combination, with the frame and its base, of the mold-sections, the bottom plate and slotted guide-standards and clamps, and the pressure-screw having a dovetailed swiveled plate, and the dovetailed projections on the upper section of the mold, with which said plate engages, whereby the upper section may be manipulated accurately with respect to the lower section, substantially as specified.

296,691. MANUFACTURE OF GLASS BASKETS. JOHN HOARE, Corning, N. Y. Filed Dec. 5, 1883. (No model.)



Claim.—1. A glass-blower's mold for forming glass baskets and similar articles with integral bow-handles, consisting of the mold A and movable yoke B, substantially as described.

2. The combination, with a glass-blower's mold, of the adjustable hood C, substantially as described.

3. The combination of the mold A, movable yoke B, and adjustable hood C, substantially as described.

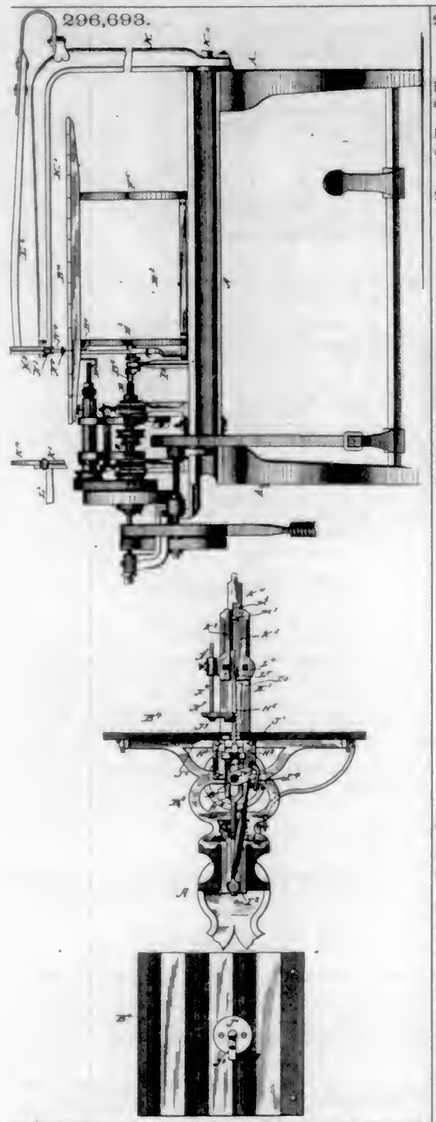
296,692. CASE FOR PRESERVING FOOD. JONATHAN J. HOTT, Chelmsford, Mass., assignor to Edward F. Richardson, same place. Filed Feb. 21, 1883. (No model.)

Claim.—1. The combination of the case provided with an external screw-thread and a ring extending vertically above said case and having an internal screw-thread engaging with the thread upon said case to guide the cover when being ground, as herein described.

2. The combination of the case A, provided with a screw-thread, A^2, the ring C, provided with screw-threads C^2 C^3, the cover B, and the ring D, provided with the screw-thread D^2, as and for the purpose specified.

3. The combination of the case A, provided with the screw-thread A^2 and flange A', the ring C, provided with the screw-threads C^2 C^3 and the shoulder C', the cover B, and the ring D, provided with a screw-thread, D^2, as and for the purpose specified.

4. The combination of the case A, provided with the screw-thread A^2, the ring C, provided with screw-threads C^2 C^3, the cover B, and the ring D, provided with the screw-thread D^2 and flange D', as and for the purpose specified.



296,693. SCROLL-SAWING MACHINE. WAYNE J. HULL, Alexandria, Dak., and WILLIAM E. VARNEY, Daytonville, Iowa. Filed Jan. 29, 1884. (No model.)

Claim.—1. In a wood-working machine, the combination, of the arm K', provided at its free end with the vertical ways K^3, and the slotted slide K^4, adjustably connected to the spring-arm L^2, the slide K^4 being provided with the lateral recess L^4, intersected by the vertical recess L^3, the latter to receive the upper end of the saw-blade and the former to receive the cross-pin L^5, by which the saw is removably connected to the slide K^4, substantially as specified.

2. In a wood-working machine, the combination, with the frame B^3, carrying the table B^4, of the circular metallic guard-plate J', having a central perforation and a radial groove, J^3, arranged in the lateral line of the table B^4, let into the table, and provided with an adjustable slide, J^5, having its inner end recessed vertically, and the scroll-saw and mechanism for operating the same, substantially as specified.

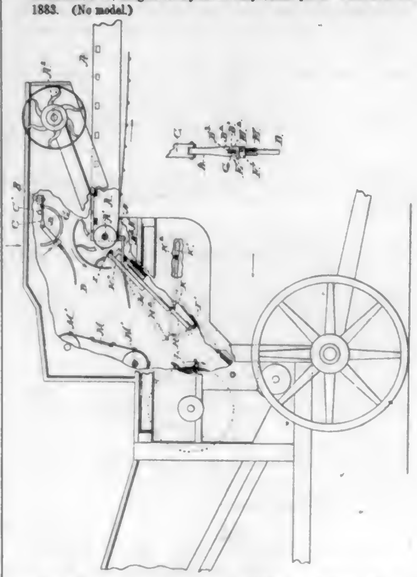
3. In a wood-working machine, the combination, with the frame B^3

296,693.

on the bench-frame A, and table B^4, located thereon, of the bifurcated arm H^4, arranged beneath the table, having the clamping-nut H^2 at its upper end, crank I^2, clamp I^4, the crank-shaft B^2, having end bearings in the frame B^3 and shaft D, pitman-rod I^3, connected at its upper end to the said crank, the arm K', rising from the frame, and provided with a spring-arm, L^2, the vertically-slotted slide K^4, the adjustable bifurcated foot N^3, and operating mechanism, substantially as specified.

296,694. BREECHING FOR VEHICLES. DANIEL HUTCHINSON, Poland, Me. Filed Feb. 4, 1884. (No model.)

Claim.—1. In an improved breeching, the combination of the breeching-strap *b*, which is buckled into the holdback *f*, with the spring *c* and the standard *e*, substantially as shown, and for the purposes specified.



2. The combination, in an improved breeching, of the spring *c*, having one end turned up into the holdback *f*, with the standard *e* and the shaft *a*, substantially as set forth.

3. The combination, in an improved breeching, of the spring *d*, having one end secured to the standard *e*, with the breeching-strap *b*, substantially as described, and for the purposes specified.

296,694.

296,695. BAND CUTTER AND FEEDER. MATTHEW H. JOSLYN, Rochester, N. Y., assignor to Myron L. Joslyn, same place. Filed Dec. 22, 1883. (No model.)

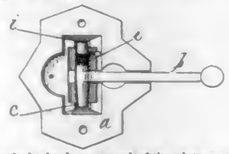
Claim.—1. The combination, substantially as set forth, of the cylinder, the grain-casting platform, hinged at its upper edge, and movable as described, and a suitable grain-feeding device arranged in position to deliver grain onto the casting-platform, substantially as and for the purposes set forth.

2. The combination, substantially as herein described, of a grain-feeding mechanism, a thrashing-cylinder, and a sectional grain-casting platform arranged in front of the cylinder, said platform being hinged at its upper and lower sides and movable at its middle portion, as and for the purposes specified.

3. In a thrashing-machine, the grain-casting platform, substantially as herein described, composed of the section H', hinged at its upper end to the framing-rods J, the section H^3, hinged at its lower end, the section H^2, hinged to section H^2, and sleeves J', fitting on rods J, all arranged and adapted to operate substantially as and for the purpose set forth.

4. The combination, with the thrashing-cylinder, the feed mechanism elevated above the cylinder, and having its delivery end arranged in advance thereof, and the returning-belt, arranged in front of the delivery end of the feed mechanism and approximately vertically over the receiving side of the cylinder, substantially as set forth.

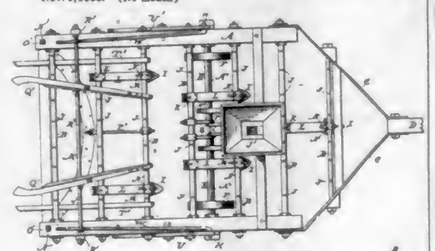
5. The combination, substantially as set forth, of the cylinder, the feed mechanism, the grain-casting platform, and the returning-belt, all arranged and adapted for use substantially as specified.



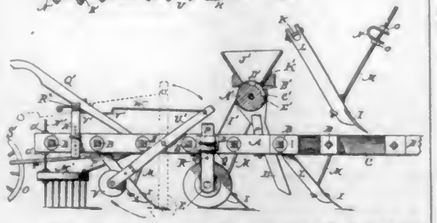
6. The combination, with the cylinder and the grain-casting platform, of lower spreader-fingers having their points extended in front of the platform, between the latter and the cylinder, and means whereby said fingers are operated or oscillated in an approximately horizontal plane, and in a line at right angles to the line of motion of the platform, substantially as set forth.

7. The combination, with the feed-belt, of a series of pivoted spreader-fingers arranged above the delivery end of the feed-belt, means whereby these fingers are oscillated in a plane at right angles to that of the feed-belt, and means whereby said fingers are adjusted and held at any suitable point to and from the feed-belt, substantially as set forth.

8. The combination, with the bar C, pivotally supported at one end, and the finger D, pivoted to the opposite end of the bar C, of the segment G, secured at one end to the bar C and lapped at its other end alongside fingers D, and means, substantially as described, whereby said finger may be clamped to said segment at any point of adjustment along the same, substantially as set forth.



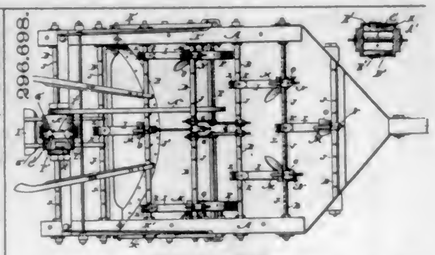
9. The combination of the feed-belt, the series of upper spreader-fingers, arranged above the inner end of said belt, the grain-casting platform, the pivoted lower spreader-fingers, arranged to vibrate in approximately a horizontal plane, the cylinder, and the grain-returning belt arranged above the cylinder, all substantially as and for the purposes specified.



296,696. WARDROBE-HOOK. CHARLES A. KUHLMAN, Richmond, Ind. Filed Feb. 4, 1884. (No model.)

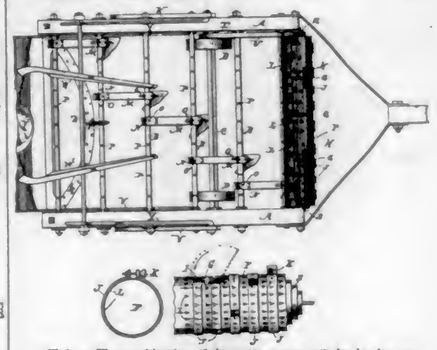
Claim.—A wardrobe-hook composed of the plate *a*, arm *b*, shaft *c*, and spring *e*, constructed and operating in the manner and for the purposes set forth.

296,697. CORN-PLANTER. HIRAM D. LAYMAN, Benton, Ark. Filed Nov. 9, 1883. (No model.)



Claim.—1. In a corn-planter, the combination of the frame having the series of parallel cross-rods B, each provided with a series of notches, J, and the plows having slotted standards L, and bolts K, passing through said standards and engaging with the notches of one rod, and the screw-rods M, connected to the next forward rod B by the clips N and nuts O, substantially as shown and described.

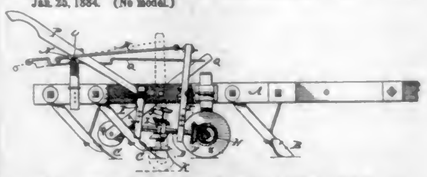
2. In a corn-planter, the combination of the frame having the series of parallel cross-bars B, each being provided with a series of notches, J, the plows arranged to open and close a furrow, and having slotted standards L, and bolts K, passing through the standards and engaging with the notches of one rod, the screw-rods M, connected to the next forward rod B by the clips N and nuts O, the hopper and seed-dropping device, and the covering-harrow, substantially as shown and described.



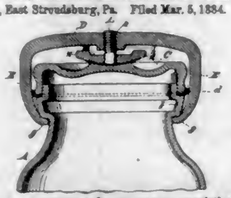
296,698. COTTON-PLANTER. HIRAM D. LAYMAN, Benton, Ark. Filed Nov. 9, 1883. (No model.)

Claim.—The combination of the frame, the series of plows I, arranged to throw up a ridge and to open a furrow therein, the cylindrical seed-drum A', having a series of uniform holes, C', therein, the band E', adapted to be shifted both longitudinally and circumferentially of the drum, and having both of its edges recessed to form lips G' therein, the lips of one edge being wider than those of the other, whereby either one or more holes C' may be covered by each lip by the proper adjustment of the band, and the drag I', for covering the seed, substantially as shown and described.

296,698.



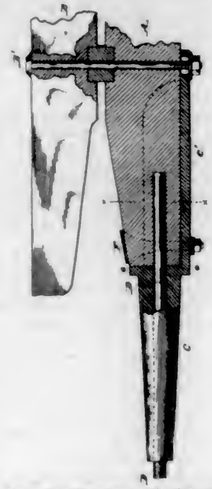
296,699. SEED-SOWER. HIRAM D. LAYMAN, Benton, Ark. Filed Nov. 16, 1883. (No model.)



Claim.—The combination of the seed-sowing cylinder having perforations therein, and transverse partitions G, the doors I, each opening to two compartments formed by said partitions, and a series of cut-off bands, J, having set-screws K, to adapt them for being set to hold the doors firmly closed, and to regulate the discharge of seed, substantially as shown and described.

296,700. COTTON-CHOPPER. HIRAM D. LAYMAN, Benton, Ark. Filed Jan. 25, 1884. (No model.)

Claim.—The combination, with the frame A and the shaft D, carrying the hoe-drum, and having bevel-pinion F, gearing with a pinion, G, on the supporting-axle of the frame, of the oscillatory hangers E E' and means for adjusting said hangers to hold the pinion F in or out of engagement with pinion G, substantially as shown and described.



296,701. FRUIT-JAR-COVER FASTENING. PHILIP LYON and JOSEPH H. BOSHARD, East Stroudsburg, Pa. Filed Mar. 5, 1884. (No model.)

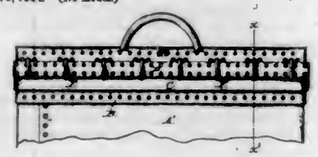
Claim.—1. A fastening for jar-covers, consisting of a transverse clamping-bar having a central projection, and a threaded perforation extending through said projection, and, engaging said perforation, a set-screw having a flattened expanded foot, formed with operating-lugs on its marginal portion, substantially as specified.

2. The transverse clamp-bar having downwardly-extending arms formed with catch ends, and a central threaded perforation, and, engaging said perforation, a set-screw having a flattened convex-bottom foot, formed with marginal operating-lugs, substantially as specified

296,702. AXLE-SKEIN. LEMUEL H. MERRIMAN, Auburn, assignor of one-half to Thomas G. Prickett, Springfield, Ill. Filed Jan. 10, 1884. (No model.)

Claim.—1. In an axle-skein, the combination, with a cast-iron arm, of a wrought-iron rod or core passing centrally through it, and adapted at one end to enter the wooden axle, the other end being screw-threaded to receive the nut for holding the wheel to the skein, substantially as described.

2. In an axle-skein, the combination, with a wooden axle, of a wrought-iron rod or core having on its outer end a screw-thread, and its inner end adapted to project into the end of said axle, and a cast-iron arm, one end of which forms a spindle through which the rod passes, and provided with a shoulder which rests against the end of the axle, and the other end projecting under and being provided with wings to embrace the axle, and being bolted thereto, all being arranged substantially as described.



296,703. BICYCLE-BEARING. OLIVER M. MITCHELL, Providence, R. I. Filed Jan. 17, 1884. (No model.)

Claim.—1. The combination, with the rim B, having the oblique portion *b*, of the split bearing-ring A, provided with threaded ends and the oblique portion *a*, and the nuts C C', arranged and operating as set forth.

2. The combination, with the split-ring bearing A, having the oblique portion *a* and the screw-threads *a'* *a'*, of the rim B, having the oblique portion *b*, the channel *b'*, the pin b^2, and the pivoted arm *c*, and the nuts C C', arranged and operating as set forth.

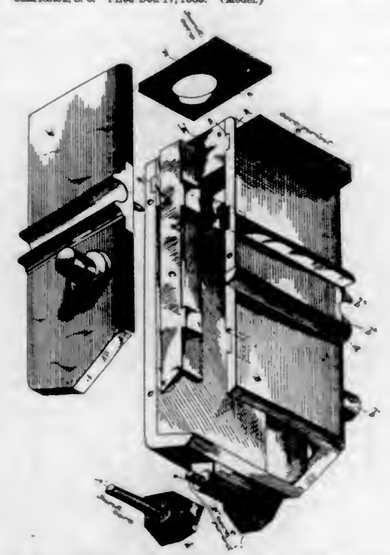
296,704. MAIL-BAG. JAMES B. MURRAY, New York, N. Y. Filed Mar. 5, 1884. (No model.)

Claim.—1. The combination, in a bag, of rigid hooks attached to one side of the bag or to a flap, and adapted, when the bag is closed, to pass through its other side and project, with an independent flexible locking device adapted to be drawn under said projecting hooks, and thereby prevent the opening of the bag, substantially as described.

2. The combination, in a bag, of rigid hooks attached to one side, adapted, when the bag is closed, to pass through its other side and project, with a flanged locking-strap adapted to be drawn under said projecting hooks, thereby preventing the opening of the bag, substantially as described.

3. The combination, in a bag provided with slots near its top, of a flap with rigid hooks attached, adapted, when the bag is closed and the flap folded, to pass through and project beyond the slots, with an independent flexible locking device adapted to be drawn under said projecting hooks, substantially as and for the purposes described.

4. The combination, in a bag provided with slots near its top, of a flap with rigid hooks attached, adapted, when the bag and flap are closed, to pass through and project beyond the slots, with a flanged locking-strap, substantially as and for the purposes set forth.

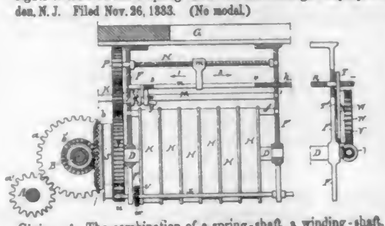


5. The bag *a*, provided with the slots M M, a flap, N, with hooks F F, and the locking-strip D, substantially as and for the purposes described.

296,705. BOTTLE-WRAPPER. JOSEPH M. NOVY and PETER HENRY, St. Louis, Mo. Filed Jan. 14, 1884. (No model.)

Claim.—A wood-veneer bottle-wrapper having corrugations *a a*, extended in concentric curves, as and for the purpose described.

296,706. PATTERN FOR CAR-AXLE BOXES. MICHAEL O'MARA, Charleston, S. C. Filed Dec. 17, 1883. (Model.)



Claim.—1. A pattern for casting car-axle boxes, consisting of the shell B, having one part, *e'*, of the dust-guard box-pattern E, and of the removable rabbet-strip C, the side D, and the separate part E of the dust-guard box-pattern, as shown and described.

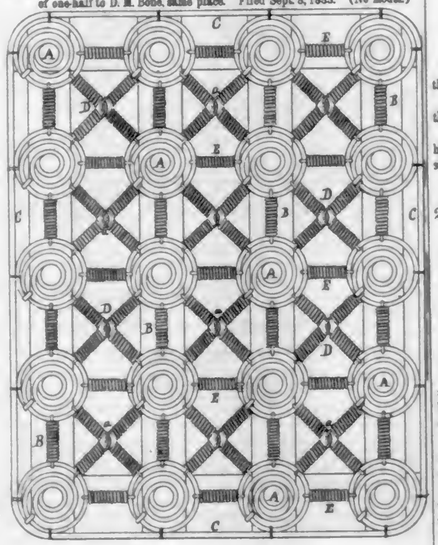
2. A pattern for casting car-axle boxes, consisting of the shell B, having the core-print *e* and one part, *e'*, of the dust-guard box E, and

of the removable rabbet-strip C, the side D, and the separate part E of the dust-guard box-pattern, in combination with the divided dust-guard box-core *n o*, as and for the purpose set forth.

3. A pattern for casting car-axle boxes, consisting of the shell B, having core-prints *c c'* and *e*, one part, *c'*, of the dust-guard box E, and of the removable rabbet-strip C, the side D, and the separate part E of the dust-guard box-pattern, in combination with the divided dust-guard box-core *n o* and the hinge-lug core *h i*, as set forth.

296,707. SPRING-MOTOR. DANIEL M. PFAUTZ, Philadelphia, Pa., assignor to the Automatic Spring Motor Car and Carriage Company, Camden, N. J. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination of a spring-shaft, a winding-shaft, a clutching device whereby the two shafts can be thrown into and out of gear, and clutch-shifting mechanism, substantially as described, operating in unison with the spring-shaft, whereby the latter is thrown out of gear with the winding-shaft when the spring is wound up, as set forth.



2. The combination of the spring-shaft, the winding-shaft, a clutching device whereby the two shafts can be thrown into and out of gear, a screw-shaft, N, geared to the spring-shaft, and having a nut, *m*, and means, substantially as described, whereby the nut is caused to traverse the screw-shaft and actuate the clutch, as set forth.

3. The combination of the spring-shaft D, the winding-shaft M, the clutch *g g'*, the slotted rod A, connected to the movable half of the clutch, the screw-shaft N, and the nut *m* thereon, having a projection adapted to the slot of the bar *h*, as set forth.

4. The combination of the spring-shaft D, a counter-shaft or axle, B, and clutching mechanism whereby the two shafts may be thrown into and out of gear, with a friction-drum secured to said shaft D, and a brake-strap applied to said drum, whereby the shaft can be locked in position when thrown out of gear with the shaft B, as set forth.

5. The combination of the spring-shaft D, having a drum, *p*, the brake-strap *s*, adapted thereto, and the lever *t*, the opposite arms of which are connected to the opposite ends of said brake-strap, as set forth.

296,708. BED-BOTTOM. FRANK J. ROBINSON, Petersburg, Ill., assignor of one-half to D. M. Bone, same place. Filed Sept. 8, 1883. (No model.)

Claim.—In a bed-bottom, the V-shaped springs D D, each consisting of two coiled portions united by a single wire, forming the apex of the spring, looped together in pairs at their apices, in combination with the bed-springs A A, and means for supporting the said bed-springs, substantially as and for the purpose herein specified.

296,709. PROCESS OF SEPARATING PRECIOUS METALS FROM ORES, &c. EDWARD HUBBARD RUSSELL, Park City, Utah. Filed May 28, 1881. (No specimens.)

Claim.—The process of separating from ores and metallurgical products gold, silver, and copper free from lead, which consists in leaching the ore or product with a hyposulphite solution containing a soluble carbonate, substantially as described.

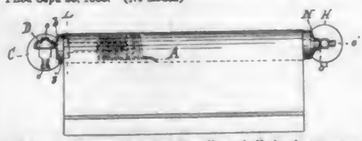
296,710. PROCESS OF SEPARATING METALS FROM ORES AND METALLURGICAL PRODUCTS AND FROM EACH OTHER. EDWARD HUBBARD RUSSELL, Park City, Utah. Filed Sept. 28, 1882. (No specimens.)

Claim.—1. The process of separating precious metals and lead from ores and metallurgical products and from each other which consists in first dissolving out the metals and lead from the ore or product by means of a hyposulphite solution, and subsequently adding to the solution containing the precious metals and the lead a soluble phosphate to cause the precipitation of the lead, substantially as described.

2. The process of separating precious metals and lead from ores and metallurgical products and from each other, consisting in dissolving out from the ore or product both the precious metals and lead by means of a hyposulphite solution, adding to the resulting solution a soluble phosphate to precipitate the lead, and finally removing the solution and precipitating the precious metals therefrom, substantially as described.

3. The process of separating precious metals and lead from ores and metallurgical products and from each other which consists in leaching the ore or product with a hyposulphite solution to dissolve out both the precious metals and lead, adding to the resulting solution a soluble phosphate to precipitate the lead, and finally removing the remaining solution and precipitating the precious metals therefrom, substantially as described.

296,711. SIDE-SADDLE. HENRY RUWART, Jefferson City, Mo. Filed Jan. 29, 1883. (No model.)



Claim.—1. A side-saddle tree having the strainer G countersunk in the side bars, as and for the purpose described.

2. The combination, in a saddle, of the flat-topped side bars, A A, the detachable roll C, and the cover E, substantially as described.

3. The combination of the side bars, A A, the cover B, the detachable roll C, the cover D, the fastenings *c c*, the cover E, and strainer G, substantially as described.

296,712. CURTAIN-FIXTURE. ALVAH SWEETLAND, Syracuse, N. Y. Filed Sept. 25, 1883. (No model.)

Claim.—1. The combination of a roller-spindle having a groove and an adjacent flat surface, and a bolt carried by a roller for locking the same by contact with the groove and the bite of the edge of the groove upon the locking-bolt, substantially as and for the purpose set forth.

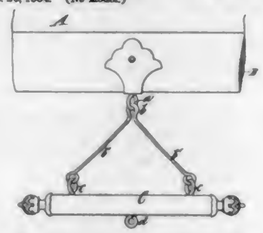
2. The combination of the spindle provided with the groove *a* and adjacent flat surface *c*, the collar E, and bolts *m*, substantially as shown and described.

3. The combination of the spring-roller A, spindle B, collar E, bolts *m*, and ferrule *i*, the spindle and collar being constructed and operating to bite the bolt with the edges of the groove, substantially as specified.

4. The head-bracket C, constructed with a base-screw, F, stem *y*, and studs *o*, provided with a shoulder, *r*, substantially as shown and described.

5. A roller-spindle constructed with hub *x*, having therein a groove, *a*, and adjacent flat surface *c*, a shoulder, *b*, and a semi-spherical head, D, having a hole, *n*, through it, by which the spindle is connected to the bracket and prevented from revolving, substantially as shown and described.

6. The tail-bracket H, constructed with base-screws F, stem *y*, and studs *o' s*, substantially as shown and described.



7. A curtain-fixture consisting of the roller A, spindle B, collar E, bolt-seats *d*, and bolts *m*, engaging with the groove *a* and flat surface *c* of the spindle, the spindle-head D, bracket C, tail-piece N, and bracket H, constructed and operated together, substantially as and for the purposes specified.

8. The spindle B, provided with a head, D, in combination with the bracket C, provided with the studs *o*, and shoulder *r*, substantially as and for the purposes set forth.

9. The perforated semi-spherical spindle-head D, in combination with a bracket having a stud, *s*, constructed substantially as described.

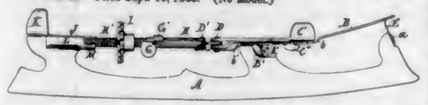
10. In a curtain-roller, the collar E, constructed with bolt-seats *d*, each being on a line tangential to the spindle-hole therein, in combination with locking-bolts *m m*, reciprocating in the bolt-seats, substantially as and for the purposes set forth.

296,713. SHADE-PULL. LUTHER G. TURNER, Torrington, Conn., assignor to the Turner & Seymour Manufacturing Company, same place. Filed Feb. 26, 1884. (No model.)

Claim.—1. The combination, with the bar or rod of a shade-pull, of a wire hanger having diverging arms connected with the bar or rod near opposite ends thereof, substantially as herein described.

2. The combination, with the bar or rod of a shade-pull, and a suspension device for attachment to a shade-stick, of wire arms diverging from said suspension device and connected with said bar or rod near opposite ends thereof, substantially as herein described.

3. The combination, with the bar or rod of a shade-pull, of a wire hanger consisting of an eye, *b*, and arms *b'*, extending therefrom and connected with the bar or rod near opposite ends thereof, substantially as herein described.



4. The combination, with the bar or rod of a shade-pull, of a wire hanger having diverging arms, the ends of which are inserted into and secured in said bar or rod near opposite ends thereof, substantially as herein described.

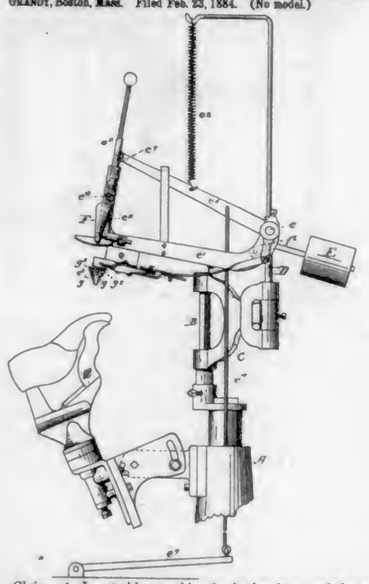
5. The combination, with the tubular bar C, and a core fitting therein, of a wire hanger having diverging arms, the ends of which are inserted into said bar and core near opposite ends of the bar, substantially as herein described.

6. The combination, with the bar or rod of a shade-pull and suspension devices connected therewith near opposite ends, of an eye, *d*, attached to said bar or rod between its two points of suspension, substantially as herein described.

7. The combination, with the bar or rod of a shade-pull, of a wire hanger having diverging arms connected with the bar or rod near opposite ends, and the eye *d*, attached to the bar or rod between the points of connection of the arms, substantially as herein described.

296,714. SKATE. JAS A. WHELPLEY, Greenwich, New Brunswick, Canada. Filed Sept. 15, 1883. (No model.)

Claim.—1. The sole-plate B, formed of a single plate, with the stamped-out portions E and B' at the front and rear, for attachment to a skate-runner, A, substantially as shown and described.



2. The clamps C C, constructed with the buttons C'' and bent edges C', in combination with the lever G and the slotted sole-plate B, when the said clamps are placed above the sole-plate, substantially as set forth.

3. The heel-plate J, constructed as described, with the depression L and projecting piece M, and adapted for attachment to a skate, substantially as set forth.

4. The combination of the heel-plate J, constructed as described, the screw-rod H H', the dog I, and lever G, as and for the purpose set forth.

5. The combination of the heel-plate J, the screw-rod H, the dog I, lever G, clamps C C, and sole-plate B, all substantially as set forth.

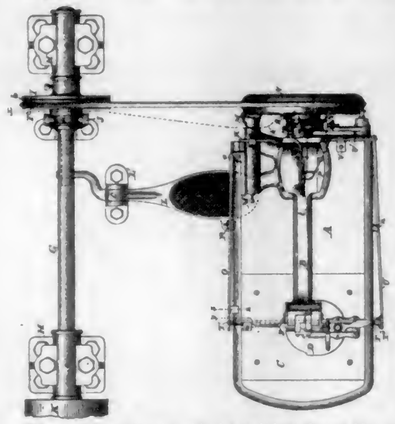
296,715. TACKING-MACHINE FOR LASTING BOOTS OR SHOES. ERASTUS WOODWARD and ROBERT ASHE, Somerville, and EDWARD F. GRANDY, Boston, Mass. Filed Feb. 23, 1884. (No model.)

Claim.—1. In a tacking-machine for lasting boots and shoes, the combination, with a jack, of a tack feeding and driving mechanism, constructed substantially as described, and adapted to be moved by one hand over the surface of the sole of a shoe fixed upon the jack in operative position.

2. In a tacking-machine for lasting boots and shoes, the combination of tack-driving mechanism, the pivoted arm *e'*, and the handle F, all substantially as and for the purposes described.

3. In a tacking-machine for lasting boots and shoes, the combination of the jack for supporting the work, the tack-driving devices supported at the end of a vertically-movable arm, *e'*, a treadle, *e²*, and connecting mechanism whereby upon the movement of the treadle the tack is caused to be driven, all substantially as and for the purposes described.

4. In a tacking-machine for lasting, the combination of a jack for supporting a boot or shoe in the lasting process, tack-feeding and tack-driving devices supported upon the end of a pivoted arm, *e'*, said pivoted arm *e'*, and its movable support, all substantially as and for the purposes described.



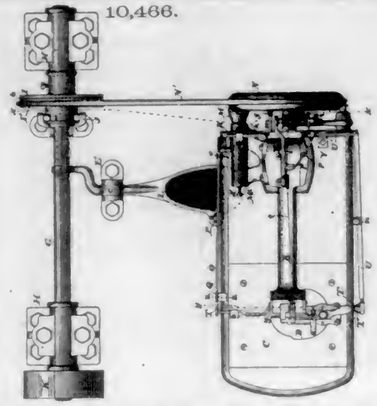
5. In a tacking-machine for lasting, the combination of a jack for supporting a boot or shoe, tack feeding and driving devices, and means, substantially as shown, for moving them vertically in relation to the work, and for holding the nozzle of the tack-driving mechanism in contact therewith during the driving of the tack, and also means for moving said tack feeding and driving devices in a horizontal direction, all substantially as and for the purposes described.

6. That improvement in lasting boots and shoes which consists in placing the last, with the upper and insole thereon, in a fixed and operative position upon the jack, drawing the upper over the insole, holding it in position with one hand, moving the tack feeding and driving mechanism over the face of the sole to the desired point with the other hand, and then driving the fastening.

7. In a tacking-machine for lasting boots and shoes, the combination of a jack adapted to be rotated in a substantially horizontal plane, and nail supporting and driving mechanism, constructed substantially as described, and having both vertical and lateral movements, as specified.

REISSUES.

10,465. BUTTON-HOLE SEWING-MACHINE. FRANK W. CROSS, Lynn, Mass. Filed Dec. 1, 1883. Original No. 279,349, dated June 12, 1883. Division A.



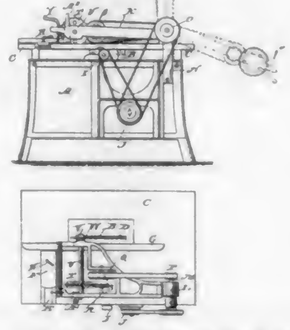
Claim.—1. In combination with a button-hole sewing-machine provided with a vertically-reciprocating needle arranged to descend alternately through the material and through the slit of the button-hole, a fly-wheel, a brake-shoe arranged to engage with said fly-wheel, and to be pressed thereon by a spring, and to be retracted therefrom by the operator, means for automatically locking said brake in said retracted position, and mechanism arranged to operate independently of the movements of the clamping device and automatically release said brake, and adapted to be adjusted to stop the machine at any predetermined point in the movement of the needle, substantially as and for the purposes described.

2. In combination with a button-hole sewing-machine provided with a work-clamping device, the spring-pressed brake-shoe M, the elbow-lever O, the catch Q, the push-pin h h^2, the counter-shaft G, provided with tight and loose pulleys, the shipper J, and the treadle-lever L, connected by the rod P to the lever O, and arranged and adapted to be depressed by the foot and thereby retract the brake-shoe and lock it, substantially as described.

3. In combination with a button-hole sewing-machine provided with a work-clamping device, the brake-shoe M, the elbow-lever O, the catch Q, the push-pin h h^2, the pin *i*, the locking-bolt R R', and an adjustable cam arranged and adapted to be revolved about its axis and to retract the locking-bolt R R' once to every two revolutions of the needle-operating shaft of the machine, substantially as described, for the purposes specified.

4. In a button-hole sewing-machine provided with an automatic stop mechanism, the combination of the vertically-vibrating elbow-lever O, the catch Q, the extensible push-pin h h^2, fitted to slide in a groove in the under side of the work-plate C, and the pin *i* of the work-clamping device D, as a means of operating the stop mechanism, substantially as described.

10,466.



10,466. BUTTON-HOLE SEWING-MACHINE. FRANK W. CROSS, Lynn, Mass. Filed Feb. 6, 1884. Original No. 279,349, dated June 12, 1883. Division B.

Claim.—1. The combination, in a sewing-machine, of a spring-pressed brake-shoe, a lever for retracting said shoe, a catch for locking said lever, a bolt for locking the brake-shoe in a retracted position, a cam or other device for retracting said bolt at regular intervals, a push-rod adapted to disengage the brake-shoe-retracting lever from its catch, a system of levers connecting said push-rod with the thread that supplies the needle, and arranged and adapted to be inoperative while the thread remains taut, and to be acted upon to move said push-rod endwise by the retractive movement of the locking-bolt whenever the thread breaks, substantially as and for the purposes described.

2. The combination of the brake-shoe M, the lever O, the catch Q, the locking-bolt R R', the adjustable screw *s*, the cam S *m*, the rod T, the levers U *p*, the link U', and rod o, all arranged and adapted to operate substantially as and for the purposes described.

3. The combination, in a sewing-machine, of a fly-wheel, a brake-shoe arranged to engage with said fly-wheel, and to be pressed thereon by a spring, and to be retracted by the operator, a device for automatically locking said shoe in its retracted position, mechanism for automatically releasing said brake-shoe independently of the movement of the work-clamp, a mechanism connecting said locking device with a thread-guide, and adapted to be acted upon by said releasing mechanism to release the brake-shoe and stop the machine when the thread breaks, substantially as and for the purposes described.

10,467. FEED MECHANISM FOR CIRCULAR SAWING MACHINES. JOSEPH H. HERMANCE, Toledo, Ohio, assignor to R. S. & R. L. Greenlee, Chicago, Ill. Filed Apr. 4, 1883. Original No. 239,497, dated Mar. 29, 1881. Patented in Canada May 1, 1882, No. 14,712.

Claim.—1. In feed mechanism for circular sawing machines, the feed-wheel consisting of the ratchet-toothed wheel W, having its teeth X beveled on their inner sides from their rear edges downward, forward, and outward, the bevel extending from the point to the base of the tooth, as at Z, so as to form an edge at the inner side of the front of the teeth, and mechanism for operating the same, whereby, should the material to be sawed be too narrow to be engaged by the ends of the teeth, the sharp edges formed by the inner bevels will engage the edge of the material and feed it forward, the tooth-marks being obliterated by the saw-kerf, substantially as specified.

2. In feed mechanism for circular sawing machines, the combination, with the feed-wheel consisting of the ratchet-toothed wheel W, mounted on the transverse shaft V in the hinged frame, and having the inner sides of its teeth X beveled from their rear edges downward, forward, and outward from point to base of the tooth, as at Z, to form an edge at the inner side of the front of the teeth, of the set-screw Y in the frame K, and the guide A^3, fixed on the table, and arranged to prevent the lateral movement of the frame K, and mechanism for operating the feed-wheel in connection with the saw, substantially as specified.

N. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

THE PENNSYLVANIA RAILROAD COMPANY APPELLANT, *v.* THE LOCOMOTIVE ENGINE SAFETY TRUCK COMPANY.

Decided March 3, 1884.

1. NEW USE—OLD PROCESS.

The application of an old process or machine to a similar or analogous subject, with no change in the manner of applying it, and no result substantially distinct in its nature, will not sustain a patent, even if the new form of result has not before been contemplated.

2. SAME—NON-INVENTION.

In trucks already in use on railroad-cars the king-bolt which held the car to each truck passed through a bolster supporting the weight of the car, and through an elongated opening in the plate below, so as to allow the swiveling of the truck upon the bolt and lateral motion in the truck, and the bolster was suspended by divergent pendent links from brackets on the frame, whereby the weight of the car tended to counteract any tendency to depart from the line of the track: *Held*, that a patent for employing such a truck as the forward truck of a locomotive-engine with fixed driving-wheels was void for want of novelty.

3. SMITH—TRUCKS FOR LOCOMOTIVES.

Letters Patent No. 34,377, granted to Alba F. Smith, February 11, 1862, for an improvement in trucks for locomotives, declared void.

APPEAL from the Circuit Court of the United States for the Eastern District of Pennsylvania.

Mr. Justice GRAY delivered the opinion of the Court.

This is an appeal by the defendant below from a decree against it upon a bill in equity for the infringement of letters patent granted on February 11, 1862, to Alba F. Smith for an improvement in trucks for locomotive-engines, the specification annexed to which, except the drawings and the letters referring to them, and the formal beginning and conclusion, was as follows:

Several laterally-moving trucks have heretofore been made and applied to railroad-cars. My invention does not relate, broadly, to such laterally-moving trucks, but my said invention consists in the employment, in a locomotive-engine, of a truck or pilot wheels provided with pendent links, to allow of a lateral movement, so that the driving-wheels of the locomotive-engine continue to move correctly on a curved track in consequence of the lateral movement allowed by said pendent links, the forward part of the engine traveling as a tangent to the curve, while the axles of the drivers are parallel, or nearly so, to the radial line of the curve. In the drawing I have represented my improved truck itself. The mode of applying the same to any ordinary locomotive-engine will be apparent to any competent mechanic, as my truck can be fitted in the place of those already constructed, or the same may be altered to include my improvement.

The specification then refers to the drawings, showing the wheels, the axles, and the frame of any ordinary locomotive-truck, made in any usual manner, with the center cross-bearing plate or platform of two thicknesses of iron plate riveted together, strengthened by cross-bars beneath, and embracing at its ends the upper bars of the frame; a bolster made of a flanged bar, the king-bolt passing through the center of the bolster, and also through an elongated opening in the plate, so as to allow of lateral motion to the truck beneath the bolster, and at the same time becoming a connection to hold the truck to the engine, the bolster taking the weight of the engine in the middle, and itself suspended at the ends of bars attached to the moving ends of pendent links attached by bolts at their upper ends to brackets on the frame, and the distance between the bars, transversely of the truck, slightly more than between the bolts, so that the pendent links diverge slightly. The specification then proceeds:

When running upon a straight road, the engine preserves great steadiness, because any change of position transversely of the track, in consequence of the engine moving over the truck or the truck beneath the engine, is checked by the weight of the engine hanging upon the links, and in consequence of their divergence any side movement causes the links on the side toward which the movement occurs to assume a more inclined position, while the other links come vertical, or nearly so. Hence the weight of the engine acts with a leverage upon the most inclined links, to bring them into the same angle as the others, greatly promoting the steadiness of the engine in running on a straight line. As the pilot or truck wheels enter a curve, a sidewise movement is given to the truck, in consequence of the engine, and drivers continuing to travel as a tangent to the curve of the track. This movement and the slight turn of the whole truck on the king-bolt not only causes the wheels to travel correctly on the track, with their axles parallel to the radial line of the curve of track, but also elevates the outer side of the engine, preventing any tendency to run off the track upon the outer side of the curve. Upon entering a straight track the truck again assumes the central position, and in case of irregularity in the track or any obstruction the truck moves laterally without disturbing the movement of the engine.

I do not claim laterally-moving trucks, nor pendent links, separately considered; but

What I claim, and desire to secure by letters patent, is—

The employment, in a locomotive-engine, of a truck or pilot wheels fitted with the pendent links, to allow of lateral motion to the engine, as specified, whereby the drivers of said engine are allowed to remain correctly on the track, in consequence of the lateral motion of the truck allowed for by said pendent links when running on a curve, as set forth.

The invention, then, as claimed, is for the combination, with a locomotive-engine, of a truck, of which the king-bolt, forming the connection to hold the truck to the engine, passes through a bolster and through an elongated opening in the plate or platform of the truck, so as to allow the truck to have a lateral motion beneath the bolster, and the bolster takes the weight of the engine in the middle, and is suspended from the frame of the truck by pendent and slightly-divergent links, so that any movement of the engine or truck sidewise, as in entering upon or passing over a curve of the track, causes the links on the side toward which the engine moves to assume a more inclined position, and the other links to become nearly vertical, and the weight of the engine, hanging upon the links, checks its own lateral movement and tends to bring both sets of links back to their original angle. In railroad-cars the trucks were allowed to swivel around the king-bolt before 1841. The transverse slot and pendent links, allowing a lateral mo-

tion, were used by Davenport and Bridges in 1841. In 1859 Kipple and Bullock made the pendent links divergent, and at the time of Smith's invention the trucks of railroad-cars had all the elements of the truck put by him under the front of a locomotive-engine. The question, therefore, is whether employing as the forward truck of a locomotive-engine with fixed driving-wheels a truck already in use on railroad-cars has the novelty requisite to sustain a patent.

After carefully considering the evidence and arguments in this case and the reasons assigned for sustaining Smith's patent, in the opinion of the court below, reported in 1 Banning & Arden, 470, and in the opinion rendered by the circuit court in the second circuit in *Locomotive Engine Safety Truck Co.* v. *Erie Railway Co.*, reported in 6 Fisher Pat. Cas., 187, and in 10 Blatchford, 292, this Court finds itself unable to escape from the conclusion that the application of the old truck to a locomotive-engine neither is a new use nor does it produce a new result.

In both engine and car the increased friction against the rails and the danger of being thrown off the track in entering upon or passing along a curve are due to the impulse of forward motion in a direction tangential to the curve and to the influence of centrifugal force. In the engine, as in the car, the object and the effect of the transverse slot allowing a slight lateral motion, and of the divergent pendent links by means of which the weight of the engine or car itself helps to keep it upon the track, are to secure steadiness and safety by lessening the friction against the rails and the danger of being thrown off the track. The only difference is that, by reason of the fixed position of the driving-wheels of the engine, the truck, which has before been applied at each end of a car, can only be applied at the forward end of the engine, and therefore the accommodation of the movement of the engine to the curve of the track may be less complete than in the case of the car. The effect of the invention upon the engine as compared with its effect upon the car is the same in kind, though perhaps less in degree.

It is settled by many decisions of this Court, which it is unnecessary to quote from or refer to in detail, that the application of an old process or machine to a similar or analogous subject, with no change in the manner of application and no result substantially distinct in its nature, will not sustain a patent, even if the new form of result has not before been contemplated. (*Hotchkiss* v. *Greenwood*, 11 How., 248; *Phillips* v. *Page*, 24 How., 164, 167; *Jones* v. *Morehead*, 1 Wall., 155, overruling S. C. nom.; *Livingston* v. *Jones*, 1 Fisher Pat. Cas., 521; *Hicks* v. *Kelsey*, 18 Wall., 670; *Smith* v. *Nichols*, 21 Wall., 112; *Brown* v. *Piper*, 91 U. S., 37; *Roberts* v. *Ryer*, 91 U. S., 150; *Keystone Bridge Co.* v. *Phœnix Iron Co.*, 95 U. S., 274, 276; *Planing Machine Co.* v. *Keith*, 101 U. S., 479, 491; *Pearce* v. *Mulford*, 102 U. S., 112; *Heald* v. *Rice*, 104 U. S., 737, 754–756; *Atlantic Works* v. *Brady*, 107 U. S., 192.)

In the well-known case of *Crane* v. *Price*, in which the English Court of Common Pleas upheld a patent for using anthracite instead of bituminous coal with the hotblast in smelting iron ore, the evidence, as Chief Justice Tindal remarked, proved beyond doubt that in the result of the combination of the hot-air blast with the anthracite not only was the yield of the furnace more and the expense of making the iron less, but "the nature, properties, and quality of the iron were better" than under the former process by means of the combination of the hot-air blast with bituminous coal. (4 Man. & Gr., 580, 604; 5 Scott N. R., 348, 389; 1 Webster Pat. Cas., 393, 410.) And the decision rests, as was pointed out by Chief Baron Pollock and Baron Parke, in *Dobbs* v. *Penn*, (3 Exch., 427, 432, 433,) and by Mr. Justice Bradley in *Hicks* v. *Kelsey*, above cited, upon the ground that a new metal or composition of matter was produced. As observed by Mr. Justice Bradley—

> In compositions of matter a different ingredient changes the nature of the compound; whereas an iron bar in place of a wooden one, and subserving the same purpose, does not change the identity of a machine. (18 Wall., 674.)

So in *Smith* v. *Goodyear Dental Vulcanite Co.* in this Court, as was observed by Mr. Justice Strong in delivering its judgment—

> A new product was the result, differing from all that had preceded it not merely in degree of usefulness and excellence, but differing in kind, having new uses and properties. (93 U. S., 486, 494. See also *Goodyear Dental Vulcanite Co.* v. *Davis*, 102 U. S., 222.)

Upon the principles which must govern this case the decisions of this Court and of the highest courts of England are in full accord, as will appear by referring to three cases, fully argued and considered, all of which were carried to the Exchequer Chamber, and two of which were finally decided in the House of Lords.

In *Bush* v. *Fox* a patent for constructing the interior of a caisson or cylinder with successive chambers to work in, "in such manner that the work-people may be supplied with compressed air and be able to raise the material excavated, and to make or construct foundations and buildings," under water, when a similar apparatus had already been used for working underground on land, was held by Chief Baron Pollock, by the Court of Exchequer Chamber, and by the House of Lords to be void for want of novelty, after able arguments in support of the patent by Sir Alexander Cockburn, then Attorney-General, and by Mr. Webster, the accomplished patent counsel, at the successive stages of the case. (Macrory Pat. Cas., 152, 167, 179; 9 Exch., 651; 5 H. L. Cas., 707.)

So the Court of Queen's Bench held that the finishing of yarns of wool or hair by a process previously applied to yarns of cotton and linen by subjecting them, while distended and kept separate, to the action of rotatory beaters or burnishers, by which they would be burnished or polished on all sides, was not the subject of a patent, because, as Lord Campbell said, in order to sustain a patent for the application of an old process to a new purpose "there must be some invention in the manner in which the old process is applied." "Here there is no novelty in the mode of application," "but merely the application of a known process by a known means to another substance." (*Brook* v. *Aston*, 27 Law Journal (N. S.) Q. B., 145; S. C. 4 Jurist (N. S.) 279; S. C., with the opinion less fully reported, 8 E. & B., 478.) The judgment was unanimously affirmed in the Exchequer Chamber. Of the opinions there delivered it is sufficient to quote from that of Baron Martin, who, after expressing his concurrence in the statement of Mr. Justice Willes in *Patent Bottle Envelope Co.* v. *Seymer*, (28 Law Journal (N. S.) C. P., 22, 24; S. C. 5 C. B. (N. S.,) 164, 173,) that "the application of a well-known tool to work previously untried materials or to produce new forms is not the subject of a patent," added "when a machine is well known it becomes in fact a tool." (28

Law Journal (N. S.) Q. B., 175, 176; 5 Jurist (N. S.,) 1025, 1027.)

But perhaps the most important English case is that of *Harwood* v. *Great Northern Railway Co.*, (2 B. & S., 194, 222, and 11 H. L. Cas., 654.) In that case a patent was obtained for "improvements in fishes and fish-joints for connecting the rails of railways." In the specification the patentee stated that in securing the joints of rails it had been found advantageous to attach to each side of the rails, by means of bolts and rivets, pieces of iron commonly called "fishes," and described his invention as consisting in making the fishes with a groove or recess in their outer surfaces, so as to receive the square heads of the bolts or rivets, and to prevent them from turning round while the nuts on the other side were being screwed on or off, and also to avoid the danger of the flanges of the wheels of the carriages striking against the heads; and he claimed—

> The constructing fishes for connecting the rails of railways with a groove adapted for receiving the heads of the bolts or rivets employed for securing such fishes, and the application of such fishes for connecting the rails of railways.

In an action for the infringement of that patent it appeared that fishes for connecting the rails of railways had never before been made with a groove or recess in their outer surfaces, so as to receive the square heads of the bolts; but it was proved that in the construction of several railway-bridges beams of timber had been laid horizontally one above the other, and fastened or bolted together with bolts and nuts, horizontal bars or plates of iron placed beneath, parallel to and in contact with the beams, and fastened or bolted by the same bolts and nuts, and each of these bars or plates of iron constructed with a groove in its under surface, which received the square heads of the bolts, and which served the double purpose of strength and of preventing the heads of the bolts from turning round. In those bridges there were no joints to be fished by the bars or plates of iron, nor were there corresponding bars or plates of iron above the horizontal beams of timber. But it was also proved that a bridge, known as the "Hackney bridge," having too great a span to be conveniently crossed by a single beam, had been constructed with two horizontal longitudinal beams of timber on each side, the ends of which met and were joined together in the middle of the bridge by scarf-joints; that beneath those beams were transverse planks, constituting the flooring of the bridge, and beneath the planks were bars of grooved iron, like those used in the other bridges, carried under the scarf-joints and under the whole length of the horizontal beams; that above and immediately over each scarf-joint, extending eighteen inches beyond each end of the joint, and resting immediately upon the longitudinal beam, was a horizontal flat plate of iron thirteen feet in length, and that the bolts passed upward through the grooved iron bars, the transverse planking, and the longitudinal beams, and also, at the middle of the bridge, through the plates of iron over the scarf-joints. A verdict supporting the patent was obtained under the rulings of Lord Chief Justice Cockburn and affirmed by the Court of Queen's Bench; but its judgment was unanimously reversed in the Exchequer Chamber in a considered judgment delivered by Mr. Justice Willes, and the judgment of reversal was affirmed by the House of Lords in accordance with the opinions of Lord Chancellor Westbury, Lord Cranworth, and Lord Wensleydale, and of a majority of the judges who attended, upon the ground, as stated by the Lord Chancellor, that the application of the channeled iron horizontally under the timbers of a bridge being well known, "the channeled iron was applied in a manner which was notorious, and the application of it to a vertical fish would be no more than the application of a well-known contrivance to a purpose exactly analogous or corresponding to the purpose to which it had been previously applied." (11 H. L. Cas., 683.) And all who gave opinions in the House of Lords concurred with the Court of Exchequer Chamber in the proposition of law that the mere application of an old contrivance in an old way to an analogous subject, without any novelty in the mode of applying such old contrivance to the new purpose, is not a valid subject-matter of a patent. (2 B. & S., 228; 11 H. L. Cas., 666, 672, 682, 684, 685.)

In the case at bar the old contrivance of a railroad-truck, with the swiveling king-bolt, transverse slot, and pendent divergent links, already in use under railroad-cars, is applied in the old way, without any novelty in the mode of applying it, to the analogous purpose of forming the forward truck of a locomotive-engine. This application is not a new invention, and therefore not a valid subject of a patent.

The decree of the circuit court must therefore be reversed, and the case remanded, with directions to dismiss the bill.

U. S. Circuit Court—Western District of Pennsylvania.

KELLER *et al. v.* STOLZENBACH *et al.*

Decided March 20, 1884.

1. A decree rendered against a plaintiff because of his failure to reply to a plea or set it down for argument is not conclusive, since all the authorities agree that in order to constitute the former judgment or decree a bar it must appear that the point in issue was judicially determined after a hearing and upon consideration of the merits.
2. During the existence of a partnership between two persons one of them invented a machine upon which a patent was granted to him. The firm paid the fees and costs of procuring the patent and the expenses of an experimental trial of the invention, and also paid the expenses of some litigation which ensued. It appeared, however, that all the outlay by the firm was more than repaid by the benefits arising from the use of the invention in the partnership business. *Held*, that upon these facts no implied license arises to the member of the firm not the inventor to make, vend, and use the patented machine after the dissolution of the partnership.

Messrs. Bakewell & Kerr and *Mr. D. F. Patterson* for the complainants.

Mr. G. H. Christy for the respondents.

ACHESON, *J.:*

Nicholas J. Keller, one of the plaintiffs, and Philip M. Pfeil, one of the defendants, entered into partnership on April 26, 1870, in the business of dredging and dealing in sand and gravel, the partnership lasting until April 10, 1875, when it was dissolved by mutual consent. During the existence of the partnership Keller invented a sand and gravel separator, for which letters patent were granted to him on May 21, 1872. With his consent, and at the firm expense, the patented apparatus was put on two boats owned by the firm—one called the "Hippopotamus," the other the

"Rainbow"—and was used thereon without charge during the continuance of the partnership. The firm paid the fees and costs of procuring the patent and the expenses of an experimental trial of the invention, and also paid the expense of some litigation which ensued. The evidence, however, tends to show that this outlay was more than made good by the advantage and benefits accruing to the firm from the free use of the invention on said boats. Upon the dissolution of the firm, each partner took at an agreed value one of the boats—Keller the "Hippopotamus," Pfeil the "Rainbow"—each then having the patented machine thereon. A contest immediately arose as to the right of Pfeil to use the patented machine on the "Rainbow," and Keller filed a bill in this court to restrain such use, alleging that the privilege had not passed with the boat. The decision of the court, however, was against him, and his bill was dismissed. Subsequently Pfeil built another boat, called the "Wharton McKnight," and placed and used thereon the patented apparatus. Thereupon Keller filed in this court another bill against Pfeil and his associates to restrain the infringement of his patent. To this bill the defendants filed a plea setting up the same matters of defense now relied on. To this plea the plaintiff did not reply, nor did he set down the same for argument. Wherefore a decree dismissing the bill was entered under and in the terms of the thirty-eighth rule in equity, viz:

> If the plaintiff shall not reply to any plea, or set down any plea or demurrer for argument on the rule-day when the same is filed, or on the next succeeding rule day, he shall be deemed to admit the truth and sufficiency thereof, and his bill shall be dismissed as of course, unless a judge of the court shall allow him further time for the purpose.

The defendants plead the decree entered under this rule in bar of so much of the present bill as relates to the "Wharton McKnight" or the use of the patented invention thereon. Whether this position is well taken is the first question in the case. That such decree is not conclusive is, I think, evident from the authorities, they all agreeing that in order to constitute the former judgment or decree a bar it must appear that the point in issue was judicially determined after a hearing and upon consideration of the merits. (1 Gr. on Ev., secs. 529, 530; Story's Eq. Pl., sec. 793; *Badger* v. *Badger*, 1 Cliff., 237, 245; *Haves* v. *Tiernan*, 53 Pa. St., 192; *Hughes* v. *United States*, 4 Wall., 232.)

In *Homer* v. *Brown* (16 How., 354) it was held that a judgment of non-suit, entered upon an agreed statement of facts submitted to the court for decision, was not a bar to a subsequent suit between the same parties and for the same cause of action. Says Mr. Justice Clifford in *Badger* v. *Badger*, *supra*:

> If the order of dismission was not upon the merits of the bill, it matters not whether it was with or without the consent of the complainant.

And Mr. Justice Field says in *Hughes* v. *United States*, *supra*:

> If the first suit * * * was disposed of on any ground which did not go to the merits of the action, the judgment rendered will prove no bar to another suit. (4 Wall., 237.)

Now, the primary purpose of rules of court being to regulate the practice and promote the dispatch of business, the intention to create an estoppel ought not to be lightly imputed to the rule now under consideration. Such effect, it seems to me, is foreign to the object to be subserved. True, the rule declares that the plaintiff so in default "shall be deemed to admit the truth and sufficiency" of the plea; but this implied admission is merely for the occasion and to open the way for a decree of dismission "as of course," without trial, hearing, or adjudication, a decree which is the equivalent of a judgment of non-suit at law for want of a narr or other default of a like nature.

It appears that the defendants are not only using the invention on the "Wharton McKnight," but that they have built another boat, the "Little Ike," upon which they intend (it is admitted) placing and using a sand and gravel separator constructed pursuant to Keller's patent; and they defend, generally, upon the ground that Pfeil is invested with a license to make, use, and sell the patented machine. No express license is shown, and none is asserted in view of the proofs. The defendants stand on the implied license. But if such license exists, it must spring from the facts heretofore stated—viz, the invention by Keller during the partnership between him and Pfeil, the free use, with Keller's consent, by the firm of the patented apparatus upon their boats, and the payment by the firm of the fees, costs, and expenses of procuring the patent, &c. But I cannot see that these facts afford any solid foundation for the defense set up.

In *McWilliams Manufacturing Co.* v. *Blundell* (11 Fed. Rep., 419) upon a substantially similar state of facts, it was held that the firm could make no claim to the patent, and after dissolution an injunction to restrain infringement issued against the late partner. Here the merit of the invention is Keller's exclusively. He is indebted to Pfeil for no ideas or suggestions. The letters patent were never treated as partnership property. At the dissolution of the firm the partners made a schedule of the firm assets at agreed valuations with a view to a division, but the patent was not in that schedule. The claim which Pfeil then asserted was the right to use the patented apparatus with which the "Rainbow" was equipped. To that extent his demand was reasonable and just, and it was sustained. But now he practically insists upon an equitable ownership in the patent, for he claims the unlimited right, individually and in connection with his present partners, to make, use, and vend the patented apparatus. But no express agreement is shown whereby the firm or Pfeil acquired any interest in the patent. If the firm paid the expenses connected with the issue of the patent, &c., they received a full equivalent in the use of the invention upon their two boats free of royalty; and in the absence of direct proof of any other or greater right in the firm, none is fairly inferable from the facts as they appear.

Our conclusion that Pfeil's right to use the invention is limited to the construction on the "Rainbow" finds support in adjudged cases. (*Brickill* v. *Mayor, &c., of New York*, 7 Fed. Rep., 479; *Wade* v. *Metcalf*, 16 Id., 130.) Nor does this view conflict with the decisions cited by the defendants. In the nature of the case (the invention being a process) the presumed license in *McClurg* v. *Kingsland* (1 How., 202) was unlimited and justly so under the circumstances.

In *Chabot* v. *American Button-Hole, &c., Co.* (6 Fisher, 71) the facts were not only substantially similar to those in *McClurg* v. *Kingsland*, but there was the additional element of an express contract, the terms of which greatly strengthened the presumption of an unrestricted license. The subject-matter of the patent in Slemmer's Appeal (58 Pa. St., 155) was a process which, if legally the invention of one partner, was in fact the result of partnership labor, experiment, and development; and the dealings of the partners with each other had been of such a character that it would have been grossly inequitable to deny to any of them the right to use the invention.

In *Kinny's Patent Button-Holing Co.* v. *Somervell et al.* (38 Law Times R., 878) the partnership was formed for the sole purpose of working the patented invention and had been conducted for several years, during which time the partner whom it was attempted arbitrarily to enjoin had aided in perfecting the invention and invested his capital in the business. It was a clear case (as was Slemmer's Appeal) of a dedication of the use of the invention to the partnership without limit as to time. But of any such dedication of Keller's patent there is a lack of evidence, and the equity of Pfeil is fully satisfied by the use of the patented apparatus on the "Rainbow."

Let a decree be drawn in favor of the plaintiffs, in accordance with the views expressed in this opinion.

Patents on Electricity.

The Patent Office has prepared, and has now for sale, an Index (arranged alphabetically, numerically, and by classes) of all patents relating to Electricity granted by the United States prior to June 30, 1882, comprising about four thousand patents, and making a volume of two hundred and fifty pages.

The price, in paper cover, is $3 per volume; bound, $5 per volume.

Issue of April 15, 1884.

DESIGNS.

14,957.—ACE OF SPADES FOR PLAYING-CARDS.—*Adolph Binkert*, Philadelphia, Pa., assignor to *Caterson, Bretz & Co.*, same place. Application filed March 13, 1884. Term of patent 3½ years.

14,958.—ORNAMENTATION OF SEWING-MACHINES.—*William Haehnel*, New York, N. Y., assignor to *Palm & Fechteler*, same place. Application filed February 21, 1884. Term of patent 7 years.

14,959.—FONT OF PRINTING-TYPE.—*Charles E. Heyer*, Chicago, Ill., assignor to *Arthur M.* and *Alson E. Barnhart*, both of same place. Application filed July 16, 1883. Term of patent 14 years.

14,960.—ORNAMENTATION OF TABLE-WARE.—*Charles A. May*, Trenton, N. J., assignor to *Joseph Burroughs* and *Elijah Mountford*, both of same place. Application filed October 29, 1883. Term of patent 7 years.

14,961.—PHOTOGRAPHIC-ALBUM LEAF.—*Stephen Meers*, Brooklyn, N. Y. Application filed March 7, 1884. Term of patent 14 years.

14,962.—ORNAMENTATION OF TABLE-WARE.—*Elijah Mountford* and *Charles A. May*, Trenton, N. J., assignors to said *Mountford* and *Joseph Burroughs*, same place. Application filed October 29, 1883. Term of patent 7 years.

14,963.—FONT OF PRINTING-TYPE.—*John K. Rogers*, Brookline, Mass. Application filed March 3, 1884. Term of patent 3½ years.

14,964.—FONT OF TYPE.—*John K. Rogers*, Brookline, Mass. Application filed March 15, 1884. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

11,086.—SOAP.—*James Armstrong & Co.*, Baltimore, Md. Application filed March 6, 1884.

"The representation of two horseshoes with the heels together."

11,087.—METALLIC PENS.—*George D. Barnard & Co.*, St. Louis, Mo. Application filed March 7, 1884.

"The arbitrary word-symbol 'VULCAN.'"

11,088.—VELVETS, VELVETEENS, VELVETAS, AND SIMILAR PILE FABRICS.—*Charles E. Bruce*, Brooklyn, N. Y. Application filed February 28, 1884.
"The word 'WONDERFUL.'"

11,089.—WATER-PROOF CLOTHING.—*John F. Carter*, Beverly, Mass. Application filed March 14, 1884.
"The representation of a lozenge, or a four-sided figure having two of its angles acute and the other two obtuse."

11,090.—SPRING-BALANCE SHADE-ROLLERS.—*Charles H. Cushman*, Boston, Mass. Application filed May 25, 1883.
"The arbitrary words 'CUSHMAN'S KNAPP,' printed in white characters on a shaded ground, representing a six coil spring-roller."

11,091.—FRENCH AND OTHER FINE CANDY.—*Darby & Co.*, Baltimore, Md. Application filed February 28, 1884.
"A boating scene. In the foreground is a body of water having on it a sail-boat and a pair of swans, in the background foliage, and on the right a cupid flying."

11,092.—SLEEVE-BUTTONS, COLLAR-BUTTONS, AND STUDS.—*Howard & Son*, Providence, R. I. Application filed February 23, 1884.
"'WORLD,' either expressed as a word or pictorially."

11,093.—CONDITION-POWDERS.—*Stephen Jennings*, Boston, Mass. Application filed March 3, 1884.
"The words 'SHERIDAN'S CAVALRY.'"

11,094.—OLIVE-OIL SOAP.—*Liebman & Butler*, Brooklyn and New York, N. Y. Application filed February 28, 1884.
"The word 'VIRGIN.'"

11,095.—ROASTED COFFEE.—*Ricker & Lee*, Galveston, Tex. Application filed March 12, 1884.
"The representation of a negro carrying a tray bearing a coffee-pot, cream-pitcher, sugar-bowl, and coffee cups and saucers."

11,096.—MEDICINE FOR THE CURE OF FEMALE DISEASES.—*C. F. Simmons & Co.*, St. Louis, Mo. Application filed December 29, 1883.
"The arbitrarily-selected words 'LA PROVIDENCIA,' in connection with the picture of a cactus."

11,097.—SAFETY-MATCHES.—*Trummer & Co.*, London, England. Application filed March 3, 1884.
"The word 'NITKDALS,' united with the arbitrary symbol of a giraffe."

11,098.—WHITE SEWING-MACHINES.—*The White Sewing Machine Company*, Cleveland, Ohio. Application filed March 3, 1884.
"The words and letters 'WHITE SEWING MACHINE CO., CLEVELAND, O., U. S. A.,' arranged in an elliptical band encircling a nude figure bearing a flowing scarf with the inscription 'WHITE PAR EXCEL.'"

11,099.—BICALCIUM ACID LACTATE.—*Avery Lactate Company*, Boston, Mass. Application filed March 8, 1884.
"The representation of a cow."

11,100.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"The letters 'C. S. I.'"

11,101.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"The words, letters, and sign 'J. CLARK & CO.'"

11,102.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed February 20, 1884.
"The word-symbol 'RACER.'"

11,103.—CIGARS.—*Frederick Glahn*, Green Bay, Wis. Application filed February 19, 1884.
"The arbitrarily-selected letter-symbol 'K. P.' in connection with the picture of a man in the uniform of a Knight of Pythias arranged within a triangle."

11,104.—BEER AND OTHER MALT AND ALCOHOLIC LIQUORS.—*Grande Société Française de Distilleries, Malteries, et Brasseries*, Paris, France. Application filed July 13, 1883.
"The representative symbol of a comet and the word 'COMÈTE.'"

11,105.—CORDIALS AND LIQUORS.—*Les Héritiers de Marie Brizard et Roger, M. B. Glotin, Achard & Glotin*, Bordeaux, France. Application filed March 19, 1884.
"The representation of a distilling apparatus."

11,106.—LIQUORS AND CORDIALS.—*Les Héritiers de Marie Brizard et Roger, M. B. Glotin, Achard & Glotin*, Bordeaux, France. Application filed March 19, 1884.
"The words 'MARIE BRIZARD & ROGER' and peculiar forms of scroll-work printed in silver and blue on a white ground."

11,107.—CORDIALS AND LIQUORS.—*Les Héritiers de Marie Brizard et Roger, M. B. Glotin, Achard & Glotin*, Bordeaux, France. Application filed March 19, 1884.
"The representation of a distilling apparatus and the words 'MARIE BRIZARD & ROGER, BORDEAUX.'"

11,108.—BAKING-POWDER.—*William Prescott*, Cambridgeport, Mass. Application filed December 19, 1883.
"The portrait of William Prescott and the word 'EXCELSIOR.'"

11,109.—SHIRTS, DRAWERS, AND OVERALLS.—*Joseph Rice* and *Israel D. Lees*, Philadelphia, Pa. Application filed March 7, 1884.
"The word 'CRESCENT' or the representation of a crescent."

11,110.—CIGARS AND CIGARETTES.—*Herman Segnitz & Co.*, Milwaukee, Wis. Application filed February 26, 1884.
"The words 'THE TRAVELER.'"

11,111.—PHOSPHATE FERTILIZERS.—*Shroff & Co.*, Leesburg, Va. Application filed February 27, 1884.
"The word 'KETOCTIN.'"

11,112.—SMOKING-TOBACCO.—*The Wellman & Dwire Tobacco Company*, Quincy, Ill. Application filed February 16, 1884.
"The words 'STANDARD TIME' and the arbitrary symbol of a clock."

11,113.—UNFERMENTED GRAPE-JUICE.—*August Werner*, New York, N. Y. Application filed March 11, 1884.
"The words 'GRAPE CREAM.'"

LABELS.

4,051.—Title: "ANTIFERMENTINE" (FOR A CHEMICAL POWDER.)—*The Antifermentine Company, (Limited.)* New York, N. Y. Application filed March 22, 1884.

4,052.—Title: "91,895 NINETY-ONE, EIGHT NINETY-FIVE. COUGH MIXTURE."—*M. J. Breitenbach*, New York, N. Y. Application filed March 22, 1884.

4,053.—Title: "TRUE AND ORIGINAL TRIPLE LEAF BRAND BAY RUM."—*D. Brilles*, New York, N. Y. Application filed February 28, 1884.

4,054.—Title: "PETROLEUM SOAP."—*George C. Buntin* and *James A. Draper*, Terre Haute, Ind. Application filed March 19, 1884.

4,055.—Title: "IMPERIAL VEGETABLE BLOOD AND LIVER PILLS."—*Reason Drake*, La Grange, Ind. Application filed March 19, 1884.

4,056.—Title: "SYRINGE."—*Albert H. Essex*, Fall River, Mass. Application filed March 22, 1884.

4,057.—Title: "BOTANIC SARSAPARILLA."—*G. R. Finlay & Co.*, New Orleans, La. Application filed March 25, 1884.

4,058.—Title: "ARTIST'S EYE LOTION."—*L. Fuller*, New York, N. Y. Application filed March 22, 1884.

4,059.—Title: "ELPHIN HAIR RESTORER."—*L. Fuller*, New York, N. Y. Application filed March 22, 1884.

4,060.—Title: "THE ORIGINAL PERFECT FITTING WAUKENPHAST." (FOR BOOTS AND SHOES.)—*Hubert Gardiner*, Philadelphia, Pa. Application filed March 17, 1884.

4,061.—Title: "SEAL ROCK SPRING WATER."—*Silas Gurney*, Boston, Mass. Application filed March 20, 1884.

4,062.—Title: "LIBERTY" (FOR TIP-LININGS FOR HATS.)—*Francis G. Hanson*, Brooklyn, N. Y. Application filed March 24, 1884.

4,063.—Title: "STAR BUTTER" (FOR CRACKERS.)—*G. W. Heathman & Co.*, Dayton, Ohio. Application filed March 22, 1884.

4,064.—Title: "CONGRESS HALL," (FOR CIGARS.)—*Louis Kuhn*, Baltimore, Md. Application filed March 25, 1884.

4,065.—Title: "DIAMOND," (FOR BITTERS.)—*Herbert W. Lake*, Waterbury, Conn. Application filed March 25, 1884.

4,066.—Title: "FABRICE PARIS" (FOR GLOVES.)—*Langfeld, Lichten & Co.*, Philadelphia, Pa. Application filed March 25, 1884.

4,067.—Title: "CHAUTAUQUA BAKING POWDER."—*Arthur S. McCall*, Jamestown, N. Y. Application filed March 25, 1884.

4,068.—Title: "CHARMING BELLE" (FOR FLOUR.)—*Meyer & Bulte*, St. Louis, Mo. Application filed March 17 1884.

4,069.—Title: "GOYNE'S GREAT BLOOD REMEDY."—*George Twigge Miller, Charles Edmund Gilbert, Edward James McGehee*, and *Louis Breard*, Perry, Ga. Application filed March 22, 1884.

4,070.—Title: "MAY BLOSSOM." (FOR CIGARS.)—*M. Richardson & Son*, Elmira, N. Y. Application filed March 24, 1884.

4,071.—Title: "SCHRODER'S MEDICATED PAD."—*John A. Schroder*, Dayton, Ohio. Application filed March 20, 1884.

4,072.—Title: "SCOTT'S COCA BEEF AND IRON WITH PHOSPHORUS."—*Charles W. Scott*, Kansas City, Mo. Application filed March 20, 1884.

4,073.—Title: "CLENZENE" (FOR SOAP OR SAPONACEOUS MATTER.)—*Alonzo Burton Simonds*, New York, N. Y. Application filed March 19, 1884.

4,074.—Title: "SPERRY'S GERMEA FOR BREAKFAST," (FOR FLOUR.)—*S. W. Sperry*, San Francisco, Cal. Application filed March 20, 1884.

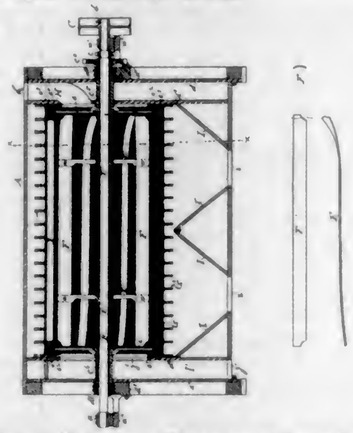
4,075.—Title: "STEWART'S A. Q. C." (FOR A MEDICAL COMPOUND.)—*J. A. Stewart* and *M. R. Stewart*, Conyers, Ga. Application filed March 4, 1884.

4,076.—Title: "DOCTOR WILLIAMS' HUMALICO." (FOR A MEDICAL COMPOUND.)—*Wm. D. Vail & Co.*, Greenbush, N. Y. Application filed March 19, 1884.

4,077.—Title: "WEEKS' WORM POWDERS."—*James E. Weeks*, Jersey City, N. J. Application filed March 18, 1884.

4,078.—Title: "SILVER DUST POLISHING POWDER."—*James T. White*, Philadelphia, Pa. Application filed March 19, 1884.

4,079.—Title: "PROCTER'S INSECT POWDER."—*John H. Winkelmann*, Baltimore, Md. Application filed March 25, 1884.

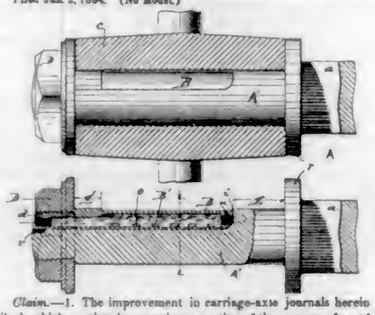


4,080.—Title: "PROCTER'S LIQUID GLUE."—*John H. Winkelmann*, Baltimore, Md. Application filed March 25, 1884.

4,081.—Title: "FLEMING'S TEA BERRY TOOTH POWDER."—*John H. Winkelmann*, Baltimore, Md. Application filed March 25, 1884.

PATENTS

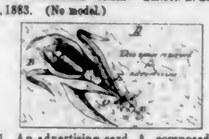
GRANTED APR. 15, 1884.



296,716. FLOUR-SIFTING MACHINE. FRANZ WILHELM ANDREE, Chicago, Ill. Filed Aug. 2, 1883. (No model.)

Claim.—1. The combination of the bolt or screen G, shaft B, and sleeves c^2 c^3, provided with the radiating arms *e*, having peripheries *e'*, with the circular plates c^4 c^4, formed with grooves c^5, and the outer beaters, D, substantially as described and shown.

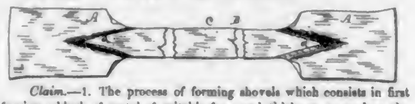
2. The bolt or screen G, shaft B, hube E, radiating arms E', concaved on their outer ends, and beaters or strips F, in combination with the sleeves c^2 c^3, provided with radiating arms *e*, having peripheries *e'*, circular grooved pieces c^4 c^4, outer beaters, D, and means for rotating said shaft and the beater-carrying sleeves at different speeds, substantially as described and shown.



296,717. SELF-OILING AXLE. ELIJAH P. BAKER, Olneyville, R. I. Filed Jan. 2, 1884. (No model.)

Claim.—1. The improvement in carriage-axle journals herein described, which consists in removing a portion of the upper surface of the journal, said cut extending from the outer end of the axle to or nearly to the collar, and adapted to receive a chambered and apertured oil-receiver, the outer end of the latter being provided with a screw-thread, thereby adapting the receiver to be retained in position by means of the axle-nut, all substantially as shown, and for the purpose set forth.

2. In a carriage-axle journal, cut away as shown and described, the removable chambered and apertured oil-receiver B, provided with means for retaining the same in position laterally, and further provided at its outer end with the threaded portion *b*, adapted to engage with the axle-nut, substantially as shown and set forth.

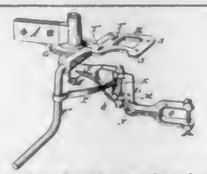


296,718. ADVERTISING-CARD. BENSON D. BALDWIN, Chicago, Ill. Filed Feb. 9, 1883. (No model.)

Claim.—1. An advertising-card, A, composed of paper or other suitable material, having the design of a flower, B, thereon, a part of the face of the card being adapted to receive advertisements, the card being cut through at points E over the flower, in combination with the bottle C, inserted in the card through the cut portions, so that the body of the bottle forms the stamen of the flower, and adapted to contain perfume, substantially as described, and for the purpose set forth.

2. An advertising-card composed of paper or other suitable material, having the design of a flower thereon, a part of the face of the card being adapted to receive advertisements, the card being cut through at points on or over the flower, in combination with a bottle adapted to contain perfume, inserted in the card through the cut portion, so that the body of the bottle forms the stamen of the flower, the bottle being secured to the card by a ribbon or string, all substantially as described, and for the purpose set forth.

296,719. PROCESS OF FORMING SHOVELS. ELMORE A. BARNES, Pittsburg, Pa. Filed Sept. 17, 1883. (No model.)



Claim.—1. The process of forming shovels which consists in first forging a block of metal of suitable form and thickness to produce the required shape and size of rolled blade-blanks, with a socket parting or cavity therein, then rolling the said block to a uniform thickness double the required thickness of the shovel-blade, or thereabout, and then completing the blade-blank by inserting it between revolving rolls from the discharge side thereof, to reduce the same, the said rolls having recesses for forming the re-enforced portion over the socket of the blade.

2. The improved process of forming shovels which consists in first forging a block of metal of suitable form and thickness to produce the required shape and size of rolled blade-blank, with a socket parting or cavity therein and the upper ends of the strap part united, then rolling the said block to a uniform thickness double the required thickness of the shovel-blade, or thereabout, and then completing the blade-blank by inserting it between revolving rolls from the discharge side thereof, to reduce the same, the said rolls having recesses for forming the re-enforced portion over the socket of the blade.

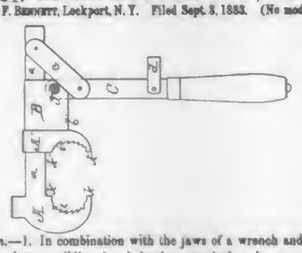
296,720. WHEEL-PLOW. JOHN W. BARTLETT, Moline, Ill., assignor to the Moline Plow Company, same place. Filed Oct. 26, 1883. (No model.)

Claim.—1. A frame carrying a mold-board plow and provided with rear sustaining-wheels, in combination with a swiveled leading-wheel arranged to travel in the preceding furrow, an independently-

296,720.

swiveling draft device, and an adjustable connection, substantially as described, whereby the draft device and wheel may be maintained in fixed relations to each other while in action, but an angular adjustment of one with respect to the other permitted at will, whereby the leading-wheel may be caused to travel constantly in one line or another with respect to the line of draft.

2. The draft-frame, the plate connected thereto by the king-bolt, the axle extending through the plate, the tongue-plate journaled on the axle, the draft devices connected to the king-bolt, and the connection between the draft devices and axle, said parts being combined substantially as described.



3. In combination with the draft-frame, and the axle connected therewith by the king-bolt, the draft-arm mounted on the lower end of the king-bolt, and the adjustable bar or brace connecting the draft-arm with the outer end of the axle.

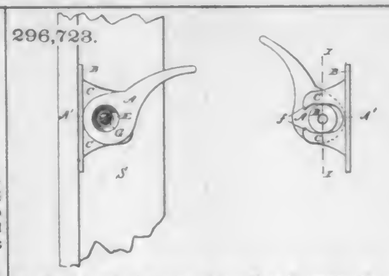
4. In a draft mechanism for a wheeled plow, a swiveling axle, a tongue, connecting devices whereby the tongue is caused to turn the axle, draft devices adjustable laterally around the pivot of the axle, and adjustable connections between said draft devices and the axle, substantially as described, whereby the wheel is caused to follow the line of draft and the lateral adjustment of the draft devices permitted.

5. In a wheeled plow, the axle movable around a vertical pivot, combined with a draft-arm movable independently around the same pivot, and intermediate devices for securing the lateral adjustment of the draft-arm with respect to the axle, substantially as shown.

6. In combination with a plow-carrying frame having sustaining-wheels at the rear, a leading-wheel mounted on a swiveling axle and adapted to travel in the preceding furrow, a horizontally-swiveling draft device, an adjustable connection whereby the wheel and draft device may be adjusted and fixed in position with respect to each other, as described, and a pole or tongue fixed to the swiveled axle by devices substantially as described, and adapted to permit a horizontal angular adjustment of the tongue with respect to the wheel and draft devices, whereby the angular positions of the tongue, wheel, and draft devices may be varied independently of each other, or fixed while in action.

296,721. SELF-ADJUSTING FULCRUM-LEVER WRENCH. BENJAMIN F. BENNETT, Lockport, N. Y. Filed Sept. 3, 1883. (No model.)

Claim.—1. In combination with the jaws of a wrench and a main bar, *a*, the short or sliding bar *b*, having attached to its rear end the movable lever-handle bar C, and with the fulcrum side braces, *c*, all arranged and operating substantially as specified.



2. In a wrench, the combination of the jaws, long bar *a*, short movable bar *b*, with jointed handle-bar, C, plate B, metallic fulcrum side braces, *c c*, and loop *d*, all arranged and operating substantially as specified.

296,722. FIRE-PROOF PAPER. D. AUSTIN BROWN, Boston, Mass. Filed Oct. 6, 1883. (No specimens.)

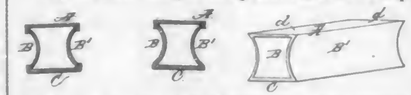
Claim.—As an improved article of manufacture, a fire-proof or non-conducting paper composed of asbestus and infusorial earth, substantially as herein described.

296,723. SASH-HOLDER. SETH A. BROWN, Buffalo, N. Y. Filed Oct. 22, 1883. (No model.)

Claim.—A sash-lock consisting of the pressing-plate B, having the separate parallel arms C C, provided with the projections F F, in combination with a cam-lever, A, having the eccentric portion or cam A' and a boss or projection, D, the latter being concentric to the pivot G,

and provided with a depression or recess, E, on its opposite side, to receive the screw-head.

296,724. TOY AND ADVERTISING MEDIUM. LEE S. BURRIDGE and NEWMAN R. MARSHMAN, New York, N. Y. Filed Nov. 15, 1883. (No model.)



Claim.—1. As an advertising medium, any figure, A, having one or two pivoted parts, F F, the wire C, and the small figure or object E, all substantially for the purpose described.

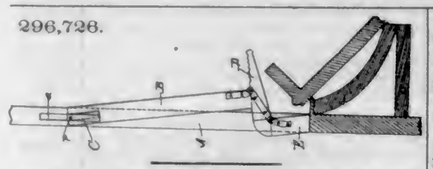
2. As a toy, any figure, A, shown on a flat surface, having one or two hinged parts, F F, the wire C, and the small figure or object E, likewise shown on a flat surface, all substantially for the purpose as shown and described.

296,725. RAILWAY-TIE. WILLIAM T. CARTER, Newark, N. J. Filed Oct. 31, 1883. (No model.)

Brief.—A hollow railway-tie having concave sides and a flat top.

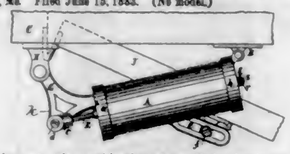
Claim.—1. As a new article of manufacture, a hollow railway-tie having concave sides, as specified and set forth.

2. The combination, in a hollow railway-tie, of the curved and concave sides and flat top or bearing surface, as specified and set forth.



296,726. MUSIC-DESK FOR PIANOS. MILO J. CHASE, Richmond, Ind. Filed Aug. 14, 1883. (No model.)

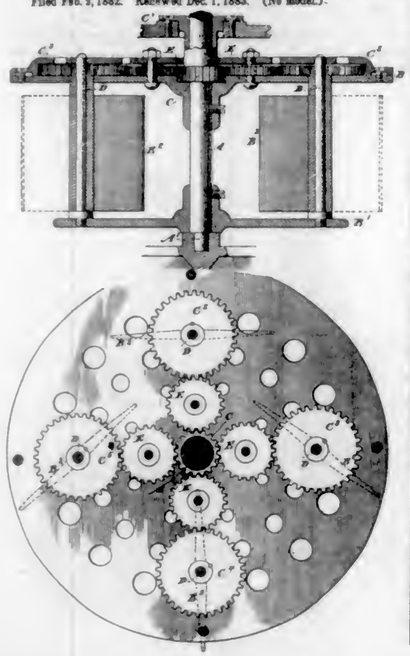
Claim.—1. A music-rack for upright pianos, consisting of a rack pivoted in the upright frame and to a ledge also pivoted in the frame, the connection being such as to permit the rack and ledge to be folded together in a vertical plane when out of use, substantially as set forth.



2. In a piano music-rack, the rack B, pivoted by a sliding connection to the piano-frame, in combination with a ledge, D, pivoted to the piano-frame and swinging outward, substantially as and for the purpose specified.

296,726.

296,727. PNEUMATIC DOOR-CHECK. WALTER C. CLARK, Auburndale, Mass., assignor to the Shaw Door-Check and Spring Company, Portland, Me. Filed June 15, 1883. (No model.)

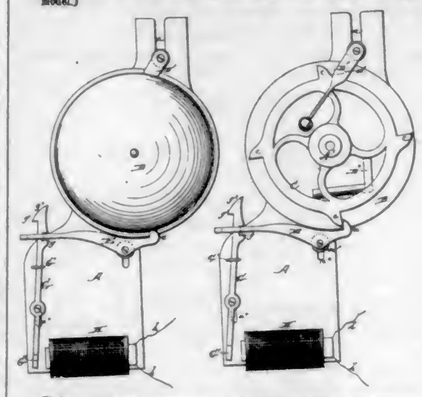


Claim.—1. The combination of a cylinder having a piston and spring therein, and pivoted at one end to the door-frame, with a lever pivoted at one end to the door-frame, having at the other end a slot, *e*, into which a stud on the door extends, and having an arm, K, to which the outer end of the piston-rod is pivoted, said arm being formed with said lever as an integral part thereof, substantially as and for the purpose set forth.

2. In combination with the disk *g*, forming part of a piston in a pneumatic door-check, and having an opening, *l*, a disk, *j*, of leather or of other pliable material, having an opening, *k*, substantially as and for the purpose set forth.

3. In a pneumatic door-check, the combination of the disk *g*, having an opening, *l*, valve *j*, of leather, or of material having like pliability, having opening *k*, cup-packing A, having one or more openings, *m*, and disk and nut *i*, having one or more openings, *n*, substantially as described.

4. In combination with the cap *b* of the cylinder, having one or more openings, *p*, the disk *q*, of felt or other suitable material, the washer *r*, and screw *s*, to form an adjustable vent and muffler, substantially as set forth.



296,728. SUBMERGED FEATHERING PADDLE-WHEEL. ALFRED CLOUGHLY, Long Branch, N. J., Executor of TRUMAN A. COOK, deceased. Filed Feb. 9, 1882. Renewed Dec. 1, 1883. (No model.)

Claim.—1. In a submerged wheel for propelling boats or vessels, the combination of a central vertical shaft, A, a fixed non-revolving gear-wheel, C, intermediate revolving wheels, E E E E, rotating propelling-blades B^2, which revolve upon shafts D, fixed on the disk of the wheel, gear-wheels C^2, C^3, C^4, and C^5, which drive the propeller-blades, and a chambered disk, B, which incloses all of the gear-wheels, substantially as and for the purpose set forth.

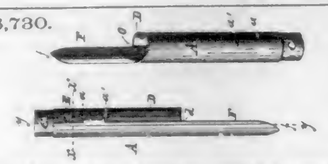
2. In a submerged wheel for propelling vessels, the combination of a central rotating shaft, A, fixed gear-wheel C, four intermediate revolving wheels, E E E E, blade-propelling wheels C^2, C^3, C^4, and C^5, the propelling-blades B^2, revolving upon fixed shafts, and the shafts D, which form bearings for the entire length of the blades, the arrangement of the parts being substantially as described, whereby the blades are maintained in their proper positions with reference to the path of the vessel, as set forth.

296,729. ELECTRIC CALL-BELL. GEORGE P. CONANT, Geneva Lake, Wis., assignor, by direct and mesne assignments, of one-half to Albert E. Lytle and Robert B. Smith, both of Chicago, Ill. Filed July 5, 1883. (No model.)

Claim.—1. In an alarm or signal bell, a call-wheel having arms or projections adapted to actuate the bell-hammer, in combination with an actuating drum or wheel upon the same shaft, formed with an angular recess, one arm of which contains a spring, and an angular pawl adapted, when placed in this recess, to engage with the arms or spokes of the call-wheel, substantially as shown and described.

2. In an alarm or signal bell, a bell, a vibrating hammer formed with a projection on its shank or arm, and a revolving striking or call wheel provided with a series of arms or projections, in combination with a vibrating lever having one end formed with a hook adapted to engage the call-wheel, an armature-lever adapted to engage with the vibrating lever, and an electro-magnet, substantially as and for the purpose set forth.

3. In an alarm or signal bell, the call-wheel C, formed with projections *c*, and the hooked escape-lever E, having a slot, *e'*, through one end, in combination with the lever G, formed with notch *g*, projection *g'*, and beveled nose g^2 upon one end, and carrying the armature G' upon the other, and the electro-magnet H, all constructed and arranged to operate substantially as and for the purpose set forth.



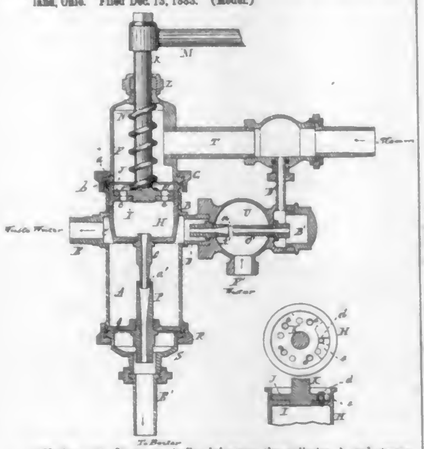
4. In an alarm or signal bell, the call-wheel C, having projections *c*, and the hooked escape-lever E, in combination with the spring-actuated drum B upon the same post as the call-wheel, and provided with the angular recess *b'*, spring *b'*, and angular pawl B^2, substantially as and for the purpose set forth.

5. In an alarm or signal bell, the base A, formed with slots a' a^2 a^4, post A', carrying the gong D, drum B, and call-wheel C, and the hammer D', formed with a projection, *d*, in combination with the escape-lever E, having hook *e* and slot *e'*, armature-lever G, having upon one end the armature G', and the other formed with the notch *g* and beveled nose g^2, the spring G^2, and the electro-magnet H, all constructed and arranged to operate substantially as and for the purpose set forth.

296,730. COMBINED PENCIL-SHARPENER, ERASER, &c. JOHN A. COOK, Buffalo, N. Y. Filed Jan. 14, 1884. (No model.)

Claim.—1. An improved article of manufacture, consisting of a tube having a knife-blade rigidly secured on one end thereof, said blade being fixed to one side of the end of said tube and projecting beyond said end, whereby the pencil may be inserted into the knife end of the tube, the pencil secured, and the edges and point of the knife protected, substantially as specified.

296,730.

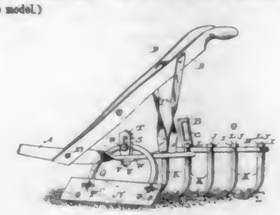


2. An improved article of manufacture, consisting of a tube having a knife-blade transversely curved and rigidly secured on one end thereof, said blade being fixed to one side of the end of the tube and projecting beyond said end, substantially as described, and for the purposes set forth.

3. The tube A, having the lip *e* formed integral therewith, in combination with the eraser and cushion C, substantially as described, and for the purposes set forth.

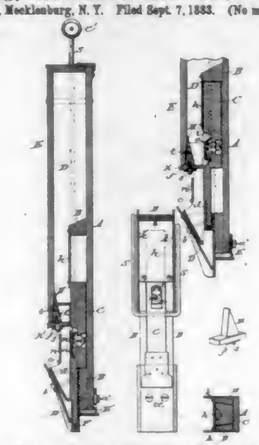
4. The blank A, for a combined pencil-holder and penknife, adapted to be formed into tubular shape, substantially as described, said blank consisting of the main portion A, having slots *a a'*, starting from the points *g g'* on one edge of said blank, the projection *e*, and the lance-shaped projection F, as specified and explained.

296,731. STEAM-BOILER INJECTOR. WILLIAM W. COWLEY, Cleveland, Ohio. Filed Dec. 13, 1883. (Model.)



Claim.—1. In steam-boiler injectors, the cylinder A and steam-chamber F, connected to each other in the relation shown and described, said cylinder having therein a steam-chamber, H, provided with a diaphragm or valve-seat, having therein steam-ports *c*, rotating valve provided with steam-ports *c'*, arranged to register with the ports *c* of the diaphragm or valve-seat, separating the interior of the steam-chamber from the interior of the cylinder, valve-stem, and spring constructed and arranged to co-operate, substantially as set forth, and for the purpose specified.

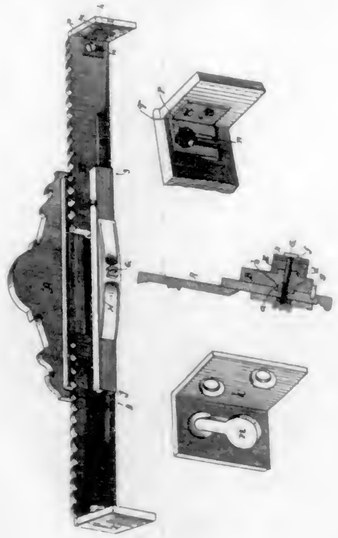
2. The arrangement and combination of the steam-chamber F, steam-chamber B', pipe T, pipe D', and hollow globe provided with an inlet for the passage of water therein, substantially as herein set forth.



3. The cylinder A, provided with an enlargement forming an interior recess around the steam-chamber H, inlet B, and waste-water pipe, substantially as herein set forth.

296,732. CULTIVATING HARROW AND SCRAPER. WILLIAM R. CRAIG, Columbia, Tenn. Filed June 15, 1883. Renewed Mar. 13, 1884. (No model.)

Claim.—The combination of the beam having one or more vertical perforations, a vertically-slotted plate having a screw-threaded shank, nutted to said beam, a bail bolted adjustably to said slotted plate and straddling the beam, and a scraper having slots through which pass bolts, by which it is connected adjustably to the ends of the said bail, as set forth.

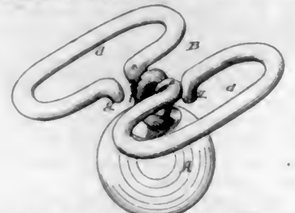


296,733. HAND CORN AND SEED PLANTER. FRANK EUGENE CULVER, Mecklenburg, N. Y. Filed Sept. 7, 1883. (No model.)

Claim.—The combination of the socket B, having a mortise with inclined sides through it, the plunger C, having in its upper portion a tenon, to fit and reciprocate in the mortise, main board A, inclined wedge H, plate A, eyelet-guides *e e*, and the metallic link S, substantially as specified.

296,734. CORNICE. WALLACE H. DODGE, Mishawaka, Ind. Filed Apr. 16, 1883. (No model.)

Brief.—An extensible window-cornice having an ornamental center-piece, two wing-pieces, and return end pieces. The wing-pieces are securely fastened to the center-piece by a clamping-bar, and is itself strengthened by a washer or plate concaved on its inner or under side.

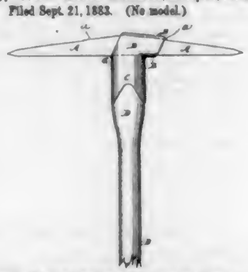


Claim.—1. The center-piece A, wings B B, clamping-piece E, and screw G, combined with the plate H, substantially as and for the purposes set forth.

2. The center-piece A, provided with the groove *a*, the wings B B, provided with piece *b* and ribs *d*, combined with clamping-piece E, provided with groove *f*, the plate H, as described, and the bolt G, substantially as set forth.

3. The wing-piece B, provided with rabbet *q*, and the detached return-piece I, combined with the angle-plate *k*, provided at one end with means for permanent attachment with said return-piece, and at the other end with the slot *n*, adapted to slip over and fit the screws *p* and hold said return-piece against the shoulder of said rabbet, as set forth.

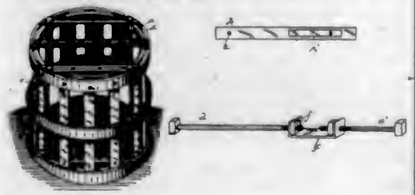
296,735. BUTTON-FASTENER. WALLACE H. DODGE, Mishawaka, Ind. Filed Sept. 24, 1883. (No model.)



Claim.—1. A wire button-fastener constructed with the central part, *e*, to hold the button-eye, and the T-head portions *d d*, curved around, substantially as shown, whereby the terminals are brought close to the part *e*, as described, to prevent displacement of the button-eye.

2. A wire button-fastener with the central part, *e*, and the T-head portions *d d*, the terminals being brought around close to the part *e*, and one or both of them turned downward, as at *g*, substantially as described.

3. A wire button-fastener having the central part, *e*, with the depressed bend *i*, and the T-head portions *d d*, having the terminals bent around near to the part *e*, and bent downward, as at *g*, substantially as and for the purpose described.

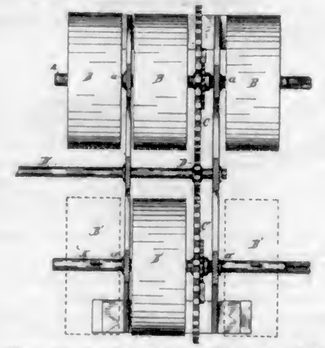


296,736. PICK. GEORGE W. ELLIOTT, Liverpool, County of Lancaster, England. Filed Sept. 21, 1883. (No model.)

Claim.—1. In combination with the handle, the tapered socket overhanging the handle on one side only, its larger end being next the handle, as described and shown.

2. In a pick, a blade-socket formed with stout curved sides, capable of giving slightly when the tapering blade is forced into the socket with great force, whereby a constant grip is maintained by the socket upon the blade, substantially as described.

296,737. KNOCKDOWN CRATE. JOEL A. H. ELLIS, Beaver Falls, Pa. Filed July 18, 1883. (No model.)



Claim.—1. A hoop for barrels, casks, or crates, which consists of an inner section, *a*, and an outer section, *a'*, said sections riveted together and provided with intermediate blocks, *b*, having stave-openings between them, substantially as and for the purposes described.

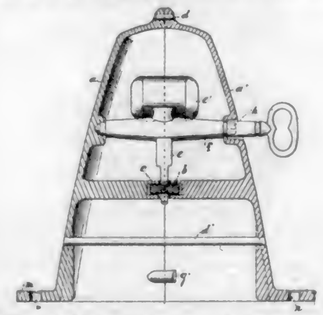
2. In knockdown crates, the staves A, provided with lateral cleats A', said cleats adapted to hold the hoops in their proper relative positions, substantially as and for the purposes described.

3. In knockdown crates, the combination, with the heads, staves, and hoops, of the bolts *d d'*, the connecting-iron *f*, and the nuts *f''*, substantially as and for the purposes set forth.

296,738. SPRING-MOTOR. JOSEPH W. FAWKES, Oak Park, Ill. Filed Feb. 23, 1884. (No model.)

Claim.—1. A spring-motor comprising a series of co-operating springs, and having a part of said springs made detachable, for the purpose of adapting said motor to render different quantities of power, substantially as shown and described.

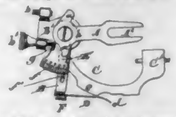
2. In a spring-motor, a shaft, A or A', bearing a series of co-operating springs, a part of which springs are adapted to be disengaged for the purpose of deriving different quantities of power from said motor, substantially as shown and set forth.



3. In a spring-motor, a shaft, A or A', having its bearings at such distance from its ends as to adapt said ends to receive one or more springs, substantially as and for the purposes set forth.

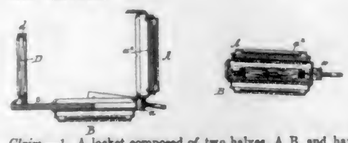
4. In a spring-motor, a shaft, A, and rod *b*, each having its bearings at such distance from its ends as to adapt said shaft and rod to receive one or more springs, B, substantially as shown and described.

5. A spring-motor comprising a series of co-operating shafts, A A', each bearing a series of detachable or removable springs, substantially as and for the purposes specified.



6. In a spring-motor, a series of shafts, A A', arranged about a central transmitting-shaft, D', said shafts A A' each bearing a series of detachable or removable springs, substantially as shown and set forth.

296,739. HITCHING-BLOCK. FRANKLIN GIFFORD, Springfield, Ohio, assignor to Joseph G. Jacobs and Christian Hanika, both of same place. Filed Oct. 13, 1883. (No model.)

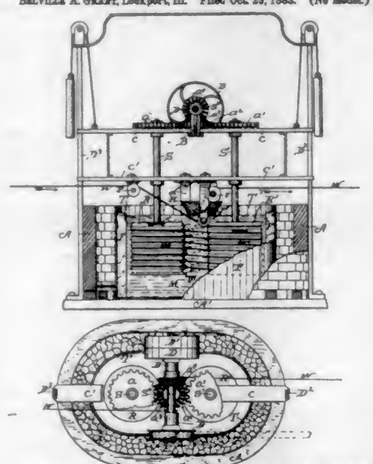


Claim.—A stationary hitching device having a casing, *a a'*, a weighted lever, *c c' f*, a slide-bolt, *b i*, working in slideways in said casing, and a key for actuating said bolt, substantially as and for the purpose specified.

296,740. RUFFLING ATTACHMENT FOR SEWING-MACHINES. HARRY C. GOODRICH, Chicago, Ill. Filed Aug. 11, 1883. (Model.)

Claim.—An arm, H, having its acting end provided with projections *a a'*, in combination with an arm, B, carrying a ruffling-blade and having adjusting devices, gage E, and frame or support C, substantially as described.

296,741. LOCKET. FORREST B. GOULD, Boston, Mass. Filed Feb. 27, 1884. (No model.)

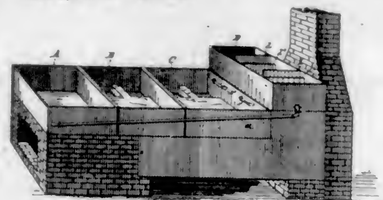


Claim.—1. A locket composed of two halves, A B, and having a slide-plate provided with a pivoted frame, *d*, the said locket and pivoted frame being adapted to receive a magnifying-glass and a picture to be magnified, the glass and frame being made movable with relation to each other, to place the picture and the magnifying-glass at the proper focal distance apart, substantially as described.

2. A hinged locket having one of its halves or sections adapted to receive and hold a picture or other object to be magnified, the other half or section being provided with a slide-plate, and an attached magnifying-glass hinged or pivoted to said slide-plate, substantially as shown and described.

3. A hinged locket having its half or section A provided with a picture-holder, *a*, and the half-section B provided with the guideway *b*, and having the beveled slide or movable plate *c* therein, and the frame *d*, having the magnifying-glass D, and hinged to said slide *c*, all substantially as described, and for the purpose set forth.

296,742. APPARATUS FOR GALVANIZING AND COATING WIRE. BELVILLE A. GRANT, Lockport, Ill. Filed Oct. 29, 1883. (No model.)



Claim.—1. The combination of the furnace A, vat T, having the vertical projecting ribs or flanges F F, vertical grooved drums R and R', shafts S and S', sliding frame *c c'*, ports D^2 and D^3, pinions *a a' a²*, sheaves P and P', *v* and *v'*, bevel-gear a^3 and a^4, shaft S'', and pulleys D and E, all adapted to operate as and for the purpose set forth.

2. In a wire-galvanizing apparatus, the grooved drums R and R', and the means whereby said drums are rotated within the vat T in the molten galvanizing metal M, to propel the wire *w* through the galvanizing material, in combination with the vat T, substantially as set forth.

3. The combination of the vat T, having the vertical ribs or flanges F, grooved drums R and R', shafts S and S', sliding frame *c c'*, ports D^2 D^3 pinions *a a' a²*, and sheaves P, P', *v*, and *v'*, as and for the purpose set forth.

4. In a wire-galvanizing apparatus, the combination of the vat T, vertical grooved rollers or drums R and R', adapted to rotate within the vat T, and the means described for rotating and holding said drums in a vertical position, as and for the purpose set forth.

296,743. SUGAR-EVAPORATOR. GUSTAVE H. GREEN, Hudson, Ohio. Filed Apr. 5, 1883. (No model.)

Claim.—1. In an evaporating apparatus, the combination, with a heater, D, having a corrugated or depressed bottom, of the wings *d*, *d'*, and *d''*, extending alternately nearly across the same from opposite sides, and the tubes d^2, d^3, and d^3, connecting said corrugated or depressed portions together and arranged on opposite sides, substantially as shown, and for the purpose set forth.

2. In a system of evaporating-pans, the sleeve G, coupling the pans in such a manner that any pan can be removed without disturbing the other pans, and preventing the liquid from boiling over from one pan to another, substantially as and for the purpose set forth.

3. In an evaporizing apparatus, the combination, with a heater, of the container E, the enlarged chamber *e*, the double lever F, and the sleeve *f*, substantially as and for the purpose shown and described.

4. In a system of evaporating-pans provided with siphons for conveying liquid from one pan to another, a covering of gauze or other suitable material placed over the ends of the siphon-tube, making the siphon portable without reversing, and also straining the juice in its passage from one pan to another, substantially as and for the purpose shown and described.

5. The combination, with the float *f'*, of the vertical perforated plate *f²* and the forked lever f^3, substantially as shown and described.

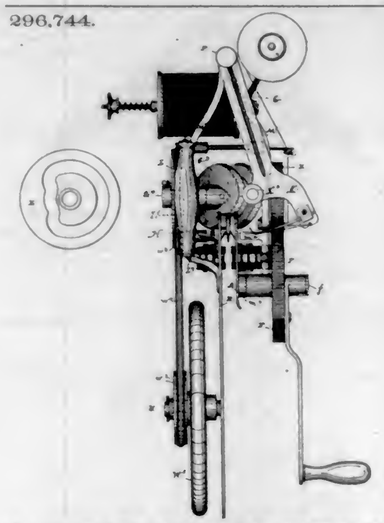
6. In a system of evaporating-pans provided with a deep pan in front and pans of less depth in the rear, the shallow pans made with one broad side suitable for attaching to the deep pan, thus making the rear pans interchangeable, and saving material in the construction of the shallow pans, substantially as and for the purpose set forth.

7. In the process of sugar-evaporating, the removing of a pan from the arch when it has become coated with deposit, and so placing it that the warm sap will flow through it in some part of the process, thereby dissolving the sediment or deposit, so that it can easily be removed from the pan, substantially as described, and for the purpose specified.

8. In a system of evaporating-pans provided with a heater, the combination, with the tubes d^2 and d^3, of the removable partitions T, that may be used in any or all of the corrugations of the heater, substantially as shown and described.

296,744. CARPET-SEWING MACHINE. GEORGE GRIBEL, Oakland, Cal. Filed May 31, 1883. (Model.)

Brief.—The machine is designed to ride upon the edges of the material to be united and stitch them together, and to have the capacity to work on both heavy or thick and light or thin material. Pawls are carried by arms that are oscillated by means of a rock-shaft. These pawls engage serrated portions on feed-rollers. The rollers are urged by a spring to grasp the material operated upon, and by their intermittent rotation produce the feed.



Claim.—1. The combination of the arched bracket M, parallel plates A B, having transverse needle-apertures *b b*, cut-away sides, and blocks C D, with the feed and stitch-forming devices carried thereby, substantially as described.

2. The combination, with the plates A B, having needle-throats, of the needle-arm G, pivoted in the top of the bracket M, and needle secured in the lower end of the needle-arm below the cam, the transverse shaft having needle-actuating cam G^3 and looper-cam L, and means for rotating said shaft, constructed as described.

3. The combination, with the plates A B, having transverse needle-throats and cut-away sides, of the transverse shaft G^4, carrying the needle-actuating cam G^3, and the oscillating needle-arm G, having a center of motion above the shaft, and bracket-arms M' M', united at the top and forming the support for the pivot of the needle-arm at that point, substantially as described.

4. The combination of the frame A B, oscillating needle-arm G, driving-gears F and *x*, cam G^3, transverse shaft G^4, cams L W, and

296,744.

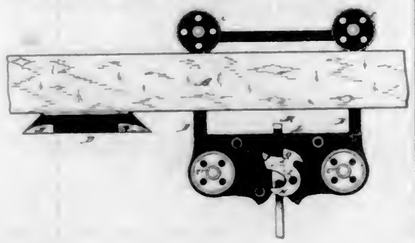
the balance-wheel W' upon the side of the frame opposite to the driving-gear, and connections between the parts, substantially as described.

5. The horizontal rock-shaft T, levers T' T', feed-pawls T^2 T^2, springs T^3, and means for operating the rock-shaft, combined with the feed-levers and feed-rollers, substantially as described.

6. The parallel plates A B, connected together only at their upper outer corners, in combination with the arched bracket M, having lugs m^2 m^2, and with the feeding and stitch mechanisms carried thereby, substantially as set forth.

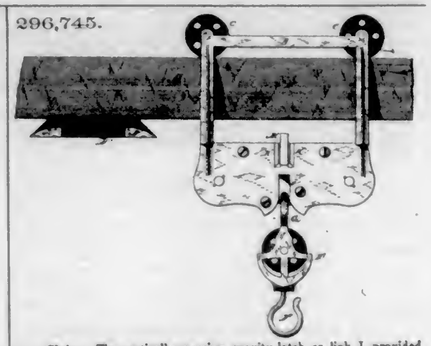
7. The combination, with the parallel plates A B, having cut-away sides, and connected together only at their upper outer ends, of the blocks C D, one fixed and the other adjustable, and the stitch-forming and feeding mechanisms, substantially as described.

8. The combination, with the parallel plates A B, having cut-away sides, and connected together only at the outer corners, of the adjustable and removable turning-in guide D, substantially as described.



9. The combination, in a suitable frame, of the pivoted feed-levers, carrying revolving feed-rollers S, with ratchet portions s^2 formed in the center of the rollers, with feed portions on each side, the vibrating levers and pawls T' T^2, and mechanism for actuating said levers and pawls, substantially as described.

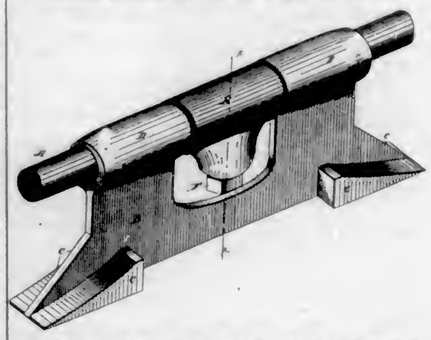
10. In a carpet-sewing machine, the combination, with the feed-operating mechanism, of revolving feed-rollers having feeding portions, S, and the intermediate ratchet portion, s^2, formed in the center of the rollers between the two feed portions, substantially as described.



11. The roller-carrying levers pivoted to the frame, having thumb-pieces R', arms R R, and hub I, and the revolving feeding-rollers, in combination, substantially as described.

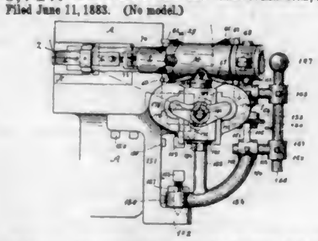
12. The automatic yielding gripper-feed, consisting of the combination of the pivoted levers R R, revolving feeding-rollers S, having central ratchet portions, s^2, spring U, feed-pawls T^2, and mechanism for actuating said pawls simultaneously, substantially as described.

296,745. HAY-CARRIER. CHARLES A. GUTENKUNST, Milwaukee, Wis. Filed Sept. 10, 1883. (No model.)



296,745.

Claim.—The vertically-moving gravity latch or link J, provided with arms M M, in combination with a single retaining-hook, H, provided with shoulder O, said arms M M being adapted to engage upon the inclined lugs N N upon the respective sides of the bracket D as the carriage approaches said bracket from either side, and drop between and be retained by said inclined lugs while the tackle and fork are being elevated, substantially as and for the purpose specified.



296,746. ADJUSTABLE STOP FOR HAY-CARRIERS. WILLIAM GUTENKUNST, Milwaukee, Wis. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination of the rod or cable way A, carriage-stop B, provided with loosely-fitting supporting-sleeves D D, and retaining-block E, provided with set-screw F, substantially as and for the purpose specified.

2. The combination, with a rod or cable way, A, of the stop E, provided with set-screw F, and carriage-stop B, provided with loosely-fitting sleeves D D, and at its respective ends with the angular lugs C C, substantially as set forth.

296,747. NAIL-PLATE FEEDER. JOHN F. HAMMOND, Omaha, Nebr. Filed June 11, 1883. (No model.)

Claim.—1. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar, means, substantially as described, whereby said collar is sustained and made radially adjustable upon the machine-bed, and the rocking barrel-yoke, to reciprocate said

barrel, substantially as set forth.

2. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar, means, substantially as described, whereby said collar is sustained and made radially adjustable upon the machine-bed, the rocking barrel-yoke, and the pivoted frame to sustain said yoke, substantially as set forth.

3. The combination, with the machine-bed, the reciprocating barrel, and the encompassing-collar journaled upon the machine-bed, of the rocking barrel-yoke and the pivoted frame which sustains said yoke, substantially as described.

4. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar having lateral journal-extension thereon, means, substantially as described, whereby said collar is sustained and made radially adjustable upon the machine-bed, the rocking barrel-yoke, and the pivoted frame about which said yoke journals, substantially as set forth.

5. The combination, with the reciprocating barrel and the rocking barrel-yoke, of the pivoted frame upon which said yoke is sustained, and mechanism, substantially as described, to hold the pivoted frame adjustably and rigidly in position, substantially as set forth.

6. The combination, with the machine-bed and its reciprocating barrel, of the rocking barrel-yoke sustained in ball-and-socket journal, whereby said yoke may easily adapt itself to the radial adjustment of the barrel about the machine-bed, substantially as described.

7. The combination, with the reciprocating barrel and the rocking barrel-yoke, of the pivoted frame upon which said yoke journals, and a link-bar to hold said frame adjustably and rigidly in position about the machine-bed, substantially as described.

8. The combination, with the reciprocating barrel and the rocking barrel-yoke, of the pivoted frame upon which said yoke journals, an arm extending therefrom, and a link-bar adjustably secured to said arm, substantially as described.

9. The combination, with the arms 154, having journal-eyes 162 thereon, of the adjustable spindle 163, which sustains the rocking barrel-yoke, substantially as described, so that its center of oscillation may be shifted in angular relation to the pivot-centers 23 and 183, substantially as set forth.

10. The combination, with the reciprocating barrel and the barrel-yoke, of the adjustable spindle, between which and said yoke there is a ball-and-socket joint to permit of free oscillations of the yoke, substantially as described.

11. The combination, with the pivoted frame having movable spindles 163, of the ball-spindle 166, adjustable therein, the rocking barrel-yoke socketed to said ball-spindle, and the reciprocating barrel, substantially as described.

12. The combination, with the reciprocating barrel K, and with the barrel-yoke joined pivotally thereto, of the ball-bearing to freely sustain yoke G in oscillating position, substantially as described.

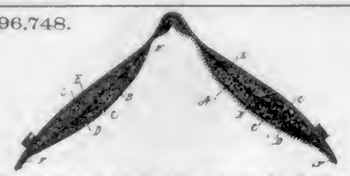
13. The combination, with the reciprocating barrel, of the rocking barrel-yoke having journal-box 169 and adjusting-block 170, and the ball-bearing 167, constituting with said box and block a ball-and-socket joint to sustain the barrel-yoke in manner free to oscillate, substantially as described.

14. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar, and means, substantially as described, whereby said collar is sustained and made radially adjustable upon the machine-bed, substantially as set forth.

15. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar, and means, substantially as described, whereby said collar is sustained and made radially and laterally adjustable upon the machine-bed, substantially as set forth.

16. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar having long journal-extension thereon, the bearing-box to receive said journal, and means, substantially as described, whereby said box is retained in radial adjustment upon the machine-bed, substantially as set forth.

17. The combination, with the machine-bed and the reciprocating barrel, of the encompassing-collar and the laterally-adjustable bearing-box to sustain said collar, substantially as described.

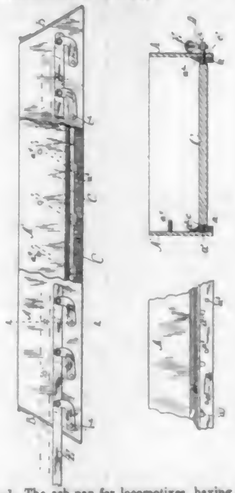


18. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar, the laterally-adjustable bearing-box to sustain said collar, and the yoke and clamp-screw to retain said box in desired adjustment, substantially as set forth.

19. The combination, with the machine-bed and with the reciprocating barrel, of the encompassing-collar, the bearing-box to sustain said collar, the base-plate, and a curved lug located between and co-operating with said base-plate and machine-bed to permit the radial adjustment of the reciprocating barrel, substantially as described.

296,748. HARNESS-PAD. JULIUS C. HARPHAM, Peoria, Ill. Filed Nov. 13, 1883. (No model.)

Claim.—1. In a harness-pad constructed, essentially, of two pieces of skin retaining the wool or hair, the wool sides being turned toward each other, the herein-described intermediate piece or partition of paper,

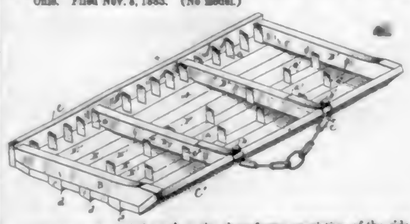


296,748.

cloth, or other suitable material, substantially as and for the purpose set forth.

2. As an improvement in harness-pads, the combination of two pieces of tanned skin retaining the wool or hair, the wool or hair sides being turned toward each other, an intermediate partition of paper, cloth, or the like, and a covering of patent-leather, enameled cloth, or equivalent material, substantially as and for the purpose set forth.

296,749. ASH-PAN FOR LOCOMOTIVES. ELI S. HART, Clinton, Iowa. Filed Dec. 27, 1883. (No model.)



Claim.—1. The ash-pan for locomotives, having a bottom composed of slats hinged by end pivots located near their longitudinal edges, and swinging upward within the pan, and devices for operating said slats, located in a plane above the bottom of the pan, substantially as specified.

2. In a locomotive ash-pan, a series of slats forming a close flat bottom when closed, swinging upward within the pan, and hinged by end pivots located near their longitudinal edge, in combination with operative devices located above the bottom of the pan, substantially as specified.

3. In an ash-pan, the combination, with the slats and means for operating the same, of the stops a^3, substantially as specified.

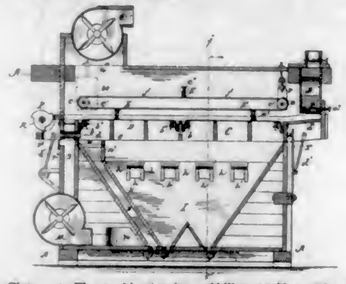
4. In an ash-pan, the combination, with the slats and means for operating the same, of the stops a^4, substantially as specified.

296,750. CLOD-CRUSHER. WILLIAM HENRY HARTSELL, Pikeville, Ohio. Filed Nov. 8, 1883. (No model.)

Claim.—In a clod-crusher, the drag-frame consisting of the side pieces or beams, B B', the intermediate beams, D D', the strips C C',

and the alternating strips E E', secured to the under faces of the beams, the lower faces of the strips E projecting below the strips E', and having rearwardly-inclined lower faces, in combination with the rearwardly-curved knives secured in slots in the strips E E', and the draft-chain secured to the beams D D', substantially as specified.

296,751. PENCIL SHARPENER AND HOLDER. THOMAS HOLDSWORTH, West Winsted, Conn. Filed Apr. 24, 1883. (No model.)



Claim.—1. As a new article of manufacture, the combined pencil sharpener and holder, consisting of sharpener *a*, tubes *b c*, and a means to attach the same to a frame or desk, substantially as shown.

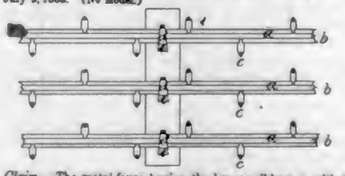
2. As a combined pencil sharpener and holder, a V-shaped roughened part and one or more tubes secured together and provided with wings *d*, to secure the device to a slate-frame, substantially as shown.

3. The pencil-sharpener *a*, in combination with wings *d*, adapted to secure the sharpener to a slate or desk, substantially as shown.

296,752. MIDDLINGS-PURIFIER. ANDREW HUNTER, Chicago, Ill. Filed Sept. 19, 1883. (No model.)

Claim.—1. The combination, in a middlings-purifier, of the shaker C, the side bars, F, and bolts H, and a series of interrupted or open brushes, E E E, having extension ends adapted to slide on said bars and operate successively upon different parts of the upper surface of said shaker, substantially as described.

2. The combination, in a middlings-purifier, of suction-fan O, the casing and inner walls forming the space S, the shaker C, graded silk D, feed-trough B, and tubes *d*, arranged for partially supplying suction-fan O with air, substantially as described.

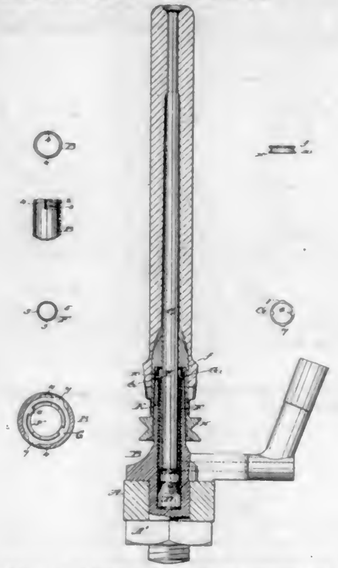


3. The combination, in a middlings-purifier, of the shaker C, sectional graded silk D, having looped sides *c*, clamps *b*, with the silk fastened to them, bolts for fastening them to the cross-section of the frame, rods *c*, and bolts c''; for stretching the silk sidewise, substantially as described.

4. The combination of the shaker-frame C, suction-fan O, blast-fan M, compartment I, and parallel wind-receptacles L L, and transverse openings *h h'*, substantially as described.

5. The combination, in a middlings-purifier, of the shaker C, blast-fan M, suction-fan O, boppered compartment I, with discharge-openings J J' J'', and chute N, substantially as described.

6. The combination, in a middlings-purifier, of the shaker C, a series of interrupted or open brushes, E E E, tubes *d*, feed-hopper B, fans M and O, boppered compartment I, with discharge-openings J J' J'', chute N, and silk D, substantially as described.

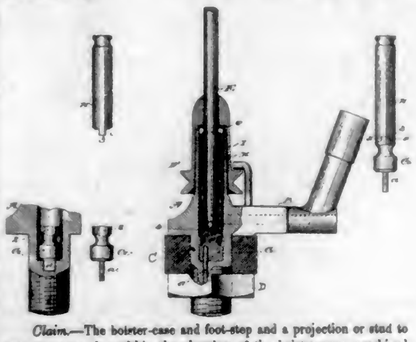


296,753. BARBED FENCE. JOHN E. KELLY, Fryeburg, Me. Filed July 9, 1883. (No model.)

Claim.—The metal fence having the bars or ribbons *a*, with the rib extending longitudinally of the same and in the center thereof, as set forth, the projections *c*, arranged in the order and constructed as set forth, and with their points turned outwardly, as described, in combination with the clamping-hook *d* and a proper post, as set forth.

296,754. SPINDLE-BEARING. JOHN KILBURN, Lowell, Mass. Filed June 18, 1883. (No model.)

Brief.—The bolster and bolster-case are provided with grooves and notches, into which projections upon the ring are adapted to fit and turn and restrain the bolster from rotation within the case.

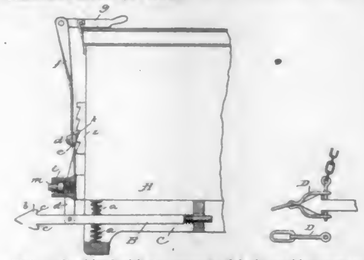


Claim.—1. The bolster and the bolster-case, combined with a ring located at the upper end of the bolster, the said parts being provided with notches and projections, to enable the said ring to co-operate with the said bolster and case and restrain the rotation of the bolster in the said case, substantially as described.

2. The bolster-case provided with the groove S, and the bolster notched *a'* its upper end, combined with the locking-ring having lugs adapted to enter the grooves of the case, and projections to enter the notches of the bolster, to operate substantially as described.

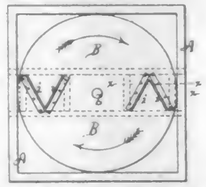
3. The bolster-case and bolster, combined with a narrow locking-ring adapted to hold the bolster and to be held by the bolster-case, the said ring being of less width than the space between the interior of the said case and the exterior of the bolster, substantially as described.

296,755. SPINDLE-BEARING. JOHN KILBURN, Lowell, Mass. Filed June 25, 1883. (No model.)



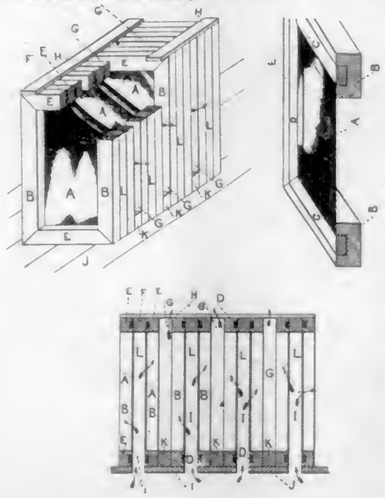
Brief.—The lower end of the bolster and upper end of the step are connected by projections and notches, and the step and bolster are prevented from being rotated in the bolster-case by a projection or stud upon the lower end of the step engaging an opening in the chamber of the bolster-case.

Claim.—The bolster-case and foot-step and a projection or stud to engage an opening within the chamber of the bolster-case, combined



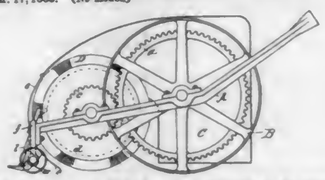
with a bolster, the lower end of the bolster and the upper end of the foot-step being provided with projections and notches, substantially as described, whereby the bolster, when engaged with the foot-step, is prevented from being rotated within the bolster-case, for the purposes set forth.

296,756. CAR-COUPLING. GILBERT A. KIRKPATRICK, Canton, Me. Filed June 30,1883. (No model.)



Claim.—Combined with the arrow-head *b*, the auxiliary removable coupling D, secured to such arrow-head by a pin passing through eyes in the part D and through the draw-bar.

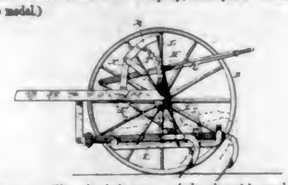
296,757. VEGETABLE-SLICER. SAMUEL KRAUSHAAR, Buffalo, N. Y. Filed Oct. 13, 1883. (No model.)



Claim.—In a device for cutting cabbage for kraut, the cutting-knives described, set in pairs in a V position, with their cutting-edges facing each other, in combination with a revolving table, in which the knives are set, means for revolving said table, and boxes or compartments set around the knives, substantially as set forth.

296,758. DUST-ARRESTER. OSWALD KUTSCHE, Grand Rapids, Mich. Filed Jan. 29, 1884. (No model.)

Claim.—In a dust-arrester, screens A, attached independently to the frames B C D E, which frames are arranged in series and connected together, substantially as shown, in combination with the inlet-chambers I, provided with closed tops F, and the outlet-chambers G, having closed bottoms K, as herein set forth.



296,759. LAWN-MOWER. HENRY LACASSE, Auburn, N. Y. Filed Mar. 17, 1883. (No model.)

Claim.—1. In a lawn-mower, the combination of the cutters, the brush, the brush-shaft, and intermediate operating devices, whereby the cutters are vibrated by the revolution of the brush-shaft, substantially as and for the purposes set forth.

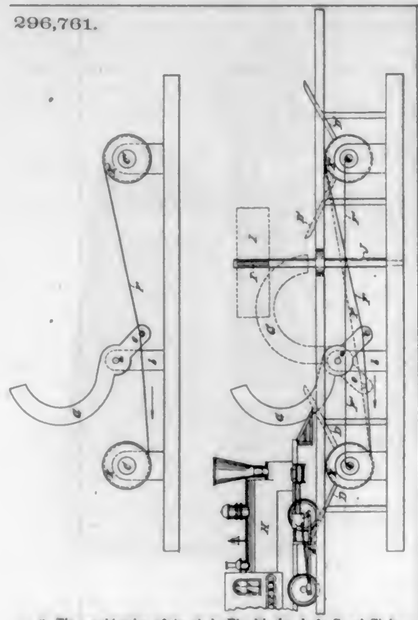
2. In a lawn-mower, the combination of the cutters, the brush, and the box C, having the curved lip, and provided with the cover *e*, as and for the purposes set forth.

296,760. WHEEL-CULTIVATOR. AUGUST LINDGREN, Moline, Ill., assignor to the Moline Plow Company, same place. Filed Jan. 5, 1884. (No model.)

Claim.—1. The wheeled frame and the shovel-beam jointed thereto, in combination with a laterally-swinging suspension device for said beam, a foot-lever pivoted to the beam, an independent suspending device for said lever, and a hand-lever and locking devices mounted on the frame, and connected to the beam-suspending and also to the lever-suspending devices, substantially as described, whereby the two suspension devices may be adjusted simultaneously.

2. In a cultivator, the combination of the following members: the wheeled frame, a vertically-swinging shovel-beam, a hand-lever mounted on the frame and provided with locking devices, a beam-suspending device extending directly from said lever to the beam, a foot-lever pivoted to the beam, and an independent suspending device for said foot-lever connected to the hand-lever, substantially as described, whereby the movement of the hand-lever is caused to adjust the beam and also adjust independently the fulcrum of the foot-lever.

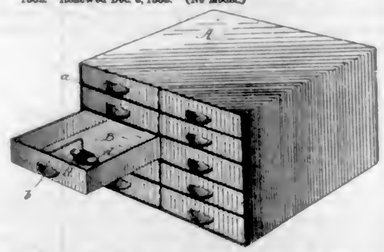
3. In a cultivator, the combination of the wheeled frame, the shovel-beam, the hand-lever, and devices to lock the same mounted on the frame, the link or chain extending from the hand-lever to the beam, the foot-lever M, pivoted to the beam, the lever mounted on the frame, and the connecting devices extending from opposite ends of said lever to the hand-lever and the beam, respectively.



296,761. OPERATING RAILROAD-GATES. JOHN LITTLE, Philadelphia, Pa. Filed Dec. 6, 1883. (No model.)

Brief.—Projecting levers to be struck by the passing train are rigidly secured to the rock-shafts, which are connected by chains, one being secured to the gate, the other to a signal. The shafts and levers are so arranged that one closes and the other opens the gate and signal as the train passes.

Claim.—1. The combination of the rocking shafts C and C', having levers D and D', arranged at opposite angles, as described, rigidly secured thereon, and chain-wheels E and E' and chain F, with the gate G, and locomotive H, having an arm, *d*, whereby the gate is brought to its lowest position before the locomotive reaches the cross-track B, and is reversed to its elevated position after the train has passed said track B, substantially as described.

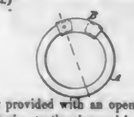


2. The combination of the chain F' with the rock-shafts C and C', having levers D and D', rigidly secured thereon, and chain-wheels E and E', connected together by means of the chain F, and with the post J, provided with a danger-signal, I, arranged at a crossing, B, substantially as described.

296,761.

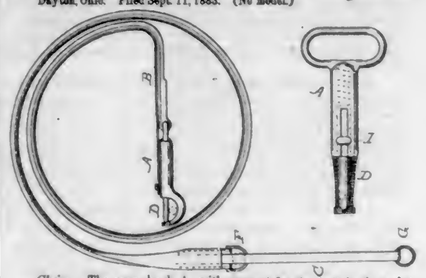
3. The combination of the chain F' with the shafts C and C', having levers D and D', rigidly secured thereon, and chain-wheels E and E', connected together by means of the chain F, and with the post J, having a danger-signal, I, at a siding, substantially as and for the purpose set forth.

296,762. BILL-FILE. JOEL H. LOUDER, Chicago, Ill. Filed Oct. 3, 1883. Renewed Dec. 6, 1883. (No model.)



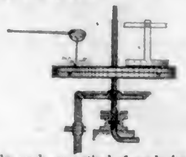
Claim.—1. In a file-holder, the combination, with the upturned rim thereof, of a needle, the point of which projects toward and is guarded by said rim, substantially as shown and described.

2. In a file-holder, the combination, with the upturned rim thereof, of an elastic needle provided with a right-angular bend, and having its point projecting in close proximity to and in a plane just below the top of the rim, substantially as described.



3. The combination, with a file-holder, of an angular bent needle, and a coiled spring formed in continuation of said needle, substantially as described.

296,763. KEY-RING. WILLIAM C. LUCAS, Meriden, Conn. Filed Jan. 2, 1884. (No model.)

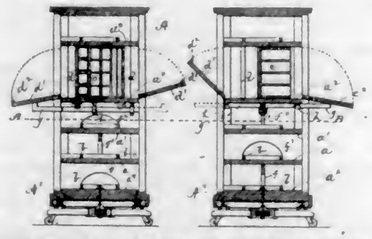


Claim.—A ring provided with an opening, *a*, and an incision, *c*, and a sleeve, B, conforming to the ring and having an inner projection, *c*, whereby the sleeve is held in place, all constructed substantially as and for the purpose described.

296,764. DETACHABLE HITCHING DEVICE. CHAS. MARQUARDT, Dayton, Ohio. Filed Sept. 11, 1883. (No model.)

Claim.—The snap-hook A, with support for the bolt in the point of the hook, in combination with the hitching-strap B and detaching-strap C, attached to bolt of said snap-hook, substantially as set forth.

296,765. MANUFACTURE OF WHITE LEAD. JOHN COWDERY MARTIN, Richmond, County of Surrey, England. Filed Dec. 1, 1882. (No model.) Patented in England Mar. 18, 1879, No. 1,054; in France Sept. 18, 1879, No. 132,767; in Germany Sept. 21, 1879, No. 10,209, and in Belgium Sept. 26, 1879, No. 49,401.



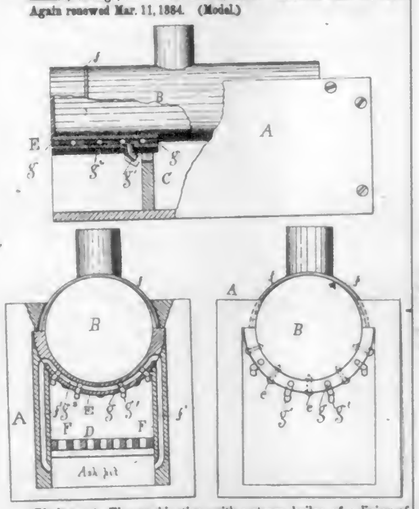
Claim.—The mode or method of producing solutions of lead salts by dropping molten lead onto stationary or moving wetted surfaces kept wet by jets or sprays of water or by occasional immersion in water, and dissolving the very small flakes or splashes of metallic lead so formed in a solvent, substantially as hereinbefore described.

296,766. TAG AND TAG-FASTENER. GEORGE W. MCGILL, New York, N. Y. Filed Sept. 27, 1881. (No model.)

Claim.—A paper-board tag combined with a metallic staple-fastener having pointed legs passed through the tag in two separate perforations, bent toward each other and parallel to the head, so as to clamp the tag between the folds of the staple-legs and the head, and bent outward at right angles to the head, substantially as shown and described.

296,767. BOOK-CASE. PETER ELTEA MCINTOSH, Rochester, N. Y. Filed Aug. 15, 1883. (No model.)

Claim.—1. The revolving book-case, substantially as described and shown, composed of the casing A, provided with suitable doors, and divided horizontally by a series of partitions, *a a' a²*, the partitions *a a'*



serving as book-racks, and the partition a^2 provided on three of its sides with book-racks d and book-supports d', hinged to said partition, and provided on its remaining side with the pigeon-hole case e, and the writing-desk e, hinged to the partition opposite the pigeon-holes, and provided with the hinged wings or extensions d' d', all as and for the purposes set forth.

2. In a book-case, the combination of the book-supports and writing-desk, hinged to the casing and turning outward, as described, the loops or keepers A, constructed with the projection A', and the supporting-bars passed through said keepers, and provided on their under side with a series of notches arranged to engage the projection A', whereby the said bars may be secured at any point desired, and the book-supports and desks supported on the outer end of said bars held at any suitable degree of inclination, substantially as set forth.

3. The combination, with the casing, of the partitions a a' a^2 and the supports f f' f^2, said supports being staggered or arranged as described, the adjacent ones being at right angles and the alternate ones in line with each other, substantially as and for the purposes specified.

4. The combination of the casing, a writing-desk hinged to and turning outward from the casing, the supporting-bar movable outward under the writing-desk, said bar being indented, and a device, substantially as shown, for engaging said indentations, whereby said bar may be held at any point desired, as and for the purposes set forth.

296,768. **STEAM-BOILER AND FURNACE LINING.** CHARLES MCMILLAN, Chicago, Ill. Filed Dec. 8, 1879. Renewed Mar. 16, 1882. Again renewed Mar. 11, 1884. (Model.)

Claim.—1. The combination, with a steam-boiler, of a lining of tiling having plain concavo-convexed faces corresponding with and suspended by the boiler in close and direct contact with the boiler over the fire-chamber, substantially as described.

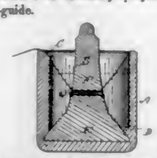
2. The combination, with a steam-boiler, of a perforated lining conforming in shape to and suspended in close contact with the entire contiguous surface of the boiler, said perforations forming air-inlets not having contact with the boiler, substantially as described.

3. A lining for steam-boilers, concavo-convex in form, held in contact with the boiler, and provided with a series of perforations, forming air-inlets, terminating in elbow-tubes, substantially as described.

4. The combination, with a steam-boiler, of a perforated concavo-convex lining suspended in contact with the same over the fire-chamber, and of a perforated side lining for the fire-chamber, substantially as described.

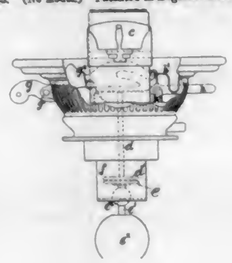
296,769. **FIRE-ESCAPE SLING.** BENEDICK MILLER and GEORGE H. HUME, Paola, Kans. Filed June 22, 1883. (No model.)

Brief.—The sling is attached to the friction device by loops, and the back strap is secured to the front strap below the loops.



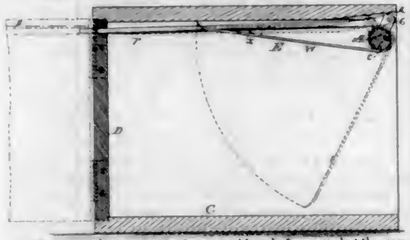
Claim.—A fire-escape sling having a supporting-strap provided with loops for the purpose set forth, and a front strap, a back strap attached to the front strap below the loops, and a net or canvas sack attached to the back and supporting strap, substantially as described.

296,769.



296,770. **THREAD-MOISTENING ATTACHMENT FOR SEWING MACHINES.** JANE NIXON, New York, N. Y., assignor of one-half to Vernon Bell, same place. Filed Mar. 9, 1883. (No model.)

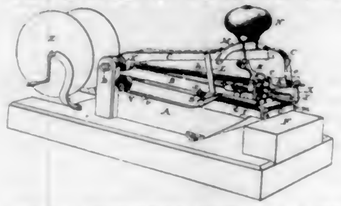
Brief.—The device is used to moisten the thread before it passes to the needle, whereby it is rendered less brittle, and consequently less liable to break when the machine is run at a high rate of speed. The vessel has on its inner side a vertical rib, and diametrically opposite thereto, near the bottom, an inwardly-projecting flange for securing therein the thread-guide.



Claim.—A thread-moistening attachment for sewing-machines, comprising a cup or vessel having on its inner side a vertical flange extending nearly to the bottom, and an inwardly-projecting flange arranged near the bottom and diametrically opposite the said rib, in combination with a disk having a transversely perforated upright, and provided with a notch in one side, as and for the purpose set forth.

296,771. **LAMP-EXTINGUISHER.** ROBERT OGDEN, Manchester, and ROBERT JAMES ANDERSON, Liverpool, County of Lancaster, England. Filed Nov. 7, 1883. (No model.) Patented in England Feb. 6, 1883, No. 657.

Claim.—The combination of a sliding extinguisher with a lever, g, for raising and lowering the same, the spring g^3, which operates said lever to automatically raise said extinguisher for allowing the same to close, the spring-pressed trigger h, which normally holds said lever out of operation, the spindle d, arranged below said trigger, and provided at its lower end with a disk, d', and the weighted spindle d', having at its upper end a disk, e, in contact with said disk d', for the purpose set forth.



296,772. **POST-OFFICE BOX.** ENOCH OSGOOD, Washington, D. C. Filed Oct. 26, 1880. Renewed Oct. 16, 1883. (No model.)

Claim.—1. In a post-office box, a rocking shaft mounted at the rear and thereof, and provided with a suitable guard device, said shaft being connected to the door, substantially as set forth, whereby when the door is opened the shaft will be rocked to throw down the guard device and close the rear end of the box, substantially as set forth.

2. In a post-office box, a rocking shaft provided with a series of spring wires or strips, said shaft being mounted as described, and connected to the front door by a rod, whereby when the door is opened said shaft will be rocked to throw down the guard-strips and close the rear end of the box, substantially as herein set forth.

296,773. **ADDRESSING-MACHINE.** HIRAM PARKER and JAMES T. DRUMMOND, Mount Pleasant, Iowa. Filed May 26, 1883. (No model.)

Claim.—1. The combination of the reservoir A, lid B, operating-arm C, elastic extension C', oscillating feed-arm H, feed-foot G, slides I, presser-foot E, knives c and c', guide X, the moistening device, consisting of the rock-shaft P, bar R, provided with cross-head R' and a porous moistener attached thereto, and operating-arm S, the springs K, K, and V, and the angular bent arm L, all arranged substantially as herein shown, for the purposes specified.

2. The combination, with the knives c and c', of the operating-arm C, having an elastic extension, C', adjustably coupled to it for the purpose of properly operating the knife c with the knife c', causing their edges, respectively, to rub each other in their movements, so as to cut shearswise, substantially as shown, for the purpose specified.

3. In combination with the operating-arm C, the oscillating arm H, and the grooved slides I, the oscillating feed-foot G, provided with adjustable teeth b, substantially as shown, for the purpose specified.

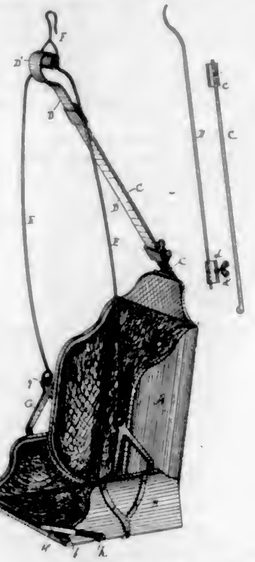
4. In combination with the operating-arm C and the feed-foot G, the oscillating arm H, having one end pivoted to a lug on the under side of said arm C and the other end pivoted to the upper end of standards or lugs a, attached to said foot, substantially as shown, for the purpose specified.

5. In combination with the grooved slides I and the sliding feed-foot G, the friction-spring f, substantially as shown, for the purpose specified.

6. In combination with the reservoir A and the reciprocating moistening device, herein shown, the lid B, provided with toothed or perforated ends, substantially as shown, for the purpose specified.

7. In combination with the lid B and guides or slides I, the retaining-springs W, substantially as shown, for the purpose specified.

8. In combination with the reservoir A, spring V, and arms C and L, the automatic moistening device, consisting of the rock-shaft P, pivoted bar R, cross-head R', provided with a dauber attached thereto, and the arm S, all substantially as shown, for the purposes specified.



296,774. **TELEGRAPHIC CABLE.** WILLIAM R. PATTERSON, Chicago, Ill., assignor, by mesne assignments, to the Western Electric Company, same place. Filed Dec. 5, 1881. (No model.)

Claim.—An improved telegraphic cable formed by the combination, substantially as set forth, of a core of electrical conductors and a sheathing consisting of a pipe composed of an alloy of lead and tin in proportions varying from ninety to ninety-seven parts of lead to from three to ten parts of tin.

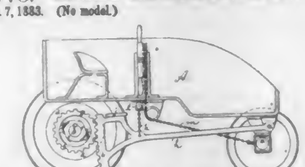
296,775. **SUSPENDED ADJUSTABLE CHAIR AND SEAT.** HENRY S. PEEK, Westfield, N. Y., assignor to the Novelty Manufacturing Company, (Limited,) Miles Grove, Pa. Filed Dec. 31, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 285,665, dated September 25, 1883, to same inventor.

Claim.—1. In a suspended adjustable chair, the combination, with the seat B and swinging or pivoted back A, of the rigid bails G G, attached to the sides of the seat B, the rigid guys E E, arching over the seat, and the adjustable back-stay C D, connecting the top of the back A with the top of the arched guys, substantially as shown, and for the purposes set forth.

2. In a suspended adjustable chair, the combination, with the seat B and swinging or pivoted back A, of a supporting-frame, G G and E E, for suspending the seat B in a horizontal position, and an adjustable back-stay, C D, for holding the back at any desired angle to the seat, substantially as shown, and for the purposes mentioned.

3. In a suspended adjustable chair, substantially as shown, the combination, with the pivoted back, of the adjustable back-stay C D, having at one end a C-spring, D', formed on one of the parts of said stay, substantially as shown, and for the purposes mentioned.

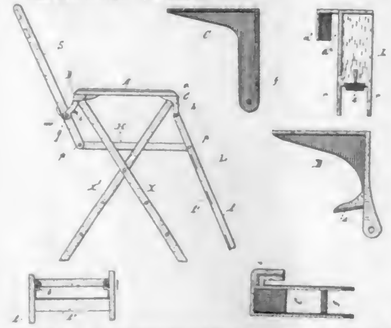


4. In a suspended adjustable chair, substantially as shown, the combination, with the seat and its suspending-guys, of the rigid bails G G, attached on the sides of the seat, and extending from at or near the ends of said sides, and meeting with an eye, g, or other means for connecting with the guys at a central point above the seat over each side piece, as set forth.

5. In a suspended adjustable chair, substantially as shown, the combination, with the seat and its suspending-guys, of the bail-pieces G G, which reach under the sides of the seat in the manner of an angle-iron, extend to points near the ends of the sides, and then curve outwardly from the sides, and finally meet above the sides, over the middle of the same, substantially as shown.

6. The combination, with the seat of a suspended adjustable chair, of the board H, pivoted on the adjustable side straps, H', substantially as and for the purposes set forth.

7. In an adjustable suspended chair, the combination, with the seat B, having notch *b*, as shown, of the board H, pivoted, as shown, on the adjustable side stays, H', and the binding-screws *h* on the sides of the seat, substantially as shown.



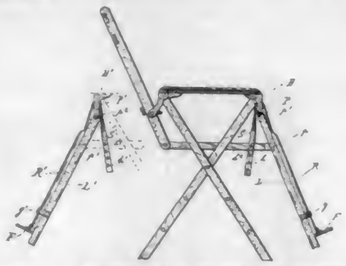
296,776. VELOCIPEDE. ALBERT PISENBIKER, New York, N.Y. Filed Sept. 7, 1883. (No model.)

Claim.—1. The combination, in a velocipede, of axle *b*, having ratchet-wheels *f* rigidly secured thereto, with the loose annular cog-wheels *e* and disks *d*, fastened to both sides of cog-wheels, and having pawls *g*, and with the foot-levers *h*, engaging cog-wheels *e*, substantially as specified.

2. The combination of axle *b*, ratchet-wheels *f*, cog-wheels *e*, disks *d*, and pawls *g*, with the foot-levers *h*, and with the chain *k*, connecting the foot-levers and passing over friction-rollers *l*, substantially as specified.

296,777. RECLINING OR HAMMOCK CHAIR. FRANK H. PLUMMER, Hennikor, assignor of one-half to G. W. & M. L. Stearns, Lebanon, N. H. Filed Nov. 14, 1883. (No model.)

Claim.—1. The combination of the arm-rests, provided at each end with brackets, with a back pivoted to the rear brackets, a leg-rest pivoted to the front brackets, and a seat pivoted to the back and leg-rest, said brackets being constructed with sockets and bent arms, substantially as described, whereby they may be connected with means for supporting the structure from above, or connected to a supporting-base, as and for the purposes specified.



2. The arm-rests and the front brackets, C C, the latter provided with bent arms *a*, depending sides for receiving the leg-support between them, and sockets for the inner chair-legs, combined with the pivoted leg-support, chair seat and back, the rear brackets, and supporting means for the structure, substantially as set forth, as and for the purposes specified.

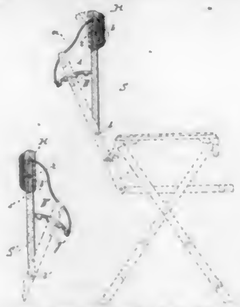
3. The arm-rests and rear brackets, D D, the latter provided with the outer-leg socket-arm a', the slot a^2, the depending hinge-arm, and the stop *s*, combined with the pivoted back, rest, and leg-support, the front brackets, and supporting means for the structure, substantially as set forth, as and for the purposes specified.

4. The combination of the back, seat, and leg-support, said leg-support and back-frame being provided with metal lugs *b b* at the point of pivoting the seat thereto, with the front and rear brackets, C C D D, the arm-rests, and supporting means, substantially as set forth, for the structure, as and for the purposes specified.

5. The combination, with the chair-supporting frame consisting of two pairs of crossed arms or bars pivoted together, one within the other, of the arm-rests provided with front and rear brackets, the back pivoted to the rear brackets, the leg-support pivoted to the front brackets, and the seat pivoted to the back and leg-support between the bars, forming the frames thereof, the said rear brackets being provided with the offset-sockets to receive the ends of the outer pair of supporting-bars, as and for the purposes set forth.

296,778. FOOT-REST. FRANK H. PLUMMER, Hennikor, assignor of one-half to G. W. & M. L. Stearns, Lebanon, N. H. Filed Nov. 14, 1883. (No model.)

Claim.—1. The combination of the main frame and supporting means, substantially as described, with the pivoted leg-support, the sliding foot-rest, and means, substantially as described, for connecting the foot-rest and main frame, as and for the purposes set forth.



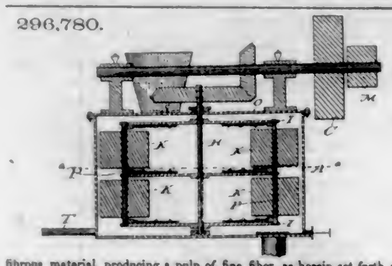
2. The combination of the foot-rest with the leg-support, the main frame, and means for connecting the foot-rest and leg-support, as set forth, and means, substantially as described, for connecting the foot-rest and main frame, whereby the foot-rest may be adjusted, as and for the purposes specified.

3. The combination of the arm-rests and their brackets, the back pivoted to the rear brackets, the leg-support pivoted to the front brackets, and a seat pivoted to the back and leg-support, with a foot-rest connected with the leg-support, substantially as set forth, and means, as described, for connecting the foot-rest and seat, as and for the purposes specified.

4. The combination of the foot-rest F and rods R R' with the adjustable straps S S', pulleys P P', the swinging leg-support, and the chair-frame, as set forth.

5. The combination of the arm-rests and brackets B B', provided with pulleys P P', with the chair-frame, leg-support, adjustable straps S S', rods R R', and the foot-rest F, as set forth.

296,779. HEAD-REST. FRANK H. PLUMMER, Hennikor, assignor of one-half to G. W. & M. L. Stearns, Lebanon, N. H. Filed Nov. 23, 1883. (No model.)



Claim.—1. The combination, with a chair, of bars pivoted at one end to the sides of the back-frame, and slotted substantially as described, a head-rest pivoted to the free ends of said bars and adjustable in the slots, as set forth, and means, substantially as described, for adjusting the inclination of said bars with respect to the chair-back, as and for the purposes specified.

2. The combination of the head-rest provided with the lateral pivot-bolts *b b'* and thumb-nuts *t t'*, with the swinging side bars, S S', provided with slots *s s'*, and recesses *r*, the pivoted rack-bars B B', and the chair, as set forth.

296,780. PROCESS OF AND APPARATUS FOR MANUFACTURING PAPER-PULP FROM WOOD. GOLDSBURY H. POND, New York, N. Y., assignor to Edmund A. Mores, Rutland, Vt. Filed July 18, 1883. (No model.)

Claim.—1. The cylinder A, with cover O, shaft H, provided with plates and arms I I, the rollers K K, and the steam-pipe T, to hold and work a charge of sawdust, chips, shavings, or other pieces of wood or

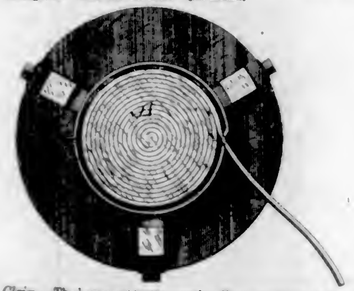
296,780.

fibrous material, producing a pulp of fine fiber, as herein set forth and described.

2. The cylinder A, provided with a shaft, having plates and arms I I, between which are hung the rollers K K, either singly or in a series, one above the other, substantially as described.

3. The rollers K K, hung between the plates and arms I I, with adjustable hangings, consisting of the set-screws N, and springs J, to set them out against the inner side of the cylinder A with any pressure required, whereby the rollers are allowed to pass over any large pieces that may be in the charge and resume their regular pressure upon the sides of the cylinder, as fully described and set forth.

4. The cylinder A, provided with shaft H, having secured thereto plates and arms I I, and rollers K K, having an opening, D, as described, revolving loosely on the pin P, whereby the rollers are automatically set out onto the inner side of the cylinder by the centrifugal force, substantially as set forth.

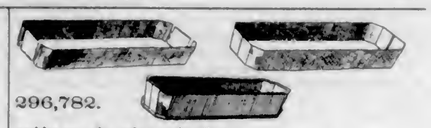


5. In a machine for reducing sawdust or other pieces of wood or fibrous material to pulp, the combination, with the cylinder A, of the shaft carrying arms and plates on which are secured rollers adapted to being operated by the centrifugal force.

6. In a machine for reducing sawdust or other pieces of wood or fibrous material to pulp, the combination, with the cylinder A, of a shaft carrying arms and plates, and the bifurcated ends of the arms having rollers held in place by set-screws and springs, substantially as set forth.

7. The process of reducing sawdust or other pieces of wood or fibrous material to a pulp, consisting of inclosing the same in a tight vessel containing a sufficient quantity of water to float the charge, giving it motion and circulation by a jet of steam under pressure, thereby toughening the fibers, then subjecting it to a light pressure by rollers set out by centrifugal force, as herein described.

8. The process of reducing sawdust or other pieces of wood or other fibrous material to a pulp, consisting of inclosing the same in a tight vessel containing a sufficient quantity of water to float the charge, giving it motion and circulation by a jet of steam under pressure, thereby toughening the fibers, and adding a small per cent. of alkali, then subjecting it to a light pressure by the rollers rolling over it on the inner side of the vessel as they are set out onto it by the centrifugal force.

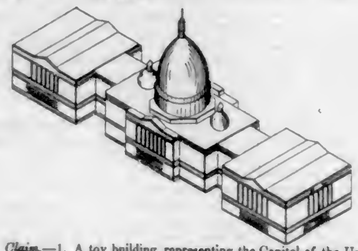


296,781. DIE FOR CUTTING LEATHER STRINGS. CHAS. E. RAMUS, Chicago, Ill. Filed Oct. 10, 1883. (No model.)

Claim.—The improved leather-cutting die A, consisting of the coiled strip C, having cutting outer edges, and the interposed blank B, of less width than the strip C, all arranged and adapted for use substantially as set forth.

296,782. COFFIN. NICHOLAS RAFFLEYES, Rochester, N. Y., assignor to the Stein Manufacturing Company, same place. Filed Apr. 27, 1883. (No model.)

Claim.—1. The herein-described method of covering burial cases or caskets with cloth, the same consisting in forming an endless band or sack of a size less than that of the casket, and stretching the same into



296,782.

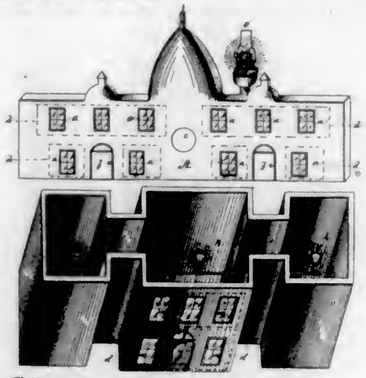
position over the casket, as described.

2. As a new article of manufacture, a covering for a casket, consisting of an endless sack or band open at the top and bottom, as described and shown.

3. As a new article of manufacture, a coffin having its body covered with cloth composed of two or more longitudinal sections having their ends stitched together, with the seam on their inner side.

296,783. TOY BUILDING. WM. S. REED, Leominster, Mass. Filed Sept. 26, 1883. (No model.)

Claim.—1. A toy building representing the Capitol of the United States, composed of one or more portions, substantially as set forth.



2. A toy building representing the Capitol of the United States, having one of the portions of which it is composed of a size sufficient to serve as a receptacle for the remainder of the toy, as described.

3. A series of strips, sheets, or tablets of suitable material, bearing the miniature representation of the architecture of the original Capitol building, in combination with grooved or other connections for assembling them together, as specified.

4. A continuous strip or sheet of suitable material, bearing the representation of the architecture of the front, rear, and ends of the original Capitol arranged in their proper relative position, of a length and height proportionate to that of the original, and adapted to be bent at the desired points to form the ground plan and elevation of the same, substantially as described.

5. The combination, with a toy building representing the Capitol of the United States, of a panorama constructed and arranged to operate as set forth.

296,784. TOY BUILDING. WM. S. REED, Leominster, Mass. Filed Sept. 26, 1883. (No model.)

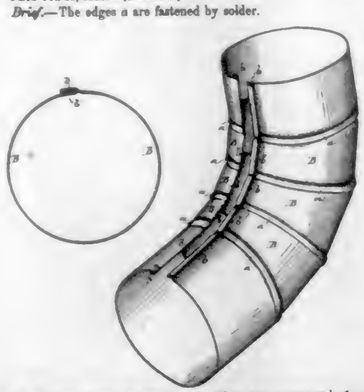
Claim.—1. A toy consisting of one or more portions bearing the representation of a part or the whole of the exterior of the Capitol of the United States, and provided with openings to represent doors, windows, &c., or apertures through which to exhibit pictures, panoramic or other views or lessons, in combination with a light located behind the same, substantially as described.

2. One or more strips or sheets of white or colored transparent material, in combination with a toy representation of the whole or a portion of the exterior of the Capitol of the United States, provided with openings to represent doors, windows, &c., or other apertures through which to exhibit pictures, panoramic or other views or lessons, and with a gas, electric, lamp, or other light so located as to be seen through the openings or apertures from the outside, as and for the purpose set forth.

296,785. PLANE. JOSEPH B. RIPSOM, Oshkosh, Wis. Filed July 21, 1883. (No model.)

Claim.—1. The combination, with the stock comprising the bottom plate having the longitudinal side flanges inclined outwardly and upwardly at an angle from the bottom plate, and formed with the throat extending entirely across the bottom plate to the vertex of the angle formed by the bottom plate and side flanges, of a lever-block fulcrumed on the stock, a set-screw for operating the said lever, a bed-plate connected with the lever, the bit carried by the bed-plate, and means for securing the bit in position, substantially as set forth.

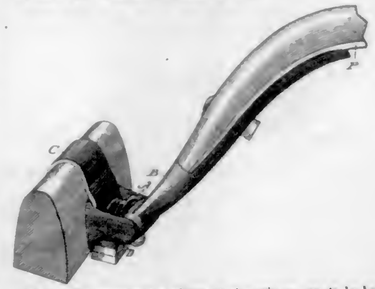
2. The combination of the stock having the throat and upright flanges, the cross-pin between the latter, the lever-block having the fulcrum-perforation, and disposed just above the bottom plate and in rear of the throat, the fulcrum-screw, the set-screw for adjusting the lever, the longitudinally-slotted bed-plate pivoted on the lever, the set-screw working in the slot in the bed-plate, the bit having the slot for receiving the head of this screw, the spring cap-plate, and the eccentric lever under said cross-pin and acting to clamp down the spring cap-plate, substantially as and for the purpose set forth.



3. The combination, in a plane, of the main bottom lever, the set-screw working through the free end of the lever, a bed-plate pivoted to the lever at its fulcrum end, the bit or cutter connected with the bed-plate, the bowed spring cap-plate, the cross-pin K, and the eccentric lever adjustable under this pin and against the spring-plate, whereby the bit can be adjusted by the set-screw and will be returned by the said spring-plate, substantially as set forth.

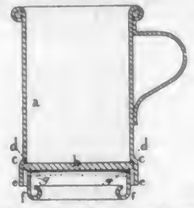
4. The combination of the bed-plate having the longitudinally-disposed slot formed with longitudinal side shoulders, the set-screw working through the slot with its head against the shoulders, the nut receiving the screw and bearing against the under side of the bed-plate, and the bit having the transverse slot that received the head of the set-screw, the bit being carried and adapted to be fed by adjusting said screw, substantially as set forth.

5. The combination of a bed-plate, the bit or cutter connected thereto, the bowed spring cap-plate, the cross-pin K, and the eccentric lever having the eccentric head formed with the transverse slot, substantially as and for the purpose set forth.



296,786. ELBOW FOR SPOUTING. DANIEL B. ROCK, Fairfield, Pa. Filed Oct. 29, 1883. (No model.)

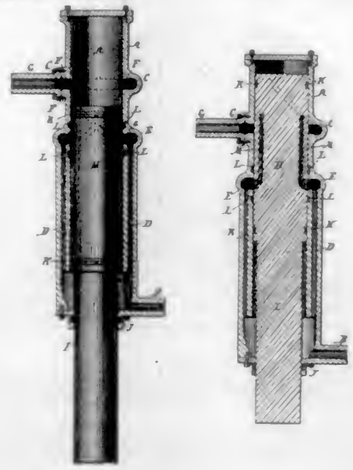
Brief.—The edges *a* are fastened by solder.



Claim.—An elbow for spouting or other uses, composed of a rectangular piece of metal having angular sections extending laterally from its sides, each section having grooved or beaded sides and flanged ends, said sections being bent into form and connected together substantially as and for the purpose specified.

296,787. THILL-COUPLING. GEO. W. ROSEMAN and JAS. E. STEVENS, Ancram, N. Y. Filed Jan. 14, 1884. (Model.)

Claim.—The combination of two steel castings—one to be bolted to the axle, the other to the thill—constructed substantially as described, with a coiled steel spring terminating at one end in an elliptical concave bearing, as above set forth, forming an improved adjustable thill-coupling of novel design.



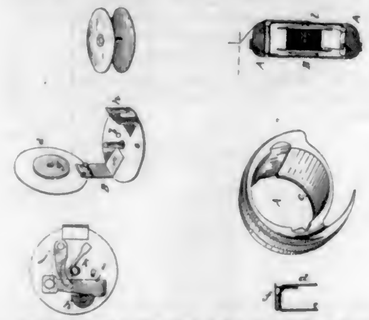
296,788. VESSEL FOR CONTAINING LIQUIDS. WILLIAM THOMPSON SALIX, Bowdoinham, Me. Filed Dec. 14, 1883. (No model.)

Claim.—1. The metal vessel *a*, having the glass bottom *b*, in combination with the groove or channel *c*, flange *e*, the ring *f*, lip *g*, and a suitable packing, the several parts being soldered, as herein set forth.

2. The metal vessel *a*, having the glass bottom *b*, in combination with the groove or channel *c*, flange *e*, the ring *f*, wire *h*, and lip *g*, and a suitable packing, the several parts being soldered, as herein set forth.

296,789. STEAM-POWER STAMP. WILLIAM S. SHARPNECK, Denver, Colo., assignor to the Nichols Manufacturing Company, same place. Filed Dec. 6, 1883. (No model.)

Claim.—1. The combination, in a steam-stamp, of a piston, having an enlarged rod to give heads of different areas, with a cylinder, both cylinder and piston provided with ports arranged, substantially as described, to allow the steam to first raise the piston, and at the same time give it a partial rotary movement, and then expand above the same and drive it downward, as set forth.



2. The combination, in a steam-stamp, of a piston provided with a passage, M, commencing at the side and terminating at the top of a cylinder provided with the inlet-port E, opening substantially in the center of the cylinder, and exhaust-port C, substantially as described.

3. The combination, with a cylinder, A, having inlet and exhaust ports, of the piston H, provided with the passages M, communicating alternately with said inlet and exhaust ports, said passages being inclined near their upper ends, substantially as and for the purpose described.

4. The combination, with the cylinder A, having the annular inlet-port E, passages D, and main inlet B, of the piston H, having heads of different areas, and provided with the passages M, inclined at their upper ends, all constructed and arranged substantially as described.

5. The combination, with the cylinder A, of the piston H, provided with inclined steam-passages, through which the steam passes on its way to the large end of the cylinder, substantially as and for the purpose specified.

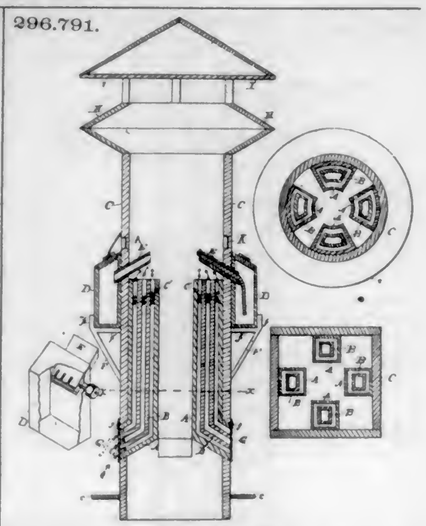
296,790. SEWING-MACHINE SHUTTLE. EARLE H. SMITH, New York, N. Y. Filed Nov. 2, 1882. (No model.)

Claim.—1. The combination, with a circular shuttle having its thread-cavity open on the rear side, of a thread-case therefor, adapted for carrying a bobbin or cop, means of preventing the thread-case from escaping at the rear, and permitting its removal from the front side of the shuttle, and a thread-delivering orifice in the thread-case at the rear.

2. The combination, with a circular shuttle and removable thread-case therefor, of means for preventing the removal of the thread-case except from the front side of the shuttle, and said thread-case provided with a tension device and guide-post, and with a thread-delivering orifice in the thread-case at the rear.

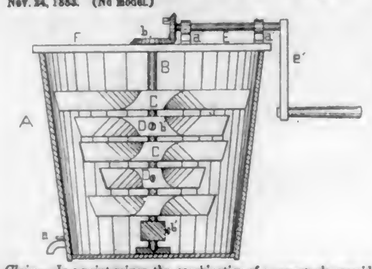
3. In a thread-case for a circular shuttle, the combination of two plates, one of which is hinged, and adapted, by means of a spring, to make a light pressure on an inclosed bobbin, and said thread-case provided with an independent tension on one of said plates.

4. The combination, with a circular shuttle, of a thread-case comprising two plates, adapted to inclose a bobbin or cop between them, a tension device and guide-post on one of said plates, and a thread-delivering orifice pierced obliquely through the thread-case to permit the shuttle-thread to pass directly from the tension to the material being sewed, as shown and described.



5. The combination, in a thread-case of a rotary shuttle, of a guide-post, *h*, spring *i*, and adjustable arm *j*, substantially as described.

296,791. SMOKE-CONSUMING DEVICE. JOHN W. SMITH and JAMES D. SMITH, Washington, D. C., assignors of fourteen twenty-fourths to Simpson P. Moses, William B. Moore, and I. Heylin McDonald, all of same place. Filed Sept. 22, 1883. (No model.)

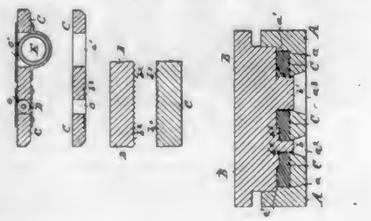


Claim.—1. The method of consuming smoke, which consists in placing an auxiliary smoke-stack upon a chimney or smoke-stack and commingling the products of combustion with atmospheric air as they are emitted from the top of the chimney or stack, and then bringing said oxygenized products into contact with a flame in said auxiliary stack, as set forth.

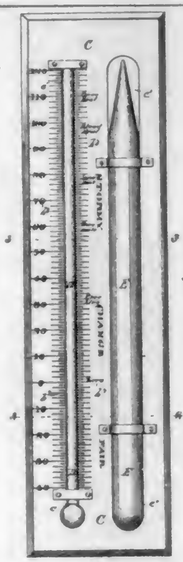
2. A smoke-consuming device consisting of an auxiliary smoke-stack provided with air-inlet tubes and lamps or flames entering said stack, substantially as set forth.

296,791.

296,792. PAINT-MIXER. RODERICK H. SMITH, Chicago, Ill. Filed Nov. 24, 1883. (No model.)

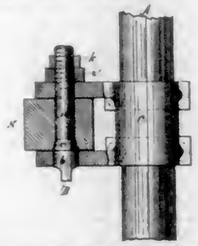


Claim.—In a paint-mixer, the combination of a receptacle provided with blades, which are beveled on opposite sides of the center in opposite directions, attached thereto, with a revolving shaft, to which are rigidly attached blades whose opposite sides are beveled in opposite directions, substantially as and for the purpose set forth.



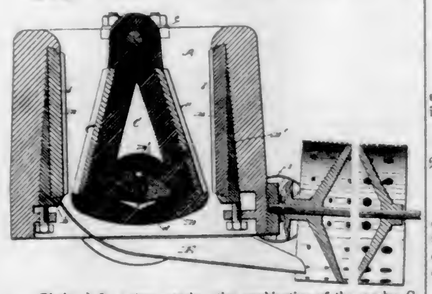
296,793. THERMOMETER AND BAROMETER MOLD, &c. WM. SOMERVILLE, St. Louis, Mo. Filed Mar. 3, 1883. (No model.)

Claim.—1. In the manufacture of thermometer or barometer plates or frames, or both combined in one piece, the mold herein described, consisting of a base or bed plate and plunger with elevations or depressions therein or thereon for forming the numerals, marks, &c., indicating degrees of temperature and changes of weather, and with or without the projections for providing in said plate a slot or slots, as and for the purposes set forth.

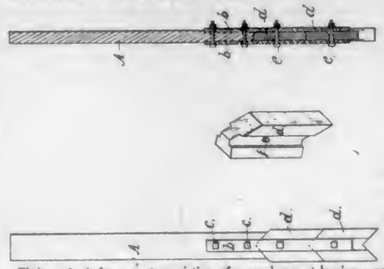


2. As a new article of manufacture, a thermometer plate or frame or barometer plate or frame, or both combined, having the usual marks, numerals, &c., pressed into or upon the plate, substantially as and for the purposes set forth.

296,793.



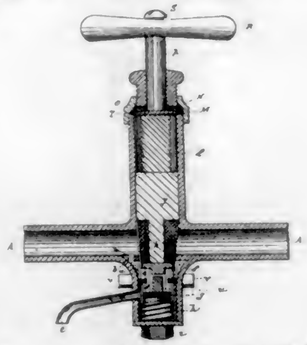
296,794. THILL-COUPLING. FREDERICK M. STEVENS, Waterbury, Conn. Filed June 4, 1883. (No model.)



Claim.—The combination, with the eye and axle-clip, of a screw-bolt having a tapering shoulder between the shank and the portion of larger diameter, flattened sides for a wrench, a nut having a projection or finger to prevent its turning when the bolt is being rotated, and a lock-nut, substantially as set forth.

296,795. STONE-CRUSHER. RENNING SUNDQUIST, Chicago, Ill., assignor of one-half to John Sontag, same place. Filed Mar. 5, 1883. (No model.)

Claim.—In a stone-crusher, the combination of the crusher C, formed with a transverse hole, *c'*, diamond-shaped in cross-section, the driving-shaft D, having an eccentric, *d*, within the crusher, a V-shaped block, D', upon either side of the eccentric, said block being concaved to fit the eccentric, substantially as shown and described, and for the purpose set forth.



296,796. FENCE-POST. ZACHARY T. SWEENEY and JOSEPH I. IRWIN, Columbus, Ind. Filed Dec. 13, 1883. (No model.)

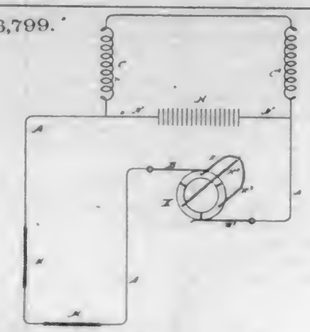
Claim.—1. A fence-post consisting of a wooden post having a pair of iron bars secured thereto on opposite sides and projecting therefrom, and a series of solid tiles adapted to fit together, and secured between said bars, all combined substantially as specified.

2. Wooden post A, bars *b b*, secured thereto, and tiles *d d*, grooved and formed as shown and described, and secured between said bars, all combined substantially as and for the purpose specified.

296,797. WASTE-COCK. HENRY TAYLOR and RICHARD B. SHARP, Cleveland, Ohio. Filed Apr. 26, 1882. Renewed Dec. 21, 1883. (No model.)

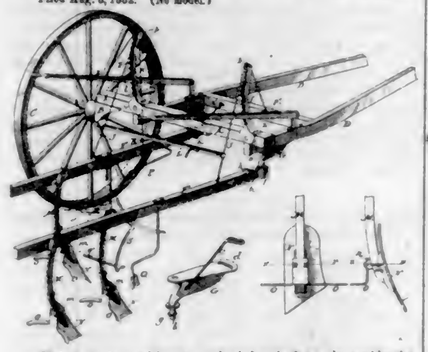
Claim.—In a waste-cock, the combination of the handle R, plunger *j*, and rubber plug *f*, with washer *g* and spring *h*, operating in the manner and for the purposes set forth and described.

296,798. BUTTON-FASTENER. JAMES F. THAYER, Providence, R. I. Filed Jan. 14, 1884. (No model.)



Claim.—The herein-described one-piece sheet-metal fastener A, consisting of the head or base portion *b* and projecting prong *a*, terminating in a rounded one-side end, *a'*, substantially as shown and described.

296,799. DYNAMO-ELECTRIC MACHINE. ELIHU THOMSON, New Britain, Conn., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Dec. 18, 1883. (No model.)



Claim.—1. The combination, with the field-magnet in a dynamo-electric machine, of a secondary or storage battery in a branch around the field-magnet coils, and arranged in the manner described, so that the discharge-current from said battery may circulate through the coils in a direction to preserve the normal polarity of the magnet.

2. The combination, in a dynamo-electric machine, of field-magnet coils connected to a commutator-brush, a branch taken from a point between the commutator and said coils, and a secondary or storage battery in said branch, as and for the purpose described.

296,799.

296,800. CULTIVATOR. NEWTON TROWBRIDGE, Council Grove, Kans. Filed Aug. 8, 1882. (No model.)

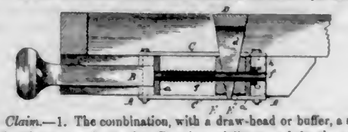
Claim.—1. In a cultivator, a wheeled main frame, in combination with a drag-bar or beam and an intermediate connecting-bracket pivoted to the main frame, and reversible end for end thereon, as described, whereby the point of connection between the beam and frame may be moved forward and backward.

2. In combination with the wheeled main frame and the drag-bar F, the intermediate reversible bracket, G, pivoted to the main frame, and provided with the journal to receive the beam-coupling, substantially as described and shown.

3. In combination with the main frame and the reversible bracket G, as described, the brace rod or arm e, adapted for connection with the frame in the two positions described.

4. The combination, with the main frame and the drag-bar, of the beam, the pivoted reversible bracket G, provided with the slot *d*, and with the brace-arm *e*, having the slotted end, as shown, whereby the bracket is adapted to be reversed end for end, and also to be adjusted laterally.

5. In combination with a cultivator-shovel having a flat curved surface, substantially as shown, two cutting-blades, *o*, located in rear of said shovel, and extending horizontally beyond its opposite sides, said blades being adjusted above the point of the shovel and adapted to travel beneath the surface of the ground.



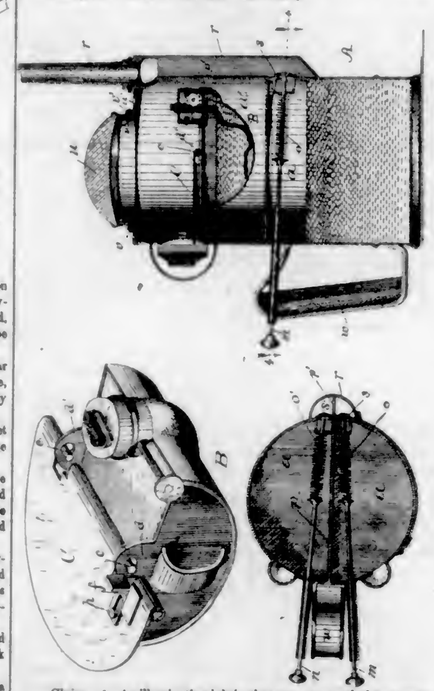
6. In combination with a cultivator-shovel, the rear plate provided with the two laterally-extending knives, and the intermediate bevel-block or washer, *n*, substantially as and for the purpose set forth.

7. In a cultivator, the combination of the following elements: a wheeled main frame, two laterally-swinging beams or drag-bars, a flexible chain or suspending device attached to each beam, a device, substantially as shown, adjustable in length, connecting the suspension devices one with another, whereby the suspending devices may be subjected to lateral strain and caused to maintain the beams normally at a given distance apart, while permitting said distance to be momentarily varied at the will of the operator.

8. In combination with the laterally-swinging beams or drag-bars F F and the chains J J, the adjustable connecting-strap I, substantially as shown.

9. In combination with the seat-supporting arms, the pivoted seat provided with the notched plate *u*, and the sliding bolt *v*, mounted upon the arm and arranged to engage with the edge of said plate, as described and shown.

296,801. DRAW-BAR AND BUFFER. WILLIAM B. TURNER, New York, N. Y., and JOHN J. MANN, Jersey City, N. J., assignors of one-third to Cornelius Beard, New York, N. Y. Filed Feb. 12, 1884. (No model.)



Claim.—1. The combination, with a draw-head or buffer, a spring, and its abutment, of a wedge, D, substantially as and for the purpose specified.

2. The combination, with a draw-head or buffer, a spring, and its abutment, of a wedge inserted between said spring and its abutment, adapted to automatically take up or prevent lost motion, substantially as described.

3. The combination, with a draw-head or buffer, a spring, and a wedge-shaped block, of a wedge, D, inserted between said spring and block, substantially as and for the purpose specified.

4. The combination of a draw-head, a spring, *g*, a wedge, D, having a recess, *d*, and two inverted-wedge-shaped blocks, all constructed, arranged, and operating substantially as described.

296,802. ILLUMINATING LUBRICATING-CAN. EUGENE R. WALKER, Chicago, Ill. Filed Nov. 23, 1883. (No model.)

Claim.—1. An illuminating lubricating-can composed of two apartments, the lower or rear apartment being that which contains the lubricating material, and the upper or forward apartment having placed therein or connected therewith a swinging lamp, so supported as to be self adjusting, and as to retain an upright position when the position of the can is changed, substantially as described, and for the purpose set forth.

2. In an illuminating lubricating-can, the combination of the can A, the lamp B, the pintles *c*, and the ears *d* and *d'*, all arranged substantially as described and for the purpose set forth.

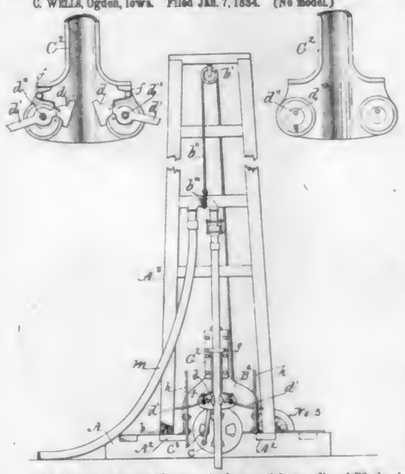
3. In an illuminating-oiler, the can A, composed of two apartments, in combination with the lamp B, placed in the forward apartment, the pintles *c*, the ears or supports *d d'*, the slide *f*, and the screw or bolt *h*, all arranged and constructed substantially as described, and for the purpose specified.

4. In an illuminating lubricating-can, the combination of the can A, composed of two apartments, the swinging lamp B, the partition *p*, and the spout *r*, substantially as described, and for the purpose set forth.

5. In an illuminating-oiler, the combination of the can A, having an oil-apartment and a lamp-apartment, the partition *p*, the rods *m* and *n*, the springs *o* and *o'*, the valves *s* and *s'*, and the spout *r*, all constructed and arranged substantially as described, and for the purpose set forth.

6. In an illuminating lubricating-can, the combination of the can A, the lamp B, suspended in the can, and the perforated plate *a'*, forming the top of the can and carrying the lens, substantially as described, and for the purpose set forth.

7. In an illuminating lubricating-can, the combination of the can A, formed so as to have an upper and lower apartment, the suspended lamp B, the reflector-plate C, the lens *u*, the door *x*, and the spout *r*, all constructed, arranged, and operated substantially as and for the purpose set forth.



8. In an oil-can, the combination of an oil-receptacle, a lamp-receptacle forming a continuation of the oil-receptacle, and having a lens in its upper part and openings for the admission of air, and a lamp pivotally suspended in the lamp-receptacle, substantially as described.

296,803. SUSPENDER-BUCKLE. CHARLES STARR WELLS, Boston, Mass., assignor of one-half to Alvin M. Cushing, same place. Filed Jan. 23, 1884. (No model.)

Claim.—A suspender buckle or fastening made of thin sheet metal, having a hook re-enforced with an additional layer or thickness of stock, as described.

296,804. ROCK-DRILL AND WELL-BORING MACHINE. WILLET C. WELLS, Ogden, Iowa. Filed Jan. 7, 1884. (No model.)

Claim.—1. A portable base, A, the metal frames B and B^2, the driving-shaft B^3, the crank-wheel C, and a reciprocating jaw-carrier, C^2, arranged and combined in a drilling-machine, substantially as shown and described, to operate in the manner set forth, for the purposes specified.

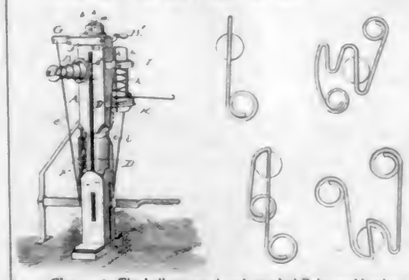
2. The levers *d'*, having jaws hinged to their ends, in combination with a reciprocating jaw-carrier, C^2, and bridles *h*, adjustably connected with the base of a drilling-machine, substantially as and for the purposes set forth.

3. The T-shaped jaws *d*, the levers *d'*, the adjustable eccentrics *d''*, and the springs *f*, arranged and combined with the reciprocating jaw-carrier C^2, substantially as shown and described, for the purposes specified.

4. The jaw-carrier C^2 having an open ring, *g*, and a hinged section, *g'*, at its top, and carrying a pair of levers, *d'*, having tube-gripping jaws on their ends, in combination with a base or frame, B^2, having adjustable bridles *h*, substantially as shown and described, for the purposes specified.

5. The adjustable slides or stops *i*, in combination with the bridles *h*, and a reciprocating jaw-carrier having pivoted jaw-bearing levers extending their long arms through the said bridles, substantially as and for the purposes specified.

6. The improved rock-drilling and well-boring machine, composed of the following-named elements and sub-combinations, to wit: the portable base A A^2, the frames B and B^2, the driving-shaft B^3, having a crank-wheel on one end and a gear-wheel on the other, the shaft B^4, having a balance-wheel and a pinion, and the shaft B^5, having a gear-wheel and pinion, the reciprocating jaw-carrier having a tube-bearing, *g g'*, at its top, and carrying tube-gripping mechanism *d d' d'' f*, the adjustable bridles *h*, having adjustable slides *i*, the detachable derrick having a pulley and rope, *b' b''*, a drum, J, and a clutch, *k*, substantially as shown and described.

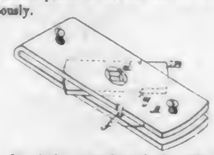


296,805. THILL-COUPLING. HENRY MASON WHEELER, Grand Forks, Dak. Filed Dec. 20, 1883. (No model.)

Claim.—1. In a thill-coupling, the combination of hollow heads C' C^2, attached to the carriage-axle, and having slots *a b* and inclined faces *g g* therein, slotted tubes E' E^2 within the hollow heads, grooved rubber cushions F' F^2 in the said tubes, and thills having T-shaped heads K' K^2, substantially as and for the purpose herein specified.

2. In a thill-coupling, the combination of hollow heads C' C^2, attached to the carriage-axle, and provided with slots *a b* therein, thills having T-shaped heads K' K^2, and pivoted covers L' L^2, covering the ends of the heads and adapted to cover and uncover the slots *a b* therein, and provided with an elastic packing, substantially as and for the purpose herein specified.

296,806. WIRE-COILING MACHINE. LA FAYETTE WILDERMUTH, Columbus, Ohio. Filed Sept. 4, 1883. (No model.)



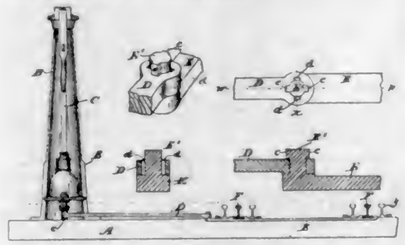
Claim.—1. The hollow post A and mandrel B, in combination with the revolvable plate *a*, the twisted bit C, cam-slide *c*, treadle-rod *d*, and treadle-lever E, all constructed to operate substantially as and for the purpose set forth.

2. The hollow post A and mandrel B, in combination with the blocks H and I, the guide-rods *h h*, bars *i i*, and treadle-lever E, all constructed to operate substantially as and for the purpose set forth.

3. The hollow post A and mandrel B, in combination with the revolvable plate *a*, provided with the groove *a'* and pin *b*, the twisted bit C, cam-slide *c*, rod *d*, cutter-blade G, rod *e*, coiled spring F, and treadle E, all constructed to operate substantially as and for the purpose set forth.

296,807. DRAWER-LOCK. JOS. WISE, Watertown, N. Y., assignor to J. Wise & Son, same place. Filed Jan. 25, 1884. (No model.)

Brief.—The lock is placed in the rail between two drawers which it locks simultaneously.

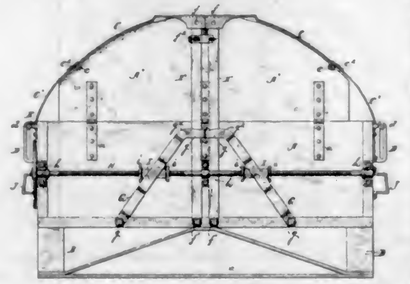


Claim.—1. In a lock, a case formed of a strip folded upon itself and inclosing a turn-bolt journaled therein between the leaves, and adapted, by turning, to be projected from and withdrawn into said case, substantially as described.

2. A double lock comprising a folded strip and a double turn-bolt journaled between the leaves of said folded strip, and adapted, by turning, to be projected beyond the same on both sides, substantially as described.

3. A lock comprising a case formed of a folded strip, in combination with an inclosed turn-bolt supported therein by a projection formed integral with one of said parts and fitting within a hole in the other, substantially as described.

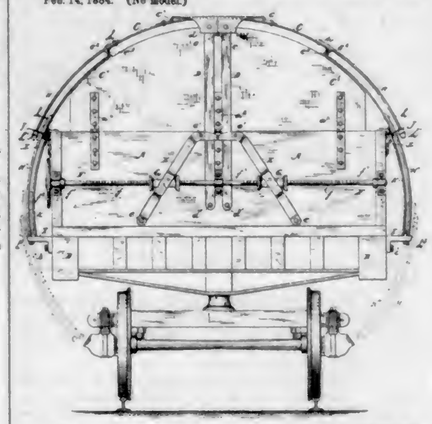
296,808. CONNECTION OF RAILWAY-SWITCH RODS. JOHN B. WITTY, Indianapolis, Ind. Filed Oct. 20, 1883. (No model.)



Brief.—The switch-bridle and the switch connecting-rod of the operative lever are jointed together by means of a winged pin on the end of one and a notched hole for receiving the pin in the end of the other, the wings and notches being arranged to register, so that the rod and bridle may be separable only when the rod and bridle are in other than nearly the same line or operative position.

Claim.—1. In a railway-switch, the combination, with the rails, of a rail-coupling having a stud provided with wings, and a connecting-rod connecting said rail-coupling to the switch-stand, having an eye, in the sides of which are notches adapted to receive said wings, the parts being so arranged, when in operative position, that the wings and notches do not register, substantially as described, and for the purposes specified.

2. In a railway-switch, the combination of the switch-rails F, rail-coupling E, said rail-coupling being provided with a stud, E', which is provided with wings *e* at its end, and the connecting-rod D, connecting said rail-coupling to the switch-stand, said connecting-rod being provided with an eye in one end, having recesses *d d* in its sides to receive the wings *e e* on the end of the stud E' on the rail-coupling, the wings of said stud and the recesses in said eye being placed at an angle with each other when the device is in operative position, whereby said rail-coupling and said connecting-rod are securely locked together, substantially as set forth.



296,809. RAILWAY-CAR COVER. RICHARD H. WYMAN, Chicago, Ill. Filed Jan. 21, 1884. (No model.)

Claim.—1. The combination, with the box or frame of a coal or open car, of the sectional hinged covers C C' C C', with the pivoted bars F F, the pivoted levers G G, shaft H, and sleeve-nuts I I, and means for rotating said shaft, whereby each of said sections may fold back upon itself, substantially in the manner and for the purpose set forth.

2. A movable cover for coal or open cars, consisting of the combination of the folding sectional covers C C' C C', the slotted brackets D, pivoted bars F F, levers G G, screw-threaded shaft H, and sleeve-nuts I I, with means for rotating said shaft, substantially in the manner and for the purposes set forth.

296,810. RAILWAY-CAR. RICHARD H. WYMAN, Evanston, Ill. Filed Feb. 14, 1884. (No model.)

Claim.—1. In a railway-car cover, the combination of the movable sections C C C' C', provided with the rigid supporting-bars H H H' H', brackets I, and bars D D and E E, with screw-threaded shaft and sleeve-nuts for operating the same, substantially as and for the purposes set forth.

2. In a railway-car cover, the combination of the movable sections C C C' C', provided with the rigid supporting-bars H H H' H', brackets I, bars D D and E E, with screw-threaded shaft F, sleeve-nuts G G, for operating said sections, and movable brackets L, for supporting said sections when closed.

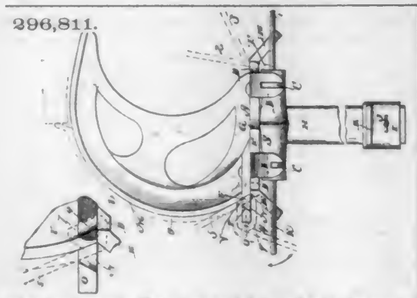
3. In a railway-car cover, the combination of the movable sections C C C' C', provided with the rigid supporting-bars H H H' H', having knobs *h h h' h'* thereon, brackets I, locking-plates J, with bars D D and E E, screw-threaded shaft F, sleeve-nuts G G, and means for operating said shaft, substantially as and for the purposes set forth.

4. In a railway-car cover, the combination of the movable sections C C C' C', provided with the rigid supporting-bars H H H' H', having knobs *h h h' h'* thereon, brackets I, locking-plates J, movable brackets L, and connecting-rods M, with bars D D and E E, screw-threaded shaft F, sleeve-nuts G G, and means for operating said shaft, substantially as and for the purposes set forth.

5. The combination of the supporting-brace O and set-screw P, having suitable bearings, as shown, with the side of a car having movable covers, whereby said side may be forced into line and so retained, substantially as and for the purposes set forth.

6. The combination, with the body of a car having sectional movable covers, of the detachable bail Q, sockets *q q*, and segmental racks and pinions, whereby said bail may be released from contact with said sections, and vice versa, substantially in the manner and for the purposes set forth.

7. The combination, with the body of a car having sectional movable covers, of the detachable bail Q, provided with the notch q^2, sockets *q q*, and segmental racks R R, with a suitable shaft and pinions for operating the same, substantially in the manner and for the purposes specified.



296,811. DEVICE FOR FORMING BAILS FOR BUCKETS. ANDREW JEREMIAH BLAIR, Knoxville, Tenn. Filed July 12, 1883. (No model.)

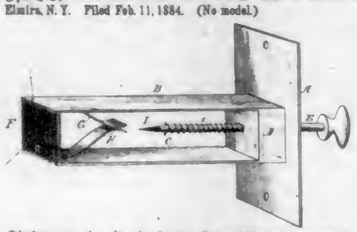
Brief.—The wire having been placed through the handle, the handle is centered on the wire by the use of the gage-collar and projecting arm. The handle is then placed over the projecting arm and under the curved flanges, and the bends at 2 and 3 are made to secure the handle upon the wire. The end of the wire is placed in the slot N in the flange, and the bends at the end are made. The bail is then shaped around the periphery of the curved flange. In forming hooks for buckets, the end is inserted in slot Q, and the wire is bent around and against periphery M, to form a common hook.

Claim.—1. A bail-forming machine having a vertical plate provided with curved flanges projecting from its top edge, recesses in the said edge near each end, and end flanges extending from these recesses and projecting in the same direction as the curved flanges, substantially as and for the purpose set forth.

2. A bail-forming machine embodying a vertical plate having flanges for retaining the bail-wood in position, supporting-flanges projecting at its ends to support the bail-wire, and recesses arranged between the re-

296,811.

taining and supporting flanges, substantially as and for the purpose set forth.



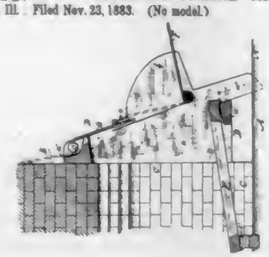
3. A bail-forming machine comprising a main plate having the curved flanges projecting from its top edge, the recesses in its top edge, the end supporting-flanges, the guide-groove, the horizontal projecting arm or plate, and the centering-collar adjustable on the latter, substantially as and for the purpose set forth.

4. A bail-forming machine having a forming-arm provided with a segmental forming-periphery, and with a projecting flange or plate having a forming-slot at the terminus of this periphery, substantially as and for the purpose set forth.

5. In a bail-forming machine, a projecting flange or plate having an ear-forming slot with convergent sides, as set forth.

6. A bail-forming machine comprising a vertical plate having rearwardly-projecting curved flanges for retaining the bail-wood in position, and supporting-flanges projecting in the same direction, recesses formed in its top edge between the retaining and supporting flanges, a forwardly-projecting forming-arm having a segmentally-curved periphery, and a projecting flange or plate having ear-forming slots at the terminus of the said periphery, substantially as and for the purpose set forth.

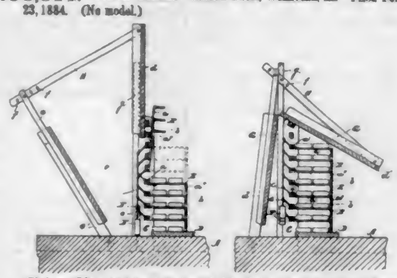
296,812. ELECTRIC DOOR-BELL PULL. SELWYN NIVEON BLAKE, Elmira, N. Y. Filed Feb. 11, 1884. (No model.)



Claim.—1. An electric door-pull consisting of an escutcheon to which are attached plates supporting contact-pieces between them, and spring-actuated knob-shaft adapted to make and break the circuit, as set forth.

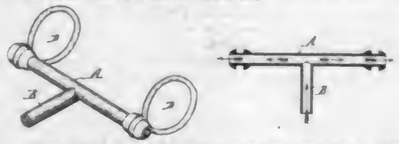
2. An electric door-pull consisting of an escutcheon to which are attached plates supporting contact-pieces connected with the electric circuit, and a spring-actuated knob-shaft having a tip of non-conducting material, adapted to make and break the circuit.

3. An electric door-pull consisting of an escutcheon, A, plates B C, attached thereto, block F, of non-conducting material, contact-pieces G H, and spring-actuated knob-shaft having non-conductor I, the whole being adapted to be fitted to the jamb of any ordinary door, as set forth.



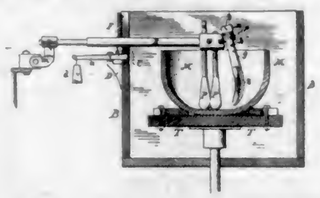
296,813. BRICK-KILN FRONT OR FURNACE. JOSEPH BLUM, Winnetka, Ill. Filed Nov. 23, 1883. (No model.)

Claim.—1. A portable brick-kiln front or furnace, consisting of the side pieces, *a a*, connected to each other by cross-bars *a' a'*, and having thereon the wings *b b*, the doors F and G, and the grate E, substantially as and for the purposes specified.



2. A portable brick-kiln front or furnace, consisting of the side pieces, *a a*, connected to each other by cross-bars *a' a'*, and having thereon the wings *b b*, the doors F and G, the pivoted arm or pendant *c*, and the grate E, having thereon the lugs or catches *s s*, arranged to engage the lower cross-bar, *a'*, substantially as and for the purposes specified.

296,814. BRICK-DRIER. JOSEPH BLUM, Winnetka, Ill. Filed Feb. 23, 1884. (No model.)



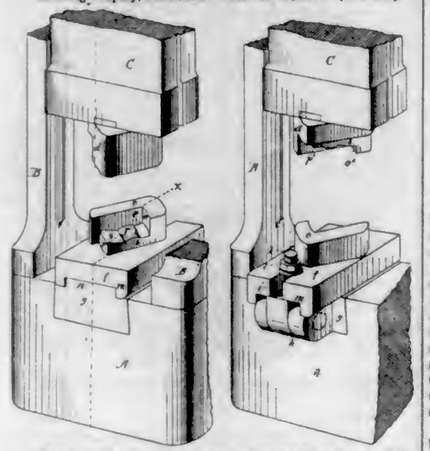
Claim.—The combination, in a brick-drier, of a stationary frame or support, and a cover or roof, G, consisting of two swinging or folding parts or sections, *d* and *d'*, hinged or connected to each other by means rendering both of the said sections simultaneously folding when either is folded or adjusted, substantially as and for the purposes specified.

296,815. BRIDLE-BIT. JOHN B. BLYHOLDER and PHILLIP HUGHES, St. Louis, Mo. Filed Jan. 21, 1884. (No model.)

Claim.—The improved bridle-bit consisting of the hollow or tubular transverse bit A, having a central tube, B, at a right angle thereto, and in communication therewith, substantially as and for the purposes set forth.

296,816. TRITURATING-MACHINE. FRANCIS E. BOERICKE and GEORGE GOLL, Philadelphia, Pa. Filed Dec. 26, 1883. (No model.)

Claim.—1. In a triturating-machine operating substantially as described, the combination, with the rod and pestles, of the pillow-block C and means for adjusting the same, substantially as and for the purpose specified.



2. The combination of the mortar, the pestles, the reciprocating rod, the pillow-block, and the pivoted and weighted lever, substantially as and for the purpose set forth.

3. The combination, with the rotating mortar, of the loosely-swinging scrapers, substantially as and for the purpose stated.

4. In combination with the mortar and the pestles, the swinging scraper and pin *g*, provided with a thumb-nut for adjusting the scraper laterally with relation to the side of the mortar, substantially as and for the purpose set forth.

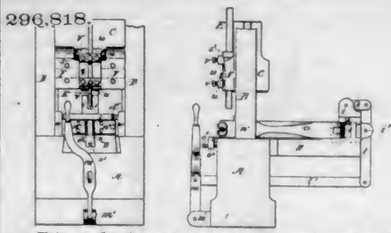
5. In combination with the mortar, the scraper having its shank provided with a series of holes therein, and a supporting-pin, whereby the scraper may be vertically adjusted with relation to the mortar, substantially as and for the purpose described.

296,817. MACHINE FOR MAKING AX-POLLS AND SIMILAR TOOLS. JOHN W. BOWERS, Franklin, assignor to the Douglas Axe Manufacturing Company, Boston, Mass. Filed Feb. 23, 1883. (No model.)

Claim.—1. In a swaging-machine, a hammer-die and an anvil-die, which, when brought together, form a closed matrix, and which are so constructed that each die embraces only such of the acting-faces of the matrix as are substantially opposite to those contained in the other, and that each die has its lateral acting-faces extended in planes parallel to the direction of movement of the hammer-die, so as to shut by and form a close joint with the acting-faces which constitute the hammer and anvil, respectively, whereby the lines of juncture of the dies, when they are in contact, will be located at the intersection of the acting-faces of the matrix formed thereby, substantially as described.

2. In a swaging-machine, an anvil-die provided with a hinged or pivoted support, which will permit the anvil-die to tilt upward when the hammer-die begins to ascend after the swaging operation, in the manner and for the purpose specified.

3. In a swaging-machine, a hammer-die and an anvil-die, each of which embraces such of the acting-faces of the matrix as are substantially opposite to those contained in the other, in combination with a hinged support for the anvil-die, all so arranged that the open side of the anvil-die shall be turned away from the hinged end of the said support, and the open side of the hammer-die shall be turned toward the hinged end thereof, substantially as described, for the purpose specified.



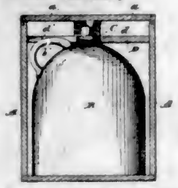
4. In a machine for swaging or pressing ax-polls or similar articles of metal of polyhedral form, a pair of partible dies, each of which contains one or more solid or polyhedral angles formed by complete adjacent acting-faces of the matrix, and each of such faces being substantially opposite to one contained in the other die, but no portion of either of them being diametrically opposite to any other face or portion thereof in the same die, substantially as described.

5. In a machine for swaging ax-polls and similar metal blanks, a pair of dies substantially such as are herein described and shown, the same being so constructed that the two dies form a closed matrix when brought together in the act of swaging the blank, that each die contains only complete acting-faces of the matrix, and such as are each substantially opposite to a face in the other die, and that a projection approximating in form and dimensions to one half of the finished eye to be subsequently punched in the blank is situated across one face of each die, at a location coincident with the position of the eye portion of the blank, and diametrically opposite to the like projection upon the similar face of the other die, whereby, during the operation of swaging, the blank is confined upon all sides, the lines of juncture of the two dies are at angles of intersection of the surfaces of the blank, and the metal displaced from the eye portion of the blank is forced into adjacent portions and given the desired shape by other parts of the matrix.

6. In a swaging-machine, a pair of partible dies, each of which contains only such of the acting-faces of the matrix formed thereby as are substantially opposite to those contained in the other, in combination with a hinged support for one of the dies, which will tilt toward the opposite die when the two dies begin to separate after the swaging operation, for the purpose specified.

296,818. MACHINE FOR PUNCHING THE EYES OF AXES AND SIMILAR TOOLS. JOHN W. BOWERS, Franklin, assignor to the Douglas Axe Manufacturing Company, Boston, Mass. Filed May 3, 1883. (No model.)

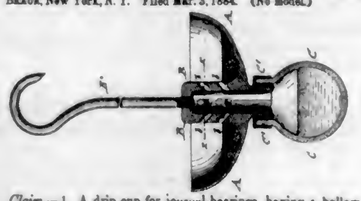
296,818.



Claim.—1. In a drop-punching machine, the combination of a drop and a tool-stock normally abutting endwise against the drop, with springs for holding the drop and tool-stock in such position, but permitting them to slide vertically upon one another, substantially as shown and described.

2. In a drop-punching machine, the combination of a drop and a tool-stock carried thereby, arranged to slide vertically one upon the other, and having their relative movement limited in one direction by abutting endwise against each other, so as to act as one mass when they descend in the operation of punching, and stops for limiting such movement in the other direction, so that after the tool has been forced into the metal and the drop begins to ascend it will at first move independently of the tool-stock, and then after acquiring momentum will suddenly act upon the tool-stock to withdraw the tool from the metal, all substantially as shown and described.

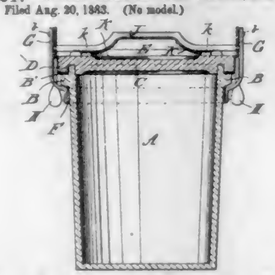
3. In a drop-punching machine, a drop, in combination with a punch held in a tool-stock capable of separate vertical movement in the drop, and clamping-levers *a a*, pivoted upon the bed of the machine for firmly holding the article to be punched in proper position to receive the thrust of the punch when the drop descends, substantially as described.



4. In a drop-punching machine for punching the eyes of axes, ax-polls, and similar articles, the combination of a drop and punch with a pair of clamping-levers having removable adjustable dies *n n* in their gripping ends, the faces of which are the counterpart in shape of that which it is desired to produce upon the sides of the finished article, and adjustable clamps *n' n'*, for holding said dies therein, all constructed and operated substantially as described.

296,819. JUG-PACKING BOX. LEONIDAS H. BRADLEY, Springfield, Ill. Filed Sept. 16, 1883. (No model.)

Claim.—The hereinbefore-described jug-holder, consisting of the box A, provided with the cover *a*, the washers C, having each a central opening, *c*, and the collar D, provided with the central opening, *d*, and radial slot *d'*, all combined substantially as and for the purpose specified.

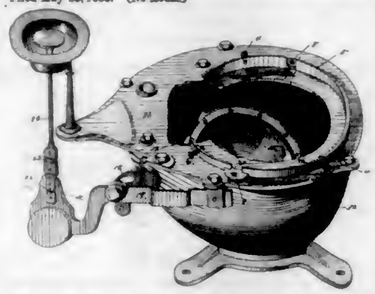


296,820. DRIP-CUP FOR JOURNAL-BEARINGS. J. GOTTFRIED BRAUN, New York, N. Y. Filed Mar. 3, 1884. (No model.)

Claim.—1. A drip-cup for journal-bearings, having a hollow perforated boss or hub, a suspension device secured to the upper end of the hub, and a receiving-vessel attached to the lower discharge end of the hub, substantially as set forth.

2. The combination of a drip-cup for journal-bearings provided with a central hollow boss or hub open at the lower end, said hub having inclined perforations at different levels, with a detachable receiving-vessel attached to the lower discharge end of the hub, substantially as set forth.

296,821. BUTTER-PACKAGE. JOHN C. BROWN, Davenport Centre, N. Y. Filed Aug. 30, 1883. (No model.)



Claim.—1. In a butter-package, the combination, with a jar and its cover, of a ring surrounding the jar, ears projecting from the same, cam-levers held to turn on the ears, and a cross-piece pivoted to the cam-levers and bent at its middle to form a handle-loop, substantially as herein shown and described.

2. The combination, with a butter-jar, of a cover having an annular ridge on its upper surface, which ridge is provided with a series of diametrically-opposite notches, ears projecting from the ring surrounding the jar, cam-levers held to turn on the said ears, and a cross-piece pivoted in the cam-levers, substantially as herein shown and described.

3. In a butter-package, the combination, with a jar and its cover, of cam-levers held to turn on ears held on the jar, and a cross-piece pivoted to the cam-levers, to which cross-piece spring-plates K are fastened, substantially as herein shown and described.

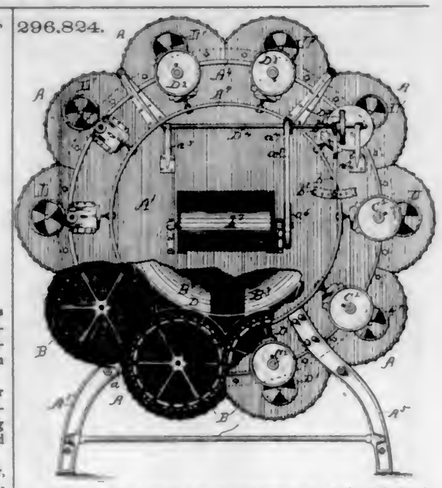
4. The combination, with a jar and its cover, of a ring, F, ears G, pivoted to said ring, cam-levers H, journaled in the ears, and a cross-bar journaled in the cam-levers, and serving the double purpose of a handle and means for holding the cover, substantially as described.

296,822. WATER-CLOSET. PATRICK CONNOLLY, Brooklyn, N. Y. Filed May 23, 1883. (No model.)

Claim.—1. In a water-closet, the combination, with the chamber or body provided with side recesses in its top opening and removable plates for closing said recesses, of the removable pan, substantially as described.

2. The combination, with the basin provided with a flange, as 7, of the body or chamber provided with a flange, as 5, and set-screws, as 4, passing through said flange 5 and abutting against said flange 7, substantially as described.

3. The combination, with the lever 19, of the rod 20, having a universal joint, as 23, substantially as described.



4. The combination, with the lever 19, provided with the ribs 2, of the nut 24, bolt 25, and pull-rod 20, substantially as described.

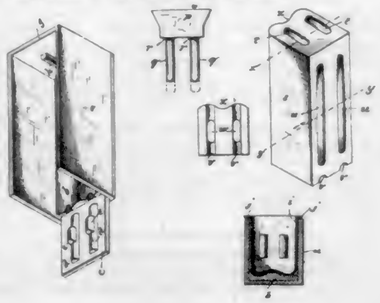
296,823. JOURNAL-BEARING. EDWARD COPLEY, JUSTUS FORDICE SELDOMRIDGE, and GEORGE DE LA VERGNE, Colorado Springs, Colo. Filed Jan. 10, 1884. (No model.)

Claim.—A journal-bearing section formed with the passage *c*, shoulders *d*, end recesses, *e*, and end shoulders, *f*, in combination with a filling of papier-maché or leatheretta, substantially as described.

296,824. COTTON GINNING AND CLEANING APPARATUS. MILO COVEL, Chicago, Ill. Filed July 3, 1883. (No model.)

Claim.—1. In a cotton-gin, the combination of a series of inclosed toothed cylinders arranged in a circular plane, the whole inclosing an annular interior space, where the cotton or other fibrous substance to be treated is subjected to the action of the continuous moving toothed cylinders, substantially as described.

2. The combination, with a series of hollow cylinders and a casing or jacket provided with openings for the admission of air into each of the cylinders, of a series of fans arranged longitudinally on the inside of each of the said cylinders for the purpose of generating a blast to assist in separating the fiber from the refuse matter and depositing the same in the lint-room when so separated.



3. In an apparatus as described, the combination, with the series of toothed rings D, and the tie-rods C^3, of the series of wire-clamps a', placed between each pair of rings, for the purpose of retaining the same with proper relation to each other, and arranged to provide openings or air-passages, substantially as set forth.

4. The combination, with a cotton-gin, of a feeding apparatus consisting of the drum b^3, the companion drum b^4, the feed-apron b^5, having the outer surface thereof studded with lag-points which are inclined back from a forward movement of the apron, the concave part *d*, provided with lag-points, and the wire screening-surface *d'*, arranged in the under side of the feed-passage, whereby a portion of the refuse matter is expelled from the substance before it passes into the ginning apparatus, substantially as set forth.

5. The combination, with a ginning apparatus, of a lint-room provided with a number of gauze-drums arranged in a horizontal plane, and self-adjusting rollers F F' F', for the purpose of separating the fiber into as many grades or lots as there are drums.

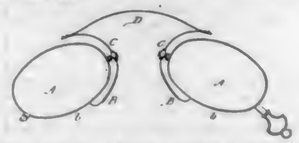
6. The combination of a ginning apparatus having a discharge-opening, and a lint-room having adjustable shield d^2, hinged to partition d^3, having a space between it and the wall of the lint-room below the discharge-opening.

296,825. MOLDING PLASTIC MATERIAL. CHARLES M. DU PUY, Philadelphia, Pa. Filed Aug. 26, 1882. (No model.)

Claim.—1. The box or mold *a*, having the hinged end-gates, a tray, *i*, therein, and projections to indent the product, and die *o*, constructed and arranged to operate substantially as shown and described, and for the purpose specified.

2. A mold, *a*, having the bottom *b* and ends *c g*, provided with internal projections to give shape to the mass being molded, the tray *i*, and end pieces, *l n*, and the die *o*, substantially as shown and described.

3. The combination, with the mold-box *a*, of the tray *i*, substantially as and for the purpose described.



4. The combination, with the mold-box *a*, of the tray *i*, having the edge flanges, *j j*, end flange, *k*, and end pieces, *l n*, substantially as and for the purpose described.

5. The combination, with a mold-box, *a*, and its tray *i*, of the die *o*, having blades or prongs *q*, substantially as shown and described.

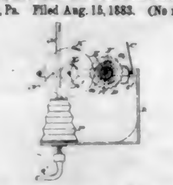
6. The combination, with the mold-box *a*, of the die *o*, having blades or prongs *q*, provided with rounded or beveled points, and slightly tapering or rounded shoulders *r*, substantially as and for the purpose specified.

7. The block *s*, formed with cavities *t t* and *u u*, grooves *v v*, and counter-cavities *w w* therein, and the curvilinear back *z*, all substantially as and for the purpose set forth.

296,826. EYEGLASSES. IVAN FOX, Philadelphia, Pa. Filed Feb. 20, 1884. (No model.)

Claim.—In eyeglasses, the springs extended over the lens or frames thereof, and a yoke having its ends attached to the ends of said springs, the connected end of the springs and yoke constituting an abutment for the lenses or frames at the top thereof.

296,827. CLASP. HENRY C. FRANK, New York, N. Y. Filed Feb. 6, 1884. (No model.)



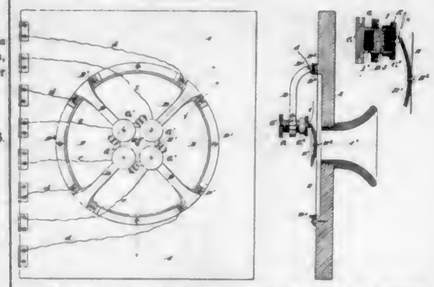
Claim.—1. The skirt-clasp described, having a single foundation, and two independent levers pivoted thereto, each part having projections, as *a*, to hold cushions M, and each lever having an operating-handle and spring, arranged reversely, as set forth.

2. The foundation A, having lugs A', and projections *a*, combined with the two independent levers, as C D, having reversely-arranged handles and springs, the pivot B, common to both levers, and the cushions M, as set forth.

3. In a clasp, as described, the combination of a foundation, as A, with two independent levers, as C D, the said levers having a combined width equal to the width of the foundation, and bearing-jaws, as C' D', and with springs, as E E', as set forth.

296,828. PNEUMATIC BELL-RINGING APPARATUS. ROBERT P. GARSED, Norristown, Pa. Filed Aug. 15, 1883. (No model.)

Claim.—1. In a bell-ringing device, a bell-hammer, in combination with an escapement-wheel fitted loosely on a shaft, and carrying a pawl, a ratchet and gear-wheel fixed to said shaft, a coiled spring connected with said wheel and the supporting-frame, gearing, and operating rack or bar, substantially as described, said spring being wound up on the advance of said bar, the subsequent uncoiling of the spring causing the ringing of the bell and restoring the parts to their normal position, as stated.



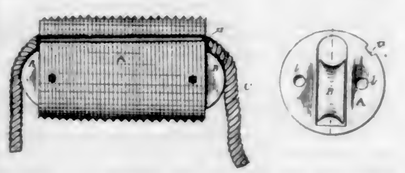
2. In bell-ringing apparatus, the combination of an operative pump, a bellows, and a pipe connecting the same and escapement mechanism, devices for operating the same, and a spring, the latter being coiled on the advance of said devices, leaving the bell-hammer inoperative, and uncoiling on the return of said devices, causing the operation of said hammer and ringing of the bell, substantially as and for the purpose set forth.

3. In bell-ringing apparatus, escapement mechanism and operating devices therefor, in combination with a spring, substantially as described, the same being wound by the primary motion of said devices without affecting the bell, and uncoiling on the return motion of said devices, causing the ringing of the bell, as stated.

4. In a bell-ringing device, a hammer, in combination with an escapement loosely fitted on a shaft and carrying a pawl and ratchet, a spring, gearing, and means for operating said gearing, whereby said spring is wound on the advance motion of the gearing without affecting the bell, the subsequent uncoiling of the spring causing the ringing of the bell and restoration of parts to their normal position, as stated.

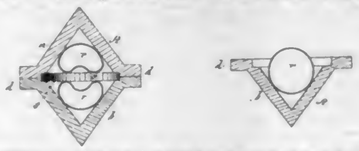
5. In a pneumatic bell-ringing apparatus, an inflatable body and operating-pump, a rack connected with said body, a pinion, gearing, and a bell-hammer, in combination with the frame or support, having a roller or pulley which guides said rack, substantially as and for the purpose set forth.

296,829. TELEPHONE. WEBSTER GILLETT, Flushing, N. Y., assignor to the Atlantic and Pacific Telephone Company, Saco, Me. Filed Oct. 15, 1883. (No model.)



Claim.—1. In a telephone, the combination of a series of separate pins, E, connected with the carbon powder J to form a variable-resistance device, and the concave disk B', fixed to a point in the vibrating disk B, whereby simultaneous vibration may be communicated to said pins, substantially as set forth.

2. In combination with the variable-resistance device formed by the pins E and carbon powder J, and the arms D, carrying the variable-resistance devices, the electrical connections *d e*, the disk B', and the diaphragm B, substantially as and for the purposes specified.



3. In a telephone, the cylinders G, carrying carbon powder J and engaging screw-threads in the arms D, the pins E, and the disks B and B', the parts J and E forming a variable-resistance device, which may be regulated by turning the cylinder G, substantially as specified.

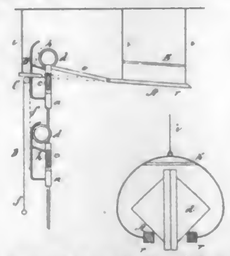
296,830. SASH-CORD GUIDE. WILLIAM C. GILMER, Oakdale, Cal. Filed Aug. 7, 1883. (No model.)

Cloim.—The cylindrical-shaped pulley-piece A, provided with screw-threads and longitudinal groove *a* on its outer surface, and holes *b* at one of its ends, in combination with the sheaves B, carrying cord C, one at each end of the receptacle of the cylinder A, substantially as and for the purpose herein described.

296,831. CASH AND PARCEL RECEPTACLE FOR CASH-CARRIER SYSTEMS. CHARLES GRANT, Jr., and DAVID LAWRENCE, Boston, Mass.; said Lawrence assignor to said Grant. Filed Mar. 13, 1884. (No model.)

Claim.—1. A hollow cash or parcel receptacle of the form of a pair of cones or frusta of cones with their bases coinciding with each other, substantially as described.

2. A hollow cash or parcel receptacle of the form of a pair of cones or frusta of cones with one or more ribs or flanges interposed between their bases, as set forth.



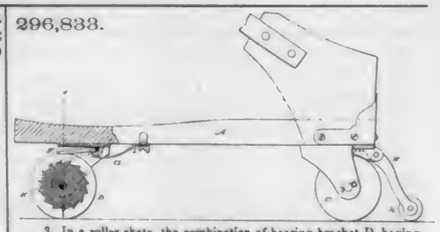
3. The combination, with a hollow cash or parcel receptacle, of a memorandum book or tablet on which to record the amount of the sale and number or name of the salesman, substantially as specified.

4. A memorandum book or tablet with an opening therein for the reception of the money or parcel, in combination with a hollow receptacle of the class described, substantially as described.

5. In combination with a hollow cash or parcel receptacle, a memorandum book or tablet having an opening therein, and with a tube projecting from one of its covers, as and for the purpose set forth.

6. A pair of elastic air-tight balls, in combination with and located in a hollow cash or parcel receptacle, operating as and for the purpose described.

296,832. CASH-CARRIER. CHARLES GRANT, Jr., and DAVID LAWRENCE, Boston, Mass.; said Lawrence assignor to said Grant. Filed Mar. 13, 1884. (No model.)



Claim.—1. In combination, an elevator with its carrier and cash or parcel receptacle, a rod or ways on which said elevator is raised by a cord or other connection, a guard for keeping in place the receptacle which is being raised, and for preventing the passage of another receptacle beyond it, and a track having a pivoted section capable of being inclined thereto, as and for the purpose set forth.

2. An elevator, in combination with a standard, one of which is provided with a projection, which enters a groove in the other, the lower portion of said groove being vertical, while its upper portion is curved, constructed to operate as and for the purpose set forth.

3. A holder actuated by a clock-spring for receiving the cash or parcel receptacle on its return from the cashier, in combination with a track having a pivoted section locked in line with the main track by a catch, which is liberated by the weight of said receptacle thereon, a spring for raising the free end of the pivoted section, and a hanging device for guiding the receptacle into the holder, the track being closed by the weight of the receptacle when it strikes said guide, constructed and arranged to operate substantially as and for the purpose described.

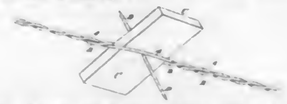
4. In combination with a track and a cash and parcel receptacle, the guard E, located thereover, and secured to the vertical track-supports *i*, substantially as described.

296,833. ROLLER-SKATE. MICHAEL F. HANLON, Brooklyn, N. Y. Filed Jan. 19, 1884. (No model.)

Claim.—1. In a roller-skate, the combination, with the usual front roller or rollers, of a ratchet-wheel fixed thereto and a gravity-pawl loosely pivoted beneath the foot-plate, with its free end adapted to engage said ratchet, and thereby prevent a backward rotation of the roller, substantially as set forth.

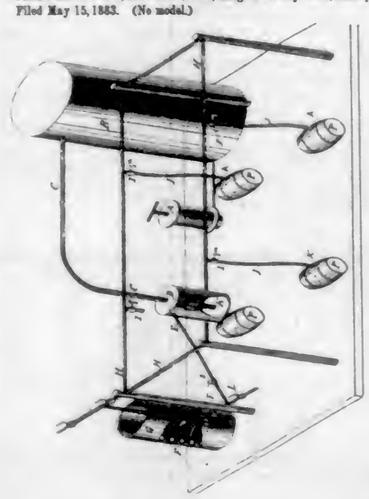
2. In a roller-skate, the combination, with the front rollers, B B, of ratchet-wheel E, embraced between them, and having spurs *b b*, which penetrate them, and with pawl F, substantially as set forth.

3. In a roller-skate, the combination of bearing-bracket D, having holes *c* and indentations *d d*, with pawl F, having ears *e e*, and with ratchet-wheel E and rollers B B, substantially as set forth.



4. In a roller-skate, the combination, with ratchet-wheel E and pawl F, of lever G, adapted to disengage the pawl from the ratchet, substantially as set forth.

296,834. VEHICLE-SPRING. JACOB HOWELL, Jackson, Mich., assignor of one-half to Henry N. Archer and Ansel N. Hovey, both of same place. Filed Apr. 18, 1883. (No model.)

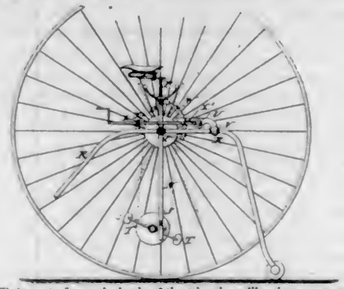


Claim.—The herein-described vehicle-spring, it consisting of the curved spring plate or bar C, extending from a line at or near the center of the body outward to the side bar and bearing upward directly against the body, in combination with another elastic spring-plate, D, which is flat, and is situated in line with the spring C, and is placed throughout its length close to and in contact with the under side of the vehicle, and the hinge or pivot which joins the two elastic parts, substantially as set forth.

296,835. WIRE FENCE. ARTHUR G. HULBERT, St. Louis, Mo. Filed Feb. 24, 1883. (No model.)

Claim.—The flat wooden tablet C, having barb D, in combination with the twisted strands A B, embracing the plain sides of said tablet, one of the strands being arranged above and the other below the barb, as shown and described.

296,836. PROCESS OF AND APPARATUS FOR AGING WHISKY. PIERRE EYMARD JAY, New York, N. Y., assignor to Jay & Co., same place. Filed May 15, 1883. (No model.)

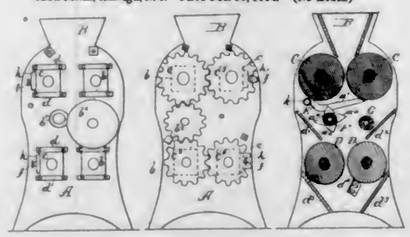


Claim.—1. The herein-described process of aging whisky and similar liquors in oaken casks by subjecting them to the action of a vacuum in said casks and condensing the resultant vapor, substantially as and for the purpose herein set forth.

2. The combination of one or more casks for containing the liquor to be aged, a condensing-worm communicating with the interior of the said cask, a tank containing a suitable deliquescent salt or material, a pump, receiver, and suitable tubular connections for insuring a vacuum within the said tank, condensing-worm, and cask, all substantially as and for the purpose herein set forth.

3. The combination of an air-pump, A, receiver B, pipe C, tank D, pipe E, having stop-cocks *b*, condensing-worm F, having discharge-cock L, pipe or pipes H, nozzles I, having stop-cocks *a*, for connecting the pipes H with the casks containing the liquor to be treated, all substantially as and for the purpose herein set forth.

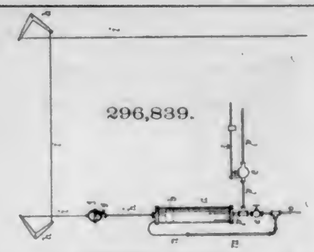
296,837. VELOCIPEDE. FREDERICK WARNER JONES, Exeter, County of Devon, England. Filed Feb. 15, 1884. (No model.) Patented in England Oct. 23, 1881, No. 4,722.



Claim.—1. In a velocipede of the tricycle or like class, a transverse swing-frame pivoted to the main frame and carrying the seat or saddle, the pedals, and the transmitting or driving mechanism, substantially as set forth.

2. In a velocipede of the tricycle or like class, a transverse swing-frame, the upper arched portion of which has a socket for the seat or saddle-bar, horizontal bearings, and vertical rods extending downwardly below said bearings, substantially as set forth.

3. The combination, with the main frame of a tricycle or other like velocipede, of a transverse swing-frame carrying the seat, pedals, and driving-gear, and means, substantially as described, whereby the swing-frame is retained in the desired position relatively to the main frame, substantially as set forth.



296,838. GRAIN CRUSHER AND DISINTEGRATOR. JESSE ARTHUR JONES, Raleigh, N. C. Filed Feb. 16, 1884. (No model.)

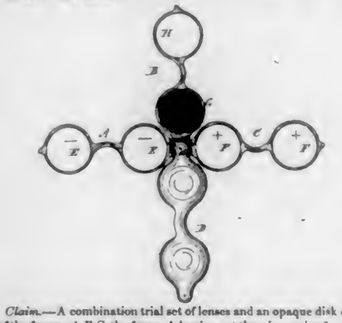
Claim.—In a machine for crushing and disintegrating grain, the combination of the two sets of rollers C C and D D, the slotted and ribbed diaphragm E, and the cylinder F, provided with the blades *a*', extended through the slots of the diaphragm, all constructed and arranged substantially as and for the purposes described.

296,839. STEAM-ALARM AND DAMPER-REGULATOR. JOHN C. JONES and CHARLES T. REID, Decatur, Ill. Filed Nov. 30, 1883. (No model.)

Claim.—The combination, in an automatic steam-alarm, of pipe *p*, cylinder *a*, plunger *b*, piston-rod *h*, weight *f*, escape-pipe *m n*, drip-valve *e*, and discharge-pipe *o*, as and for the purpose set forth.

296,839.

296,840. CAR-WHEEL. JOHN N. KAUFHOLZ, Cleveland, Ohio. Filed Sept. 7, 1883. (No model.)



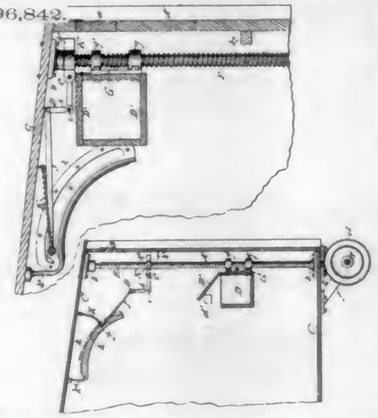
Claim.—1. The hubs A and A', so fitted as to require great pressure to bring them properly together, in combination with the thimble B, and adapted to support and firmly hold the disks that support the rim of the wheel, substantially as and for the purpose set forth.

2. The hubs A and A', in combination with the thimble B and the disks C and C', substantially as shown and described.

3. The combination, with the two-part hub and thimble B, of the disks C C', secured to the two-part hub in the manner described, each disk being provided with an inwardly-projecting lip, and the rim D, provided with the beveled rib *d*, all of the above parts combined as described.

296,841. TRIAL-LENS. JULIUS KING, Cleveland, Ohio. Filed Dec. 13, 1883. (No model.)

Claim.—A combination trial set of lenses and an opaque disk consisting of the frames A B C, the frame A having set therein a pair of — or concave lenses, and the frame C with + or convex lenses, (the above concave and convex of slight power,) and a frame, B, having set therein an opaque disk, whereas the opposite end of frame is a clear opening, the said frames being pivoted in a case or handle, D, substantially as herein set forth, and for the purpose specified.



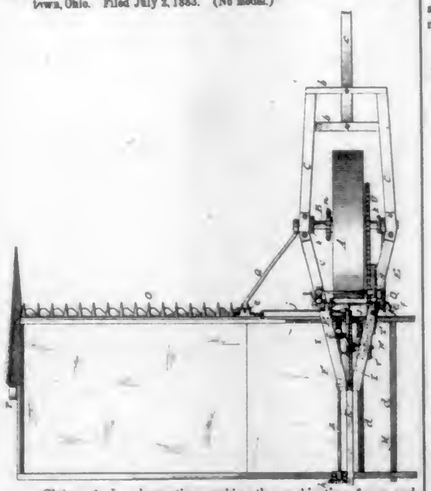
296,842. CATTLE-CAR. WILLIAM KLAEBER and FRED SELL, Milwaukee, Wis. Filed Jan. 29, 1884. (No model.)

Claim.—1. In a cattle-car, a water-trough and a feed-rack mounted on vertical screw-rods, whereby as said rods are turned in one or the other direction both devices will be simultaneously raised close up to the car-top or lowered down for use, in combination with stop-blocks fastened at suitable points in the sides and ends of the car, whereby the said devices are automatically adapted for use, substantially as set forth.

2. In a cattle-car, the threaded screw-rods E E, pivot-plates *b b'*, the pinions *c c*, hangers *f f* for shaft F, carrying the beveled pinions *d d*, ratchet-wheel *f''*, and hand-crank *f'*, and pawl *f''*, in combination with the water-trough D' and the hay-rack D, substantially as shown and described, and for the purpose set forth.

3. In a cattle-car, the screw-threaded rods E E, the trough D', having hanger G, with heads *g* and *g'*, and the hay-rack D, having the loose

296,842.



collar K', with projection k^3, in combination with the sides A', having the trap-doors *a a a* and the stop-blocks k^4, substantially as shown and described, and for the purpose set forth.

4. In a cattle-car, the hay-rack D, having the rigid L-shaped base *i*, collar K', with projection k^3, longitudinal rods i' and i^2, and the vertical articulated arms *j* on upper rods j', in combination with the slotted plate *k*, rod k^3, chain K, the trough D', screw-rods E E, trap-doors *a a*, and stop-blocks k^4, substantially as shown and described, and for the purpose set forth.

5. In a cattle-car, the trough D, having cover D^2, with sections d' d^2 d^3, in combination with the screw-rods E, and the ends A^2 of the car-box having stop-blocks d^3, substantially as shown and described, and for the purpose set forth.

296,843. GRAIN-HARVESTING MACHINE. JOSIAH KNOOP, Cass town, Ohio. Filed July 2, 1883. (No model.)

Claim.—1. In a harvesting-machine, the combination of a ground-wheel, a main frame supported thereon, a harvester-platform suspended from said frame in rear of the wheel, and a counter-balance applied to the frame in advance of the wheel.

2. The combination of the main wheel, the main frame provided with the elevated rear extension, the platform-frame, and suspension devices, substantially as described, connecting said platform-frame with the rear extension of the main frame, as described.

3. The combination of the wheeled main frame having an overhead extension behind the wheel, the platform-frame, the bar K, suspended at an intermediate point from the main frame above the platform-frame, and suspending devices extending from the opposite ends of said bar to the platform-frame, as described.

4. The combination of the main wheel, the main frame, the rearwardly and upwardly extending arms E, and the brace G.

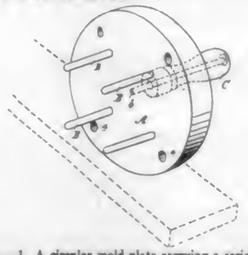
5. In combination with the wheeled main frame having the rear extension, the platform-frame suspended by overhead connections from the rear end of the main frame, and means, substantially as described, for effecting the tilting or rocking motion of said platform-frame in a forward and backward direction.

6. In a harvesting-machine, a platform or receiver connected at its front and rear edges by suspending devices to opposite ends of a sustaining-bar, said bar being pivotally supported at an intermediate point in its length, substantially as described, whereby the rocking or tilting motion of the platform is permitted.

7. The combination of the main frame and its elevated rear extension, the platform, the suspending-chains L, bar K, suspending-chain I, and means, substantially as described, for effecting the adjustment of said chain.

8. In combination with the wheeled frame having the elevated extension at its rear, the grain-platform, the overhead suspending devices connecting said platform with the main frame, and the hand-lever T, connected by means substantially as described with the forward edge of the platform.

9. In combination with the main wheel and the main frame having an overhead extension at its rear, the platform, means, substantially as described, for suspending said platform at its front and rear edges from the overhanging frame, and draft-arms Q, extending backward from the ends of the main axle and jointed to the forward edge of the platform.



10. In combination with the wheeled main frame, the platform-frame arranged to rise and fall in relation thereto, the vertically-adjustable reel supported upon the main frame or its axle, and devices, substantially as shown, connecting the platform and reel, whereby the reel is caused to rise and fall in unison with the platform.

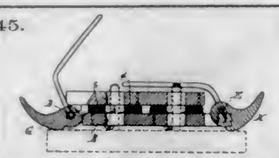
11. In combination with the wheeled main frame, the standards, the reel-supporting arms jointed thereto, the connecting-arms Q, and the brace *u*, extending from the arms Q to the reel-sustaining arms, whereby the vertical movement of the platform is caused to produce a like movement of the reel.

12. In combination with the main frame and the vertically-swinging reel-support thereon, the vertically-movable platform, the rods *u*, and adjustable devices, substantially as shown, connecting said rod with the reel-supporting arms, whereby the vertical adjustment of the reel may be effected independently of its automatic movement.

13. In combination with the wheeled main frame and the reel-standards, the platform, the upright arm *s*, and the rod or brace *r*, connecting said arm with the standards.

296,844. CAPSULE-MACHINE. JOHN KREHBIEL, Detroit, Mich., assignor to the Globe Capsule Company and Henry J. Milburn, same place. Filed Oct. 16, 1883. (No model.)

Claim.—1. A circular mold-plate carrying a series of mold-pins adapted to be rolled on its edge, and provided with means, substantially as described, for holding and rolling it, substantially as and for the purposes described.

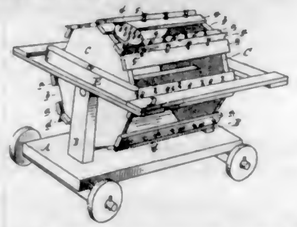


2. A circular mold-plate provided with a series of mold-pins, and a handle projecting from the rear of said plate at its axis, substantially as and for the purposes specified.

3. A circular mold-plate provided with a series of mold-pins adapted to roll upon its edge, and provided with guide-holes to facilitate the cutting of the capsules from off said mold-pins, substantially as and for the purposes set forth.

296,845. CAPSULE-MACHINE. JOHN KREHBIEL, Detroit, Mich., assignor to the Globe Capsule Company and Henry J. Milburn, same place. Filed Oct. 16, 1883. (No model.)

Claim.—1. In a capsule-removing device, a series of sliding jaws arranged on suitable supports, as A B, in combination with cams connected with said sliding jaws, and having one part constructed to close the jaws upon the mold-pins on which the capsules are formed, and another part to push the jaws with the capsules off the mold-pins, substantially as described.

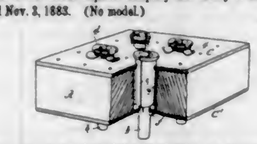


296,845.

2. In a capsule-machine, the combination of yielding jaws arranged in pairs upon sliding plates provided with holes designed to register with the pins upon the mold-plate, and upon which the capsules are formed, and cams, substantially as described, for closing such jaws around the mold-pins, substantially as set forth.

3. In a capsule-removing device, the combination of a mold-plate provided with mold-pins, and the plates A B, having orifices to register with the mold-pins, and yielding jaws C, with cams, substantially as described, for separating the plates from the mold-plate, and thus stripping the capsules from the mold, as set forth.

296,846. CAPSULE DRYING RACK. JOHN KREHBIEL, Detroit, Mich., assignor to the Globe Capsule Company and Henry J. Milburn, same place. Filed Nov. 3, 1883. (No model.)



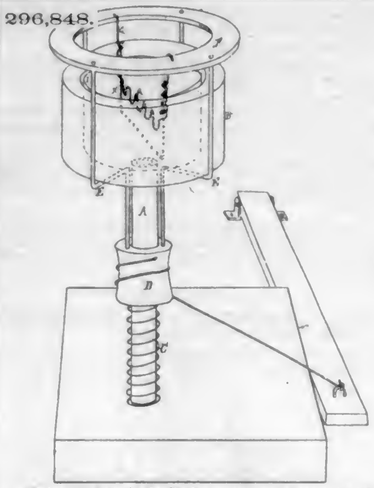
Claim.—1. The combination, with a revolving capsule-drying rack, of a series of capsule-mold plates, and means, as *c*, substantially as described, for securing said plates to the rack, as and for the purposes specified.

2. The combination, with a revolving capsule-drying rack, of a series of capsule-mold plates, means, as *c*, for securing said plates to the rack, and a locking-stop, as E, substantially as and for the purposes specified.

3. The combination, with a revolving capsule-drying rack, of a series of capsule-mold plates, means, as *c*, for securing said plates to the rack, a locking-stop, as E, and flanges or troughs, as *d*, substantially as and for the purposes set forth.

4. A revolving capsule-drying rack consisting of the following elements: a truck, A, a polygonal rack, C, supported upon said truck, locking-clamps *c*, locking-stop E, and flanges or troughs *d*, the parts being constructed, arranged, and operating substantially as and for the purposes described.

296,847. CAPSULE-MACHINE. JOHN KREHBIEL, Detroit, Mich., assignor to the Globe Capsule Company and Henry J. Milburn, same place. Filed Nov. 3, 1883. (No model.)



Claim.—1. A hand-tool for lubricating or greasing gelatine-capsule mold-pins, consisting of a series of self-adjusting thimbles set in a yielding support and carrying the lubricant, and adapted to register with the mold-pins upon the plate, substantially as and for the purposes set forth.

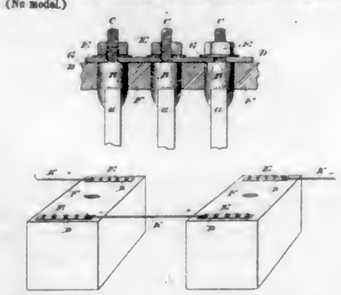
2. In a device for lubricating capsule mold-pins, the slotted thimbles B, within the bore of which are secured by the cord *s* the greasing-cloths *d*, such thimbles being arranged in a yielding bed-plate, by means of which said thimbles are capable of adjusting themselves to register with the pins to be lubricated, substantially as described.

296,848. CAPSULE-MACHINE. JOHN KREHBIEL, Detroit, Mich., assignor to the Globe Capsule Company and Henry J. Milburn, same place. Filed Nov. 21, 1883. (No model.)

296,848.

Claim.—1. A device for dipping capsule-molds, consisting of a vertically-moving supporting-frame carrying stirrers adapted to recede and advance as the molds are immersed and withdrawn, substantially as set forth.

2. In a device for dipping capsule-molds, the combination, with a suitable vessel for containing the solution from which the capsules are to be formed, of a vertically-moving supporting-frame carrying stirrers, and mechanism by means of which such stirrers are rotated or partially rotated within the dipping-vessel, substantially as described.



3. In a device for dipping capsule-molds, the combination of the steam-jacket B, supporting frame or ring E, with the pan I and stirrers H G, substantially as set forth.

4. In a capsule-dipping device, the combination of the pan I with two stirrers, one of which moves vertically independent of the other, and means for rotating the same, substantially as described.

5. In a device for dipping capsule-molds, a yielding supporting-frame arranged above the dipping-vessel, and adapted to be depressed by the operator and to assume its original position as the force of such depression is removed, substantially as set forth.

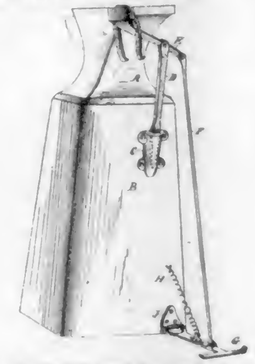
6. In a device for dipping capsule-molds, the combination, with a steam-pipe, A, and jacket B, of the spring C, sleeve D, and brackets E, carrying a supporting-frame, F, provided with advancing and receding stirrers within the pan I, substantially as specified.

296,849. DEVICE FOR CONNECTING THE ELEMENTS OF SECONDARY BATTERIES. WILLIAM LACHLAN, London, England, assignor to the Light and Force Company, New York, N. Y. Filed Jan. 23, 1883. (No model.)

Claim.—1. An electrode comprising a plate having at one edge a lug of greater thickness than the body of the plate and a pin or stud partly embedded in said lug, substantially as described.

2. An electrode comprising a plate with a projecting piece and a pin or stud partly embedded in a lug cast on said projecting piece, substantially as described.

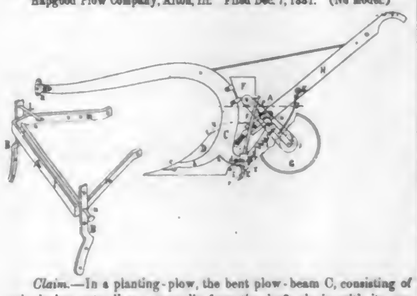
3. The lead electrodes of a secondary battery, provided with a



partly-embedded pin or stud of brass, copper, or gun-metal, said pin or stud having the embedded portion tin-coated and secured in the lead by casting, substantially as described.

4. The combination of the perforated cover, the electrodes with lugs projecting through said cover, the pins or studs partly embedded in said lugs, the nuts, and the connecting-strips, substantially as described.

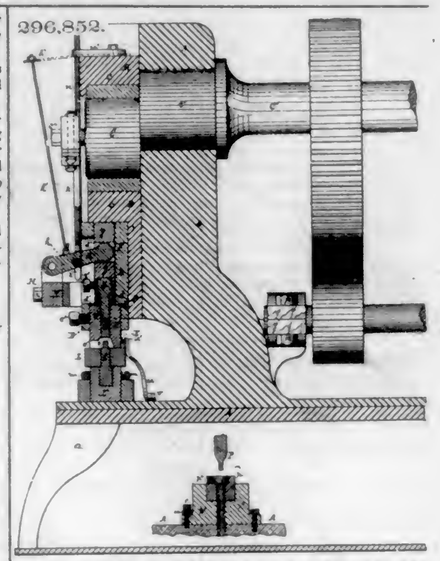
5. The combination, with a series of plates constituting the electrodes of a cell of secondary battery, each plate having a lug projecting through a hole in the cover of said cell, and a threaded pin of copper or copper alloy embedded in said lug, of conductors clamped by nuts on said pins and connecting alternate electrodes with each other, and the two sets thus formed with the poles of other cells or apparatus, substantially as described.



6. In combination with the plates of a secondary battery provided with lugs and screws set therein, the metal connecting strip having perforations, and the nuts for binding the said strip, substantially as described.

296,850. ATTACHMENT FOR ANVILS. MARVIN A. LADD, Springville, Mich. Filed Apr. 26, 1883. (No model.)

Claim.—In combination with the anvil A and lever E, provided with a weighted clamping-jaw, and pivoted substantially as described, whereby said jaw will automatically fall downwardly and away from the anvil by its own gravity, the rod F, treadle G, and spring H, all combined and operating substantially as set forth.



296,851. PLANTING-PLOW. JOHN LANE, Hyde Park, assignor to the Hapgood Plow Company, Alton, Ill. Filed Dec. 7, 1881. (No model.)

Claim.—In a planting-plow, the bent plow-beam C, consisting of a single bar extending rearwardly from the draft-clevis, with its rear part bent curved downward under the mold-board of the plow, substantially as shown, in combination with the listing-plow D, attached to the foot end of the said beam, the drill-tooth following the heel of the said beam, and adjustable vertically, the dropping-box F, with pipe *f*, and the wheel G, with yoke A, provided with pivotal connection with the plow, and handles H H, with brackets B B, attached to the mold-board, all substantially as and for the purpose set forth.

296,852. MACHINE FOR MAKING EYE-RODS AND HOOK-AND-EYE HINGES. CHARLES LANE, Pittsburg, Pa. Filed Jan. 17, 1883. (No model.)

Claim.—1. In dies for forging eye-rods and hooks, a matrix having a side recess and a movable bottom adapted to be advanced after

296,852.

the forging of the blank, and discharge it from the matrix, substantially as set forth.

2. In dies for forging eye-rods and hooks, the matrix-die E, having the matrix *e*, provided with a side recess, *e'*, in combination with the movable plunger-bottom G and lever A, substantially as and for the purposes set forth.

3. In dies for forging eye-rods and hooks, the combination, with the reciprocating frame, of the block D, secured therein, and having the bore *d*, the die E, secured in said block, and having the matrix *e*, and the movable plunger G, forming the bottom of said matrix during forging, and adapted to discharge the forged blank, substantially as set forth.

4. In combination with the matrix-die E, the movable plunger-bottom G, lever A, and spring-rod *k'*, substantially as and for the purposes set forth.

5. In combination with the matrix-die E, the plunger G, slide *g*, having the slot g^2, and lever A, pivoted in the frame H, substantially as set forth.

6. In combination with the block D, having the bore *d*, and slot d^2, the matrix-die E at the base of the block, plunger G within said bore *d*, and lever A, extending through said slot d^2 into the plunger, substantially as and for the purposes set forth.

7. In combination with the movable plunger G and lever A, the forked arm *k*, adapted to press down said lever and plunger after the forging operation, substantially as and for the purposes set forth.

8. In combination with the eccentric C, the arm *k*, journaled at one side of the face thereof, substantially as and for the purposes set forth.

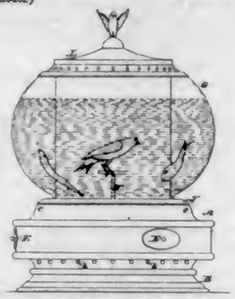
9. In combination with the lever A, the eccentric C, having the wrist-pin *c*, extending out from the face thereof, and the arm *k*, journaled on said pin, and adapted to press upon said lever, substantially as and for the purpose set forth.

10. In combination with the lever A, the arm *k*, adapted to press thereon, and the spring-rod *k'*, substantially as and for the purposes set forth.

11. The combination of the anvil L, punch *l*, extending through said anvil, and lever M, extending under and adapted to raise the anvil, substantially as and for the purposes set forth.

12. The combination of the punch *l*, the anvil L, fitting around said punch, and having the shoulders *l'*, and the lever M, having the arms *m m*, adapted to press against said shoulders and raise said anvil, substantially as and for the purposes set forth.

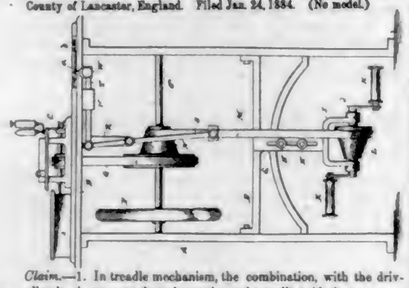
13. In combination with the anvil L, the lever M, the rod *n*, and the reciprocating frame B, substantially as and for the purposes set forth.



14. In combination with the anvil L, the lever M, the rod *n*, having the stop n^2, and reciprocating frame having the bearing *n'*, through which the rod passes, substantially as and for the purposes set forth.

15. In combination with the punch *l* and the vertically-movable anvil L, the arms *u*, having lips *u'*, for limiting the movement of the anvil, substantially as set forth.

16. In combination with the punch *l* and vertically-movable anvil L, the arms *u*, fitting against said anvil, and having lips *u'*, extending above it, substantially as and for the purposes set forth.



17. The combination of the matrix-die having the matrix *e* and side recess, *e'*, the movable plunger-bottom G, having the short teat *s*, and the anvil L, having the punch *l*, of greater length than the teat *s*, substantially as and for the purposes set forth.

296,853. AQUARIUM. AUGUST LEDIG, Philadelphia, Pa. Filed May 2, 1883. (No model.)

Claim.—A chambered base, in combination with an aquarium-globe formed of double walls, separated at top, the inner wall of which incloses a central space having a removable cover, said space being in communication with said base, so that a bird may occupy either space or base and be seen through the globe.

296,854. TREADLE MECHANISM. HENRY LEEMING, Manchester, County of Lancaster, England. Filed Jan. 24, 1884. (No model.)

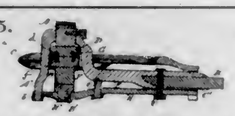
Claim.—1. In treadle mechanism, the combination, with the driving-pulley having a cone-shaped exterior and an adjustable hanger, constructed substantially as described, in which its shaft is mounted, of the auxiliary driving-shaft having a like pulley, the two being geared together by means of a belt and having their contracted ends oppositely disposed.

2. In treadle mechanism, the combination, with the driving-pulley having a cone-shaped exterior, and having its shaft mounted in an adjustable hanger, and the auxiliary shaft having a like pulley, of the belt and the belt-shifter, adapted to shift the belt laterally on the pulleys.

3. In treadle mechanism, the combination of a belt-shifter provided with a pointer with a speed-indicating plate, whereby the position of the belt on the pulleys is shifted and the speed indicated.

4. In treadle mechanism, the combination, with a pivoted belt-shifter having a bifurcated extension adapted to embrace the belt, and the arm connected to its upper end, supported by a bearing, and having a pointer, of an indicator-plate provided with characters or words to indicate fast or slow or intermediate speed, according to the position of the pointer.

5. In treadle mechanism, the combination, with the supporting-bracket, of a shaft-hanger secured thereto and capable of adjustment.



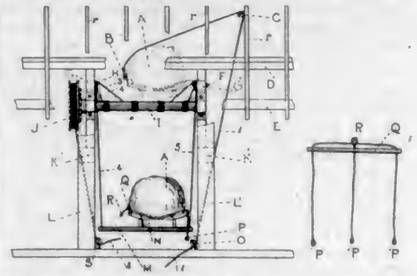
6. In treadle mechanism, the combination, with the adjustable hanger having its extremities constructed to form bearings, of a driving-shaft provided with a driving-pulley, and treadles secured thereto at either side of the pulley.

7. In treadle mechanism, the combination, with an adjustable hanger, the driving-shaft mounted therein, and provided with a cone-shaped driving-pulley, and treadles secured to either side thereof, of an auxiliary shaft having a like pulley, the contracted ends of the said pulleys being oppositely disposed.

296,855. VEHICLE FIFTH-WHEEL. JOHN W. LEETE, South Meriden, Conn. Filed Dec. 4, 1883. (No model.)

Claim.—1. An axle-coupling formed with the annular seats *d* and *f'*, whose exterior walls fit upon each other, and having the center studs,

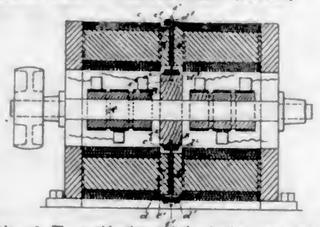
296,855.



as described, and a separately-formed ring, G, inserted in the seats and held inside and outside by the walls and center studs, as set forth.

2. An axle-coupling formed with the annular seats *d* and *f'*, and uniting ring or band G, set in and held by the walls and center studs of the seats, said coupling being provided with a pivot, B', a binding-plate, H, having a bearing, H', for the pivot B', and means, substantially as set forth, for securing the binding-plate.

3. In an axle-coupling, the combination of the bars A and B, provided with seats *d* and *f'*, a ring, G, a pivot, B', a cap-piece, H, provided with the bearing H' for the pivot, the reach E, provided with the screw-stud *e*, and the front arm, A', having the screw-threaded end *b*, said screws adapted to pass through the cap and receive nuts for holding the cap, as set forth.



296,856. HAY AND GRAIN ELEVATOR. JOHN G. LIVINGSTON, Bowne, assignor of one-half to Frederick Robbins, Campbell, Mich. Filed Jan. 16, 1884. (No model.)

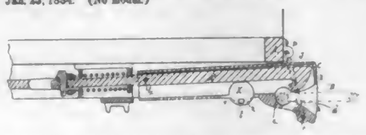
Claim.—1. The combination, in a hay and grain elevator, of the roller I, having drum-wheel J, the ropes 3 4 5 6, the pulleys H H and H' H', the ratchet W, the catch V, and the rope 7, with the removable poles M M', as shown and described, and for the purpose set forth.

9. In a hay and grain elevator, the combination of the bail composed of the stick Q and the ropes passing through the same, having the loops P P P and R, with the rope 1, passing through the pulleys O and C, and having at its upper end the hook B, intended to catch the loop R, and the pegs F F F, to engage the said loops P P P, all substantially as described.

296,857. DYNAMO-ELECTRIC MACHINE. ADOLPH E. GUSTAV LUBKE, New York, N. Y. Filed Mar. 13, 1884. (No model.)

Claim.—1. The combination, with the circular ranges of field-magnets, of a revolving armature composed of radial bars, all in the same plane, and connected up in two or more circuit-rings by means of lateral connections that pass alternately from the outer and the inner ends of such radial bars, substantially as set forth.

2. The combination, in a circular armature-wheel, of radial bars, all in one plane, and alternate lateral connections from the respective bars, to compose two or more separate armature-helices, substantially as set forth.



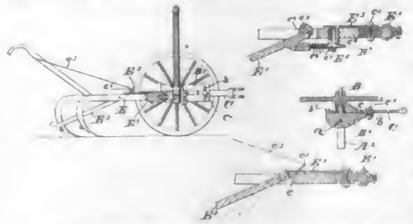
3. In a circular armature-wheel, radial bars composed of thin plates set together flatwise, with insulating material between, and connected up into a circuit by the alternate connections at the ends, substantially as set forth.

4. In an armature-wheel, the radial bars in two ranges, connected together at their outer ends and at the alternate inner ends of the respective ranges, substantially as specified.

296,858. PROCESS OF MAKING ZINC SULPHIDE ANHYDROUS. THOMAS MACFARLANE, Montreal, Quebec, Canada, assignor of one-half to A. RAMSAY, same place. Filed Aug. 24, 1883. (No specimens.)

Claim.—The method of rendering hydrated sulphide of zinc anhydrous, which consists in heating said hydrated sulphide of zinc to redness in the presence of chloride of zinc, whereby access of air and oxidation are prevented by the fumes of the chloride of zinc, and discoloration and loss of covering-power are avoided, substantially as set forth.

296,859. CAR-COUPLING. CHARLIE EDGAR MARK, Flint, Mich. Filed Jan. 23, 1884. (No model.)



Claim.—1. In a car-coupling, and in combination with a draw-bar and buffer, a swinging bail or gate pivotally pendent from the end of the car, and pivotally connected to said draw-bar and buffer on one side of a vertical line drawn through the pivotal connection to the car, whereby a swinging support for said draw-bar and buffer is provided which will give a slight upward movement and not interfere with their reciprocating movements, substantially as and for the purposes specified.

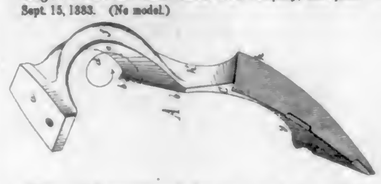
2. In a car-coupling, and in combination with the hooked end of the draw-bar, and with an inclosing metallic case, a cam eccentrically secured to a shaft which is pivotally secured to the lower side of said case and working in a slot therein, said cam being operated from either side of the car by means of crank-arms secured in suitable boxes at the bottom of the car by means of diagonally-located connecting-rods and universal joints, substantially as and for the purposes specified.

3. In a car-coupling, and in combination with the hooked end of the draw-bar and with an inclosing metallic case, a cam the periphery of which is flattened opposite to or at the point farthest from the shaft to which said cam is eccentrically secured, said shaft being pivotally secured to the lower side of said case, with the cam working in a slot therein, and operated from either side of the car by means of crank-arms secured in suitable boxes to the bottom of the car, the inner ends of said crank-arms connecting with the cam-shaft by means of diagonally-located connecting-rods and universal joints, substantially as and for the purposes set forth.

4. In a car-coupling, and in combination, a hooked draw-bar inclosed within a metallic case, a cam, diagonally-located connecting-rods connecting the cam-shaft with crank-arms by universal joints, the parts being constructed and operating substantially as and for the purposes described.

296,860. CULTIVATOR. MARION W. MCCANN, Posey, Fayette County, Ind. Filed Nov. 5, 1883. (No model.)

Claim.—1. In a wheel-cultivator, the combination, with the wheel-spindle having a bracket, B', at its inner end pivoted on the axle, of a draft-rod journaled on said spindle and secured to said bracket, substantially as described, and for the purposes specified.



2. In a wheel-cultivator, the combination, with the wheel-spindle B, provided with a bracket, B', and adapted to be hinged to the end of the axle, of the draft-rod C, journaled on said spindle and adjustably secured to said bracket, whereby the draft-rod may have vertical adjustment on said spindle and bracket, substantially as set forth.

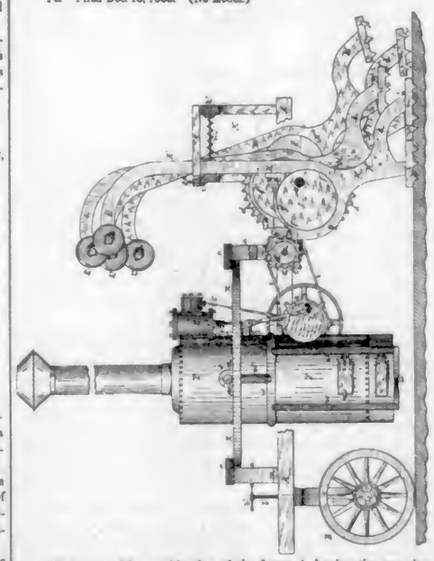
3. The combination of the bracket B', having in its front end the slot *b* and on its rear end the lip *b'*, the wheel-spindle B, the draft-rod C, adjustable on said spindle and bracket, and the hinged axle A, substantially as shown and described.

4. The combination, in a wheel-cultivator, of the axle A, the horizontal portions of which are in two parts, the link-shaped extension-pieces D, adapted to be adjustably secured to either of said parts, the wheel-spindle B, hinged thereto, and the draft-rod C, adjustably mounted on said spindle, substantially as described, and for the purposes specified.

5. In a wheel-cultivator, the combination, with the plow-beam E, of the runner E^2, pivoted thereto at its front end, and provided with a notch, *e*, and the spring E^3, secured to said plow-beam and running back over the end of said runner when it is in a raised position, and engaging with the notch *e* when it is in a lowered position, substantially as described, and for the purposes specified.

296,861. PLOW-STANDARD. JAMES P. MCINTYRE, Eau Claire, Wis., assignor to the Eau Claire Chilled Plow Company, same place. Filed Sept. 15, 1883. (No model.)

Claim.—1. A standard-neck for a plow, having a spirally-twisted hollow surface extending from the landside inward, upward, and backward toward the furrow side of the plow, substantially as and for the purpose described.



2. The standard formed with a neck having the spiral upwardly and inwardly inclined throatway *d*, substantially as and for the purpose described.

3. The standard formed with the head *a*, neck *c*, flange-brace *f*, mold-board, share, and landside supporting portions *g* and *h*, and the web-brace *h'*, substantially as and for the purpose described.

4. The spirally-twisted neck *c*, forming the throatway *d*, and having the flange-brace *f* on its landside edge, in combination with the mold-board, share, and landside supporting portions *g* and *h*, and the bracing-web *h'*, substantially as described.

5. The neck of the plow-standard, twisted spirally, and having a throatway which inclines inward, upward, and backward, and is of segmental curvature, and diminishes gradually but slightly toward the furrow side of the plow, substantially as described.

296,862. TRACTION-ENGINE. HENRY B. MCMURRAY, Burgettstown, Pa. Filed Dec. 13, 1883. (No model.)

Claim.—1. The combination of the frame A, having the cross-bar *k* supported above it, the shaft *c*, carrying the eccentrics *f*, and legs or bars H, journaled to said eccentrics and extending up back of said cross-bar *k*, substantially as and for the purposes set forth.

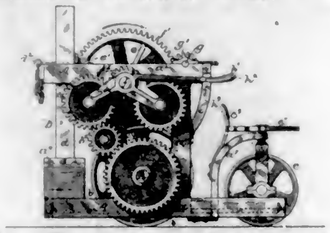
2. The combination of the frame A, having the upper guide-frame, K, the shaft *c*, carrying the eccentrics *f*, and legs or bars H, journaled to said eccentrics and extending up within said guide-frame, substantially as and for the purpose set forth.

3. The combination, with the frame A, having the upper guide-frame, K, of the legs or bars extending through said guide-frame, and having the curved upper ends, *h'*, and weights h^3, substantially as and for the purposes set forth.

4. In combination with the frame A, having the upper guide-frame, K, the legs or bars extending through said guide-frame, and cushioning-springs *l*, substantially as and for the purposes set forth.

5. In combination with the frame A, having the upper guide-frame, K, the legs or bars H, extending through said frame, and the springs *m*, secured in said frame, substantially as and for the purposes set forth.

6. The combination of the leg or bar H, having the journal-box *g*, formed therewith and extending out therefrom, cover *g'*, and eccentrics *f*, having the side flanges, *f'*, substantially as and for the purposes set forth.



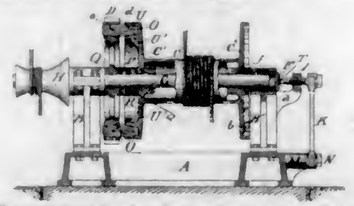
7. In traction-powers, the frame A, having the bearings *a a'*, ring R, pivoted thereon, and boiler P, pivoted on said ring, substantially as and for the purposes set forth.

8. In traction-powers, the frame A, having the bearings *a a'*, ring R, pivoted thereon, boiler P, and basket *w'*, carrying said boiler and pivoted on said ring, substantially as and for the purposes set forth.

9. In traction-powers, the boiler P and engine E, movably hung in the frame thereof, in combination with a power-shaft and chain-power connections between said engine and shaft, substantially as and for the purposes set forth.

10. In traction-powers, the leg or bar H, having the branch *h* and feet or shoes *n*, substantially as and for the purposes set forth.

296,863. MACHINE FOR PACKING ENSILAGE, &c. LOUIS MCMURRAY, Baltimore, Md. Filed Feb. 28, 1884. (No model.)



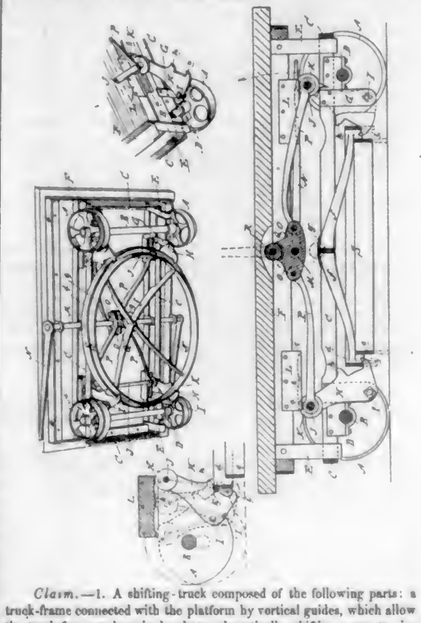
Claim.—1. The combination, substantially as hereinbefore described, of the frame mounted upon a rotating supporting-axle, the vertically-reciprocating stamps, the tappet arm-shaft, the hand-crank, and gearing for connecting the hand-crank to the tappet-arm shaft and to the rotating supporting-axle, whereby the machine is propelled and the stamps operated by power applied to the hand-crank, as set forth.

2. The combination, substantially as hereinbefore described, of a frame mounted upon a rotating supporting-axle, one or more vertically-reciprocating stamps, a tappet-arm shaft for lifting and dropping said stamps, and clutch-gearing connecting said tappet-arm shaft with the rotating supporting-axle, and for disconnecting the same.

3. The combination of the compressing-roller, its frame, and the rotating supporting-axle with gearing and a hand-crank for propelling the roller, substantially as described.

4. The combination of the frame mounted upon a rotating axle, one or more vertically-reciprocating stamps, a tappet-arm shaft for operating said stamps, reversible clutch-gearing for connecting and disconnecting said shaft and supporting-axle, and a hand-crank, substantially as described, whereby the machine can be propelled in either direction by the hand-crank with or without simultaneously operating the stamps, or the stamps operated without propelling the machine, as set forth.

296,864. HOISTING-MACHINE. JAMES MCNEIL and THOMAS MCNEIL, Pittsburg, Pa. Filed Feb. 15, 1884. (No model.)



Claim.—1. A winding-drum having a head provided with flanges having their opposite faces inclined, in combination with a drive-wheel and wooden blocks secured to the drive-wheel, and having their projecting ends beveled on their inner and outer sides, substantially as described.

2. A winding-drum having a head provided with flanges having their opposed faces inclined, in combination with a drive-wheel having a slotted rim and double-wedge-shaped blocks, one of the ends of said blocks being adapted to be secured in the slots of the drive-wheel, the other ends of the blocks being adapted to be forced into frictional contact with the inclined flanges of the drum, substantially as set forth.

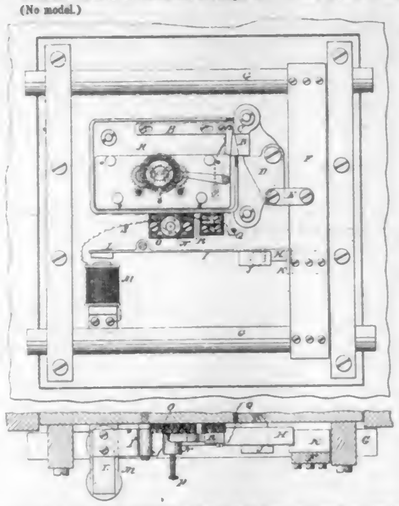
3. The winding-drum C, the shaft G, in combination with the cylindrical socket F, adapted to rotate and slide along said shaft, the screw I, the arm J, the rods K, and the treadle L, substantially as set forth.

296,865. SHIFTING-TRUCK. PATRICK H. MCWILLIAMS, Detroit, Mich. Filed Oct. 16, 1883. (No model.)

Brief.—A truck with a turn-table and devices for shifting the load from the wheels onto the turn-table, and vice versa. Said devices are so constructed that the weight is transferred without raising or lowering the platform on which the load is carried.

Claim.—1. A shifting-truck composed of the following parts: a truck-frame connected with the platform by vertical guides, which allow the truck-frame to be raised or lowered vertically, shifting supports pivotally secured upon their lower ends to the truck-frame, and supporting the platform upon their upper ends, a circular turn-table supported by the shifting supports and placed centrally between the truck-frame and below the platform, and mechanical devices for oscillating the shifting supports, whereby the load may be transferred from the truck-frame onto the turn-table, and vice versa, substantially in the manner and for the purpose described.

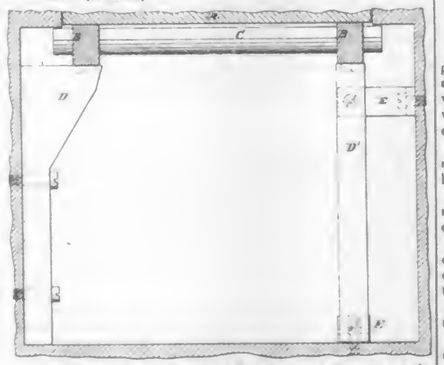
2. In a shifting-truck, the combination of the shifting supports H, their actuating mechanism, and the turn-table S, with the lugs *i i* of the shifting supports, substantially as and for the purposes described.



3. In a shifting-truck, the combination of the bearing-plates L, having segmental circular bearing-faces *a b c*, with the shifting supports H and their shifting-fulcrums I *k*, which form the respective centers of the bearing-faces *a b c*, substantially as and for the purposes described.

4. In a shifting-truck, the combination of the lever or levers N, rock-shaft M, rock-arms O, links P, and shifting supports H, forming the devices by which the shifting supports are operated, and so arranged that they form a self-locking device, substantially as and for the purposes described.

5. In a shifting-truck, the combination of the turn-table S, provided with the central bearing-plate, *g*, with the rock-arm Q, bearing friction-roller R, substantially as and for the purpose described.



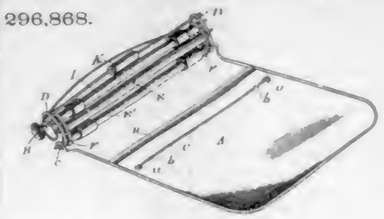
6. In a shifting-truck, the combination of the shifting supports H, and devices for operating the same simultaneously, the pivot I, and lug *k*, one forming a fulcrum upon which the load is supported by the truck, and the other forming a fulcrum by which the load is supported by the turn-table, substantially as and for the purpose described.

296,866. ELECTRIC LOCKING MECHANISM FOR SAFES AND VAULTS. HENRY F. NEWBURY, Brooklyn, N. Y. Filed Apr. 24, 1883. (No model.)

Claim.—The combination of the door-bolts of a safe or similar structure, a locking device for holding said bolts in the locking position, an electro-magnet for controlling such locking device, and an electric circuit leading to the magnet, with provision for a change in the continuity of the circuit, substantially as and for the purpose described, whereby a sudden and heavy shock directed against the exterior of the structure will change the electric circuit from its normal condition, and thus secure the door-bolts from being unlocked.

296,867. MEANS FOR SUPPORTING THE BOLT-WORK OF SAFES AND VAULTS. HENRY F. NEWBURY, Brooklyn, N. Y. Filed Apr. 24, 1883. (No model.)

Claim.—1. The combination of the bolt-frame of a safe or vault door and supporting-abutments, to prevent the same from being detached by the force of a shock directed against the door.



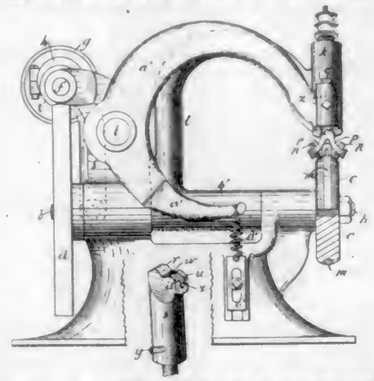
2. In combination with the bolt-frame of a safe or vault door, supporting-abutments for preventing the frame from being detached by the force of a shock, but capable of being moved out of the way when the door is opened, substantially as and for the purpose set forth.

296,868. COPY-HOLDER. EDWARD NUMAN, San Francisco, Cal. Filed Sept. 21, 1881. Renewed Oct. 18, 1883. (No model.)

Claim.—1. In a copy-holder, the tablet A, having at its upper end a downward bend, B, adapted to serve as a paper-cutter, and provided upon its upper face with the guiding rod or rest C, having stops *b b*, substantially as shown and described.

2. In a copy-holder, the combination, with the tablet A, having bend B, of the beveled head-piece G, provided with transverse strip Z,

296,868.



substantially as shown and described.

3. In a copy-holder, the combination of the tablet A, wire frame bent to form brackets or bearings D *c*, rollers E E' I, and bands F F, substantially as shown and described.

4. In a copy-holder, the combination, with the rollers E E' and roller I, having knob H, of the upper roller, K, substantially as shown and described.

296,869. SEAM-FINISHING MACHINE. WILLIAM Y. OBER, Lynn, and FRANK M. STEVENS, Boston, Mass. Filed July 2, 1883. (No model.)

Claim.—1. In a seam-finishing machine, the supporting-wheel c, grooved and provided with a band, *m*, of leather or other suitable and slightly-yielding material, and also having the peripheral face of the wheel, on either side of said band, formed oblique to the plane of the wheel, whereby the cross-section of the face constitutes an unbroken curved line, substantially as specified.

2. The supporting-wheel *c*, formed with a central recess and inserted band, *m*, and with its periphery upon each side of said band oblique to its plane, substantially as specified.

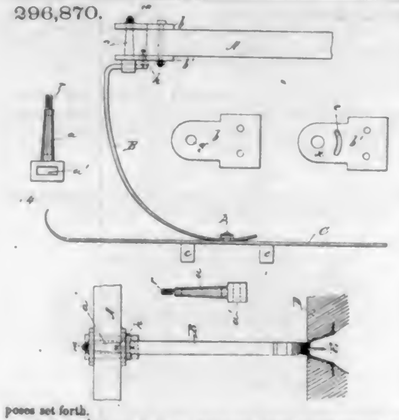
3. In combination with supporting-wheel *c* and rubber *s*, the small rolls *n n*, arranged to allow the seam to pass between them and to co-operate with said wheel and rubber, substantially as specified.

4. The combination, with the supporting-wheel *c*, formed with a central bearing, *m*, and an oblique peripheral face on each side thereof, of rolls *n n*, arranged with their axes and peripheries coincident with the oblique faces of said wheel, substantially as specified.

5. The rubber *s*, formed with a groove, *x*, extending partially but not wholly across its face, substantially as specified.

6. The rubber *s*, formed with the facial ridges *n v*, and the depression *w* between the same, substantially as specified.

7. The rubber *s*, formed with the facial ridge *u*, having the slot *x* therein, and the ridge *v*, extending across the face of the rubber, substantially as specified.



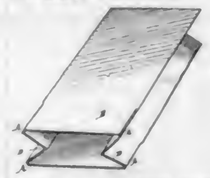
296,870. MACHINE TO PROTECT CABLE-ROAD SLOTS. MAGNUS OHLSON, Chicago, Ill. Filed Oct. 22, 1883. (No model.)

Brief.—The street-cleaning machine carries a spring-arm, to which is attached a sliding shoe which travels over the grip-slot to protect it from dirt, snow, &c., during the process of sweeping or cleaning the street surface.

Claim.—1. In a machine to protect cable-road slots, the combination of the spring B and the shoe C and means of attaching same to the plow, substantially as described, and for the purposes set forth.

2. In a machine to protect cable-road slots, the combination of the spring B and the shoe C, provided with the lugs *c c*, and means of attaching the same to the plow, substantially as described, and for the pur-

296,870.

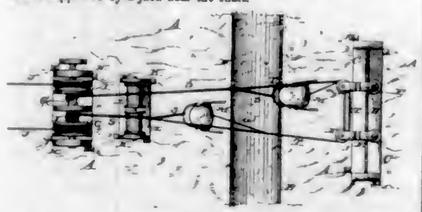


poses set forth.

3. In a machine to protect cable-road slots, in combination with the substantially-described plates *b b'*, the bolt *a*, spring B, and shoe C, provided with the lugs *c c*, substantially as described, and for the purposes set forth.

4. In a machine to protect cable-road slots, in combination with the plates *b b'*, provided with the holes *g x* and slot *s*, the spring B, provided with the pin *h*, and the pivot-bolt *a*, provided with the slot *a'*, and the shoe C, provided with the lugs *c c*, and bolt and pin *p*, substantially as described, and for the purposes set forth.

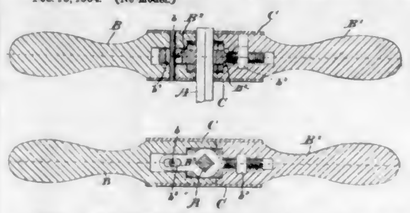
296,871. PAPER BAG. JOHN P. ONDERDONK, Philadelphia, Pa. Filed May 26, 1883. (No model.)



Claim.—1. A paper bag having a satchel-bottom and inward bellows folds, in which the corners of the inward bellows folds are cut apart, substantially as shown and described.

2. A paper bag having a satchel-bottom and inward bellows folds, in which the corners of the inward bellows folds are cut apart and the flaps D D cut off, substantially as shown and described.

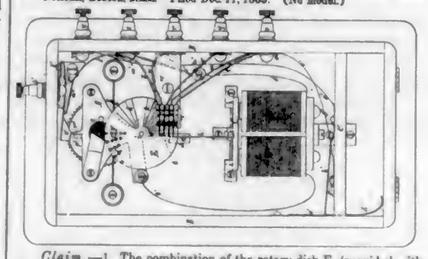
296,872. DITCHING-MACHINE. ANDREW J. OSBORNE, Erie, Ill. Filed Jan. 2, 1884. (No model.)



Brief.—A chain running from a shaft which is driven by chains reversely wound on drums thereon, and around which its ends are reversely wound, passes around two pulleys on a supporting-frame, and has scrapers attached to it intermediately of the pulleys and the shaft, and is supported by a jack near the shaft.

Claim.—1. The frame C, provided with pulleys F F, rope or chain S, shaft G, jack K, and scrapers M M, in combination, substantially as shown, and for the purpose described.

2. The shaft G, suporting-jack K, pulleys F F, rope or chain S, scrapers M M, and ropes or chains J, or other suitable means of revolving the shaft G, substantially as shown, and for the purpose specified.



296,873. AUGER-HANDLE. DAVID M. PARRY, Rushville, Ind. Filed Feb. 15, 1884. (No model.)

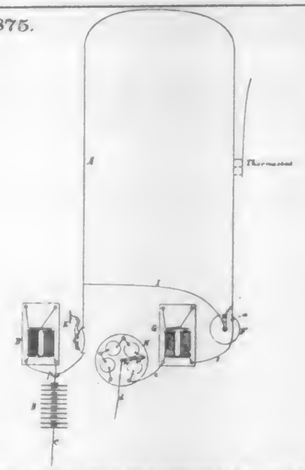
Claim.—1. An auger-handle constructed in two parts, having an aperture formed in its center, one of said parts having a clamp-bolt adjustably secured in its portion of said aperture, and the other of said parts having a nut set in its portion which engages with a screw-threaded end of said clamp-bolt, whereby the same is operated, substantially as described, and for the purposes specified.

2. In an auger-handle, the combination of the part B, having a socket for the admission of the auger-shank, the clamp-bolt B^3, adjustably secured in said part B, and provided with a hole in its center, which forms a part of the socket for the auger-shank, the part B', having a nut, b^3, set therein, which engages with a screw-threaded end of the clamp-bolt, and the sleeve C, surrounding the center of the handle, substantially as described, and for the purposes specified.

296,874. ELECTRIC FIRE-ALARM APPARATUS. MAJOR DANE PORTER, Boston, Mass. Filed Dec. 11, 1883. (No model.)

Claim.—1. The combination of the rotary disk E, (provided with ribs and studs, as described,) the series of fingers *m*, the clock-movement A, the electro-magnet D, its armature C, and the mechanism connected therewith and with the escapement-wheel of the said clock-movement, and consisting of the wire *k*, spring *d*, projection *e*, and stud *c*, all being adapted and to operate with electric-circuit wires and circuit-closers and an electric alarm, substantially in manner and for the purposes as represented.

2. The combination of circuit-breaking mechanism, substantially as described, (consisting of the spring *l'*, arm n^2, insulating-block *m'*, hard-rubber cam *o'*, abutment *p'*, disk *q'*, and its tooth or cam *r'*, arranged and adapted as set forth,) with mechanism, essentially as explained, consisting of the rotary disk E, (provided with ribs and studs, as described,) the series of fingers *m*, the clock-movement A, the electro-magnet D, its armature C, and the mechanism connected therewith and with the escapement-wheel of the said clock-movement, and consisting of the wire *k*, spring *d*, projection *e*, and stud *c*, all adapted and for use substantially and for the purposes as represented.

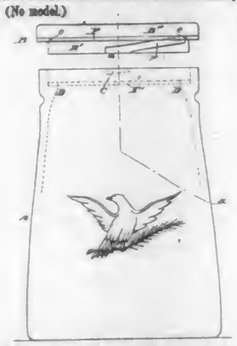


3. The combination of the circuit-closing mechanism, (consisting of the spring *b'*, its handle *d'*, metallic strip *f''*, and latching-spring *e'*,) arranged in the lower part of the case B, as explained, with mechanism, essentially as represented, consisting of the rotary disk E, (provided with ribs and studs, as described,) the series of fingers *m*, clock-movement A, electro-magnet D, its armature C, and the mechanism connected therewith and with the escapement-wheel of the clock-movement, and consisting of the wire *k*, spring *d*, projection *e*, and stud *c*, all being adapted and for use substantially and for the purpose as set forth.

296,875. ELECTRICAL ALARM APPARATUS. MAJOR DANE PORTER, Boston, Mass., and EDMUND RAYNSFORD WILDER, Portland, Me., assignors, by mesne assignments, to said Porter. Filed Dec. 11, 1883. (No model.)

Claim.—1. The combination of the electric-alarm circuit A, battery B, switch F, auxiliary wire I, two relays, D and G, and one or more resistance-coils, H, all being adapted or applied substantially to operate as and for the purpose or purposes as set forth.

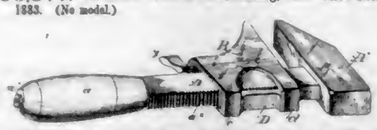
2. The combination of the electric-alarm circuit A, battery B, switch



296,875.

F, two relays, D and G, one or more resistance-coils, H, auxiliary wire I, and the connecting-wires *b c*, constructed and arranged as described.

3. The combination of the electric-alarm circuit A, battery B, switch F, having the stud *e* and switch-arm *f*, two relays, D and G, the resistance-coils H and their arm A, auxiliary wire I, and connecting-wires *b c* all constructed and arranged as and for the purpose set forth.

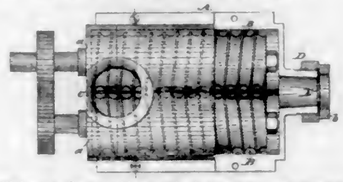


296,876. PRESERVE-JAR FASTENING. ENRICO ROSENTH, Pittsburg, Pa., assignor of one-fourth to Charles F. McKenna, same place. Filed Nov. 22, 1883. (No model.)

Claim.—1. The body A, formed with lugs C and a shoulder, D, in combination with the lid formed with an overhanging rim, B″, and a neck, B′, and the two gaskets, the neck being spirally grooved, as at E, substantially as and for the purpose set forth.

2. The body A, formed with lugs C and a shoulder, D, in combination with the lid having a rim, B″, which overhangs the top of the body, a spirally-grooved neck, and a circumferential groove, *c*, located at the top of the neck, and the two gaskets, substantially as and for the purpose set forth.

296,877. WRENCH. BARNEY ROSS, Sterling, Ohio. Filed Dec. 26, 1883. (No model.)

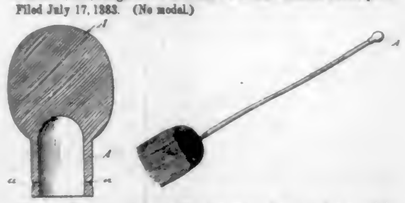


Claim.—1. A wedge operating in a chamber in the movable jaw of a wrench, and provided with a longitudinal recess and a transverse worm-groove, in combination with a worm adapted to engage the groove and actuate the wedge, and provided with a shank extending through the rear end wall of the movable jaw, and a thumb-lever for operating the same, substantially as set forth.

2. The combination, with the worm G, provided with the shank and thumb-lever, as aforesaid, of the jaw B, provided with the hole *b* and the accompanying slot, by means of which the parts may be assembled, substantially as set forth.

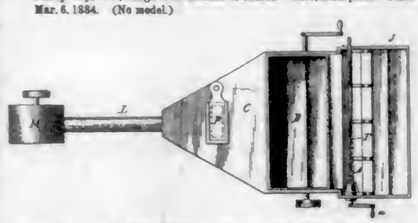
3. The bands c and *d*, provided each with beveled edges, in combination with the rack-piece D, provided with ribs or projections swaged or bent so as to engage the said beveled edges and hold the parts firmly in position, substantially as set forth.

296,878. MACHINE FOR PLOTTING SOAP, &c. FRANCIS S. RUTSCHMAN, Philadelphia, Pa. Filed July 23, 1883. (No model.)



Claim.—1. In a machine for plotting soap, &c., two spiral conveyers arranged side by side, in combination with a casing formed of a two-part body, the two conveyers being located in the opposite sides of said casing, substantially as and for the purpose set forth.

2. A casing having an inlet and outlet and a removable die, in combination with two spiral conveyers, the grooves or threads whereof are pitched in reverse order, said conveyers being arranged parallel in opposite sides of said casing, substantially as and for the purpose set forth.

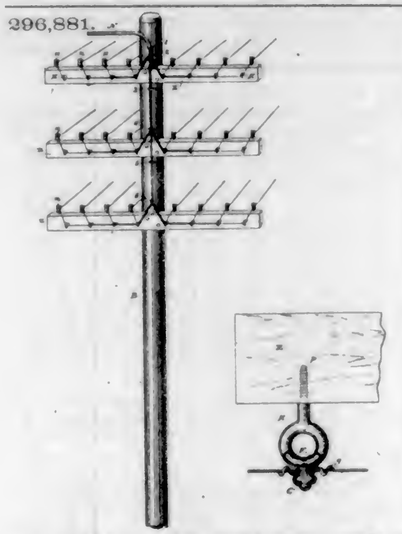


3. A casing formed of two bodies communicating with each other at their places of junction, in combination with two spiral conveyers arranged parallel in the opposite bodies of said casing, substantially as and for the purpose set forth.

296,879. BALANCE-TIP FOR BROOMS. WILLIAM A. SCOLLAY, San Francisco, Cal., assignor of one-fourth to Wilmer Bradford, same place. Filed July 17, 1883. (No model.)

Claim.—The combination, with a broom-handle, of a balance-weight consisting of the metal tip A, having a globular head, and provided with a hollow shank, A′, substantially as shown and described.

296,880. MANUFACTURE OF GREEN-SAND CORES. JAS. SCULL, Jersey City, N. J., assignor of one-half to Samuel Vance, same place. Filed Mar. 6, 1884. (No model.)



Claim.—The improvement in making cores herein set forth, the same consisting in forcing the green sand by an air-blast upon a revolving mandrel, to pack the same thereon, as specified.

296,881. INSULATOR. JOHN A. SEELY, New York, N. Y. Filed Jan. 11, 1884. (No model.)

Claim.—1. An insulator having a shank provided with a gimlet-point for attaching said insulator to a cross-arm, and a wire-supporting head whose surface is covered with vulcanized india-rubber or an equivalent material, as described.

296,881.

2. An insulator for supporting electrical conductors, consisting of a gimlet-pointed screw, and a ring-eyelet whose surface is covered with vulcanized india-rubber or its equivalent, as described.

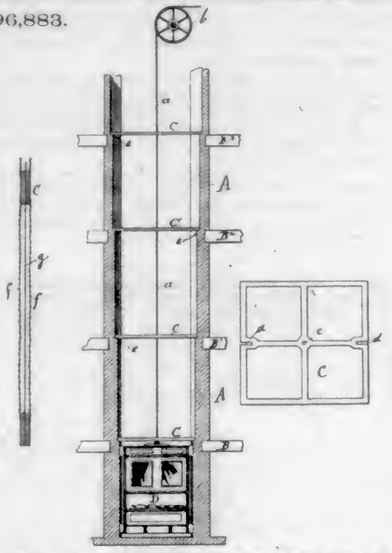
3. An insulator having a shank for attaching the same to a cross-arm, and an eyelet-head formed of a ring whose surface is covered with vulcanized india-rubber or its equivalent material, substantially as described.

4. The combination of an eyelet-headed screw, the ring of which is covered with insulating material, and an insulating-knob placed upon said ring, around the neck of which wire may be wound.

5. The combination of a telegraph-pole, a cable made up of many individual wires, cross-arms, eyelet insulating supports, as described, and anchors placed upon said cross-arms, to which the wires are individually connected.

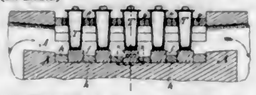
6. The combination of devices for distributing the wires of a cable upon the cross-arms of a telegraph-pole, which consist of means for separating the wires of the cable into groups, means for taking a group at a time from the cable at different points of its length, means for carrying each group along a cross arm or support, and for taking a wire at a time at different points along its length from the group, for the purpose set forth.

296,882. LEGGIN. HENRY J. SHIBEL, Jr., and SALLIE M. SHIBEL, Philadelphia, Pa. Filed Nov. 5, 1883. (No model.)



Claim.—1. A new article of manufacture, consisting of a leggin made of water-proof material and open from top to bottom, and having thereon the two rows of lacing-hooks *b b*, one of said rows of hooks being set back, so as to form an overlapping edge, the lacing-cord *c*, and the garter *a*, secured to the top of the leggin, substantially as shown.

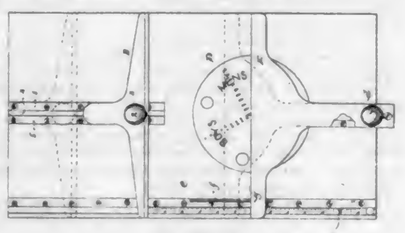
2. A leggin made of water-proof material, and having the rows of lacing-hooks *b b* attached thereto, so as to form an overlapping edge, in combination with the lacing-cord c and garter *a*, secured to the top of the leggin, said garter having at one end thereof a fastener, *d*, and at the other end one of the lacing-hooks *b*, substantially as and for the purpose shown and described.



296,883. SAFETY ATTACHMENT FOR ELEVATORS. RUDOLF SHIFFERT, Chicago, Ill. Filed Jan. 23, 1884. (No model.)

296,883.

Claim.—In an elevator-shaft provided with offsets, as described, the combination of elevator D and frames C, of different dimensions, and provided with screens of coarse and fine wire, as described and shown.

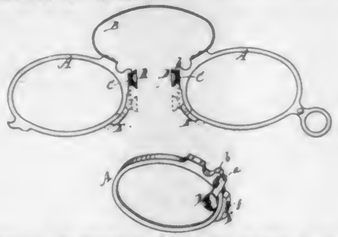


296,884. METHOD OF MANUFACTURING METAL ALLOYS. GUSTAV SELVE, Altena, Westphalia, Prussia, Germany. Filed June 19, 1883. (No model.)

Claim.—1. The method of smelting alloys, more particularly those of zinc, in closed crucibles that are situated with their lower parts in the furnace, while their upper parts project out of the same, consisting in supplying the crucible with copper and melting it, then quickly adding zinc in proper proportions and brass waste, then closing the crucible and applying heat to the lower part thereof, while the upper part is externally exposed to the air, whereby the zinc vapors generated in the lower hotter layer of metal become condensed in rising up into the upper cooler layers, as herein specified.

2. In smelting zinc alloys, the method herein described, consisting in supplying the crucible with copper and melting it, then adding zinc in proper proportions and brass waste, then closing the crucible and applying heat to the lower portion of the same, and thus effecting the condensation of the zinc vapors generated in the lower part of the crucible by means of the cooler upper layers of metal therein, substantially as herein specified.

296,885. TOE-TIP-INDICATING APPARATUS FOR BOOTS AND SHOES. HENRY D. SMITH, Rockland, Mass., assignor of one-half to Zenas M. Lane, same place. Filed Feb. 11, 1884. (No model.)

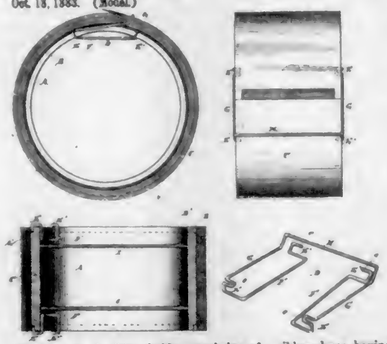


Claim.—1. In a toe-tip indicator, the base A and a gage to position the seam end of the upper, combined with a dial provided with numbers or marks to indicate sizes of boots and shoes to be provided with toe-tips, substantially as described.

2. The base A, a gage for the seam end of the upper, and a movable dial provided with numbers or marks to indicate sizes, combined with an adjustable toe-tip gage, to operate substantially as described.

3. The base A and toe-tip gage, and dial provided with numbers or marks to indicate sizes, combined with a rule, substantially as and for the purpose set forth.

4. The base A, the adjustable gage B, for the seam end of the upper, the adjustable toe-tip gage, and the movable dial provided with one or more radially-arranged rows of numbers or marks to designate the sizes of boots or shoes to be provided with toe tips or caps, to operate substantially as and for the purpose set forth.



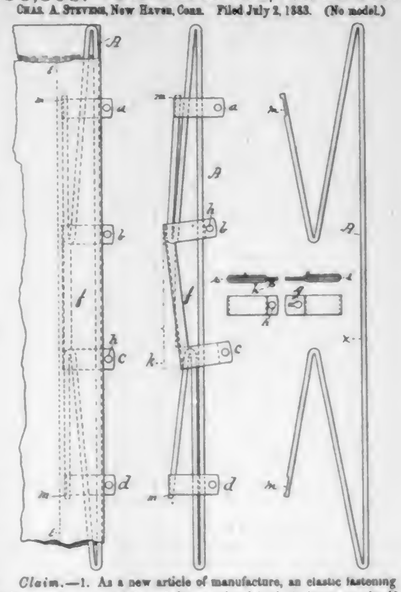
296,886. EYEGLASSES. CHARLES F. SPENCER, Rochester, N. Y., assignor to Charles F. Marsh and Fletcher M. Thrasher, both of same place. Filed Feb. 23, 1884. (No model.)

Claim.—1. The combination, with a pair of eyeglasses, of arms pivoted or attached to the upper inner edges of the glass-frames, capable of being turned at right angles to the same, and pads attached to the outer ends of the arms, as shown and described, and for the purpose specified.

2. The combination, with a pair of eyeglasses, of arms pivoted or attached to the upper inner edges of the glass-frames, capable of being turned at right angles thereto, pads attached to the outer ends of the arms, and separate bearing-blocks attached to the lower inner edges of the frames, as shown and described, and for the purpose specified.

296,887. RIBBON-HOLDER. AMOS STEVENS, Philadelphia, Pa. Filed Oct. 18, 1883. (Model.)

Claim.—1. A ribbon-holder consisting of a ribbon-drum having free annular flanges or edges, in combination with a sliding spring-holder adapted to slide upon said free edges and clamp the ribbon, substantially as and for the purpose specified.

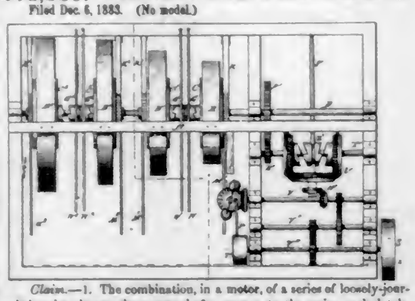


2. A ribbon-drum having free annular flanges or edges and circumferential grooves, in combination with a sliding holder adapted to fit upon and slide upon said free edges, and adapted to clamp the ribbon, the jaws or holding-prongs of said holder running in said grooves, substantially as and for the purpose specified.

3. The ribbon-drum A, provided with one or more heads, I, secured therein so as to leave the edges of said drum clear and form annular flanges, in combination with a spring ribbon-holder, provided with means, substantially as described, to clamp itself to said free edges of the drum, substantially as and for the purpose specified.

4. A ribbon-holder consisting of bars F F, having jaws or hooks E E', prongs *e*, spring-bars G, and cross-bar H, in combination with drum A, substantially as and for the purpose specified.

5. The combination of tubular drum A with cross-bar H, spring-arms G, and arms F, running upon the inner face of the tubular drum A, and retained thereon by the spring-arms G, which clamp the ribbon against said drum, substantially as and for the purpose specified.



296,888. COMBINED ELASTIC CORSET BUSK AND CLASP. CHAS. A. STEVENS, New Haven, Conn. Filed July 2, 1883. (No model.)

Claim.—1. As a new article of manufacture, an elastic fastening device for corsets, consisting of the angulated busk A, bent upon itself at the ends to form a spring, and secured to the end clasps by niches *m m*, together with the movable clasps *a*, *b*, *c*, and *d*, provided with studs and slots, the whole being arranged to operate substantially as and for the purpose set forth.

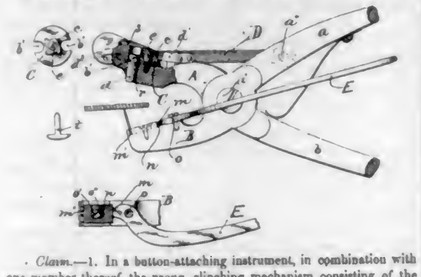
2. In a combined elastic busk and clasps for corsets, the angulated busk A, having movable clasps *a b c d*, with studs and slots, and a cross-bar, *f*, connecting the clasps *b* and *c*, and niches *m m* on the ends of the busk for retaining the clasps *a* and *d* in position, substantially as shown, and for the purpose set forth.

296,889. SPRING-MOTOR. PASCHAL A. TARBOX, Louisville, Ky. Filed Dec. 6, 1883. (No model.)

Claim.—1. The combination, in a motor, of a series of loosely-journaled spring-drums, the power-shaft common to the series, and clutching devices intermediate between the drums for attaching two or more of them while in operation simultaneously to the shaft, substantially as described.

2. The combination, in a motor, of a series of loosely-journaled spring-drums, a power-shaft common to the series, and separate clutching mechanism for each of the series, whereby any desired drum of the series may be clutched upon the shaft while in operation on the shaft, substantially as described.

3. In a spring-motor, a drum consisting of a head-piece, I, a barrel and additional head-piece, C, in combination with a power-shaft provided with annular collars E E, for preventing horizontal movement of the drum, substantially as described.



4. In a spring-motor, the combination, with a power-shaft, of a drum loosely mounted thereon, a spring attached at its inner end to the drum and at its outer end to a fixed support, and shifting clutch mechanism upon the shaft for engaging the drum therewith, substantially as described.

5. In a spring-motor, a drum provided with a spring to be wound thereon, pawl-and-ratchet mechanism upon one of the faces of the drum, a lever for operating one of the pawls to wind the spring, and means for releasing the other pawl from the ratchet at will, substantially as described.

6. In a spring-motor, a drum consisting of two head-pieces and a body slotted horizontally at an acute angle, in combination with a spring rigidly fixed at its outer end to a fixed support, and bent or hooked at its inner end to engage with the acute slot, substantially as described.

7. In a spring-motor, the combination, with the spring mechanism, the power-shaft provided with clutching devices, and the shafts and gearing transmitting power to the band-wheel, of a regulator in the train of such gearing, a friction-shoe operated thereby, and a brake-wheel upon the band-wheel shaft controlled by such regulator and shoe, substantially as described.

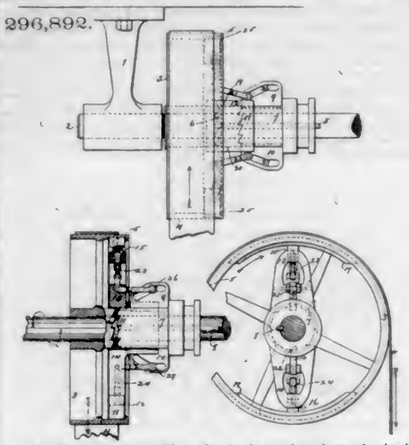
296,890. BUTTON-ATTACHING INSTRUMENT. JAS. F. THAYER, Providence, R. I. Filed Feb. 27, 1884. (No model.)

Claim.—1. In a button-attaching instrument, in combination with one member thereof, the prong-clinching mechanism consisting of the pin *d*, rotary disk C, spring *d'*, and the lever D, attached to the handle *a* back of the pivot *a'*, combined, arranged, and adapted for use, substantially as described.

2. In a button-attaching instrument, in combination with one member thereof, the herein-described fastener-clamping device, consisting of the recess *m'*, plate *n*, and cam-lever E, combined, arranged, and adapted for use, substantially as described.

3. The herein-described button-attaching instrument, consisting of the member A, provided with pin *d*, rotary disk C, spring *d'*, and connection D, and the member B, provided with recess *m'*, plate *n*, and cam-lever E, the whole combined, operated, and arranged substantially as shown and described.

296,891. BUTTON. EDOUARD A. THIERY, Newark, N. J., assignor to Carter, Sloan & Co., same place. Filed Feb. 25, 1884. (No model.)



Claim.—1. A button consisting of a suitable head or face, a duplex or bifurcated shank, and eccentric shoes on the inner ends of the shank, substantially as set forth.

2. A button consisting of the head A, the duplex or bifurcated shank B, and the eccentric shoes or plates C C, attached to the free ends of the shank, so as to project outwardly therefrom in reverse directions, substantially as set forth.

296,892. CLUTCH. JOHN THOMSON, Brooklyn, N. Y. Filed July 25, 1883. (No model.)

Claim.—1. The combination, with a pulley, of a locking-clutch, the construction being such that the clutch will operate by a continuous movement of the sleeve, first, to impart the motion of the driving to the driven mechanism by means of friction; second, to then relieve the sleeve from the strain developed by the friction devices; third, to momentarily maintain and drive the driven mechanism by the friction thus developed, and, fourth, to finally directly and positively engage the sleeve and the pulley, substantially as described.

296,892.

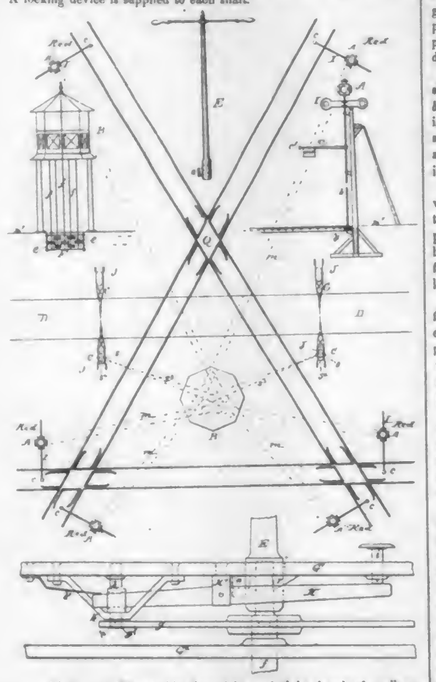
2. The combination, with a pulley having teeth or claws, of a clutch-sleeve provided with cam-slots and teeth or claws, and friction devices connected with the sleeve, the arrangement being such that the frictional devices are operated to engage with the pulley, and the teeth or claws upon the sleeve and pulley are then caused to positively engage, whereby a direct and practically instantaneous engagement is effected without shock or jar.

3. The combination, with a pulley and friction and locking devices, of a sleeve having cam-slots and claws or teeth, substantially as shown, the arrangement being such that by the continuous movement of the shipping-gear the friction devices are first caused to gradually engage by impact with the pulley, and then to positively and directly connect the sleeve with the pulley, substantially as described.

4. The combination, with a pulley, friction-segments engaging therewith, toggles connected to the friction-segments, and levers connected with the toggles, of a sleeve provided with slots, whereby, upon the movement of the sleeve, the friction-segments are caused to engage with a constantly-increasing force until the said toggles are brought to a straight line, when the sleeve is released from the resistance of the friction devices, and is free to be slid into direct and positive engagement with the pulley.

5. The combination, with a pulley having claws or teeth, friction-segments engaging therewith, and toggle-levers connected with the segments, of a clutch and locking-sleeve having the cam-slots, substantially as shown, engaging with the levers, the arrangement being such that upon the continuous movement of the sleeve the friction-segments are caused to engage with the pulley with a constantly-increasing force, and when the maximum is reached such force is maintained by the toggles, and the sleeve is relieved and free to be locked in direct engagement with the teeth on the pulley, substantially as described.

6. In combination, the pulley 3, friction-segments 17 18, arms 13 14, toggles 23 24, bell-cranks 21 22, cams 9 10, sleeve 7, claws 6 11, and shaft 2, for the purpose herein set forth.



7. The combination, with a pulley having teeth or claws, of a clutch-sleeve provided with cam-slots, teeth or claws, and frictional devices connected with the sleeve, the arrangement being such that the frictional devices are operated to engage with the pulley, and the teeth or claws are then caused to positively engage, whereby a practically-instantaneous engagement is effected between the pulley and clutch without shock or jar.

8. The combination, with a pulley, friction-segments engaging therewith, toggles connected to the friction-segments, levers connected with the toggles, and a sleeve provided with inclined slots, whereby, upon the movement of the sleeve, the friction-segments are caused to engage with the pulley with a constantly-increasing force, substantially as described.

9. The combination, with a pulley having claws or teeth, friction-segments engaging therewith, toggle-levers connected with the segments, and a clutch and locking-sleeve having the inclined cam-slots, substantially as shown, engaging with the levers, the arrangement being such that upon the continuous movement of the sleeve the friction-segments are caused to engage with the pulley with a constantly-increasing force, and when the maximum is reached such force is maintained and the sleeve locked in engagement with the teeth on the pulley, substantially as described.

296,893. RAILWAY SAFETY-SIGNAL. ELISHA H. TOBEY, Denver, Colo. Filed Jan. 9, 1884. (No model.)

Brief.—Crossing-signals operated from shafts independently mounted in a central tower, each shaft being accessible for actuating purposes only through a common plate perforated to allow the application to each shaft of a key for rotating the shaft, and provided with stops on its inner surface to limit the motion of the key between the "danger" and "safety" positions of the signal. The key has a lip which, passing beneath the plate, prevents the withdrawal of the key, except in the normal "danger" position of the signal, whereby, as only a single key is allowed to the operator, only one signal can be set to "safety" at a time. A locking device is supplied to each shaft.

Claim.—1. The combination of day and night signals of a railway-crossing with mechanism for operating the same, a key for directly actuating said signals, and means by which it is locked to said mechanism after being operated to give the right of way over one track only, substantially as set forth.

2. The combination of a signal-operating mechanism for railway-crossings, and a key for directly actuating the same, with mechanism, substantially such as described, whereby the signal and its operating mechanism are automatically locked in the position to indicate "danger" or in the position to indicate "safety" to approaching trains.

3. The combination of a signal-operating mechanism for railway-crossings, a key directly operating the same, and means for retaining said key locked to said mechanism after being operated to give the right of way over one track only, substantially herein described, with a locking device for said mechanism, and a treadle device to release said lock, substantially as described.

4. A signal-operating mechanism for railway-crossings, and a key directly actuating the same, combined with means, substantially herein described, for retaining the key in its actuating position when the signal is moved to indicate "safety," and an automatic signal-locking device.

5. A signal-operating mechanism for railway-crossings, consisting of pulley-operating shafts, cables connecting their pulleys with the signals of all the tracks, a key-box into which said pulley-shafts extend, suitable locking mechanism for said pulley-shafts, a suitable device for unlocking said pulley-shafts, a key-plate, a key for directly actuating the signals, and means for retaining the key within the key-plate, substantially as set forth.

6. The combination of the signal-operating pulley-shafts formed with angular ends, as described, with a key-box, G, having a key-hole plate, into which said angular ends extend, an inclosed device for locking said shafts with said box, a device for unlocking said shafts, a key for directly actuating the signal-operating pulley-shafts, and means for retaining the key within said box, as set forth.

7. The combination, with a signal-operating mechanism for railway-crossings, substantially such as described, and a central tower or station therefor, of the box G, having a top key-hole plate G', arranged to form a part of the tower-floor, and to serve as a cover to prevent access to said signal-operating mechanism except by means of a key, by which the same is directly actuated, substantially as set forth.

8. A signal-operating mechanism for railway-crossings, operated by a key in the manner described, consisting of a box, F, arranged below the surface of the ground and containing pulleys and shafts, the cables connecting them with the track-signals, a key-box, G, arranged above the ground, having a top key-hole plate within the key-holes, in which said pulley-shafts terminate, suitable locking and releasing devices for said pulley-shafts arranged within said key-box, the signal devices, and a key directly actuating the same, substantially as set forth.

9. The combination, with the closed boxes F and G, the winding-shafts *f*, mounted therein, their pulleys *e*, the cables *m*, the signal-shafts *b*, their pulleys *d*, and a key, of an automatic locking device for said winding-shafts, arranged within the box F, means, substantially such as described, whereby said key is retained in a locked position in the box G, and means, substantially such as described, whereby said automatic locking device is released.

10. The combination, with a signal-operating mechanism for railway-crossings, operated directly by a key, of a key-box, G, having a top key-hole plate G', affording access to said mechanism, and a key provided with an arm, means arranged on the inner side of said box for limiting the turning movements of the key, an automatic locking device for said mechanism, and means, substantially such as described, for releasing said locking device, controlled by the foot of the operator.

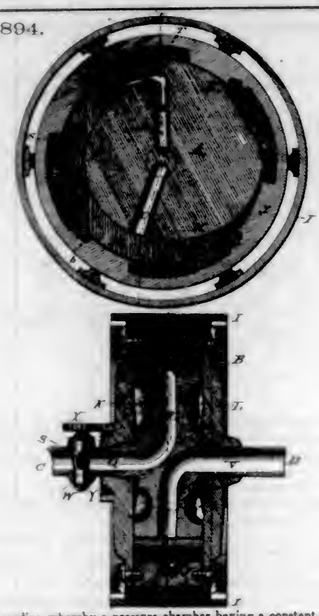
11. The combination, with an inclosed signal-operating mechanism for railway-crossings, operated directly by a key, and means adapted to engage said key to limit its turning movements, of an automatic locking-pin for said mechanism, which, when locked in "safety" position, acts to prevent the release of the key, and a treadle device connected with said locking-pin for releasing the lock, substantially as described, for the purpose specified.

12. The combination, with an inclosed signal-operating mechanism for railway-crossings, operated directly by a key, and means adapted to engage said key to limit its turning movements, of a spring-depressed locking device for said mechanism, a lever carrying said locking device, an inclosing key-box for the latter, and a releasing treadle-pin adapted to be operated outside of said box, substantially as set forth.

13. The combination, with an inclosed signal-operating mechanism for railway-crossings, and the track-signals, both operated directly by a key, of a key-hole plate permitting the application of a key to operate a single signal, and a key which is fastened to said key-plate by the means substantially as herein set forth.

14. The combination, in a system for operating signals for railway-crossings, of day and night signals 1 A, the independent winding-shafts *f* and pulleys *e*, each shaft having a disk, *g*, provided with perforations *g' g'*, cables *m*, signal pulley shafts *b*, pulleys *d*, the foot-levers H, locking-pins *h*, means for locking said pins with said disks, the treadle-pin *i*, a key for operating the system, closed boxes for the operating mechanism, and means for retaining the key within the key-hole plate when the signal is moved to indicate "safety," substantially as described.

15. The combination, with the winding pulley-shafts *f*, each having a perforated disk, *g*, of a closed box, G, having a key-hole plate, G', provided on its under side with stops *r r*, a key having an arm, *a*, the treadle H, having a pin, *h*, the spring *k'*, the treadle-pin *i*, cables *m*, and the signal-carrying shafts, the said stops being arranged to determine the movements of said disk to receive the locking-pin, substantially as described.



16. A signal-operating mechanism for railway-crossings, comprising the following instrumentalities, viz: a number of key-operated shafts, *f*, having each a pulley, *e*, inclosed beneath the surface of the ground, and a disk, *g*, near its upper end, a key-box, G, arranged above the pulleys and containing the disks *g*, an automatic locking device for each shaft-disk, a device for releasing each shaft-disk from its lock, a key-plate having key-holes corresponding with the pulley-shafts, through which access is had thereto for operating them, a key, stops *r r*, co-operating with said key to limit the turning of said shafts, signals, and cables connecting the key-operated shafts with the signal-shafts, all combined for operation substantially as described, for the purpose specified.

17. In combination, the central station or tower, B, provided with mechanism for operating the signals of railway-crossings, the pivoted weighted gates C, the pulleys *s w*, the cables s^2, the shaft K, its pulley J^2, and hand-wheel H', all constructed and adapted for operation independent of the signals, said gates being opened from the signal-station only when a safety-signal is displayed.

296,894. ROTARY MOTOR. HENRY A. TOBEY, Dayton, Ohio. Filed Sept. 8, 1883. (No model.)

Claim.—1. In a rotary motor, a fixed interior cylinder the periphery of which is composed of two arcs of different radii connected by cam-surfaces, in combination with an outer rotating casement provided with freely-swinging pistons, and adapted to fit closely over the arc having the long radius, whereby a pressure-chamber having a constant area in cross-section is formed between the outer casement and the arc of the cylinder having the short radius, substantially as set forth.

296,894.

2. In a rotary motor, a rotating casement provided with pistons hung freely at their forward ends to the casement at equal distances apart, in combination with a fixed interior cylinder the periphery of which is composed of two arcs of different radii connected by cam-surfaces, of which arcs the one having the long radius is adapted to be fitted closely to the inner surface of the casement, whereby a pressure-chamber having a constant area in cross-section is formed between the outer casement and the arc having the short radius, the length of said arc being determined by the distance between adjacent pistons, substantially as set forth.

3. In a rotary motor, rotating casement provided with pistons hung freely thereto at their forward ends, in combination with an inner stationary cylinder the periphery of which is constructed as described, whereby a pressure-chamber is formed between said casement and said cylinder, and a steam-admitting passage constructed in said cylinder and opening into said pressure-chamber at or near its beginning, the steam being admitted in the direct line in which its force is to be applied, substantially as set forth.

4. In a rotary motor, a rotating casement provided with pistons hung freely at their forward ends thereto, in combination with an interior fixed cylinder having its periphery composed of arcs and cam-surfaces, substantially as herein described, and a steam-admitting passage formed in said cylinder opening into said pressure-chamber at its commencement, whereby the full force of the steam is constantly and uniformly exerted upon each piston, substantially as set forth.

5. In a rotary motor, the rotating casement provided with pistons, substantially as described, in combination with a fixed interior cylinder the periphery of which is composed of arcs and cam-surfaces, as described, and inlet and exhaust passages for steam formed in said cylinder, the inlet-passage having its mouth at the commencement of the arc having the short radius, and the exhaust-passage having its opening at the termination of said arc, the length of said arc being determined by the distance between adjacent pistons.

6. The outer rotating casement, in combination with pistons hung to said casement and swinging freely thereon, whereby the centrifugal force of the casement causes the pistons to fold into the rim of said casement, and suitable means whereby the pistons are swung out from the rim, so that they may be operated upon by the motive power, substantially as described.

7. The stationary cylinder having its periphery composed of arcs and cam-surfaces, as described, in combination with a rotating casement inclosing said cylinder, as described, whereby a chamber is formed between said casement and cylinder, the arrangement being such that the chamber commences at the highest point of the cylinder, as set forth.

8. The stationary cylinder having its periphery composed of arcs and cam-surfaces, as described, in combination with a rotating casement provided with freely-swinging pistons inclosing said cylinder, whereby a chamber is formed between the cylinder and casement, the arrangement being such that the chamber commences at the highest point of the cylinder, and a steam-admitting passage formed in said cylinder opening into said chamber at or near its commencement, substantially as described.

9. The combination of the stationary cylinder, the rotating casement, the pistons, the pressure-chamber, the steam-admitting passage, grooves in the rim extending behind said pistons, and a branch steam-passage adapted to communicate with said grooves, substantially as set forth.

10. The outer casement provided with pistons equidistant apart, and with steam-admitting grooves extending behind the pistons, as described, in combination with an inner stationary cylinder, its periphery being composed of two arcs of different radii and connecting cam-surfaces, and provided with the inlet and exhaust passages, the length of the arc having the short radius being determined by the distance between adjacent pistons, the length of the arc having the long radius being determined by the length of a piston and the groove extending behind it, and the length of one cam-surface being determined by the extent of the inlet-opening, whereby the other cam-surface is made as long as possible, substantially as set forth.

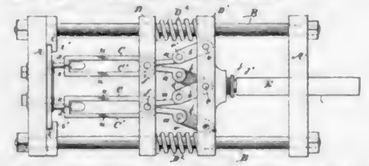
11. The combination of the stationary cylinder, the rotating casement, the pistons, the main steam-admitting passage, the branch admitting-passage, and a groove extending behind each piston, and adapted to communicate with said branch passage, the length of the mouth of said groove being determined by the distance between the mouths of the main and branch admitting-passages, substantially as set forth.

12. The pistons provided with hollowed-out inner sides adapted to retain steam, which acts as a cushion to prevent the noise made by the pistons, substantially as set forth.

13. The concave plate N, secured to the stationary cylinder, in combination with the side plate of the casement, substantially as and for the purpose described.

14. The concave plate N, secured to the stationary cylinder at its apex, in combination with the side plate of the casement, against which the free edge of the concave plate is adapted to rest.

15. The stationary cylinder, hollowed out on the side, as described, and the concave plate N, secured to said cylinder on said hollowed part, in combination with the head of the casement, substantially as described.



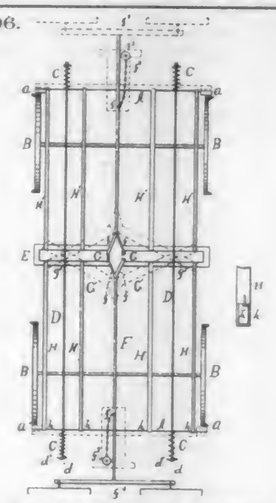
16. The stationary cylinder, hollowed out on the side, as described, and the concave plate N, secured to said cylinder on said hollowed part, the depth of which part is less than the height of said plate, in combination with the head of the casement, substantially as set forth.

17. The piston formed with lugs at or near its free end, in combination with grooves or ways cut in the heads of the casement, substantially as and for the purpose described.

18. The pistons provided with lugs at or near their free ends, as described, in combination with the inner stationary cylinder, and the heads of the casement provided with grooves in which said lugs are adapted to slide, substantially as and for the purpose set forth.

19. The cut-off valve situated in the steam-admitting pipe and provided with a cog-wheel, as described, in combination with the rotating casement provided with gearing adapted to engage directly with the cog-wheel on said valve, substantially as set forth.

296,895. CAPSULE-STRIPPING MACHINE. WILLIAM A. TUCKER, New York, N. Y. Filed July 27, 1883. (No model.)

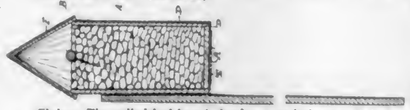


Claim.—1. The combination, in a gelatine-capsule-stripping machine, of the plates D D', arranged to slide on the rods B, the springs D^2, acting to force or hold said plates apart, the stripping-jaws C C', hinged together at *f* in the plate D, and the links *b*, pivoted at their outer ends in the plate D' at *e*, and at their inner ends to the outer ends of the said jaws, at *e'*, and the set-screw F, all as and for the purpose described.

2. In a capsule-stripping machine, the combination of the plates or frames D D', jaws C C', links *b*, rod E, provided at its outer end with the rack *g*, the rocking lever G, provided with the toothed segment *g'*, and the crank I', provided with the crank-pin *r*, arranged to work in the opening h^2 in said lever, all as and for the purpose described.

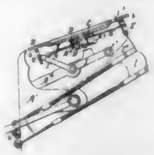
296,896. CAR-BRAKE. FLAVIUS J. UNDERWOOD, North Springfield, Mo. Filed Nov. 20, 1883. (No model.)

296,896.



Claim.—1. An improved automatic brake composed of a brake-bar, A, set by springs C, attached to and supported by a rod, D, which is made so as to adjust the tension of the said spring, levers G, having pushing-rods H H', for removing the said brake by an attached rod, F, connecting the said levers with the propelling-power of the vehicle, all substantially as shown and described.

2. In an automatic brake, springs C, adjustably attached upon a rod, D, by means of a nut, *d*, and washer *d'*, pushing-rods H H', with loops A and adjustable device *h'*, levers G G, with fulcrum *g'*, rod F, with fork *f f*, and attachment *f'*, all substantially as shown and described.



3. The combination of an automatic brake composed of springs C, rods D H F, and levers G, with a common brake-wheel, *f'*, all substantially as and for the purpose set forth.

296,897. POP-CORN PACKAGE. VINCENT D. URSO, Evansville, Ind. Filed Feb. 21, 1884. (No model.)

Claim.—The cylindrical box A, having a conical cover, B, in combination with stick C, as described, and for the purposes set forth.

296,898. PRINTING-PRESS. JOHN H. UTTER, Westerly, R. I. Filed Mar. 6, 1883. (No model.)

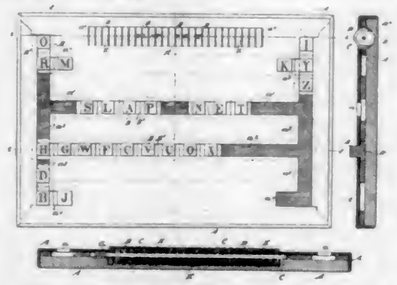
Claim.—1. In a printing-press, the cam I², carried on the vibrating frame I, in combination with the lever J, link H, ring G, arm G', disk B, and pawl E, as and for the purposes specified.

2. In a printing-press, the disks B C and pawls K E, combined with the cam I², frame I, lever J, having roller J', link H, ring G, arm G', and movable stop I², as and for the purposes set forth.

296,899. AUTOMATIC SHAFT-TUG. JAMES T. WATSON, St. Louis, Mo., assignor of three-fourths to Richard T. Bishop, same place, and Jean C. Bohrer, St. Paul, Minn. Filed Feb. 7, 1884. (No model.)

Claim.—1. In an automatic shaft-tug, the combination, with the back-band, of pivoted hooks connected thereto, and the girth attached to the hooks, said devices operating in the manner described, so that when the girth is buckled together the hooks will close around the shafts, as set forth.

2. In an automatic shaft-tug, the combination, with the back-band and girth, of hooks adapted to fit around the shafts, said hooks being operated by buckling the girth, as set forth.



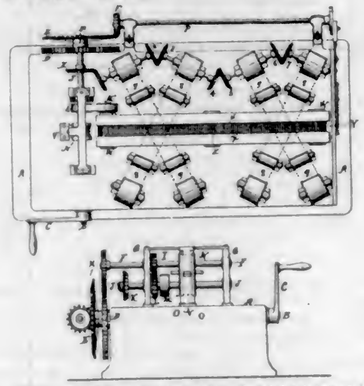
3. In an automatic shaft-tug, the combination, with the back-band, of an extension attached to the back-band on each side, hooks pivoted in the extensions, and the girth attached to the ends of the hooks, and operating as described, for the purpose set forth.

4. In an automatic shaft-tug, the combination, with the back-band, of a buckle attached to the same, and provided with a downward extension, hooks pivoted in the extensions, and the girth attached to the ends of the hooks, as set forth.

5. In an automatic shaft-tug, the combination, with the back-band, of a buckle attached to the ends of the same, and provided with downward extensions, a roller fitted in the end of the extension, hooks pivoted in the extensions, and the girth attached to the ends of the hooks and passing over the rollers, as set forth.

6. As an improved article of manufacture, the herein-described shaft-tug, comprising a buckle provided with a downward extension, the latter having a roller at the lower end thereof, a hook pivoted in the extension, and a cross-bar at the lower end of the hook, arranged and operating for the purpose set forth.

296,900. GAME. BENJAMIN S. WHEELER, Orange, N. J. Filed July 27, 1883. (No model.)

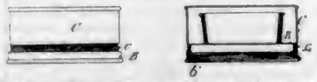


Claim.—1. The board A, having the connected grooves *a* and the recess *a'*, in combination with the blocks B B', sliding in the grooves *a*, and the wheels D, capable of being turned in the recess *a'*, and adapted for joint operation, substantially as herein specified.

2. The series of blocks B B', each carrying a letter on its face, in combination with each other and with the series of wheels D, separating-washers E, and shaft or axle-wire C, and with a board having a system of connected grooves, *a*, and a recess, *a'*, all arranged for joint operation, as herein specified.

3. A toy or game apparatus adapted for educational purposes, having a series of grooves and letter or figure bearing blocks movable therein while not entirely separable therefrom, in combination with each other, and with convenient means for holding and exhibiting changeable copies in proximity thereto, substantially as and for the purposes herein specified.

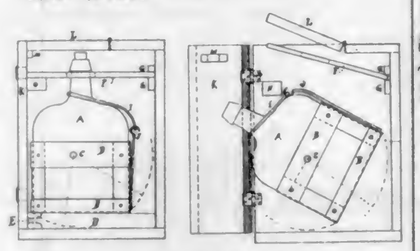
296,901. CANDY-MACHINE. JOHN P. WIER, Cleveland, Ohio. Filed Nov. 6, 1883. (No model.)



Claim.—1. The combination of the rollers 8 8 9 9, belts 8 8 9 9, channels or guides X X, and cutters W and Y, as and for the purpose set forth and described.

2. The hollow groove or channel formed by guides X X and belt Z, constructed in the manner and for the purposes set forth and described.

3. The belts or webs moving over the groups of rollers or pulleys 8 8 9 9, and designed to impart a rotary progressive movement to the stick of candy within the guides X X, substantially in the manner and for the purposes set forth and described.

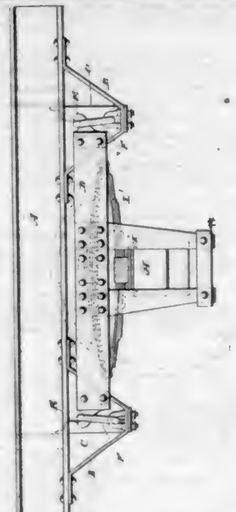


296,902. COLLAPSING CUP. AUGUST H. WIRZ, Philadelphia, Pa. Filed Mar. 10, 1884. (No model.)

Claim.—1. In a collapsing cup, the cap C, having on its outer lower edge the screw-thread *c*, in combination with the base B, having on the inner lower edge thereof the screw-thread *b'*, substantially as and for the purpose described.

2. In a collapsing cup, the base B, having thereon the inner and outer screw-threads, *b* and *b'*, in combination with the cap C, having inner and outer screw-threads, *c c'*, substantially as described and shown.

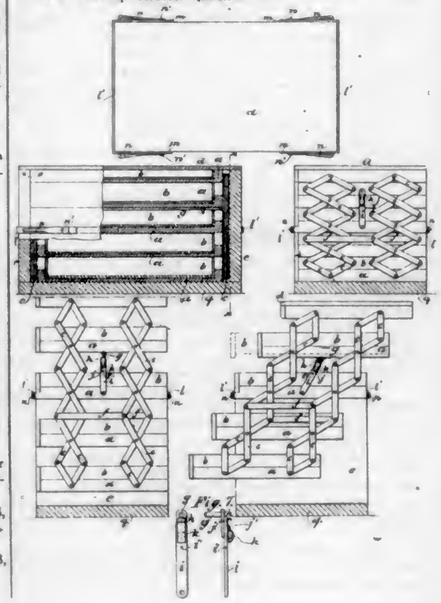
296,903. DEMIJOHN OR BOTTLE SAFE. ISAAC B. WOLLARD, San Francisco, assignor to the Oakland Glass Works, Oakland, Cal. Filed Jan. 12, 1884. (No model.)



Claim.—1. A demijohn or bottle safe having a swinging basket or tray, B, in combination with the wedge D, substantially as and for the purpose described.

2. A demijohn or bottle safe having a swinging basket or tray, B, in combination with the yoke F, for securing the neck of the vessel, substantially as described.

3. A demijohn or bottle safe having a swinging basket or tray, B, in combination with the loop I and hook J, substantially as set forth.

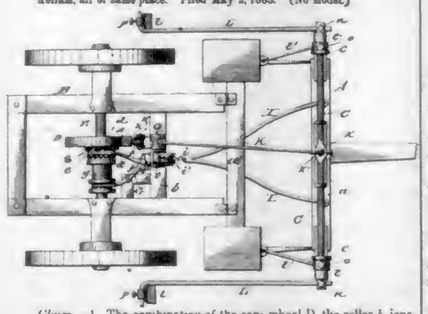


296,904. RAILWAY-TRUCK. LARS SEVERIN ZACHARIASEN, Christiania, Norway. Filed Aug. 23, 1883. (No model.) Patented in England July 30, 1883, No. 3,713, and in France Oct. 18, 1883, No. 156,522.

Claim.—1. The combination, with the car-frame, provided with depending unyielding brackets, of the axle-frame, the axle yieldingly supported within said frame, and the unyielding swinging links forming the sole connection between rigid parts of the axle-frame and the brackets, substantially as set forth.

2. The combination, with the car-frame A and brackets B, of the axle-frame F, guides I, axle-boxes H, springs I', hooks E, and links F, all of the above parts combined as described.

296,905. CHEST OF DRAWERS. ABE LINCOLN ADAMS, Fly Creek, N. Y. Filed Apr. 11, 1883. (Model.)



Claim.—1. A slide-drawer chest having the cover *d* ends *e*, and bottom *g*, the loose trays *a*, and the tray *a'*, made fast to said ends, in combination with the lazy-tongs *c c*, connected together by bars *f f*, and pivoted to the cover and trays, as shown and described, whereby the trays *a* may be folded up to or drawn out from the fixed tray *a'*, as specified.

2. The combination, with the frames *a*, trays *b*, and lazy-tongs *c*, of the rod *g*, having at each end a crank, *h*, with hole *h'*, the bar *i*, having hole *i'*, and pivoted at one end to the crank and at the other to the next tray-frame below it, the spring *j'*, carrying pin *j*, bent at one end, and having an eye or loop, and the pivot-bolt *k*, whereby the extended trays may be locked or unlocked, as described.

3. The combination, with the middle tray, of the case having ends *e* and holes *o*, the band *l'*, attached at *m* to said tray, and extending around the ends of the case, and the catches *n*, pivoted at *n'*, as shown and described.

296,906. CORN-PLANTER. ARCHIBALD D. ADAMS, Prophetstown, Ill., assignor of three-fourths to John J. Greene, Joel E. Loomis, and Harry F. Kellam, all of same place. Filed May 2, 1883. (No model.)

Claim.—1. The combination of the cam-wheel D, the roller A, journaled in the bifurcated arms H of lever K, the lever K, oscillating bar C, rods L, hoes *l*, rods *l'*, and the usual seed-slide, substantially as shown, and for the purpose described.

2. The combination of the branch arms H I, chain *i*, pulley *i'*, lever F, lug *f'*, arm *f*, and the wheel D, whereby the operation of the machine is suspended coincidently with the elevation of the furrow-openers or runners, substantially as shown, and for the purpose specified.

296,907. GRAIN-DOOR FOR FREIGHT-CARS. ALEXANDER W. ALEXANDER, Piqua, Ohio. Filed Mar. 12, 1884. (No model.)

Brief.—A frame having a covering secured over its face, the ends of which extend around the ends of the frame, and a longitudinal flexible strip secured between said frame and covering, and projecting from the bottom of the door. A water-proof pasteboard covering is preferred.

Claim.—1. The combination, in a grain-door, with the frame, of a surface or covering secured over the face of the same, and having its ends extended around the ends of the frame and secured to the opposite face thereof, substantially as and for the purpose set forth.

2. The combination, in a grain-door, of the frame, a surface or covering secured over the face of the frame and having its ends extended around the ends thereof, and a longitudinal flexible strip projecting from the bottom, substantially as and for the purpose set forth.

3. The combination, in a grain-door, of the frame, a surface or covering secured over the face of the same, and a longitudinal flexible strip secured between the frame and surface and projecting from the bottom of the door, substantially as set forth.

4. As an improvement in grain-doors, the combination of the frame, the surface or covering secured over the face of the same, and having its ends extended around the ends of the frame and secured to the opposite face thereof, and a longitudinal flexible strip secured between the frame and surface and projecting from the bottom of the door, substantially as set forth.

5. As an improved article of manufacture, a grain-door comprising a frame, and a water-proof pasteboard surface or covering secured to the face of the same, substantially as set forth.

296,908. FASTENING FOR SHOE-SOLES. LEWIS J. ATWOOD, Waterbury, Conn., assignor to the Plume & Atwood Manufacturing Company, same place. Filed Dec. 29, 1883. (No model.)

Claim.—The shoe nail or fastening, having a roughened body portion and a round point that is a gradual taper from the inward curve at the base to the sharpened end, substantially as set forth.

296,909. CASH-CARRIER SYSTEM. GEORGE A. BADGER and WILBER FOWLER LAKIN, Quincy, assignors to John H. Lakin, Boston, Mass. Filed Mar. 12, 1884. (No model.)

Claim.—1. The carrier, with its drum M, clock-spring V, and horizontal axis *m*, in combination with a cash-receptacle secured to the drum by a pair of connections, *x x*, wound in the same direction thereon, substantially as described.

2. The guide-rolle *y* and connections *x x*, in combination with a cash-receptacle, and a carrier having a drum, M, located on a horizontal axis, *m*, and actuated by a clock-spring, as and for the purpose set forth.

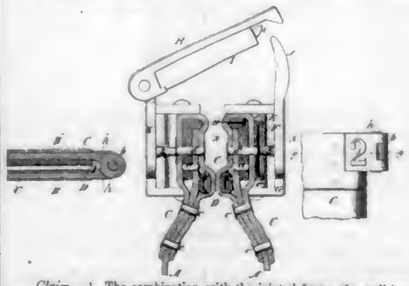
3. In combination with a carrier and a cash-receptacle, a pair of closely-wound spiral-spring connections, *x x*, as and for the purpose specified.

4. The latch *y'*, in combination with a spring-actuated drum, M, having a hub provided with an aperture for its reception, as set forth.

5. The carrier-retaining device L, and the arm I, with its elastic cushion *f* and spring *h* for starting the carrier, in combination with a means for unlocking the same, as described.

6. The carrier-retaining device L, with its spring *h* and the arm N, in combination with the guide C and its stop *n* for releasing the carrier, substantially as specified.

7. The sliding holder B with its pin *u*, and the latch S with its notch *t*, spring, and eye *r*, in combination with cords or suitable connections for raising and lowering the holder, as set forth.



8. A pair of brackets for holding the guide C, in combination with and capable of adjustment on a vertical rod resting in bearings, substantially as described.

9. A pair of brackets for holding the guide C, and adapted to swing and be adjusted upon a vertical rod resting in suitable bearings, a pair of double-grooved pulleys mounted in said brackets, a sliding holder, B, for the end of the track, and a cord or other connection for elevating and depressing the track-holder, combined and arranged to operate as and for the purpose set forth.

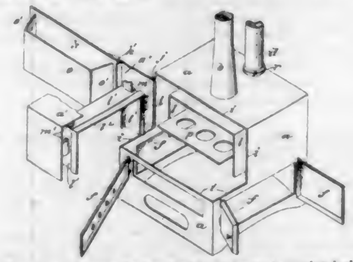
10. In combination with a post, a pair of bearing-plates and a series of bracket-supporting rods, as specified.

11. The guide C and its adjusting-screws, in combination with a pair of adjustable brackets and a vertical rod supported in suitable bearings, substantially as described.

296,910. MAIL-BAG. JOHN S. BAILEY, Buckingham, Pa. Filed Feb. 18, 1884. (No model.)

Claim.—1. The combination, with the jointed frame of a mail-bag, of the shield-plate G, attached to one of the center joints of the said frame, and provided with fingers on its inner face for bracing the frame and for holding the labels, as set forth.

2. The combination of the jointed frame of a mail-bag and a suitable hasp, with the shield G, attached to one of the center joints *b* of said frame, and formed with a staple-plate, *f*, substantially as set forth.



3. The combination, with the jointed frame of a mail-bag and a suitable staple, of the plate K, attached to one of the joints *b'*, and formed with the bracing-fingers *k* on its inner face and the hasp-plate H, hinged to plate, substantially as set forth.

4. The combination, with the jointed frame of a mail-bag and label-holding plate E, on either side of one of the joints *b'*, of the plate G, attached to the said joint *b'*, and provided on its under side with fingers *g*, whereby the said fingers will hold the label firmly within the label-plate, and serve as a brace to the frame, substantially as set forth.

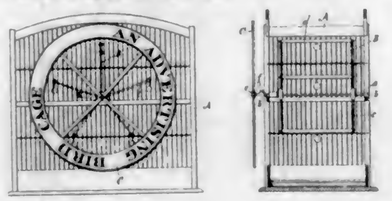
5. The combination of the jointed frame of a mail-bag with a plate or shield attached to one of the central joints and formed with fingers on its inner face, and with a staple on its upper end, and a similar plate attached to the opposite joint and formed with fingers on its inner face, and having a hinged hasp on its upper end, whereby when the hinged frame is closed the fingers of the two plates will brace said central jointed portions, and the hasp be made to engage said staple, substantially as set forth.

6. The combination of the main leather body A of the bag, metal plates B at the upper edge thereof, and elastic strips or tubes D below the edge, with the outer leather, C, folded to embrace the outer and inner edges of the bag and inclose the plates and elastic material, and rivets for securing said parts together, substantially as shown and described.

296,911. STOVE-JACKET. WILLIAM H. BENSON, Elston, Md. Filed Sept. 5, 1883. (No model.)

Claim.—1. A stove-jacket consisting of an outer casing inclosing the stove, and an inner hot closet supported from the outer casing, which casing and closet have independent connections to the draft-flue of the stove, substantially as shown and described.

2. A stove-jacket constructed with a main body portion, *a*, resting on the floor and surrounding the entire stove, and a hinged section, *a'*, adapted to be swung from over the stove-top, said body portion being provided with doors or openings registering with the draft, oven, and other doors of the stove, substantially as shown and described.



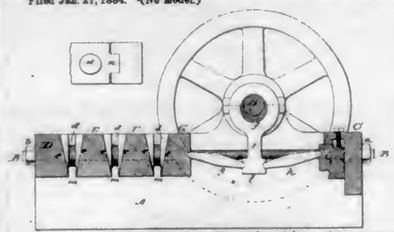
3. A stove-jacket constructed with outer casing, *a*, having hinged section *a'*, and a hot closet consisting of sections *l l'*, fixed, respectively, to sections *a a'*, substantially as shown and described.

4. A stove-jacket constructed with outer casing, *a*, having hinged section *a'*, and a hot closet, *l l'*, in combination with separate hot-air-discharge pipes *b n*, substantially as shown and described.

5. The combination, with the jacket *a*, surrounding the entire stove and resting on the floor, its hinged section *a'*, and the hot closet *l l'*, of the door *k*, having the plate *o*, for closing the front of the hot closet, whereby dust and ashes will be prevented from entering said chamber while the grate is being shaken, substantially as shown and described.

6. The combination, with the stove-jacket and stove-pipe *d*, of the hot closet *l*, fitted to the pipe *d* within the jacket, and secured to said jacket by brackets *n* in rear of the pipe, substantially as shown and described.

296,912. ADVERTISING BIRD-CAGE. HENRY BISHOP, Baltimore, Md. Filed Aug. 23, 1883. (No model.)



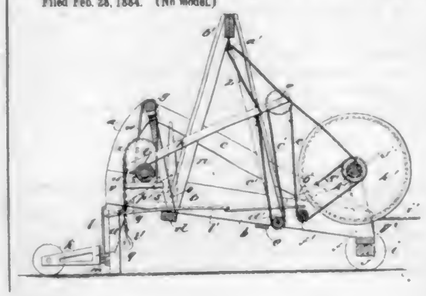
Claim.—An advertising bird-cage consisting of a closed cage, A, a revoluble perch, *d*, located within the cage, and a disk, C, situated outside the cage and having a space adapted to receive advertisements, the disk being secured to the revoluble spindle *a* of the perch, substantially as specified.

296,913. METHOD OF COLORING PHOTOGRAPHS. AUGUSTE BISSON, Paris, France. Filed Jan. 15, 1884. (No specimens.)

Claim.—1. The treatment of the translucent bodies for the reception of photographic impressions, consisting in subjecting them to the action of a bath composed of benzine, resin, and linseed-oil, in or about the proportions herein specified, substantially as herein described.

2. The improvement in the art of printing photographs in colors, consisting in first obtaining stencil-plates or sheets cut out in the contours of the different colors, next applying said plates or sheets to lithographic stones coated with bichromate, then exposing the said stones and plates or sheets together to the action of the light and pressure under a glass, then removing the sheets and coating from the stones, and afterward printing from said stones in flat tints, substantially as herein described.

296,914. STONE-CRUSHER. THEODORE A. BLAKE, New Haven, Conn. Filed Jan. 21, 1884. (No model.)



Claim.—1. The combination of a series of jaws, (two or more,) parallel guides, upon which said jaws are arranged and made movable in a path parallel to said guides, and mechanism, substantially such as described, to impart movement to the said series of jaws, the said guides serving to support the said jaws in the same inclination with relation to each other throughout their entire movement, substantially as described.

2. The combination of a series of jaws, (two or more,) parallel guides upon which said jaws are arranged and made movable in a path parallel to said guides, a stationary jaw at one end of the series, and mechanism, substantially such as described, to impart reciprocating movement to the said series of jaws toward and from the fixed jaw and upon their guides, the said guides supporting the said jaws in the same inclination with relation to each other throughout their entire movement, substantially as described.

3. The combination of a series of jaws, parallel guides therefor, a fixed jaw at one end of said series, a toggle at the other end arranged to bear upon the jaw at that end, the adjacent faces of the said jaws diverging from their lower edges upward, whereby a crushing-mouth is formed between each pair of jaws, said toggle serving to impart a crushing movement to said jaws, and the guides serving to retain the jaws in the same inclination with relation to each other throughout their movement, substantially as described.

4. The combination of the fixed jaw D, the movable jaws E F G, &c., rods B, springs *d* between the jaws, and a toggle arranged to bear against the rear jaw and operate to force it, with the intermediate jaws, toward the said stationary jaw, substantially as described.

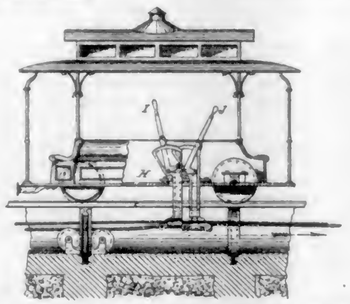
296,915. STUMP-PULLER. CHARLES ALFRED BLOWE, Union City, Ind. Filed Feb. 28, 1884. (No model.)

Claim.—1. The combination, in a portable supporting-frame, of the pulling-lever *h*, chain *y*, windlass *g' h'*, ropes *c'* and *i'*, guide-pulleys *d' e'*, and the roller *f''*, substantially as described.

2. The combination, in a portable supporting-frame, of the pulling-lever *h*, eccentric block *x*, axle *t*, chain *y*, and the windlass and ropes and guide-pulleys for working the lever, substantially as described.

3. The improved supporting-frame for a portable stump-puller, consisting of legs *a*, main side timbers *b*, upper side timbers *c*, cross-timbers *d*, *e*, and *f*, cross-beam *g*, and the derrick *b'*, said side timbers being upwardly inclined from cross-bar *f* to the parts *a*, and said parts being inclined above timbers *a* to the ends of timbers *c*, substantially as described.

4. The lever-axle *t*, having bearings on the timbers *b*, and re-enforced between said timbers by the stirrups *v w*, suspended from the cross-beam *g*, substantially as described.



5. The improved stump-pulling machine, consisting of the frame *a*, *b*, *c*, *d*, *e*, and *f* and the derrick *b'*, having the pulling-lever *h*, chain *y*, and the windlass, rope, and pulley mechanism, substantially as herein described, for working said lever, and said frame having the truck *i j* for supporting the front end, and the adjustable casters *k*, attached to the hind end, as specified.

6. The combination of the elbow-levers *n*, cords *p*, and suitable guides, *q*, for said cords, with the casters *k*, adjustably attached to the legs *a* by the pivot-rods *l* and eyes *m*, substantially as described.

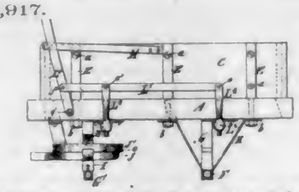
7. The combination, with the pulling-lever *h*, hoisting-cord *s*, and the pulling-rope *c'*, of the windlass-shaft *g'*, for working said lever by said cord and rope, said shaft having a smaller section, *k'*, for the cord *s* than the section whereon the rope *c'* winds, substantially as described.

296,916. SYSTEM OF PROPELLING CARS BY MEANS OF CABLES. JOHN L. BOOMS, San Francisco, Cal. Filed Jan. 22, 1884. (No model.)

Brief.—Parallel cables in same tube or cable-way traveling at different speeds, so as to start cars by engaging the slow cable and then engage the fast cable.

Claim.—1. In the cable system of propelling cars, the endless ropes or cables *d e*, mounted parallel with each other and driven at different rates of speed, in combination with two grippers, I J, for connecting the car or dummy with said ropes.

2. The combination of a fast and a slow moving cable, *d e*, with a car to be moved on a track, and separate gripping devices for connecting the car with either cable, substantially as described.



3. The improvement in starting cars from a state of rest, consisting in first connecting them by a suitable gripper, J, with a slow-moving rope or cable, and then, when the car has attained the speed of the slow-moving rope or cable, releasing the gripper from said rope or cable and connecting the car with a fast-moving rope or cable, substantially as described.

4. The improvement in the cable system of propelling cars on a track by means of an endless rope or cable mounted on pulleys in an underground slotted tube or tunnel, consisting of the two separate and independent cables *d e*, mounted on two separate and independent sets of pulleys in the same tube, one of said cables being located on each side of a perpendicular line drawn through the slot in the tube or tunnel, and separate gripping devices for connecting the car with either cable at will, substantially as described.

296,917. DUMPING-WAGON. THOMAS W. BOYCE and CHRISTIAN FRISCHE, Brooklyn, N. Y. Filed Nov. 23, 1883. (No model.)

Claim.—The combination of the parts L L', journals L^2, supported in bearings on the frame, the rod L^3, pivotally connected by pins *e e'* to arms L^4, the lever L^5, adapted to be swung forward and backward to impart a rocking motion to the parts L L', and the resilient bar M, rig-

296,917.

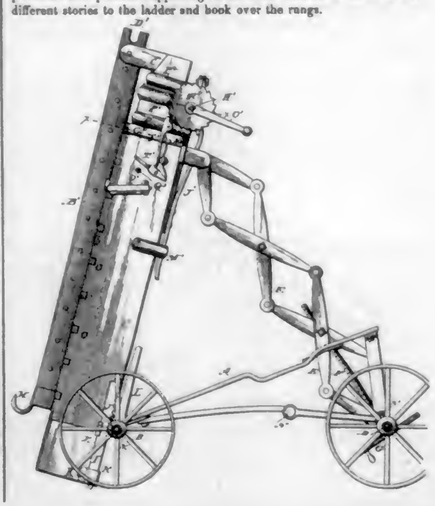
idly affixed near one end to the side of a wagon-body for locking the lever L^5, so as to secure the parts L L' in position to support a load.

296,918. HAT-SWEAT. GEORGE S. BRACHER, New York, N. Y. Filed Jan. 26, 1884. (Specimens.)

Claim.—1. A sweat-leather provided with a reed dressed and finished with an application of varnish, attached to said sweat-leather without a covering, substantially as set forth.

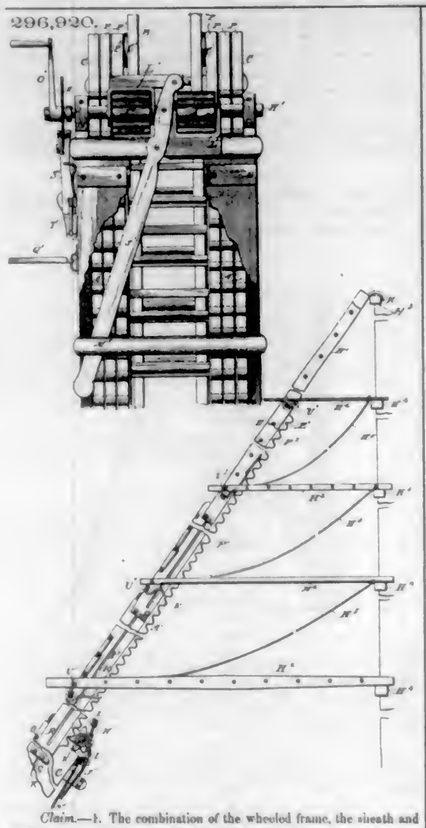
2. A sweat-leather provided at its edge with a reed dressed and polished with an application of varnish, without covering, except the inclosing-stitches whereby it is united to the sweat.

3. A sweat-leather provided with a dressed and finished reed, *c*, without covering, and the backing-strip *f*, united to said sweat, but concealed behind the reed, substantially as set forth.



296,919. REED FOR HAT-SWEATS. GEORGE S. BRACHER, New York, N. Y. Filed Jan. 28, 1884. (No specimens.)

Claim.—1. As a new article of manufacture, a reed of rattan or analogous material impregnated with a filling material, and surface-hardened by compression and friction, all substantially as and for the purposes specified.



2. A method of treating reeds to improve their qualities and appearance for hat-sweat and other uses, consisting in coloring, filling, compressing, and surface finishing, all substantially as set forth.

296,920. FIRE-ESCAPE LADDER. WM. BRAHNAM, Fredericksburg, Va. Filed July 23, 1883. (No model.)

Brief.—The sheath which contains the folded ladder is pivoted to the rear axle of the truck, and is raised and lowered by a lazy-tongs brace operated by a screw. Rack-bars are secured to the ladder-sides, and the ladders are extended by adjustable pinions engaging with said racks and held extended by spring-catches. The top section is connected to the next lower section by pivoted link-bars. Supplemental ladders provided with pendent supporting-cords reach from the windows of the different stories to the ladder and hook over the rungs.

296,920.

Claim.—1. The combination of the wheeled frame, the sheath and ladder pivoted to the rear axle of said frame, the lazy-tongs and operating-screw connecting the sheath to the forward axle of said frame, and the anchors adapted to be set in the ground when the ladder is elevated, substantially as shown and described.

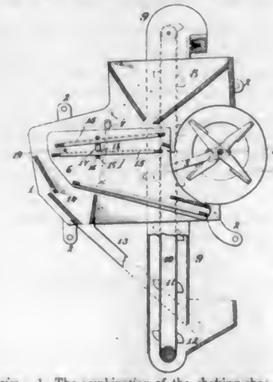
2. The combination of the sheath, the sections of ladder arranged one within another, and having rack-bars secured to their sides, the spring-catches adapted to connect said sections rigidly together, and the adjustable pinions adapted to engage with each pair of rack-bars in turn, substantially as shown and described.

3. The combination, with the sections of ladder having rack-bars thereon and arranged one within another, of a shaft supported in suitable bearings, a pair of pinions feathered thereon, a lever pivoted to the shaft between the pinions, and connected to the latter by sliding yokes, and means for holding the lever in desired positions, substantially as shown and described.

4. The combination, with the connected sections of ladder, of a top section connected to one of the other sections by pivoted link-bars, and having one end recessed to engage with a round of said other section, and spring-catches for forming a rigid connection between the top section and said link-bars, substantially as shown and described.

5. The combination, with the ladder, and means for elevating and supporting the same, of supplemental ladders having hooks at one end adapted to engage with rounds of the main ladder, while their other ends rest on window-sills, and having pendent cords reaching, severally, to each next lower supplemental ladder, substantially as shown and described.

296,921. SEAL. CHARLES H. BUNDY, Middletown, Ohio. Filed Feb. 23, 1884. (No model.)



Claim.—1. A seal formed of a waxen or resinous compound, and containing a fibrous netting or web, substantially as and for the purpose set forth.

296,921.

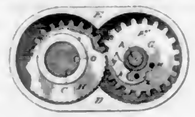
2. As a new article of manufacture, sealing-wafers formed of a fibrous net-work or web coated with a waxen or resinous compound, for the purpose set forth.

296,922. RECLEANING ATTACHMENT FOR THRASHERS OR SEPARATORS. HOWARD CAMPBELL, Richmond, Ind., assignor to Gaar, Scott & Company, same place. Filed Dec. 7, 1883. (No model.)

Claim.—1. The combination of the shaking shoe, the plates fixed to the shoe-sides, and each provided with a pair of lateral pins, the top screen having its side edges adjacent to the centers of their length supported between the pairs of pins, to oscillate in a vertical plane between the pins, and devices for holding the screen when oscillated to adjust it to the desired plane, substantially as described.

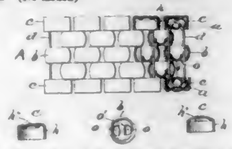
2. A recleaning attachment for grain-separators, combining in its structure the receiving-hopper, a screen for receiving the grain from the hopper, an elevator having a chamber at its lower end, and its upper end arranged to deliver the grain to the hopper, and an inclined conductor having one end connected directly with the chamber of the elevator, and its upper end formed into a mouth arranged under the discharge-mouth of the screen, to convey the tailings to the chamber of the elevator, substantially as described.

296,923. REFRIGERATOR. JAMES CASTELL, Blue Rapids, Kans. Filed Aug. 3, 1883. (No model.)



Claim.—1. In a refrigerator, the combination of the filter K' and the four-angular pipe J, substantially as shown, and for the purpose described.

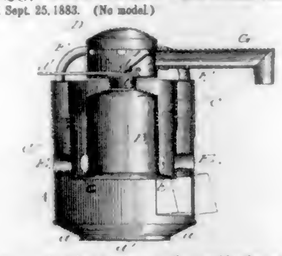
2. In a refrigerator, the combination of the receptacle having dead-air spaces or chambers, ice-chambers having removable ice-pans with tapered bottoms, drip-pan filter K', and four-angular pipe J, substantially as shown and described.



3. In a refrigerator, the overflow-receptacle consisting of a four-angled pipe with its middle portion arranged lower than its receiving and discharging ends, substantially as and for the purpose set forth.

296,924. SELF-FEEDING RATCHET-DRILL. ROBERT N. CHERRY, Jersey City, N. J. Filed Nov. 15, 1883. (No model.)

Claim.—The combination of the eccentric wheels E and E', the ratchet H, pawl A, feed-screw C, and stock B, substantially as herein shown and described.

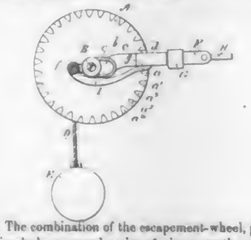


296,925. ROLLER-CHAIN. HENRY A. CHURCH, Providence, R. I. Filed Jan. 2, 1884. (No model.)

Claim.—1. The roller-chain A, herein described, consisting of the intermediate units, *b*, edge units, *a*, and binding-wires *d*, each of said units being provided with the two openings *o* through the end thereof, in combination with the metallic caps *c*, each having a closed end and parallel sides adapted to receive and be secured to said edge units, the whole arranged substantially as shown and set forth.

2. In a roller-chain, the combination, substantially as shown and set forth, of intermediate units, *b*, binding-wires *d*, edge units, *a*, smaller than the intermediate units, and caps *c*, the latter adapted to be secured to the edge units.

296,926. HOT-AIR FURNACE. PERRY H. CLARK, Minneapolis, Minn. Filed Sept. 25, 1883. (No model.)



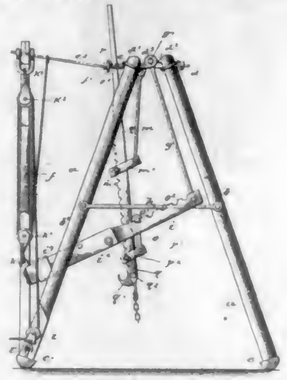
Claim.—1. In a hot-air furnace, the combination, with the inner shell or dome, B, combustion-chamber D, exit-pipe G, and pipe *b*, of the hinged perforated hood or damper *f*, damper *d*, and operating-handle *d'*, substantially as and for the purpose herein shown and described.

2. The combination, with the combustion-chamber D and exit-pipe G, of the perforated hood or damper *f*, substantially as and for the purpose set forth.

3. In a hot-air furnace, the combination, with the shells B C, provided with the flues F E, of the combustion-chamber D, opening into the interior shell, B, said opening being covered by a damper, the actuating-rod of which is also pivotally connected to and actuates a perforated hood, *f*, communicating with the exit-pipe, as and for the purpose set forth.

296,927. VARIABLE ESCAPEMENT. JESSE D. COTTRELL, Central Falls, R. I. Filed Jan. 17, 1884. (No model.)

Claim.—1. The combination of the escapement-wheel, provided on its side with a circularly-arranged series of pins or teeth, with a reciprocating pallet and a pivoted pawl arranged for simultaneous movement with each other at the face of the escapement-wheel, substantially as and for the purpose specified.



2. The combination of the escapement-wheel, provided on its side with a circularly-arranged series of pins or teeth, with a reciprocating pallet and a pivoted pawl arranged for simultaneous movement with each other at the face of the escapement-wheel, and means for moving the reciprocating pawl both directly and pivotally, substantially as described.

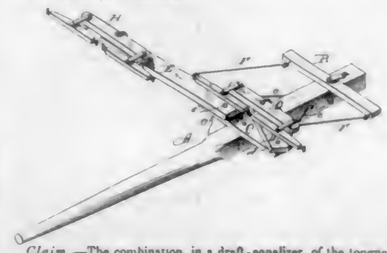
296,928. MANUFACTURE OF PAPER. ENOS M. CRANE, Dalton, Mass. Filed Mar. 14, 1884. (No specimens.)

Claim.—1. The method herein described of designating the thickness or weight of paper of any description, which consists in impressing upon each sheet during the process of manufacture a water-mark indicating the said thickness or weight.

2. As a new article of manufacture, a sheet of paper having impressed upon it by a water-mark an arbitrary character which shall indicate the thickness or weight of said paper per unit of superficial area.

296,929. STUMP-EXTRACTOR. AMBROSE S. CROXTON, Cedar Springs, Mich.; Olive A. Croxton, Administratrix of said Croxton, deceased. Filed July 25, 1883. (No model.)

Claim.—1. The combination, with the shears *b*, mounted on the runners *c*, and provided at their upper ends with the eyebolts d^2 and band *d*, of the shear *b'*, mounted on the runner *c'*, and provided at its upper end with the eyebolts d^2, band *b'*, having projecting shanks carrying the sleeves *e*, and plate for forming the guide, and the pintle *g'*, for connecting the eyebolts d^2 d^2 and suspending the hanger-rod *g*, substantially as specified.

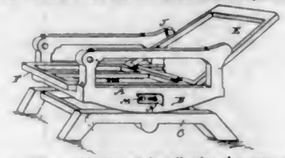


2. The combination, with the shears *b'* of the frame *a*, having the rod e^2, connected to the plate *e'* of the lifting-bar guide, of the pulley-shear connected to the rod e^2 and to the shears *b'*, substantially as specified.

3. The combination, with the frame *a*, provided with the hanger-rod *g*, pivoted to the fulcral end of the hoisting-lever, the rope and tackle for operating the power end of said lever, and the pulley-shear, of the hanger-rod *m*, provided with the pivoted clutch-block *m'*, the short hanger *o*, carrying the cross-pin *o'* at its upper end and the pivoted clutch-block p^2 at its lower end, and the notched lifting-bar *q*, provided with the hook and the perforation in its lower end, said lifting-bar passing through the clutch-blocks p^2 *m'*, the space between side bars of the lever *i*, and through the guide at the top of the frame, substantially as specified.

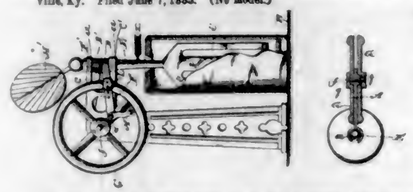
4. The round rod having the friction-rings and dogs, adapted to engage the clutch-blocks, the rod to pass through rings and between the iron side bars of the lever *i*, substantially as specified.

5. The bifurcated wooden lever A, having the bifurcated face-plate, in combination with the forked bearing carrying the pivoted hanger, the rack-stem, pawl and ratchet, and operating-crank, as specified.



296,930. DRAFT-EQUALIZER. WILLIAM CROSIER, Goodwin, Dak. Filed Oct. 18, 1883. (No model.)

Claim.—The combination, in a draft-equalizer, of the tongue A, bar B, centrally pivoted thereto, bar C, rigidly secured to the tongue, arms D E, respectively pivoted at the ends of the rigid bar C, the bar

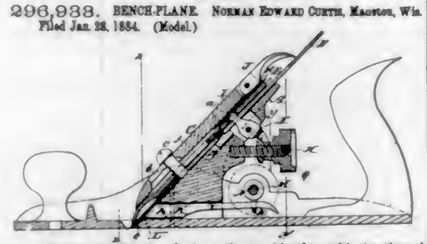


D extending toward the center and having secured to its rear end a pivoted bar, G, and affording therefor a central pivot-bearing carrying the central draft devices at each end, a bar, H, centrally pivoted at the outer end of the arm E and carrying whiffletrees, and connecting-rods F, one of which is connected to the bar D and bar B, for the purpose set forth.

296,931. COMBINED PLATFORM-ROCKER AND RECLINING-CHAIR. PETER B. CUPP, Van Wert, Ohio. Filed July 19, 1883. (Model.)

Claim.—The combination of the following elements: the seat-frame A, having side grooves and arms provided with closed slots H, the sliding seat F, having rack K, the hinged back E, having studs G, projecting laterally into said slots, the rotatable pinion-shaft M L, having a squared end, and the forked sliding plate N, arranged as described, to lock said shaft, all as hereinbefore set forth.

296,932. CHURN. JESSE M. CURTICE and WILLIAM H. CURTICE, Louisville, Ky. Filed June 7, 1883. (No model.)

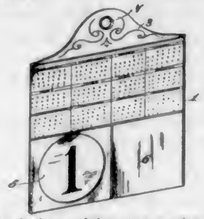


Claim.—1. The combination, with two horizontal arms having half-bearings at their outer ends, of a dasher-shaft having grooves adapted to register with the half-bearings, and an intermediate drum, wheels journaled to the standard, and two straps, the opposite ends of which are respectively connected to the wheels and to the drum of the dasher-shaft, substantially as described.

2. The combination, with the standard, horizontal arms having bearings at their outer ends, and two drive-wheels journaled to the standard, of a dasher-shaft and sectional straps connecting the dasher-shaft and drive-wheel, substantially as described.

3. The combination, with the standard A, having arms C C', the bearings *g*, and shaft *f*, of the wheels G, dasher-shaft E, and straps connecting the wheels and dasher-shaft, substantially as described.

296,933. BENCH-PLANE. NORMAN EDWARD CURTIS, Mauston, Wis. Filed Jan. 28, 1884. (Model.)



Claim.—1. In a bench-plane, the combination, with the pivoted plane-iron having in its lower rear side a longitudinal groove, of the laterally-adjustable lever adapted to fit into the groove of the plane-iron, and capable of adjustment by the hand, substantially as and for the purpose set forth.

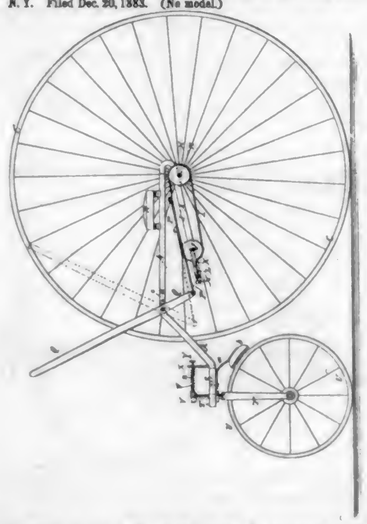
2. In a bench-plane, the combination, with the longitudinally-grooved bed-piece, of the cap-iron having the rear headed projection or screw, with its head entering the groove of said bed-piece, and the adjusting-lever engaging said iron, and actuated by an adjusting-nut, substantially as and for the purpose set forth.

3. In a bench-plane, the combination, with the pivoted plane-iron having in its lower rear surface a longitudinal groove, of the laterally-adjustable lever having a tongue entering the groove of the plane-iron, and the headed screw carrying a nut or sleeve provided with a loop which receives the outer end of the aforesaid lever, substantially as and for the purpose set forth.

296,934. CALENDAR. JOHN CUSSONS, Glen Allen, Va. Filed Feb. 13, 1884. (No model.)

Claim.—1. A calendar consisting of an envelope having a pocket open at the top and closed at the bottom and sides, and provided at one corner with a face-aperture and a sheet bearing numerals adapted to be inserted into and removed from the pocket of the envelope, and when therein to disclose the day of the month through the corner-aperture, substantially as described.

2. A calendar consisting of an envelope having at one corner a face-opening and a sheet bearing daily dates and folded into quarto, as described, said sheet when so folded being capable of insertion into and removal from the pocket of the envelope, and when therein to disclose the numeral designating the day of the month through the corner face-aperture, substantially as set forth.



3. A calendar consisting of an envelope having its face provided with an aperture, and bearing an annual calendar and a sheet bearing numerals on its opposite surfaces and folded into quarto, as described, and capable of insertion into and removal from the pocket of the envelope, and when therein to disclose the day of the month through the face-aperture, substantially as set forth.

296,935. PROCESS OF MANUFACTURING CELLULOSE FROM WOOD, &c. CARL FERDINAND DAHL, Dantzic, Prussia, Germany. Filed Mar. 4, 1884. (No specimens.)

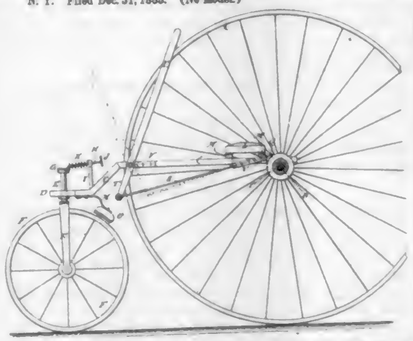
Claim.—1. The process of producing cellulose from wood or other vegetable matters by boiling the same under pressure in a watery or hydrated solution containing sulphate of soda, carbonate of soda, soda hydrate, and sodium sulphide, substantially as set forth.

2. The process of treating sulphate of lime and the salts regained from the resultant material in the production of cellulose by boiling the same with lime, substantially as and for the purpose set forth.

296,936. HAND-POWER VEHICLE. THOMAS A. DAVIES, New York, N. Y. Filed Dec. 20, 1883. (No model.)

Claim.—1. In a hand-power vehicle, the combination, with the frame A and the axle B, of an endless chain passing around chain-wheels on the frame and axle, and hand-levers pivoted to the frame, and hav-

ing their lower ends connected to the said endless chain, substantially as herein shown and described.



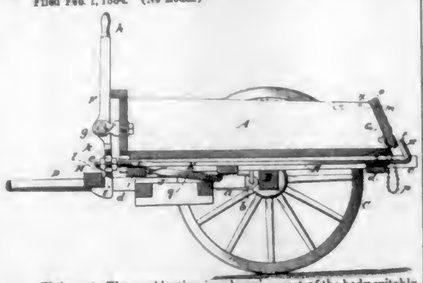
2. In a hand-power vehicle, the combination, with the arm of the frame A, of the spring *a*, secured to said arm, and provided with the brake-shoe *b* at its free end, substantially as described.

3. In a hand-power vehicle, the combination, with the frame A and the hand-levers Q, of the stops *c*, substantially as herein shown and described, whereby the movements of the said hand-levers are limited, as set forth.

4. In a hand-power vehicle, the combination, with the frame A, the axle B, and the drive-wheels C, of the hand-levers Q, the endless chain I, the chain-wheels H J, and the ratchet-wheel and pawl D E, substantially as herein shown and described, whereby the vehicle will be driven forward by the movements of the said levers, as set forth.

5. In a hand-power vehicle, the combination, with the frame A, the chain-wheel J, and the endless chain I, of the clevis K, the rod L, and the hand-nut M, substantially as herein shown and described, whereby the tension of the said endless chain can be readily regulated, as set forth.

296,937. HAND-POWER VEHICLE. THOMAS A. DAVIES, New York, N. Y. Filed Dec. 31, 1883. (No model.)

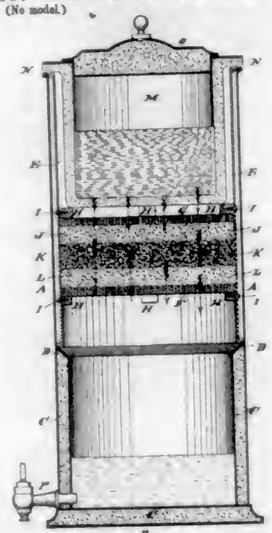


Claim.—1. In a hand-power vehicle, the combination, with the hubs or hub of the drive wheels or wheel A and the frame C, of the ratchet-wheels P, the flexible pawls Q, and the levers T, substantially as herein shown and described, whereby the propelling-power will be applied directly to the drive-wheels, as set forth.

2. The flexible pawl Q, constructed substantially as herein shown and described, with links so constructed that the said pawl will bend, as set forth.

3. In a hand-power vehicle, the combination, with the frame C, the connecting-rods S, and flexible pawls Q, of guides U, substantially as herein shown and described, whereby the said flexible pawls are kept from folding or buckling while being pushed back for another stroke, as set forth.

296,938. DUMPING-WAGON. LEMUEL C. DEER, Lake Charles, La. Filed Feb. 1, 1884. (No model.)



Claim.—1. The combination, in a dumping-cart, of the body suitably mounted and pivoted, a bar adapted to move longitudinally in guides located on the under side of the body, and adapted to hold the end-gate in a closed position, a lever pivotally secured on the cart-body, and capable of securing the body in proper position, and adjustably connected to the said longitudinal bar, substantially as and for the purpose set forth.

2. The combination, in a dumping-cart, of the body suitably mounted, and provided with devices for securing the body in proper position and for maintaining the end-gate in a closed position, and connected to each other, to be simultaneously withdrawn, and an end-gate, G, pivoted as described, and limited in its movements by chains or cables, substantially as set forth.

3. The combination, in a dumping-cart, of the body, pivoted as described, body and end-gate devices, connected and operating as set forth and a bar secured pivotally on the under side of the body, and adapted, when said body is tilted, to come in contact with and be braced by a block secured between the shafts, substantially as specified.

296,939. FILTER. ABNER B. DENTON, St. Louis, Mo. Filed July 28, 1883. (No model.)

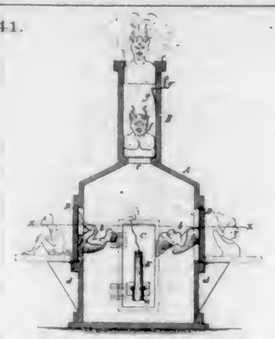
Claim.—1. The combination, with an outer case and porous vessel removable therefrom, of an inner case intermediate of the porous vessel and outer case, provided with perforated plates having filtering material between them, as set forth.

2. The combination of outer case, A, having shoulder D, inner case, E, supported on the shoulder, perforated plates fitting the interior of the inner case, having filtering material between them, and porous vessel M, supported on the cases by a suitable rim, and removable therefrom without removing the inner case, as set forth.

3. The combination, in a filter, of the outer case, A, and a removable case, E, with removable perforate plates F G, and removable rests or cleats H, for the purpose set forth.

296,940. FRAME FOR POCKET-BOOKS, &c. HIPPOLYTE DIDOCT, Fils, Paris, France. Filed Feb. 27, 1884. (No model.)

Claim.—A frame for pocket-books and similar receptacles, comprising the two jaws A and A′, of elastic metal, hinged together as shown, and provided with concave-convex engaging-flanges c and c′, respectively, constructed and arranged to operate substantially as set forth.



296,941. TOY. CHARLES DIENER, New York, N. Y. Filed Feb. 23, 1884. (No model.)

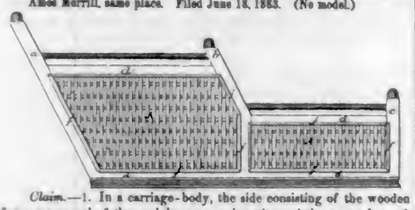
Claim.—1. A fire-cracker toy made substantially as herein shown and described, and consisting of an inclosure in which the fire-cracker is to be exploded, the inclosure being provided with images arranged to be deployed by the force of the explosion, substantially as set forth.

2. The inclosure A, formed with the chimney B, having an image, *f*, placed therein, and provided with the spring *g*, for holding the image at the top of the chimney, substantially as described.

3. The door C of the inclosure A, formed or provided with the

296,941.

socket *a*, for holding a fire-cracker, substantially as and for the purposes set forth.

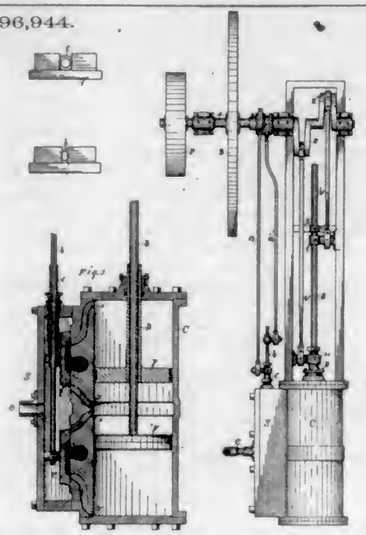


296,942. WRENCH. JAMES DU SHANE, South Bend, Ind. Filed Nov. 30, 1883. (No model.)

Claim.—1. In a nut or pipe wrench, the combination, with the rack-bar, of the fixed jaw, the movable-jaw frame, the screw therein, and a threaded nut on this screw having a groove in its periphery, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. The combination, with the rack-bar, of the fixed jaw, the movable-jaw frame, the adjusting-screw having its bearings therein, the nut on this screw, and the collar G, adjustably fixed thereon, substantially as and for the purposes described.

296,943. CARRIAGE-BODY. GEORGE A. ELLIS, Gardner, Mass., assignor to Henry Heywood, George Heywood, Alvin M. Greenwood, and Amos Merrill, same place. Filed June 18, 1883. (No model.)



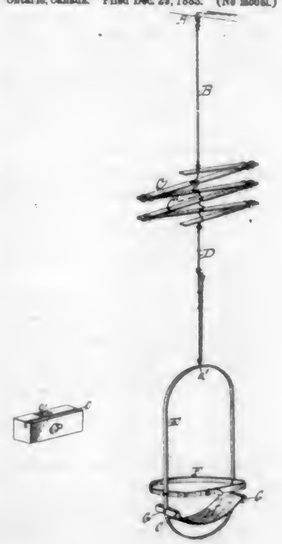
Claim.—1. In a carriage-body, the side consisting of the wooden frame composed of the upright posts *a*, *b*, and *c* and the cross-pieces *d*, connecting said uprights, combined with panels of woven cane or similar material united with said frame in substantially the manner and for the purpose described.

2. A carriage-body having its sides composed of the upright posts *a*, *b*, and *c*, cross-pieces *d*, connecting said uprights and constituting frames, panels of woven cane or similar material united to said frame, the usual interior upholstering, and board foundations interposed between said upholstering and panels, and to which the upholstering is secured, substantially as set forth.

296,944. BALANCED STEAM-ENGINE. BENJAMIN FIELD, Dalley, Mich. Filed Aug. 18, 1883. (No model.)

Claim.—In a steam-engine, the combination, with a cylinder and steam-chest, each having two intermediate and two end induct-ports, two exhaust-ports, and slide-valves *r t*, of two cut-off-valve rods, one playing through the other, connected by independent eccentrics to the shaft A, two piston-rods which are adapted to play one through the other, having piston-heads F F′ and connecting-rods e e′, the cranks E E′, as specified, and the shaft A, the whole arranged substantially as set forth.

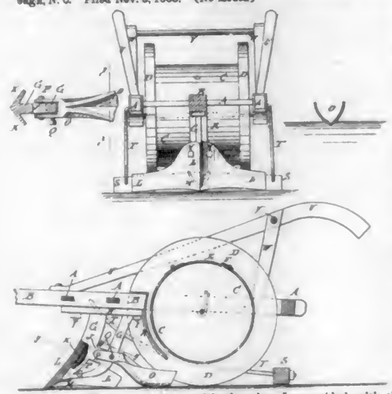
296,944.



296,945. FOUNTAIN ATTACHMENT FOR MARKING-BRUSHES. PETER C. FORRESTER, Leavenworth, KANS. Filed Aug. 20, 1883. (No model.)

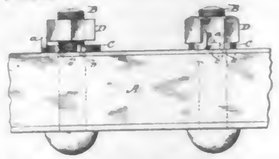
Claim.—An elastic bulb, A, provided with end necks, B B′, and a vent, E, in the neck B, extending from the enlargement in the bulb to the lower part of said neck, said bulb being adapted to be passed over any ordinary brush-handle, substantially as shown and described.

296,946. BABY-JUMPER. CHARLES TOWNSEND GARDNER, Napanee, Ontario, Canada. Filed Dec. 29, 1883. (No model.)



Claim.—1. A baby-jumper consisting of an oval seat-frame formed from a single blank, slotted cleats, and a confining hoop or band secured to the frame, a yielding seat the ends of which are fastened in the slots of the cleats, and means for suspending said frame and its attachments, substantially as shown and described.

2. In a baby-jumper, a spring formed by uniting the ends of a series of suitable blanks or staves, substantially as shown, in combination with a safety-cord passed through perforations in the intermediate staves, and its ends secured to the upper and lower plates of the springs, and detachably connected to suspension-cords, as and for the purpose specified.

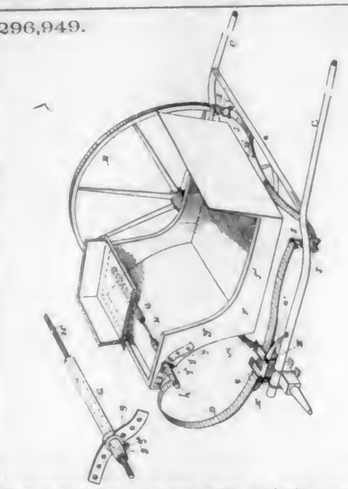


3. In combination, the spring C, having means to suspend it from a support, and provided with an independent safety-cord, C', adjusting-cord D, a seat-frame, E, having a confining hoop or band, F, and slotted cleats G, secured thereto, and a seat H, the ends of which are fastened in the slots of the cleats, substantially as shown and described.

296,947. COTTON-PLANTER. WILLIAM THOMAS GARDNER, Tarboro, N. C. Filed Nov. 8, 1883. (No model.)

Claim.—The combination, with the plow L, provided with the socket M, and the adjustable pivoted channel-opener O, of the standard G, provided with the side wings, K, and made in two parts, united in a point at their lower ends, connected at their upper ends by the plate H, and provided at their middle parts by a web, J, substantially as shown and described.

296,948. NUT-LOCK. JOHN GILSOUR, Columbus, Ind. Filed Dec. 20, 1883. (No model.)



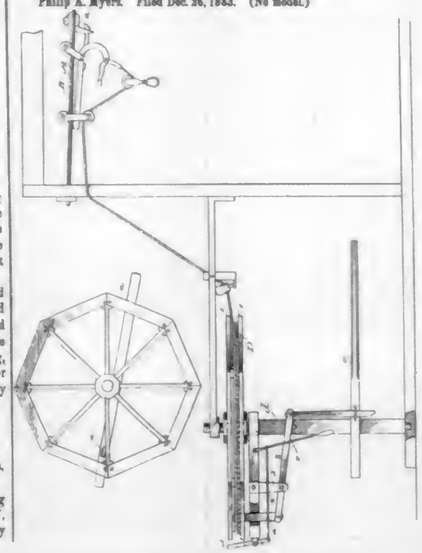
Claim.—1. As a new article of manufacture, a washer for locking nuts upon bolts, having the projections *b b'* formed on one side of the same, and an upturned end, *a*, the diameter of the washer being enough larger than the diameter of the bolt to permit the upturned end to be bent into or out of the path of the nut by bending the washer at a point between its upturned end and the projection *b'*.

2. A device for locking nuts, consisting of an open ring, one end of which projects outward and apart from the other, so that its upturned end is in a circumference of longer radius than that in which the inner end lies, and having on its under side two or more projections, whereby the nut may be screwed to place without striking the outer end of the ring, and may force the projections into the underlying surface, and the outer end may then be bent inward against the side of the nut, substantially as and for the purpose stated.

296,949. TWO-WHEELED VEHICLE. WILLIAM T. GOODMAN, Fulton, Cal. Filed Jan. 14, 1884. (No model.)

Claim.—1. In a two-wheeled vehicle, the side springs, D, having upwardly and forwardly curved rear ends, and the front cross-spring, D', connected with the side springs by links, in combination with the body

296,949.



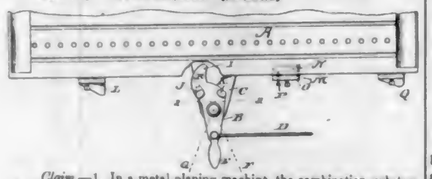
F, supported in front on the cross-spring, and having a cross-shaft, H, loosely mounted or journaled through its rear or seat portion, said shaft having its projecting ends journaled in rear curved ends of the side springs, substantially as herein described.

2. In a two-wheeled vehicle, the side springs, D, having curved rear ends, and front cross-spring, D', in combination with the body F, having pipe G through its seat portion, and the transverse pivot-shaft H, on the ends of which the curved rear ends of the side springs are pivoted, substantially as herein described.

3. In a two-wheeled vehicle, the side springs, D, having the links I pivoted in their forward ends, said links having the small bottom loops, *i*, in combination with the front cross-spring, D', having in its ends the pivoted links J, passing through the small loops *i*, substantially as and for the purpose herein described.

4. In a two-wheeled vehicle, the axle A and shafts C, clipped thereto, in combination with the springs D, the clips E, securing them to the axle, and the yoke *e*, having arm *e'*, secured to the shafts, substantially as and for the purpose herein described.

296,950. ELEVATOR-POWER FOR HAY-CARRIERS. JOHN S. GRAHILL, Hayesville, Ohio, assignor of two-thirds to Francis E. Myers and Philip A. Myers. Filed Dec. 26, 1883. (No model.)

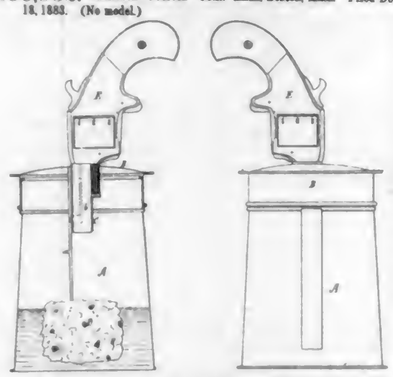


Claim.—1. In combination with a hay-carrier and track of substantially the class described, a winding drum or wheel loose on its shaft, an ordinary horse-power mechanism within reach of the driver, for connecting or disconnecting at will the wheel and horse-power shaft, and a hoisting-rope of the carrier connected to the wheel, all substantially as described.

2. The combination of the track, the carrier and rope, and the wheel or drum loose on its shaft *d*, a pole for the horse, and mechanism for connecting or disconnecting the wheel and shaft within reach of the driver, all substantially as described.

3. In combination with an elevated carrier, a vertical shaft, a wheel loosely attached to its upper end, means for connecting the draft-animal to the shaft, devices for connecting or disconnecting shaft and wheel, and a rope to the carrier, adapted to be wound on the wheel, whereby the rope is kept out of the way of the animal, all substantially as described.

296,951. METAL-PLANING MACHINE. GEORGE A. GRAY, Jr., Covington, Ky. Filed Oct. 22, 1883. (No model.)

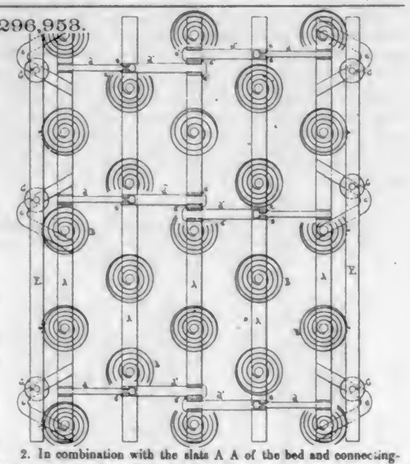


Claim.—1. In a metal-planing machine, the combination, substantially as set forth, of a reversing-tumbler, a front dog adjustable along the table, and adapted to throw the tumbler into position to give the table a backing motion, a suppressible back dog adjustable along the table, and adapted to throw the tumbler into position to give the table a forward motion, and a stop-dog adapted to throw the tumbler into a neutral position.

2. In a metal-planing machine, the combination, substantially as set forth, of a reversing-tumbler, a front dog, a suppressible back dog, and a stop-dog adjustable along the table.

3. In a metal-planing machine, the combination, substantially as set forth, of a reversing-tumbler, a front dog, a suppressible back dog, and a stop-dog fitted to throw the tumbler and start the forward table motion, and upon its retreat to throw the tumbler to a neutral point.

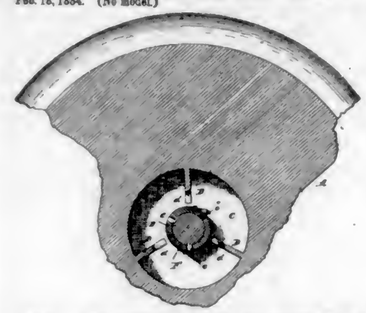
296,952. SIGNAL-TORCH. JOHN HALL, Boston, Mass. Filed Dec. 18, 1883. (No model.)



Claim.—1. The combination of the pot or can and its cover with the torch and pistol or fire-arm adapted to such cover, so as to operate substantially and for the purpose as set forth.

2. The combination of the can or pot and its cover with the torch and the pistol-barrel socket or receiving-tube adapted to such cover, essentially as represented.

296,953. SPRING BED-BOTTOM. BENJAMIN A. HAM, Boston, Mass. Filed Sept. 15, 1883. (No model.)



Claim.—1. The slats A A and the springs B, in combination with the cross-bars *d d'* and clips *e e'*, attached to the slats, substantially as described, whereby the bars may slide at right angles to the slats in the clips *e e'*, substantially as set forth.

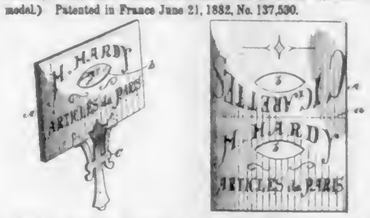
296,953.

2. In combination with the slats A A of the bed and connecting-bars, supported springs B, the bracket-pieces *e e*, the top side slat, E, and the auxiliary spring C, placed directly beneath said top slat and upon the bracket-pieces *e e*, substantially as described.

296,954. CAR-WHEEL. MAHLON HAMLIN, Catawissa, Pa. Filed Feb. 18, 1884. (No model.)

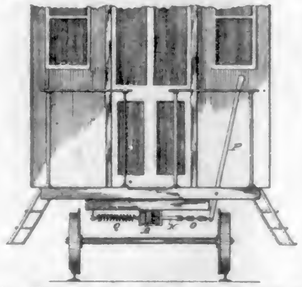
Claim.—1. The chamber C in a car-wheel, surrounding the eye of the same and provided with the slotted flanges D D, integral with the wheel, in combination with the perforated steel casing in the eye, substantially as and for the purpose set forth.

2. The oil-chamber C and flanges D D, as constructed, in combination with the perforated steel casing F, and the pins O O, playing in the perforations of same, substantially as and for the purpose set forth.



296,955. NON-HEAT-CONDUCTING VESSEL. HIRAM M. HANMORE, White Plains, N. Y. Filed Mar. 4, 1884. (No model.)

Claim.—1. The combination, with a vessel for containing liquid or solid substances, of a non-conducting covering of raw-silk waste and calcined or carbonate of magnesia, and a surrounding jacket, substantially as herein described.

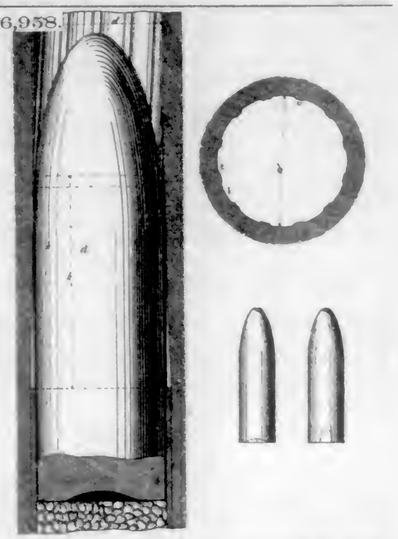


2. The combination, with a vessel for containing liquid or solid substances, of a covering of raw-silk waste wrapped around the vessel, a coating of calcined or carbonate of magnesia applied to the raw-silk waste, a superposed layer of paper, a layer of felt applied outside the paper, a second layer of paper outside the felt, and an inclosing-case, the whole forming a non-conducting protection, substantially as and for the purpose herein described.

296,956. ADVERTISING MUSICAL INSTRUMENT. HIPPOLYTE HARDY, Paris, France. Filed Dec. 6, 1882. Renewed Feb. 18, 1884. (No model.) Patented in France June 21, 1882, No. 137,530.

Claim.—The folded advertising-card A, provided with openings *b*, in combination with the intermediate reed or diaphragm sheet, B, and removable clip or handle C, as herein shown and described.

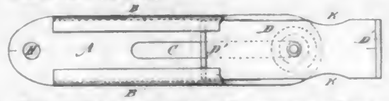
296,957. CAR-COUPLING. CHARLES L. HATHAWAY, Austin, Tex. Filed Feb. 23, 1884. (No model.)



Claim.—The combination of the draw-head forming the shoulder having the spring-bolt, the lever pivoted to the same, the connecting-rod, and the lever and rectangular bail, with the sliding bar fitting with its eyed inner end upon the curved inner end of the lever, having a lug or enlargement upon its inner end sliding in a slot in the side of the draw-head, and having means for pulling it out to the side, as and for the purpose shown and set forth.

296,958. BARREL FOR FIRE-ARMS. WILLIAM HEBLER, Zurich, Switzerland. Filed Jan. 11, 1883. (No model.) Patented in Italy Dec. 27, 1882, No. 14,898; in Belgium Dec. 30, 1882, No. 59,888; in Sweden Mar. 13, 1883; in France Mar. 30, 1883, No. 152,669; in Spain May 6, 1883, No. 3,747, and in England July 3, 1883, No. 333.

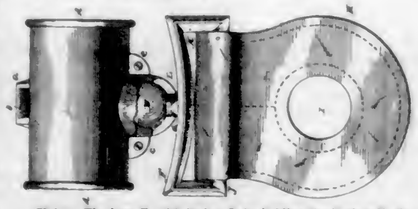
Claim.—1. The rifle-barrel having broad shallow grooves and narrow lands, the surfaces of which lands and the bottoms of which grooves are in arcs of concentric circles, the said lands and grooves being connected by curved or rounded portions, and having a pitch of one turn in from fifteen to forty centimeters, and also having a slightly conoidal portion connecting the rifled portion of the barrel with the bullet-seat, as set forth.



296,958.

2. A rifled gun-barrel provided with a bullet-seat of slightly conoidal form, adapted to receive a projectile or bullet, the diameter of which bullet, including its envelope or wrapper, is greater than the diameter of the bore of the barrel taken in the grooves, whereby, as the cartridge is fired, the bullet is engaged by the lands, and the space in the barrel behind the bullet is rendered gas-tight, as set forth.

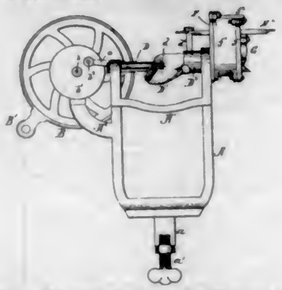
296,959. LABEL-HOLDER FOR MAIL-BAGS. FRANK LOUIS HEROLD, Terryville, Conn., assignor to the Eagle Lock Company, same place. Filed Mar. 12, 1884. (No model.)



Claim.—1. In a tag or label holder, the combination, with the strip A, having grooved flanges B, and a longitudinal slot, C, of the slide D and the pintle F, substantially as herein shown and described.

2. In a tag or label holder, the combination, with the strip A, having grooved flanges B, and a longitudinal slot, C, of the slide D, the pintle F, and the spring-washer E, substantially as herein shown and described.

3. In a tag or label holder, the combination, with the strip A, having grooved flanges B, and a longitudinal slot, C, of the slide D, having upturned ends D', substantially as herein shown and described.



4. In a tag or label holder, the combination, with the strip A, of the slide D, having notches K in the side edges at one end, substantially as herein shown and described.

296,960. NECK-YOKE. NICHOLAS HIATT, Independence, Kans. Filed Dec. 20, 1883. (No model.)

Claim.—The loop F, with its bar J, for holding the leather H, the neck *e*, and the ball D, all cast in one piece, in combination with the divided sleeve provided with a shell in which is a globe-shaped socket to receive and retain the ball D, substantially as and for the purpose set forth.

296,961. CHERRY-SEEDER. WILLIAM F. HIBNER, Baltimore, Md., assignor to the Scott Manufacturing Company of Baltimore City. Filed Nov. 15, 1883. (Model.)

Claim.—1. The combination of the tube D^2, having its forward end cut diagonally, plate H, and tube A, arranged therein, box G, plate I, and tube *i*, attached to the front of said box, and means, substantially as described, for reciprocating the tube D^2 and its connections, as set forth.

2. The combination, with the main frame A, of the rod D, trough D', and tube D^2, attached together, means for reciprocating them in said frame, box G, having perforated top, and plate E, attached to the tube D^2 and having a perforation therein, and arranged to reciprocate therein and act as a trap for the cherries, as set forth.

3. In combination, box G, having perforated top, tube D^2, having tube *h* secured therein, tube *i*, attached to the front of box G in line with tube A, standard *d'*, plate E, attached to said standard, and means, substantially as described, for reciprocating tube D^2 and plate E simultaneously, as set forth.

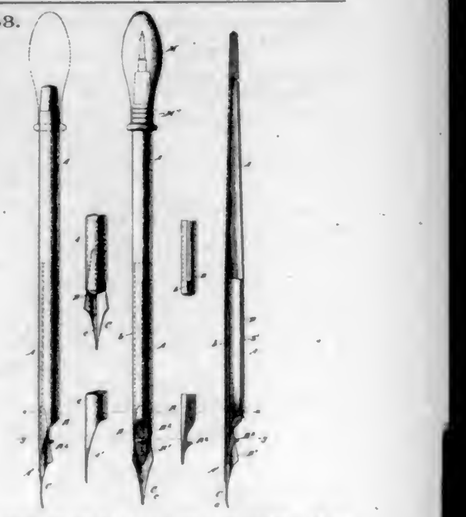
296,962. SPINDLE-BOLSTER FOR SPINNING-MACHINES. ADDISON S. HOPKINS, Pascoag, R. I. Filed May 31, 1883. (No model.)

Brief.—The bolster-case is provided in its upper end with a conical shoulder. The bolster is provided with a conical flange which is adapted to fit loosely upon the said shoulder, and is also provided below its bearing-surface with a slot for engagement with a pin to prevent its rotation, said construction permitting partial axial and vertical movement of the bolster within the case.

Claim.—The bolster-case A, having a socket for the reception of the bolster, and provided in its upper end with a conical shoulder and a pin, M, in combination with the bolster E, having a projecting flange formed with a conical shoulder on its upper side adapted to fit loosely and be supported upon the conical shoulder in the bolster-case, and provided below its bearing-surface with a slot, *d*, for engagement with the pin M, as and for the purpose set forth.

296,963. FOUNTAIN-PEN. JAMES P. HOTT, Newtown, Conn. Filed Feb. 23, 1884. (No model.)

Claim.—1. The hollow casing A, having the upper end tightly closed and the lower end nearly closed, to form a holding-seat for a separate pen, as C, with a point, A', properly formed to constitute a writing-point integral with the body of the case A, whereby the said casing may be used as a pen, or as a holder for a separate pen, or both simultaneously, as herein specified.



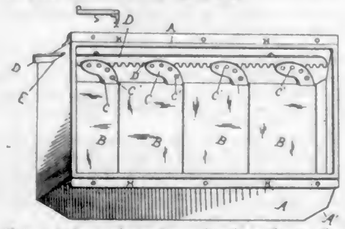
2. The casing A, adapted to perform the double functions of a pen-handle and ink-reservoir, in combination with a suitable writing-point at the lower end, with an elastic bulb, M, at the upper end, and with a separate pen, as C, all arranged for joint operation, as herein specified.

3. The inner case or feeder, B, having the split *b*, in combination with the outer casing, A, having a tightly-closed upper end, arranged for joint operation, as herein specified.

4. The inner case or feeder, B, having a point, B', and a projection, B^3, the outer case, A, having a point, A', and means for tightly closing the upper end, combined and arranged for joint operation, as herein specified.

5. In a fountain-pen, the outer case, A, and inner case or feeder, B, combined as shown to present a thin annular aperture between them, in combination with a coating of wax or analogous water-repelling material applied on one of the surfaces, substantially as herein specified.

296,968.



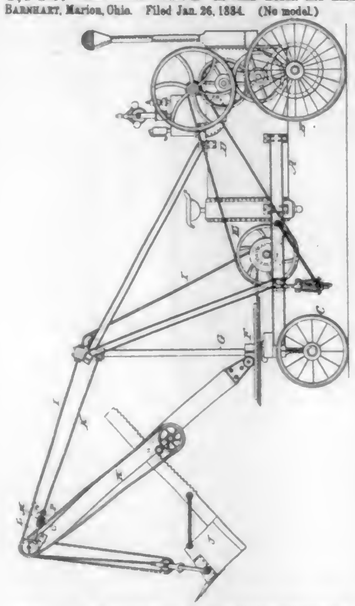
6. A fountain-pen case in two parts—one within the other—the inner part, B, having a projection, B^3, and being removable and adjustable by sliding within the other, substantially as herein specified.

7. In a fountain-pen, the elastic bulb M, in combination with the outer case, A, and adjustable inner case or feeder, B, the device being arranged to allow the slow escape of the ink, as herein specified.

8. A fountain-pen having two concentric casings, A and B, one of which is equipped with a pen-point, A', integral therewith, arranged as shown, so as to serve at will, either as a pen itself or as a holder to receive a separate pen, C, and to supply ink properly under either condition, as herein specified.

296,964. LOCOMOTIVE ASH-PAN. JOSEPH W. HOYT and JOHN WESTLEY TWIGGS, Jackson, Mich., assignors of one-third to Derrick O. Dyer, same place. Filed Dec. 6, 1883. (No model.)

Claim.—1. In an ash-pan, the combination of the pan, the pivoted bottom slats or sections provided with a rack curved on an arc struck from their pivots, and the rack-bar suitably supported in position to engage said curved racks and movable longitudinally, substantially as set forth.



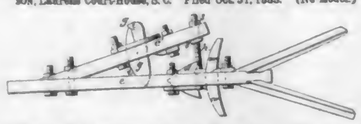
2. In an ash-pan, the combination, with the pan and the pivoted bottom slats or sections provided with a plate projected vertically from one end, of the rack-teeth projected laterally from the said plate below its upper edge and arranged in the arc of a circle, and the rack bar suitably supported in position to engage the rack-teeth, substantially as and for the purposes specified.

3. In a locomotive ash-pan, the herein-described slats or sections pivoted in the pan, and having the forward and rear edges beveled rearwardly from their upper to their lower sides, said bevels being formed in similar angles on the opposite edges, whereby the slats may be reversed and extended the full length of said slats, substantially as described, whereby the joint between the adjacent slats is formed in a continuous inclined plane, substantially as and for the purposes specified.

4. The ash-pan, substantially as hereinbefore described, composed of the pan having a slot formed in one side, the slats pivoted in the pan and provided with curved racks, the rack-bar secured within the pan and meshed with the curved racks, the pin or stud having one end secured to the rack-bar and its opposite end projected through the slot F,

and the link arranged outside the pan and secured to the pin or stud, substantially as and for the purposes set forth.

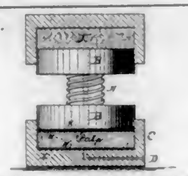
296,965. TRAVELING CRANE. EDWARD HUBER and HENRY M. BARNHART, Marion, Ohio. Filed Jan. 26, 1884. (No model.)



Claim.—1. The combination of the traction-engine truck having the boiler, windlass, and the engine, the mast secured upon the turn-table operated by the windlass, the crane-beam secured at its lower end upon the turn-table, a brace-chain extending from the upper end of the mast, and a bail secured to the outer end of the crane-beam, and having a spring-cushioned rod secured to the outer end of the brace-chain, as and for the purpose shown and set forth.

2. The combination of the upright mast of a crane, the crane-beam, a brace-chain secured to the upper end of the mast, a bail secured to the upper end of the crane-beam and forming a box for the reception of a spring-cushion, and a rod secured to the end of the brace-chain, and bearing with its enlarged end against the outer end of the spring, as and for the purpose shown and set forth.

3. The combination of a bail secured to a crane-beam and forming a box at its middle, having its rear end closed and perforated, a spring bearing with its rear end against the closed end of the box, and a rod attached to the end of a brace-chain sliding in the perforated end of the box, and bearing with its enlarged outer end against the outer end of the spring, as and for the purpose shown and set forth.

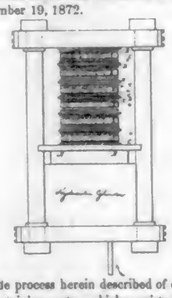


296,966. SHOVEL-PLOW. ROBERT H. HUDGINS and HENRY R. ALLISON, Laurens Court-House, S. C. Filed Oct. 31, 1883. (No model.)

Claim.—The combination, in a cultivator-plow, with the main beam *c*, angularly-placed adjustable beam *c'*, and bracing-standards *a b* of the shovel *d*, the bow-scraper *w*, secured upon the rear standard, as described, and scraper *g m*, having side and bottom cutting-flanges, *i i*, secured to the forward standard, all constructed and arranged substantially as shown, and for the purpose described.

296,967. ART OF MANUFACTURING CELLULOID AND OTHER COMPOUNDS OF PYROXYLINE. JOHN W. HYATT, Newark, N. J., assignor to the Celluloid Manufacturing Company, New York, N. Y. Filed Feb. 11, 1884. (No model.)

296,967.



Claim.—1. The process herein described of removing aqueous particles from pyroxyline pulp, which consists in effecting the displacement of the aqueous particles by means of pressure applied to a suitable liquid, whereby the aqueous particles are caused to leave the pulp, their places being occupied by the unobjectionable liquid particles, substantially as set forth.

2. The process herein described of removing aqueous particles from pyroxyline pulp and loading the pulp with alcohol or other suitable liquid, which consists in subjecting the pulp containing the aqueous particles to pressure, in connection with the alcohol or other suitable liquid, a means of escape for the aqueous particles being provided, whereby the particles of alcohol or other suitable liquid are made to take the place of the aqueous particles, substantially as set forth.

3. The process herein described of treating pyroxyline pulp, which consists in effecting the displacement of the aqueous particles by means of a liquid which can afterward be utilized as a solvent, substantially as described.

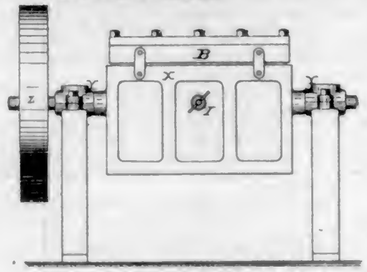
296,968. PROCESS OF AND APPARATUS FOR EFFECTING THE DESICCATION OF PYROXYLINE PULP. JOHN W. HYATT, WILLIAM H. WOOD, and JOHN H. STEVENS, Newark, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. Filed Feb 11, 1884. (No model.)

Brief.—Improvement on the invention in Letters Patent No. 133,229, dated November 19, 1872.

Claim.—1. The process herein described of effecting the desiccation of pyroxyline containing water, which consists in, first, subjecting it, with an absorbing agent, to great pressure in a press, whereby a large percentage of the aqueous particles are expelled; and, second, removing the moisture that remains by subsequent treatment of an analogous character or otherwise, substantially as set forth.

2. The process of effecting the desiccation of pyroxyline pulp containing water herein described, which consists in, first, forming the pulp into a cake; second, subjecting the cake to great pressure in contact with a surface of bibulous material, whereby a large percentage of the aqueous particles is removed; and, third, completing the desiccation by subjecting the partly-desiccated material to the action of a surface of dried bibulous material or otherwise, substantially as set forth.

3. The process herein described of effecting the desiccation of pyroxyline containing water, which consists in forming a pile composed of a series of layers of pyroxyline, bibulous material, and plates B, and subjecting the pile thus formed to pressure, substantially as set forth.



4. The process herein described of effecting the desiccation of pyroxyline containing water, which consists in forming a pile composed of a series of layers of pyroxyline, bibulous material, and plate B, and subjecting the pile thus formed to pressure, and then subjecting the pyroxyline to further treatment by means of dry bibulous material, or otherwise, to free it from the moisture which remains, substantially as set forth.

5. The process herein described of effecting the desiccation of pyroxyline containing water, which consists in forming a pile composed of a series of layers of pyroxyline, pads of blotting-paper, and plates B, and subjecting the pile thus formed to pressure, substantially as set forth.

6. The process herein described of effecting the desiccation of pyroxyline containing water, which consists in forming a pile composed of a series of layers of pyroxyline, blotting-paper, and plate B, and subjecting the pile thus formed to pressure, and then subjecting the pyroxyline to further treatment by means of dry bibulous material, or otherwise, to free it from the moisture which remains, substantially as set forth.

7. The process herein described of effecting the desiccation of pyroxyline, which consists in, first, subjecting it with an absorbing agent to great pressure in a press, the pressure being continued for a given time; and, second, effecting the removal of the moisture which remains by subsequent treatment with a dry absorbing agent or otherwise, substantially as set forth.

296,969. MANUFACTURE OF PYROXYLINE MATERIAL. JOHN W. HYATT, JOHN H. STEVENS, WILLIAM H. WOOD, and JOHN EVERDING, Newark, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. Filed Mar. 22, 1884. (No model.)

Claim.—1. The process herein described of effecting the impregnation of pyroxyline material with liquid solvents, which consists in, first, forming it into cakes or plates; second, placing it in a suitable vessel; third, introducing the liquid solvent, and, fourth, agitating the liquid solvent by rotating the vessel or otherwise, whereby the solvent is caused to pass over the surface of the cakes or plates until they are impregnated, substantially as described.

2. The process hereinbefore described of impregnating cakes of pyroxyline with liquid solvents, which consists in causing the passage of the solvents over the surfaces of the cakes while said cakes are held apart until they have absorbed a sufficient amount of the solvents.

3. The process hereinbefore described of treating pyroxyline material, which consists, first, in forming it into cakes or plates; second, causing liquid solvents to flow over the cakes until a sufficient amount has been absorbed while the cakes are held apart, and, third, then allowing the material to remain in an air-tight case for a proper length of time.

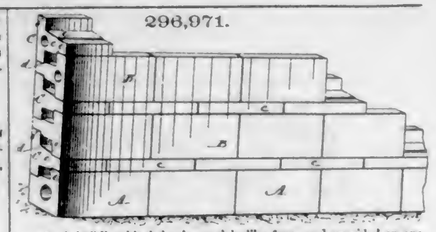
4. The apparatus hereinbefore described, consisting of a receptacle of suitable dimensions to receive the cakes of material, and provided with an inlet for the liquid solvents, and means for retaining the cakes apart during the agitation of the receptacle.

5. The receptacle for receiving the cakes of pyroxyline, provided with the detachable rods R R, the bars P P, carrying pins, the strips M and S, substantially as set forth.

6. The receptacle provided with the bars P P, carrying pins, the detachable rods R R, strips S S and M M, and the inlet-aperture having a compression-plug, substantially as set forth.

296,970. MANUFACTURE OF CELLULOID AND OTHER COMPOUNDS OF PYROXYLINE. JOHN W. HYATT, JOHN H. STEVENS, and WILLIAM H. WOOD, Newark, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. Filed Mar. 22, 1884. (No specimens.)

Claim.—1. A process in which pyroxyline is first ground to a pulp, then pressed into cakes and dried, and the said cakes softened with the required amount of liquid solvent by being formed into a pile with the solvent between the cakes, and then mixed or masticated in heated rolls or other suitable apparatus.

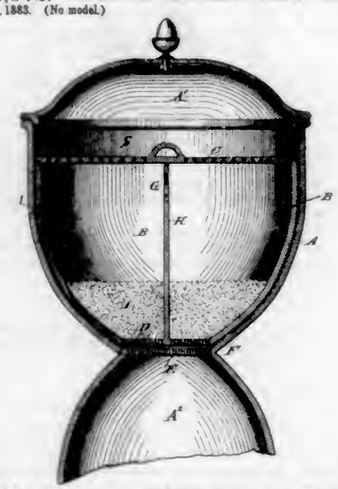


2. A process in which pyroxyline is first ground to a pulp, then formed into cakes and dried, and the cakes softened with a liquid solvent by being formed into a pile, the solvents being held between the cakes by means of suitable pads, the material being afterward mixed or masticated in heated rolls or other suitable apparatus, substantially as described.

3. A process in which pyroxyline is first ground to a pulp and pressed into cakes and dried, the proper amount of liquid solvent introduced by spreading the solvent in a viscid condition between the cakes, and the whole then mixed or masticated in heated rolls or other suitable apparatus, substantially as described.

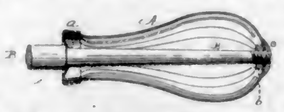
296,971. BLOCK FOR BUILDING PURPOSES. THOMAS L. JOWETT, Boston, Mass. Filed May 23, 1883. (Model.)

Claim.—1. An improved building-block having a slab-like form, and provided with a rib or tongue on one of its longitudinal sides, the rib or tongue being of a length equal to the thickness of the block, substantially as herein shown and described.



296,971.

2. A building-block having a slab-like form, and provided on one of its longitudinal sides with a tongue or rib having shoulders *c* on opposite sides, substantially as herein shown and described.

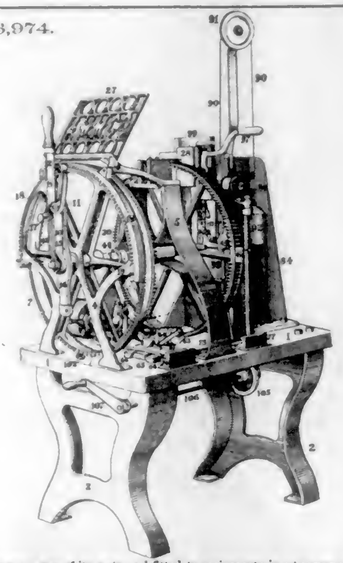


3. In a wall, floor, or other like structure, the combination of a series of slab-like blocks provided with longitudinal tongues having shoulders on opposite sides, the shoulders being at a distance from the edge of the tongues equal to the thickness of the block, substantially as herein shown and described, whereby passages between the blocks will be formed.

296,972. WATER-FILTER. EMILE KARST, St. Louis, Mo. Filed Nov. 2, 1883. (No model.)

Claim.—The combination of the outside vessel or receptacle having a neck or contracted part provided with the fixed foraminated plate E, and the removable inside vessel, B, provided with the perforated cover C, foraminated bottom plate, D, and central partition, H, having hand-hole G, substantially as and for the purpose shown and set forth.

296,973. BICYCLE-HANDLE. GEORGE SEELEY KELSEY, Birmingham, County of Warwick, England, assignor to Benjamin Kelsey, same place. Filed Nov. 26, 1883. (No model.) Patented in England Sept. 4, 1882, No. 4,200.



Claim.—The combination, with the hollow longitudinally-slotted handle A and the guiding-bar B of a bicycle, of the internal nut, *b*, and external convex nut, *c*, arranged and constructed substantially as and for the purpose above described.

296,974. MACHINE FOR MAKING MATRICES. ROBERT L. KIMBERLY, Philadelphia, Pa., assignor to the American Matrix Machine Company, New York, N. Y. Filed Aug. 3, 1882. (No model.)

Claim.—1. The combination, substantially as set forth, of a type or die carrying wheel, a series of die-stocks, each having a type or charac-

296,974.

ter die upon one of its ends, and fitted to reciprocate in a bearing in said wheel, a stationary index or guide, and mechanism for arresting and securing the type or die wheel in such position that any desired die of the series shall be brought into a position which is indicated and determined by the index.

2. The combination, substantially as set forth, of a type or die carrying wheel secured upon a shaft, a series of type or character dies fitted to reciprocate in said wheel, an operating arm or lever provided with a pin or projection, and coupled by a detachable connection to the shaft of said wheel, and a stationary index or guide segment having a series of openings or recesses, each adapted to receive said pin, these members being combined for joint operation to enable any die of the series to be selected, brought into determined position, and the further movement of the die-wheel arrested.

3. The combination, substantially as set forth, of a type or die carrying wheel secured upon a shaft, an operating arm or lever coupled detachably to said shaft, a pair of arms secured to and projecting in opposite directions from said shaft, and a pin by which the operating-lever may be coupled to either of said arms, these members being combined for joint operation to enable either half of the type-wheel to be rocked, as desired, by the movements of the operating-lever within a semicircle on a determined side of its center.

4. The combination, substantially as set forth, of a type or die carrying wheel secured upon a shaft, a collar adapted to be reciprocated on said shaft by the operating-arm thereof, a counter-shaft for the reception of driving-power from a prime mover, a driving-shaft connected by a clutch-coupling with said counter-shaft, so as to be capable of being rocked intermittently thereby, tripping mechanism for engaging and disengaging the counter and driving shafts, and a rock-shaft connected with said tripping mechanism and rocked by the movement of the collar on the type or die wheel shaft, these members being combined for joint operation to admit of a single revolution being imparted to the driving-shaft by a movement of the operating-arm and collar.

5. The yielding pressure plate or shield, substantially as and for the purpose set forth.

6. The combination, substantially as set forth, of a die-stock having a type or character die upon one of its ends, and a pressure plate or shield interposed between a shoulder on the die-stock and a matrix block or bed, for the purpose of distributing the impressing force over a uniform enlarged area.

7. The combination, substantially as set forth, of a die-stock having a type or character die upon one of its ends, a reciprocating plunger acting to effect impressions of said die in a matrix-block, and a movable pressure plate or shield interposed between a shoulder on the die-stock and the face of the die.

8. The combination, substantially as set forth, of a feed-regulating wheel having a series of stops or projections of different lengths located circumferentially upon it, an operating arm or lever for the purpose of rotating said wheel either partially or entirely, as desired, and a sliding abutment, the travel of which is regulated by the length of the projection selected by the movement of the operating-arm and feed-wheel.

9. The combination, substantially as set forth, of a feed-regulating wheel and a type or die wheel, both secured to a shaft which is susceptible of either entire or partial rotation, an operating arm or lever connected to said shaft, and a stationary index or guide segment, with which said operating-arm is adapted to be engaged at different points.

10. The combination, substantially as set forth, of a feed-regulating wheel having a series of stops or projections of varying lengths secured thereto, a reciprocating block adapted to abut against any one of said series of stops, and feed mechanism connected with said reciprocating block, these members being combined for joint operation to enable varying degrees of traverse dependent on the lengths of the several stops to be imparted by the feed mechanism.

11. The combination, substantially as set forth, of a driving-shaft, a block reciprocated thereby, and a double-armed vibrating lever pivoted upon said block and adapted to receive and impart varying degrees of traverse to feed mechanism.

12. The combination, substantially as set forth, of a series of stops of varying lengths, a double-armed lever pivoted upon a reciprocating block or slide, and having a toothed segment upon each of its ends, a rack formed upon a block adapted to abut against any one of said series of stops, and engaging one of the toothed segments of the double-armed lever, and a rack engaging the other segment thereof and imparting rotation to a feed-shaft.

13. The combination, substantially as set forth, of a feed-regulating wheel having a circumferential series of stops or projections, a reciprocating block adapted to abut against said stops, and a bearing or abutment to prevent displacement of the feed-regulating wheel by the impingement of said block against said stops.

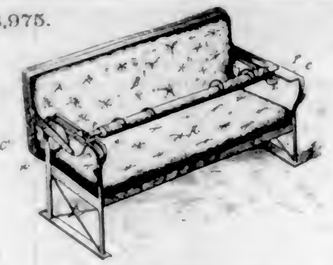
14. The combination, substantially as set forth, of a matrix-block holder having a series of teeth upon one of its sides, an adjustable clamping-jaw having a slide working in said holder, and an arm pivoted to said jaw, and having a series of teeth adapted to engage the teeth of the matrix-block holder.

15. The combination, substantially as set forth, of a carrier fitting in guides on a head or frame, and having an inclined side, a matrix-block holder supported and movable within said carrier at right angles to the guides thereof, a key having one of its sides inclined correspondingly with the inclined side of the carrier, and suspended so as to be elevated by a weight or spring, and a reciprocating plunger acting upon the straight side of the key, these members being combined for joint operation to effect the advancement, intermittently, of the carrier throughout the length of its guides by the successive alternate movements of the plunger in one direction.

16. The combination, substantially as set forth, of a matrix-block holder supported in a laterally-moving carrier, a vertically and laterally moving key acting to transmit successive movements of a plunger to said carrier, and a retracting-shaft having pulleys secured by flexible connections to the carrier and to the key, respectively.

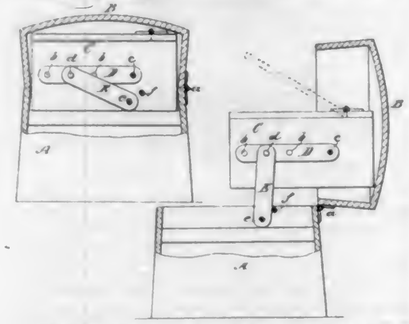
17. The combination, substantially as set forth, of a carrier, a matrix-block holder fitted to move vertically therein, pawl-and-ratchet mechanism for imparting intermittent vertical movement to the holder within the carrier, an independent retaining-pawl and ratchet for maintaining the holder in position during the intervals between its movements in the carrier, and a releasing device for throwing the several pawls out of contact with their ratchets, to admit of the return of the matrix-block holder to its initial position at the termination of its traverse in the carrier.

18. The combination, substantially as set forth, of a matrix-block holder, a sliding head carrying said holder, a stationary frame or abutment, and a spring interposed between said abutment and the sliding head, for regulating the position of the matrix-block relatively to the face of an impressing-die.



19. The combination, substantially as set forth, of a stationary frame or standard, a head or frame fitted to slide in guides on said standard, a carrier supporting a matrix-block holder and adapted to traverse in guides on one end of said head or frame, a spring bearing against the opposite end of said head and against an abutment on the stationary frame or standard, and a locking-shaft and screw to secure said head in the position into which it may be moved by the tension of the spring.

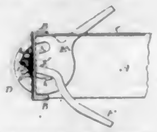
296,975. SAFETY-BRACE FOR CAR-SEATS. WILLIAM R. LAMPTON, Terre Haute, Ind. Filed Jan. 11, 1884. (No model.)



Claim.—1. The combination, with a frame of a car-seat having arm-rests, one of which is slotted, of a block fitted in said slotted arm and adjustable therein, and the bar swiveled and hinged at one end to said block, and the other end engaging with the opposite arm-rest, substantially as shown and described.

2. In a car-seat, the combination, with the frame thereof having arm-rests, one of which is slotted, of the block fitted in said slotted arm-rest and adjustable therein, and the safety-brace hinged and swiveled at one end to said block, and provided at its other end with means, substantially as shown, for retaining the same in any desired position on the arm-rest, as and for the purpose described.

296,975.

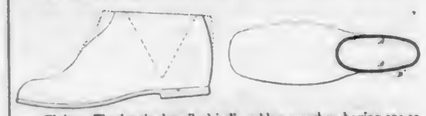


296,976. TRUNK. WILLIAM J. LARKE, Brooklyn, N. Y. Filed Jan. 11, 1884. (No model.)

Claim.—1. The combination, with the trunk body and lid, of the tray directly pivoted to the lid and pivotally connected to the body, substantially as and for the purpose set forth.

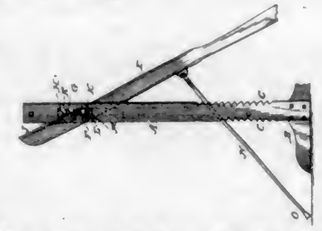
2. The tray C, pivoted in the lid B, in combination with the plates E and stop-pins *f*, the plates being pivoted to the body and tray of the trunk, substantially as and for the purposes described.

296,977. MECHANICAL MOVEMENT. JOSEPH P. LAVIGNE, New Haven, Conn., assignor to Joseph S. Sackett and Jane Halliwell, both of same place. Filed Jan. 28, 1884. (No model.)



Claim.—1. The combination of the lever C, arranged for vibratory movement, the lever E, arranged for vibratory movement in a plane at right angles to the plane of the lever C, a dog, *a*, on said lever C, and arranged to be moved in a plane at right angles to the plane of the lever C, and the lever E, constructed with shoulders *h i* forward of the dog on opposite sides of the pivot of the said lever E, and with a stud, *l*, in rear of the dog, whereby in the vibratory movement of the lever E the said stud is thrown to the right and left of the dog, the dog constructed to engage said stud in each vibratory movement of the lever C, whereby the dog will be thrown from side to side and engage one of said shoulders *h i* in each full vibration of said lever C, and whereby two full vibrations of the lever C will impart but a single full vibration to the lever E, substantially as described.

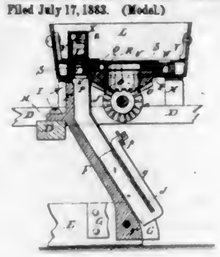
2. The combination of the lever C, arranged for vibratory movement, the lever E, arranged for vibratory movement in a plane at right angles to the plane of vibration of the lever C, and the dog *a*, arranged in bearings in said lever C in a plane at right angles to the plane of vibration of said lever C, and so as to slide from right to left, the said dog constructed with a projection, *m*, the lever E constructed with shoulders *h i* forward of the dog and each side of the pivot of said lever E, and with a stud, *l*, in rear of the pivot and of the dog, whereby in each movement of the lever C in one direction the said projection *m* will strike the stud *l* on the lever E and force said dog to the right or left, as the case may be, and whereby one end of the said dog will engage one of said shoulders on the lever E in one movement of the lever C, and in the next movement in the same direction the opposite end of the dog will engage the opposite shoulder, substantially as described.



3. The combination of the lever C, arranged for vibratory movement, the lever E, arranged for vibratory movement in a plane at right angles to the plane of the lever C, a dog, *a*, on said lever C, and arranged to be moved in a plane at right angles to the plane of the lever C, the lever E constructed with shoulders *h i* forward of the dog on opposite sides of the pivot of the said lever E, and with a stud, *l*, in rear of the dog, whereby in the vibratory movement of the lever E the said stud is thrown to the right and left of the dog, the dog constructed to engage said stud in each vibratory movement of the lever C, whereby the dog will be thrown from side to side and engage one of said shoulders *h i* in each full vibration of said lever C, and whereby two full vibrations of the lever C will impart but a single full vibration to the lever E, and the lever F, pivoted to the base in rear of the pivot of the lever E and in connection with the said lever E, whereby the movement of the lever E in one direction imparts a movement to the lever F in the opposite direction and in the same plane, substantially as described.

296,978. OVERSHOE. GEO. A. LEWIS, Naugatuck, Conn., assignor to Goodyear's Metallic Rubber Shoe Company, same place. Filed Feb. 18, 1884. (No model.)

Claim.—The herein-described india-rubber overshoe, having one or more elastic gores introduced into a corresponding-shaped recess in and so as to make substantially a part of the lining, the lining and gore covered on the outside by a continuous india-rubber surface, substantially as described.

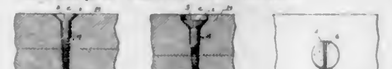


296,979. WAGON-JACK. JOSEPH F. LUDWEY, Marion, Ohio. Filed Feb. 18, 1884. (No model.)

Claim.—1. The combination, in a wagon-jack, of the parallel notched standards having side openings, E, notched plates F, inserted into said openings, so as to leave a narrow slot, H, opening into the notched bearings G, lever I, having fulcrum-bolt K, adapted to slide up and down in the slot H and to engage the bearings G, and brace-rod N, having cross-head O at its free end, substantially as and for the purpose shown and set forth.

2. The combination, in a wagon-jack, of the parallel standards A A, having wedge-shaped notches C *c* and notched bearing-plates F, lever I, having fulcrum-bolt K, and rod N, having the wedge-shaped cross-head O at its free end, adapted to be wedged into the notches C *c* and held in place therein, substantially as and for the purpose shown and set forth.

296,980. CHECK-ROW CORN-PLANTER. THOMAS J. LINDSAY, Lafayette, Ind. Filed July 17, 1883. (Model.)



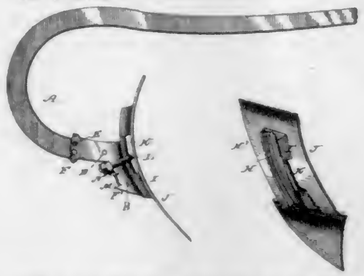
Claim.—1. In a corn-planter, the combination, with the shaft *b* and the spout F, of the vibrating plate *r*, hung in the spout, and formed with an upwardly-projecting arm or lever, *q*, pivoted upon the outside of the spout, the beveled gear-wheel *k*, crank-shaft *m*, having the beveled pinion *l*, centrally-pivoted lever *o*, and connecting-rods *n p*, substantially as shown and described, and for the purpose specified.

2. In a corn-planter, the revolving serially-apertured plate S, disposed under the coincidently-apertured false bottom U of the seed-holder, the beveled gear-wheel O, the shaft *b*, carrying the pinions *a k*, and crank-shaft *m*, having the beveled pinion *l*, in combination with the vibrating plate or valve *r*, hung in the spout F, and formed with an upwardly-projecting arm or lever, *q*, pivoted on the outside of the spout, centrally-pivoted lever *o*, and connecting-rods *n p*, substantially as and for the purpose set forth.

3. In a corn-planter, the shaft *b*, having the toothed wheel *s*, and the spring-lever *u*, having the roll *t*, in combination with the valve or plate *r*, hung in the spout F, and formed with an upwardly-projecting arm or lever, *q*, pivoted on the outside of the spout, centrally-pivoted lever *o*, and connecting-rods *n p*, substantially as and for the purpose set forth.

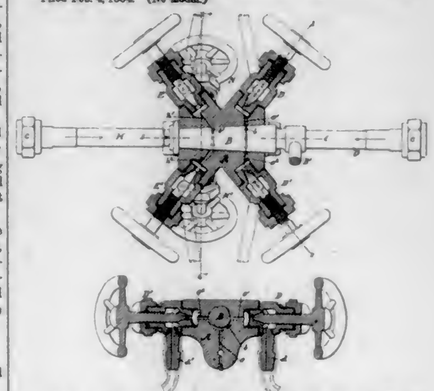
4. In a corn-planter, the shaft *b*, carrying the toothed wheel *s*, the spring-lever *u*, having the roll *t*, the rotating serially-apertured plate S, arranged under the coincidently-apertured false bottom U of the seed-hopper, the gearing *a k l*, the crank-shaft *m*, connecting-rods *n p*, centrally-pivoted lever *o*, and the valve or plate *r*, hung in the spout F, and formed with an upwardly-projecting arm or lever, *q*, pivoted upon the outside of the spout, substantially as and for the purpose set forth.

296,981. CHECK-ROW WIRE. CHARLES S. LOCKE, Joliet, Ill. Filed Nov. 9, 1883. (No model.)



Claim.—The cast malleable shell described, being spherical in form, or nearly so, and having an opening on one side, extending from pole to pole, of sufficient width to admit the coupled ends of the wires, and adapted to have its edges closed together to inclose the coupled ends of the check-row wires, as and for the purpose set forth.

296,982. WOOD-SCREW. JESSE B. LOW, New York, N. Y., assignor of three-fourths to George H. Seeley, Nathan Seeley, and James H. Taylor, all of same place. Filed Nov. 24, 1883. (No model.)

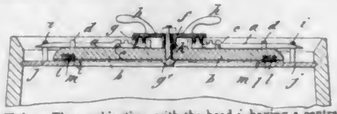


Claim.—A self-countersinking screw-head having the cutting edges or devices composed of those two of the ends of the drive-slot walls which project throughout their entire lengths from the shank to the periphery beyond the opposite edges of the drive-slot walls, substantially as shown and described.

296,983. CULTIVATOR. DAVID N. LOEB, Ross, Iowa. Filed Feb. 5, 1884. (No model.)

Claim.—As an improvement in cultivators, the combination of the curved beam A, having apertures A' A'', and rounded at its lower end, shovel-holder consisting of the curved rounded tongue B, having the longitudinal grooves G and lugs or projections F', and jaws C C, adapted to fit on either side of the lower rounded end of the beam A, pivot-bolt D, removable and adjustable shovel, comprising the blade J and saddle I, secured to the rear side of the shovel-blade, and provided with the recess K and longitudinal grooves H, and yoke L, having cross-piece M and nuts N, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

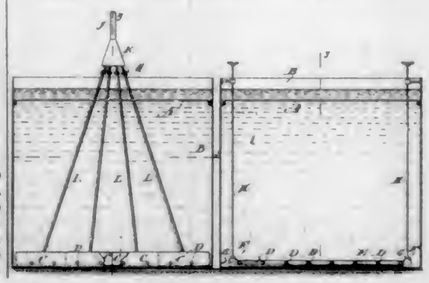
296,984. DISSOLVING-COCK. TIMOTHY J. MAPES, Philadelphia, Pa. Filed Feb. 4, 1884. (No model.)



Claim.—1. The combination of the body and main plug of a dissolving-cock and supply-pipes with channels leading from the plug, and needle-valves, substantially as described, controlling said channels.

2. The combination of the body and main plug of a dissolving-cock and supply-pipes with self-contained needle-valves detachably applied to said body, and channels leading from the plug to the valves, as set forth.

3. The combination of the nozzles *d d'*, to which are applied flexible tubes leading to the lanterns of a stereopticon apparatus, with a dissolving-cock having channels, and provided with a plug having grooves *b b'* of the relative proportions herein set forth, whereby the dissolving effect is produced without diminishing the light on the screen in changing from one lantern to the other.



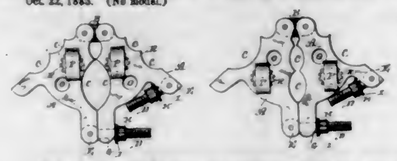
4. The combination of a dissolving-cock and its handled plug with a bearing-piece, G, and cam-lever F, substantially as described.

296,985. CHURN-COVER FASTENER. MARK MARSDEN MATOCK, Buffalo, N. Y. Filed Dec. 29, 1883. (No model.)

Claim.—The combination, with the bead *j*, having a central opening and staples *i*, and cover *b*, provided with the guides *c d*, of the disk *f*, provided with the separate overlapping curved flanges *g* on its under face, and handles A and radially-sliding bolts *a*, each having a tapered outer end, a rack, *e*, near its inner end, and a T-head, *n*, substantially as shown and described.

296,986. APPARATUS FOR AGITATING THE LIQUOR IN TANVATS. THOMAS A. MAYER, Philipsburg, Pa. Filed Sept. 14, 1883. (No model.)

Claim.—1. The combination, with a vat, of boxes or compartments on the bottom of the same, perforated tubes projecting from the compartments, and pipes for conducting compressed air into the compartments, substantially as herein shown and described.



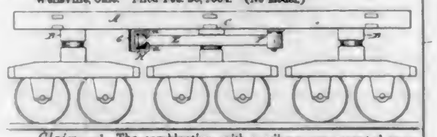
2. The combination, with a vat, of perforated pipes on the bottom of the same, which pipes connect compartments or boxes, and a transverse pipe, which is provided at the ends with valves, substantially as herein shown and described.

3. The combination, with a vat, of the boxes C, the perforated pipes D, the pipe E, and the pipes L, for conducting air into the boxes, substantially as herein shown and described.

4. The combination, with a vat, of the boxes C, the perforated pipes D, the pipe E, the valve-casings F in the ends of the same, the valves G in the casings F, the rods H, and the pipes L, for conducting air into the boxes C, substantially as herein shown and described.

5. The combination, with a vat, of the pipes L, the box K, the pipe J, the cocks M, the boxes C, the perforated pipes D, and the pipe E, substantially as herein shown and described.

296,987. TIRE-TIGHTENER. SPENCER MCCAY, Topeka, Kans. Filed Oct. 22, 1883. (No model.)

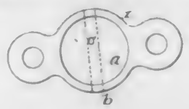


Claim.—1. In a tire-tightener, the combination of the two grooved reversible blocks, which are loosely connected together with suitable clamping devices, substantially as shown.

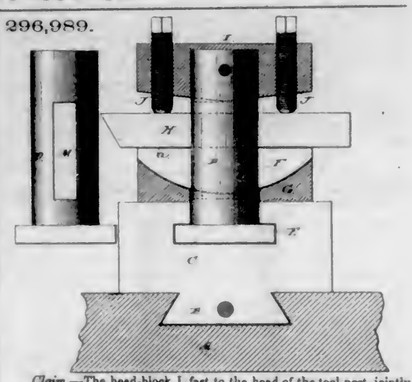
2. In a tire-tightener, the combination of the two reversible blocks loosely connected together, and provided with grooves of different sizes in their opposite faces, with the clamping devices for securing the blocks to a spoke, and suitable jack-screws for forcing the felly outward, substantially as described.

3. The combination, in a tire-tightener, of the two blocks loosely connected together, and provided with different-sized grooves upon their opposite faces, and provided with a series of holes through their tops, with the clamping devices for holding them together, and the jack-screws, substantially as set forth.

4. In a tire-tightener, the combination of the two blocks A, grooved upon opposite faces, and loosely connected together by the link B, the pivoted screw-bolts D, provided with nuts H, the jack-screws P, grooved nuts R, and a suitable device for turning the nuts, substantially as specified.



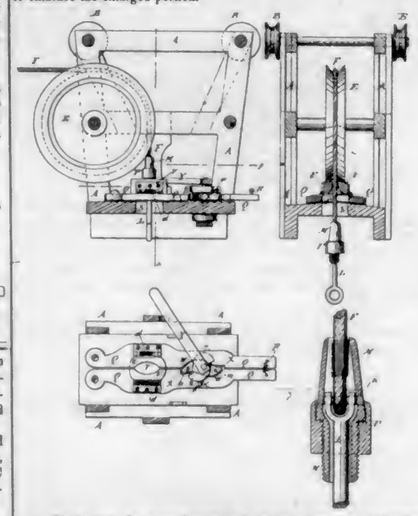
296,988. CAR-TRUCK. JAMES H. MCCLURE and GEORGE F. MURDOCK, Wellsville, Ohio. Filed Feb. 20, 1884. (No model.)



Claim.—1. The combination, with a railway-car mounted upon two end trucks, of a beam pivoted at one end to the car, a truck supporting the beam midway upon a pivot, and means, substantially as described, connecting the other end of the said beam with the car, as and for the purpose specified.

2. The combination, with the car-body A, and the trucks connected therewith by bolsters B, of the beam E, pivoted at F to the car-body, the roller H on its other end, the segmental way G, and the bolster C of a truck pivoted to said beam E, as shown and described, for the purpose specified.

296,989. TOOL-HOLDER. ALFONSO MERCER, Norfolk, Va., assignor of one-half to William Sanderlin and Thomas M. Sanderlin, both of same place. Filed Sept. 27, 1881. (No model.)



296,989.

Claim.—The head-block I, fast to the head of the tool-post, jointly with the binding-screws J, for clamping the tool, substantially as specified.

296,990. EARTH-REMOVER. SAMUEL A. MILLER, Philadelphia, Pa. Filed Aug. 29, 1883. (No model.)

Brief.—A traveling carriage has two pivoted bucket-supporting levers held together by a spring, thrown apart by a pivoted double cam, (operated by a similar cam on a lever striking pins on such first cam,) and recessed in their meeting edges for the passage of the elevating-rope, and having hinged spring-pressed blocks for a cone on said rope to rest on. The cone is made in two semi-cylindrical screw-threaded sections enlarged above the threading, and through which passes a pin going through eyes on the bucket-attaching rod and on the end of the hoisting-rope, and held together by an interiorly-threaded band countersunk to embrace the enlarged portion.

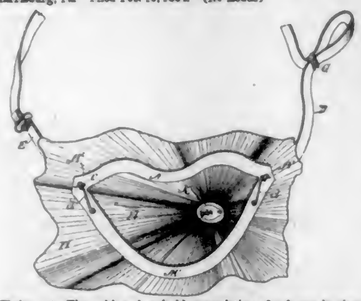
Claim.—1. In an earth-removing apparatus, constructed substantially as herein shown and described, and consisting of the trip-cone, a carriage having the hinged catch-blocks, the levers carrying the said catch-blocks, and the lever-operated cam for separating the levers and catch-blocks and allowing the cone to pass down, as set forth.

2. In an earth-remover, the cone M, constructed, substantially as herein shown and described, in two parts, having a screw-thread upon their reduced lower ends and secured in place by a screw-band having a countersunk upper part, as set forth.

3. In an earth-remover, the combination, with the hoisting-rope F, the coupling-rod L, and their connecting-pin K, of the cone M and screw-band P, substantially as herein shown and described.

4. In an earth-remover, the combination, with the bottom of the

carriage A, of the hinged catch-blocks U, having springs *d*, the recessed levers Q, having spring R, and a lever-separating mechanism, substantially as herein shown and described, whereby the bucket will be supported and can be readily released, as set forth.



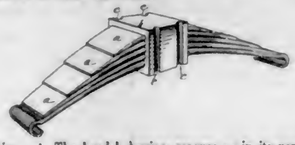
5. In an earth-remover, the combination, with the levers Q, carrying the hinged catch-blocks U, of the double cam X and the lever Y, having cross-head Z, substantially as herein shown and described, whereby the said levers and catch-blocks can be readily separated, as set forth.

296,991. SCREW. ALEXANDER MITCHELL, Fredericton, New Brunswick, Canada. Filed May 15, 1882. (No model.)

Claim.—A wood-screw having a cylindrical threaded barrel, A, terminating in a chisel-edge or awl-point, *a*, of a width at its edge and base corresponding to the width of the cylindrical barrel cut away inward and upward from circumference to center, to form the inverted-V-shaped recess and outer cutting-edges, as shown and set forth.

296,992. DENTAL-RUBBER-DAM HOLDER. ROBERT H. MOFFITT, Harrisburg, Pa. Filed Feb. 19, 1884. (No model.)

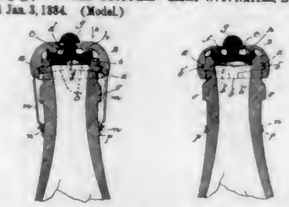
Claim.—1. The rubber-dam holder consisting of a frame having an arched portion adapted to apply over the upper lip transversely, and an arched or curved portion adapted to apply below the lower lip and extended to embrace said other arched portion, both said portions being provided with attaching-hooks for holding the rubber dam thereon, and means for attaching said frame to the head, substantially as and for the purpose set forth.



2. The rubber-dam holder A A' M *a*, provided with band D, in combination with the shield N M', applied to the said holder, substantially as and for the purposes set forth.

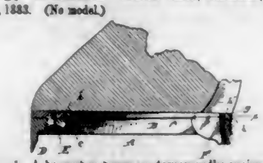
296,993. FOLDING SATCHEL. ROBERT MOFFLY, Philadelphia, Pa. Filed Feb. 23, 1884. (No model.)

Claim.—In a folding satchel made from a single piece of leather or similar material, the combination, with the bottom and sides, of the regulating-flaps and central weighted flaps, as and for the purposes specified.



296,994. VEHICLE-SPRING. GEORGE W. MORRIS, Pittsburg, Pa. Filed Feb. 13, 1884. (No model.)

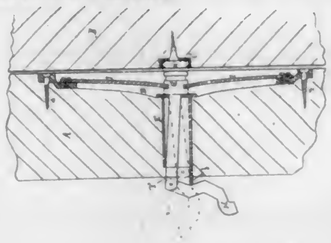
Claim.—1. The band *b*, having grooves *c c* in its vertical outer sides, in combination with the spring and the clip-bolts *d*, seated in said grooves, whereby to lock the band to the spring-securing bolts, substantially as described.



2. The elliptic half-spring having its leaves secured by a hot-pressed band, having grooves in its outer vertical walls, as shown, and for the purpose described.

296,995. BOTTLE-STOPPER. ERNST W. F. NATTER, Everett, Mass. Filed Jan. 3, 1884. (Model.)

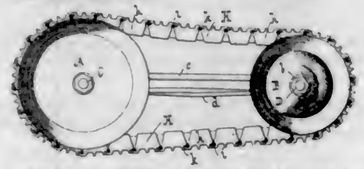
Claim.—The bottle-neck provided with one or more projections, *a*, and the metal cap B, provided with a central opening, and with an inclined annular groove, *b'*, and the annular projection A, combined with a flexible or india-rubber washer having a neck and head, the neck being extended through the cap, the washer being held loosely in the cap, and acted upon by the annular projection, the latter forcing the flanged part of the washer down into the neck of the bottle to close the same tightly, the cap rotating independently of the washer, all substantially as described.



296,996. HORSESHOE. HOLGER OLSON, Mariadahl, Kans. Filed Nov. 12, 1883. (No model.)

Claim.—1. A horseshoe having a downwardly-projecting flange on its under side, and having a dovetailed opening in said flange and partially in the toe of the shoe, in combination with a toe-calk which is adapted to fit into said opening, and which has a rear extension which lies against the web of the shoe and turns up and over said web, as and for the purpose set forth.

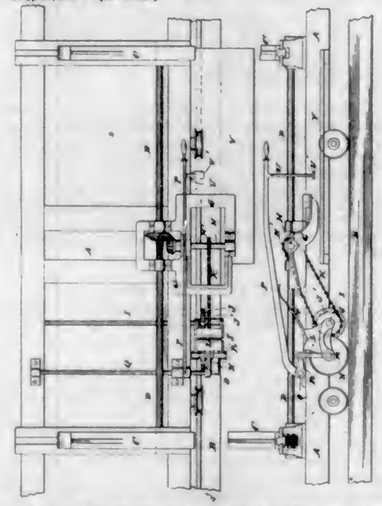
2. A horseshoe having a downwardly-projecting flange on its under side, and provided at its heel with a longitudinal lateral slot at the base of the flange and a longitudinal vertical slot in the web of the shoe, in combination with the calk having splines on two of its sides to fit into said slots, substantially as and for the purpose set forth.



296,997. SASH-FASTENER. ARILLA D. ORDWAY, Reed City, Mich. Filed Nov. 21, 1883. (No model.)

Claim.—1. A window-stop consisting of the bolt F, having a head, G, provided with a channel, as described, in combination with springs I, having one end secured to the sash and the other fitting in and engaging with said channel, as and for the purpose set forth.

2. In a window-stop, the combination of the bolt F, having head G, springs I, bent lever H, thimble E, provided with arm *b*, serving as a fulcrum for said lever, and cup-stop C, when constructed, arranged, and operating substantially in the manner and for the purposes specified.

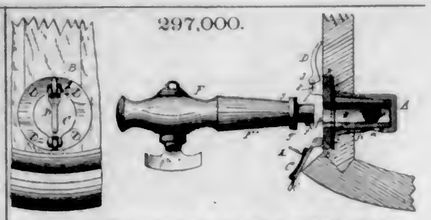


296,998. ROAD-ENGINE. GEORGE F. PAGE, Baltimore, Md. Filed Jan. 5, 1884. (No model.)

Claim.—1. In a road-engine, the driving and pilot wheels provided with peripheral grooves and connected by an endless chain having a V cross-section, substantially as and for the purpose specified.

2. In a road-engine, the driving and pilot wheels connected by an endless track composed of hollow links having extensions which extend into the adjoining links, substantially as and for the purpose specified.

296,999. HEAD-BLOCK FOR SAW-MILLS. DARIUS PARKHURST, St. Louis, Mo., assignor of one-half to Geo. H. Knight, same place. Filed Aug. 20, 1883. (No model.)



Claim.—1. The combination, with a carriage, a set-works counter-shaft, a chain-wheel on the counter-shaft, a friction-roller, and means for raising and lowering the friction-roller, of the intermediate shaft secured to the carriage, cog-wheel and chain-wheel on the intermediate shaft, yoke secured to the means for raising and lowering the friction-roller, shaft supported by the yoke, and on which the friction-roller is mounted, cog-wheel on the yoke-shaft, and frame hinging the yoke-shaft to the intermediate shaft, as set forth.

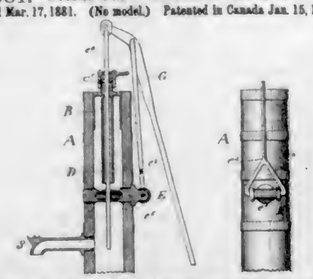
2. The combination, with a carriage, a set-works counter-shaft, a chain-wheel on the counter-shaft, a friction-roller, and a shaft having a crank, of the intermediate shaft secured to the carriage, cog-wheel and chain-wheel on the intermediate shaft, yoke secured to the crank, shaft supported by the yoke, and on which the friction-roller is mounted, cog-wheel on the yoke-shaft, and frame hinging the yoke-shaft to the intermediate shaft, as set forth.

297,000. FAUCET ATTACHMENT TO BARRELS. JACOB PAULUS, New York, N. Y., assignor to himself and August Hartmann, same place, and Louis Remshardt, Brooklyn, N. Y. Filed May 31, 1883. (No model.)

297,000.

Claim.—1. The combination of a socket, A, attached to the faucet-hole of a barrel, said socket having an opening, *a*, an interior tube, E, having an opening, *e*, a retaining face-plate, B, a hinged valve, C, and means for locking said valve into closed position, substantially as set forth.

2. In a faucet attachment to barrels, the combination of a socket, A, secured to the faucet-hole, said socket having an opening, *a*, an interior tube, E, having an opening, *e*, a face-plate, B, a hinged valve, C, having a pin, *h*, fitting into recesses f^3 f^3 of the face-plate B and tube E, respectively, and means for locking said valve in closed position, substantially as set forth.



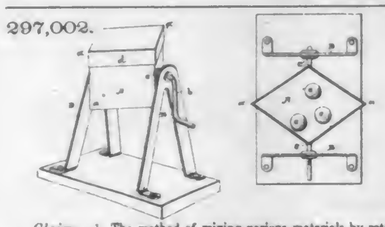
3. In a faucet attachment to barrels, the combination of a socket, A, attached to the faucet-hole, said socket having an opening, *a*, an interior tube, E, having an opening, *e*, a face-plate, B, and a faucet, F, the barrel F' of which is provided with means for engaging the interior tube, E, and turning the same on its axis, so that its opening is thrown in or out of register with the opening of the socket, substantially as set forth.

4. In a faucet attachment to barrels, the combination of the fixed socket A, having an opening, *a*, an interior tube, E, having an opening, *e*, a face-plate, B, having an opening in line with the opening of the interior tube, said face-plate and tube being provided with recesses f^3 f^3, respectively, a faucet, F, the barrel F' of which is provided with a cylindrical end, *f*, and lug *f'*, whereby the interior tube can be engaged and turned around its axis, substantially as set forth.

5. In a faucet attachment to barrels, the combination of a fixed socket, A, having an opening, *a*, interior tube, E, having an opening, *e*, and recess f^3, face-plate B, having recess f^3, faucet F, the barrel F' of which is provided with a cylindrical end, *f*, lug *f'*, collar *g*, and elastic ring *g'*, substantially as set forth.

6. In a faucet attachment to barrels, the combination of a fixed socket, A, having opening *a*, interior tube, E, having opening *e* and recess f^3, face-plate B, having recess f^3 and quadrangular cam-groove f^4 at its rear side, faucet F, having cylindrical end *f*, lug *f'*, collar *g*, and elastic ring *g'*, substantially as and for the purpose set forth.

297,001. WOODEN PUMP. DAVID PLEWS, Toronto, Ontario, Canada. Filed Mar. 17, 1881. (No model.) Patented in Canada Jan. 15, 1881.



Claim.—1. A foot-iron, E, in a banded wooden pump, constructed with two threaded bearings—one on each side of the bore of the pump—provided with a shoulder-flange, e^3, screwed fast up to the barrel thereof, and an aperture, e^3, for the pump-rod to pass through, and a journal-socket, e', in which the rock-axle turns, substantially as specified and described, and operating as set forth.

2. In a banded wooden pump, the combination, with the foot-iron E, having a socket, e', and shoulder-flange e^3, of the hinged rock-arm e^2, the handle G, the pump-rod e^4, and the stuffing-box e', as shown and described.

3. In a banded wooden pump constructed with a foot-iron, E, the combination, with the barrel *a*, of the cylinder B, carrying the tube D, as shown and described, and operating as set forth.

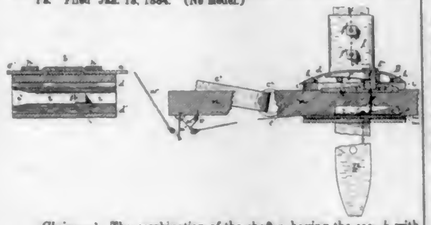
297,002. APPARATUS FOR MIXING SOLIDS AND LIQUIDS AND FOR OTHER PURPOSES. ERASMUS A. POND, Rutland, Vt. Filed Oct. 5, 1883. (No model.)

297,002.

Claim.—1. The method of mixing various materials by rotating them in such way that the particles will all be projected constantly and regularly toward a common point, substantially as described.

2. A box or receptacle journaled as set forth, so that in rotating the corners or points of the box or receptacle farthest from the axis of rotation move always in the vertical plane passing through the center of the box or receptacle, substantially as described.

3. A box or receptacle of cubical, rhombic, or similar form, hung on trunnions attached at the middle points of two diagonally-opposite edges, substantially as described.



4. The combination, with the box or receptacle constructed and operating as set forth, of the iron balls, substantially as and for the purpose described.

5. The box or receptacle hung on trunnions attached at the middle points of diagonally-opposite edges, and having a corrugated interior, substantially as described.

6. The combination, with a box or receptacle supported and revolving as set forth, of a removable corrugated lining, substantially as described.

7. A rotary box or receptacle made of open-work material in a conical, rhombic, or similar form, provided with a corrugated interior, and supported so that in rotation the corners or points farthest from the axis will in succession occupy the lowest central point, substantially as described.

297,003. HARNESS. JAMES MCC. PORTER, Collier, Allegheny County, Pa. Filed Jan. 18, 1884. (No model.)

Claim.—1. The combination of the shaft *n*, having the seat *k*, with the sleeve D, supported by the harness, and having the spring-key *l*, substantially as set forth.

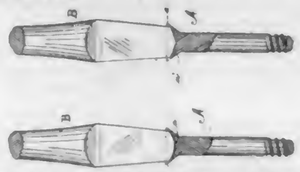
2. In combination with the shaft, a sleeve supported on the harness and fitting around said shaft, connecting apparatus between said sleeve and shaft, and mechanism within the shaft for disengaging said apparatus, substantially as set forth.

3. The combination of the sleeve having a spring-key, shaft having a corresponding seat, and mechanism for freeing said key from said seat, substantially as set forth.

4. The combination of the sleeve D, having the slot *i* and spring-key *l*, of the shaft *n*, having the lugs l^1 l^2 and seat *k* between them, substantially as and for the purposes set forth.

5. The combination of the sleeve D, having the extension *f*, the combined point-strap and billet, the back plate, *f'*, and securing-bolts, substantially as and for the purposes set forth.

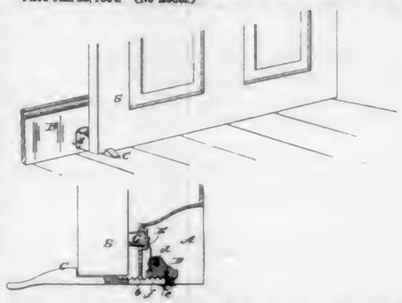
6. The combination of the sleeve D, having the extension *f*, the combined point-strap and billet, the back plate, *f'*, and bolts, where said extension and back plate have the lips f^2 and the edge of said plates thinned, as at f^3, substantially as and for the purposes set forth.



7. The combination, with the sleeve D, of the combined trace-strap and stay-strap, and means for securing it firmly to the sleeve, substantially as and for the purposes set forth.

8. In combination with the sleeve D, having the key *l*, and shaft *n*, having the seat *k*, the pin *r* and wedge *p*, supported within the shaft, substantially as and for the purposes set forth.

9. In combination with the shaft *n*, the guide-plate *s*, having the ribs *s'*, wedge *t*, and pin *r*, substantially as and for the purposes set forth.



10. In combination with the shaft having the pins *r* and wedges *t* therein, the wires *t'*, rod *u*, and spring mechanism for operating said wedges, substantially as and for the purposes set forth.

297,004. SCREW. STACY POTTS, Washington, D. C. Filed Oct. 18, 1883. (No model.)

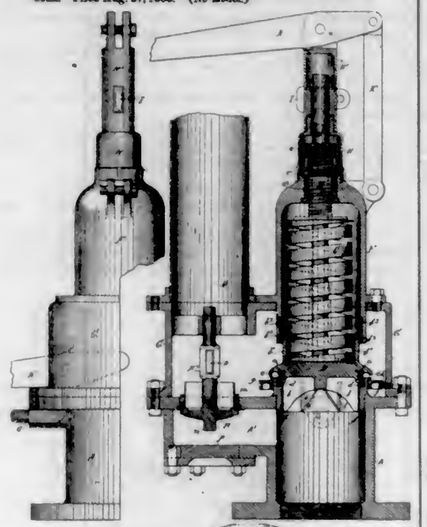
Claim.—A screw the head of which is provided with a drive-slot extending entirely across and sloping downward toward the center from the opposite ends, substantially as illustrated and described.

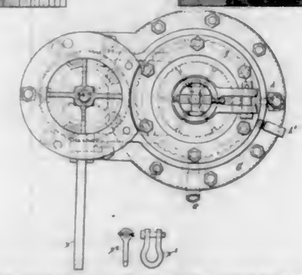
297,005. DOOR-CHECK. LOUIS RALL, GUSTAV RALL, and EDWARD RALL, Glasgow, Mo., assignors of one-fourth to Moritz Lahmann, same place. Filed Jan. 28, 1884. (No model.)

Claim.—1. In combination with the box or case A, the catch C, for holding the door open, made longitudinally adjustable to adapt it to doors of different thicknesses, the pivoted carrier D, constructed to engage with said catch at different points in its adjustment, and the spring E, substantially as specified.

2. The door-check herein described, consisting of the casing A, carrier D, pivoted therein and serrated on its under side, the catch C, slotted at *f*, and provided with the serrations *b*, and a set-screw *e*, for securing said serrated parts when properly adjusted, substantially as set forth.

297,006. WHIP. ALONZO C. RAND, Minneapolis, Minn. Filed Feb. 13, 1884. (No model.)





Claim.—1. A whip stock or body having an independent core or center which is capable of being given tension, longitudinally to the stock, by means substantially as described, and adapted for the purpose set forth.

2. A whip stock or body composed of sections bound together by means of an independent core which passes through them, and which is provided with an enlarged threaded end, and a nut adapted to secure the

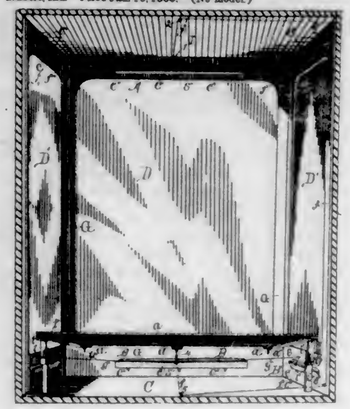
parts firmly together and keep the whip taut, yet still elastic, substantially as set forth.

297,007. MARINE SAFETY-VALVE. GEORGE W. RICHARDSON, Boston, Mass., assignor to the Consolidated Safety Valve Company, Hartford, Conn. Filed Aug. 27, 1883. (No model.)

Claim.—1. In combination with the two-part lock-up case, composed of the two independent sections mounted upon the spring-casing, the lever connected with and arranged to move the upper section, said section being connected with the valve-spindle, substantially as shown and described.

2. The combination, as before set forth, of the slotted valve-spindle, the two-part lock-up case, the key passing through the upper section and through the valve-spindle, and arranged to receive a lock, and the testing-lever connected with the upper section, substantially as explained.

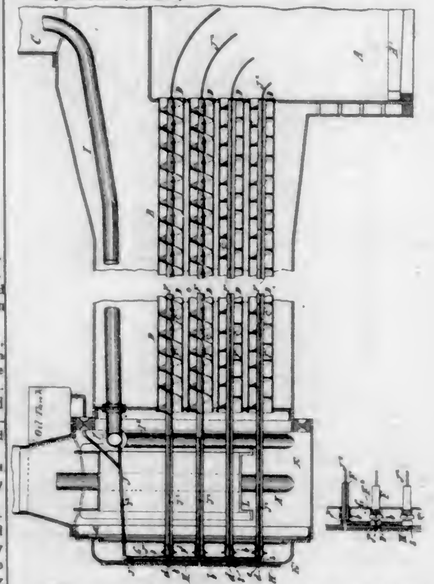
3. In combination with the base piece carrying a safety-valve and its appliances, a relief-valve communicating with the chamber which incloses the safety-valve, and a steam-discharge conduit leading from said chamber, substantially as shown and described.



4. In combination with the relief-valve mounted upon same base as the safety-valve, the removable hand-hole plate, arranged substantially as shown, and for the purposes set forth.

5. The herein-described appliance for steam-boilers, the same consisting, essentially, of a spring-actuated safety-valve, a relief-valve, and a conduit for conveying steam discharged from the ports governed by said valves, the whole being mounted upon a suitable base, arranged to communicate with the interior of the boiler through a single opening therein, and adapted for operation substantially in the manner and for the purposes explained.

6. In combination with the casing surrounding the seat for the safety-valve, and also the seat for the relief-valve, as explained, the drain-pipe tapped into said casing, and arranged to drain the chamber formed thereby, substantially as shown and described.



7. In an appliance for steam-boilers of the character herein set forth, the casing surrounding the openings governed by the relief and safety valves, and the casing for the tension-spring mounted upon the first-named casing and made removable therefrom, substantially as shown and described.

297,008. SHOW-WINDOW VENTILATOR. GEORGE W. RICHWINE, Muncie, Ind. Filed Jan. 10, 1883. (No model.)

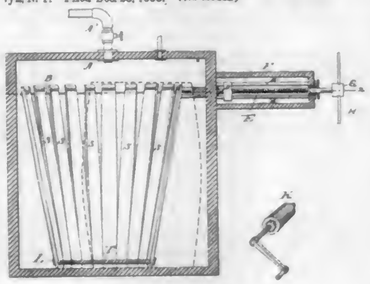
Claim.—The combination, with a window-frame, of a hinged floor, supported above the lower part of the frame by overlapping adjustable legs, substantially as set forth.

297,009. STEAM-BOILER. JACOB ROEBLING, Brooklyn, N. Y. Filed July 16, 1883. (No model.)

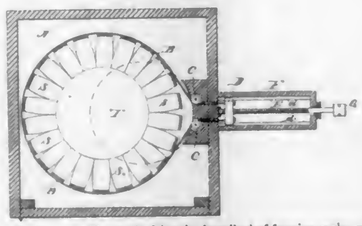
Claim.—1. In a steam-boiler, the combination, with a fire-box, a smoke arch, chamber, or passage, and flues extending between the same, of perforated tubes extending through the flues and serving to conduct air into the same, and spiral flanges between the flues and tubes, substantially as described, whereby the products of combustion are caused to circulate spirally through the flues and air is discharged from the tubes into them.

2. In a steam-boiler, the combination, with a fire-box, a smoke arch, chamber, or passage, and flues extending between the same, of perforated

air-tubes extending through the flues, capable of being turned, and having spiral flanges secured upon them within the flues, substantially as herein described, whereby the products of combustion are caused to circulate spirally through the flues and air is discharged from the tubes into them.



3. In a steam-boiler, the combination, with a fire-box, a smoke arch, chamber, or passage, and flues extending between the same, of air-tubes arranged within the flues, spirals between the tubes and flues, and pipes passing through the air-tubes and serving to convey steam to the fire-box, substantially as specified.



4. In a steam-boiler, the combination, with a fire-box, a smoke arch or chamber, and flues extending between the same, of perforated tubes extending into the flues, and a door or cover at the front of the smoke arch or chamber provided with perforations with which the forward ends of the tubes communicate, substantially as specified.

5. In a steam-boiler, the combination, with a fire-box, a smoke arch or chamber, and flues extending between the same, of perforated tubes extending into the flues, spiral flanges secured to those portions of said perforated tubes which extend into said flues, a door or cover at the front of the smoke arch or chamber provided with perforations with which the forward ends of the tubes communicate, and a perforated slide plate or valve, whereby the passage of air through the perforations of the door or cover may be regulated, substantially as specified.

6. In a steam-boiler, the combination of the flues D, the tubes F, the spiral flanges F', secured to said tubes, the diaphragm G, the springs F'', pins or their equivalents beyond the springs, and the door or cover E', substantially as specified.

297,010. BARREL-SHAPING MACHINE. JOS. M. ROBINSON, Brooklyn, N. Y. Filed Dec. 28, 1883. (No model.)

Claim.—1. The method herein described of forming casks, which consists in submitting the straight staves, when set up around one of the heads of the cask, to the action of steam in a steaming-box, drawing and completely closing the softened staves together to form the cask while still inclosed within the steaming-box, and binding and securing the free ends of the closed staves in position before removing the cask from the box.

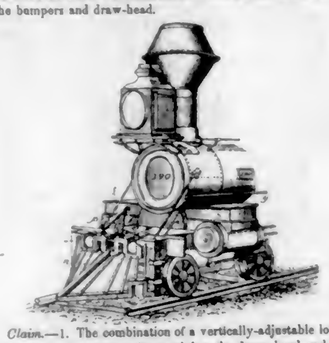
2. The combination, with a steaming-box adapted to receive the set-up shook of a cask, of a flexible contractile loop or band fitted within the box in position to encircle the staves of the shook, and arranged to be contracted by suitable mechanical devices operated from without the box, substantially in the manner and for the purpose herein set forth.

297,011. HARNESS-PAD. CHAS. W. ROGERS, Baltimore, Md. Filed Jan. 23, 1884. (No model.)

Claim.—1. The plate E, provided with the ribs d^2 and loop e, and having openings d' to receive the nuts d^4 d^4, as and for the purposes set forth.

2. The combination, substantially as described, of the pad-top, the tree, the plates E, constructed as described, the nuts d^4 d^4, and the bolts G G, as and for the purpose set forth.

3. The combination, with the pad, of the tree provided with turn-back strap-loop and check-rein hook, the plate E, having loop e', and the bolts and nuts for connecting the same, as set forth.



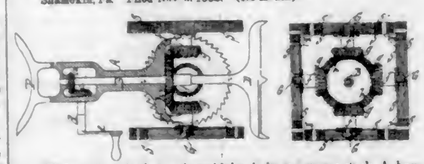
4. As an improved article of manufacture, the tree herein described, provided with perforations d d^3, rabbets d' d^3, and loop d^5, as set forth.

5. The tree provided with perforations d d^3 and rabbets d' d^3, in combination with eyebolts and nuts and the check-rein hook, as and for the purpose set forth.

6. As an improved article of manufacture, the tree herein described, provided with perforations d d^3 and rabbets d' d^3, and having the turn-back strap-loop d^5, made integral therewith, as set forth.

297,012. SAFETY DEVICE FOR LOCOMOTIVE-PILOTS. OSCAR ROTHROCK, Beech Creek, Pa. Filed Dec. 13, 1883. (No model.)

Brief.—A vertically-adjustable pilot is moved upon suitable guides at the forward end of the locomotive-truck, and is operated by a connection with the cab of the locomotive. Recesses are formed in the pilot for the bumpers and draw-head.

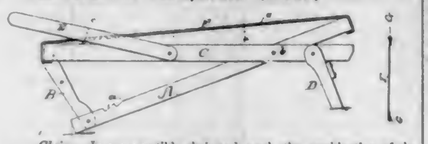


Claim.—1. The combination of a vertically-adjustable locomotive-pilot having spaces n n n, for receiving the draw-head and bumpers, with the mechanism consisting of the links f f'', rock-shaft E, lever h, and rod g, substantially as and for the purpose set forth.

2. The combination, with a locomotive-truck having posts p p, of a vertically-adjustable pilot attached to said posts, and means for operating said pilot at the will of the operator, as described.

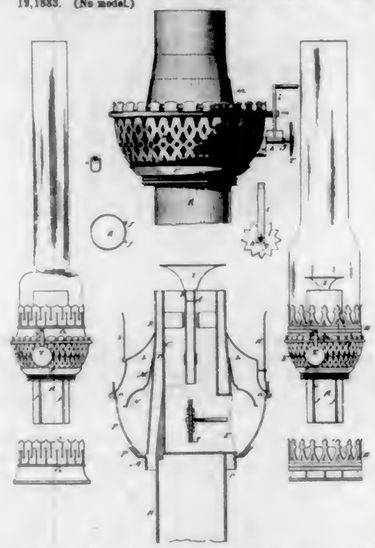
3. The combination, with a locomotive-truck having posts p p at its forward end, said posts having guides o o, of the vertically-adjustable pilot constructed as described, and the means, substantially as herein set forth, whereby the same is operated from the cab of the engine.

4. The combination, with a locomotive-truck having suitable guides at its forward end, of a vertically-adjustable pilot moving in said guides, and means for raising and lowering the same, substantially as described.



297,013. TOOL FOR BORING SQUARE HOLES. MAIER ROTHSCHILD, Shamokin, Pa. Filed Nov 8, 1883. (No model.)

Claim.—1. A boring-tool combining in its structure a stock, A, having four projecting arms, f, the spindle B, passing longitudinally through the stock and carrying the drill D, the four independent transverse spindles G, mounted, respectively, in the arms on the stock, a circular saw, S, mounted on each transverse spindle, and through which the latter passes, a secondary saw, S', in the form of an annulus, connected with the outer face of each saw at its periphery, to cut a passage-way for the outward-projecting ends of the transverse spindles, and means for revolving all the spindles, substantially as described.



2. The combination, in a boring-tool, of the stock A, having the breast-plate P at its outer end, and four projecting arms, f, at its other end, the spindle B, passing longitudinally through the stock and carrying the drill D, the four independent transverse spindles G, mounted, respectively, in the arms on the stock, a circular saw, S, mounted on each transverse spindle, and means for revolving all the spindles, substantially as described.

297,014. CONVERTIBLE CHAIR AND BEDSTEAD. ELI RUNDELL, Santa Barbara, Cal. Filed Sept. 8, 1883. (No model.)

Claim.—In a convertible chair and couch, the combination of the frame A, reversible supports B, frame C, provided with buttons c, loop or frame E, and seat F, substantially as described.

297,015. LAMP-BURNER. STERNE RUSSELL, Waterbury, Conn., assignor to the Scovill Manufacturing Company, same place. Filed Sept. 19, 1883. (No model.)

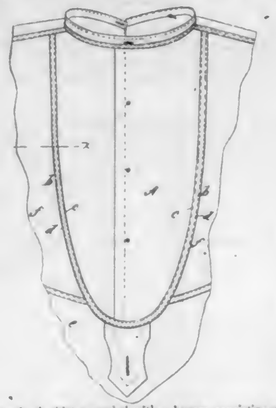
Claim.—1. In a tubular lamp-burner, the tubular extension R, extending downward from the inner tube, and constructed with the vertical parallel ribs f f, substantially as and for the purpose described.

2. In a lamp-burner, the annular drip-flange P, made as a fixed part of the burner and extending around its base above the screw, substantially as described.

3. In a lamp-burner, the combination of the wick-adjusting shaft g, the sleeve h, loose thereon, the lever i, hung in said sleeve, its end constructed to engage the shaft, substantially as described.

4. In a lamp-burner, the combination of the wick-adjusting shaft g, the sleeve h, loose thereon, the lever i, hung in said sleeve, its end constructed to engage the shaft, and the frictional spring n, substantially as described.

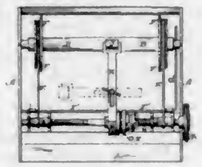
297,016. JOURNAL-BOX. EPHRAIM H. RUNT, Boston, Mass. Filed Mar. 4, 1882. (No model.)



Claim.—The combination of the journal box or frame and the packing therein, composed of a substantially homogeneous admixture of asbestus and silicate of soda or equivalent substance, substantially as set forth.

297,017. METHOD OF PRODUCING ROLLER-SURFACES FOR PRINTING, STAMPING, OR EMBOSSING. J. JULIUS SACHS, Manchester, County of Lancaster, England. Filed July 1, 1880. (No specimens.) Patented in England July 4, 1879, No. 2,724.

Claim.—In the preparation of metal rollers for printing, the improvement consisting in covering the roller with chrome-gelatine, placing around it a curved or flexible pattern adapted to transmit light to certain parts and prevent the transmission to others, exposing the roller to light and revolving it to present each portion to the light, and removing the soluble portions of the chrome-gelatine coating, substantially as described.



297,018. SHIRT. JOHN H. SCRIVEN, Grafton, N. Y. Filed Jan. 9, 1884. (Model.)

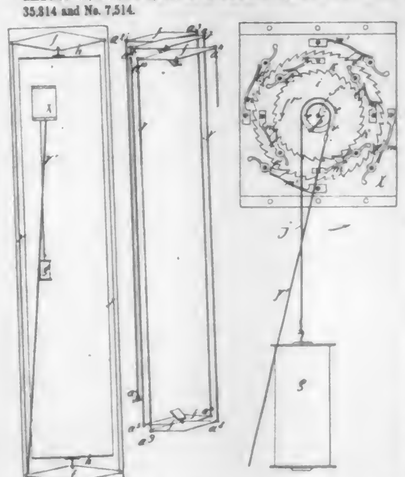
Claim.—1. A shirt provided with a bosom consisting of an outer ply hemmed around its outer edge, an interlining, and an inside lining, all secured together by stitches at their centers and attached to the body of the shirt by stitches i h, and the outer ply extending beyond the inter and inside linings and attached at the outer edge of its hem to the body of the shirt by the stitches d, substantially as described.

2. The method herein described of forming a shirt, consisting in hemming around the outer ply of the bosom and attaching said ply to an inter and an inside lining, then attaching the several plies to the body of the shirt by rows of stitching, one of which passes through the hem of the outer ply at its edge beyond the point of attachment of the other plies, substantially as described.

297,019. LET-OFF MECHANISM FOR LOOMS. JACOB SHAW, Wilmington, Del., assignor of one-half to Henry C. Downward, same place. Filed May 3, 1883. (No model.)

Claim.—1. The combination of the beam, the frame, the springs, the bands which are attached at one end to the springs, and then passed up over the beam, the tightening-shaft C, to which the other ends of the bands are fastened, a clutch placed upon the tightening-shaft, and an arm attached to a part of the clutch for bearing against the yarn on the beam, the shaft C being made to extend across the frame parallel to the beam, substantially as shown.

2. The combination of the beam, springs, and bands which are attached to the springs, and which pass up over the beam, with the shaft, which is provided with pulleys for receiving the bands, a clutch, and a friction-roller connected to the shaft for bearing against the beam, substantially as described

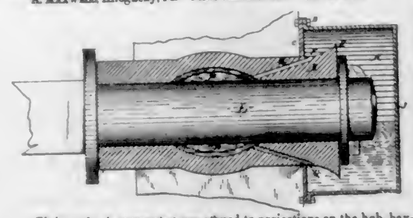


3. The combination of the beam with the bands E, springs, to which the bands are attached, the shaft C, a clutch, H O, spring Q, the friction-roller, the arm attached to the part H of the clutch, and carrying the friction-roller, and means for turning the shaft to adjust the tension of the springs and bands, substantially as set forth.

4. The combination of the beam with the bands E, springs, to which the bands E are attached at one end, a shaft for receiving the opposite ends of said bands, a clutch, H O, a spring, Q, upon said shaft, the roller J, and the slotted support for said roller attached at its lower end to the part H of the clutch, substantially as specified.

5. The combination of the beam B with the bands E, springs G, shaft C, and clutch H O, spring Q, a friction-roller, which is carried by the part H of the clutch, and bears against the beam, and the pin B', substantially as specified.

6. The combination of the beam with the bands E, springs G, rod F', provided with the arms H' and the handle G', the connecting-hooks which unite the springs and the arms together, and the shaft C, to which the bands E are fastened at one end, substantially as set forth.

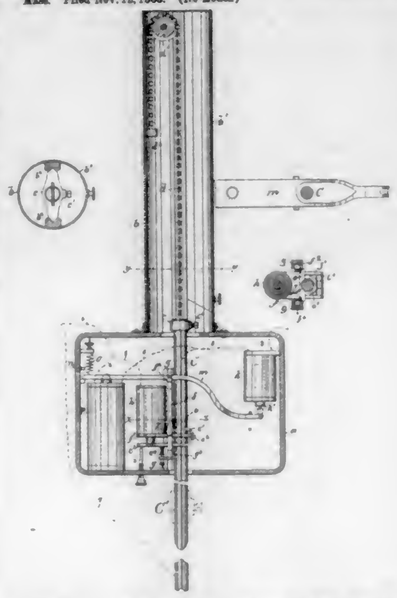


297,020. AUTOMATIC CLOCK-WINDING DEVICE. NATHAN SILBERBERG, Targ, Roumania. Filed July 3, 1883. (No model.) Patented in Germany Oct. 25, 1882; in France Oct. 26, 1882, No. 151,758; in England Nov. 28, 1882, No. 5,661, and in Austria-Hungary Feb. 24, 1883, No. 35,314 and No. 7,514.

Claim.—1. In a clock, the combination, with a metal chain formed of a series of bars or rods connected by levers, of the weight *g*, the chain *j*, the disks *b d* on the shaft *f*, the rope *e*, the ratchet-wheels *i k*, the pawls *l l'*, and the springs *m m'*, which ratchet-wheel *k* is connected with the chain for winding up the weight or spring of the clock, substantially as herein shown and described, and for the purpose set forth.

2. In a clock, the combination, with a metal chain formed of a series of bars or rods connected by levers, of devices for winding up the weights or springs of a clock, and of a safety-catch for automatically preventing the further winding of the spring or weight at the proper time, for the purpose of preventing overwinding of the clock-work, substantially as herein shown and described.

297,021. CAR-WHEEL LUBRICATOR. JAMES P. SULLIVAN and JAMES A. MAXWELL, Allegheny, Pa. Filed Jan. 24, 1884. (No model.)



Claim.—1. A corrugated cap affixed to projections on the hub, having a central aperture for the introduction of a lubricant, substantially as described.

2. In a corrugated cap affixed to projections on the hub, a gutter formed by the expanded forward end of the hub and the surrounding wall of the cap, substantially as described.

3. The combination of the cap A with gutter F and the channels G, leading to the corrugated chamber H in the hub, substantially as shown and described.

297,022. ELECTRIC-ARC LAMP. JOSEPH J. SKINNER, Newtonville, Mass. Filed Nov. 12, 1883. (No model.)

Claim.—1. In an electric lamp, a clamp and lifting mechanism therefor, combined with a magnet controlling the jaws or carbon-gripping portions of the clamp independently of the position or movement of the clamp, whereby the said gripping portions are operated without bodily movement of the said clamp parallel with the carbon, substantially as described.

2. In an electric lamp, a clamp and lifting mechanism therefor, combined with an electro-magnet rigidly connected with the said clamp and movable therewith, substantially as described.

3. In an electric lamp, a clamp and lifting mechanism therefor, combined with an independent magnet included in a shunt around the arc, and operatively connected with the jaws or gripping portion of the clamp, whereby the said gripping portion is operated to feed the carbon independently of the bodily movement of the clamp relative to the lamp-box, substantially as described.

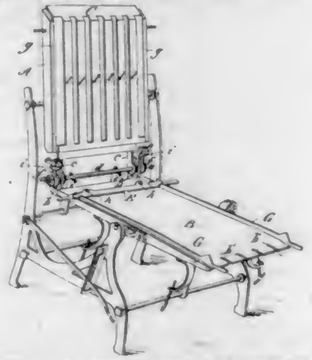
4. In an electric lamp, a clamp and lifting-magnet therefor, combined with a depressing-magnet in a shunt-circuit around the arc, a retractor for said depressing-magnet, and an independent magnet operatively connected with the jaws or gripping portion of the clamp, and controlling the said gripping portion independently of the position of the clamp relative to the lamp box or frame, substantially as described.

5. The clamp and its lifting-magnet and a depressing-magnet in a shunt-circuit around the arc, the said magnets tending to move the clamp in opposite directions, and each operating independently of the other to produce its raising or lowering effect upon the clamp, combined with an independent controlling-magnet for the jaws or the gripping portion of the clamp, substantially as described.

6. In an electric lamp, the lamp-box containing the feed-controlling devices of the lamp, and tube surmounting the said box, having one side movable for the purpose of introducing the carbons from above the lamp-box, the carbon being engaged directly by the clamp, substantially as described.

7. The lamp-box and clamp and its operating mechanism therein, combined with the tube surmounting the box, provided with guides, and the cross-head movable therein, the said cross-head and clamp constituting the guides for the carbon, substantially as described.

8. The clamp and lifting mechanism therefor, combined with a magnet operatively connected with the jaw or gripping portion of the clamp, the said magnet being in a shunt-circuit around the arc, and the said shunt-circuit including the carbon and clamp-jaw, substantially as described.



9. The clamp-frame having a jaw or gripping member fixed upon it adapted to engage the carbon at one side only, and a co-operating jaw or gripping member pivoted on the said frame and adapted to engage the carbon at the opposite side, one of the said jaws being higher than the other, and the said jaws permitting a free movement of the carbon between them when the said carbon is in an inclined position, substantially as described.

10. In an electric lamp, the clamp-frame having carbon-gripping devices or jaws, combined with guides fixed with relation to the lamp-box or frame-work, the said guides controlling the movement of the said clamp-frame, substantially as described.

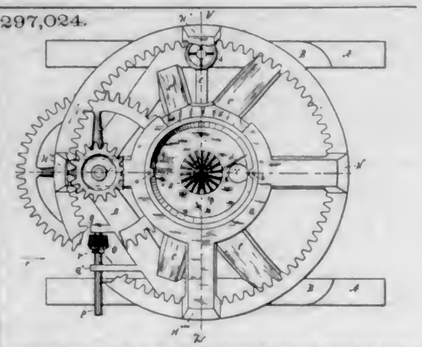
11. In an electric lamp, a clamp and lifting mechanism therefor, combined with an independent magnet operatively connected with the jaws or gripping portion of the clamp, and controlling the said gripping portion independently of the position of the clamp relative to the frame-work of the lamp, and a stop whereby the grip of the clamp upon the carbon is relaxed when the clamp is in its lowest position with relation to the frame-work, substantially as described.

12. The lamp box or frame and guides *b'*, and the cross-head C, movable therein, combined with the clamp-frame and clamp and guides therefor, the said cross-head and clutch determining the position of or guiding the carbon in its feeding movement, substantially as described.

297,023. APPARATUS FOR STEREOTYPING. FREDRICK J. SMITH, Brooklyn, assignor of one-half to JAMES H. BEALS, Jr., New York, N. Y. Filed Nov. 29, 1882. (Model.)

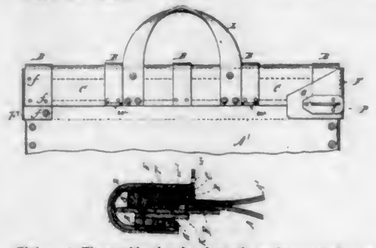
Claim.—1. In a stereotyping apparatus, the combination, with a nowel having its forward end slotted, of a foot-piece having its forward side notched and removably secured to the rear end of the nowel, and removable side bars engaging with the notches and slots of foot-piece and nowel, substantially as herein shown and described.

2. In a stereotyping apparatus, the combination, with nowel B, provided with holes near its rear end, and the slots *b'* at its forward end, of the foot-piece E, provided with the pins *h* and notches *e'*, and the removable side bars G, substantially as herein shown and described.



3. The slotted hinge-plates *b b*, formed on the nowel B, and having the perforated plates *i i*, formed at their upper ends, in combination with the eye-plates *c c*, formed on the cope, the rod *d* and the eyebolts *f f*, placed on the rod and passing up through the plates *i i*, and nuts *e e* on said eyebolts, for adjusting the hinge, substantially as set forth.

297,024. GRINDING-MILL. GEORGE K. SMITH, Freeport, assignor to H. C. Staver & Co., Chicago, Ill. Filed June 4, 1883. (No model.)



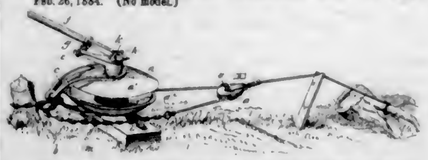
Claim.—1. In a grinding-mill, the combination of suitable grinding mechanism, a train of gearing connected with said grinding mechanism, and adapted to propel the same, a power-transmitting shaft connected with said train of gearing, and adapted to transmit the motion thereof to machinery other than said grinding mechanism, and means whereby said grinding mechanism and power-transmitting shaft may be thrown out of engagement with said train of gearing, substantially as shown and described, and for the purpose set forth.

2. The combination of the master-wheel G, pinion L, spur-gear K, pinion M, mounted on the shaft J', lever *e*, supporting said shaft, and removable pin *m*, supporting said lever and adapted by its withdrawal to throw said pinion M out of engagement with the spur-gear K, substantially as shown and described, and for the purpose set forth.

3. In a grinding-mill of the class described, the combination of an internally-geared horizontal master-wheel, a vertical shaft rotating in the center of the master-wheel, and independent thereof, a horizontal grinding-burr, and a horizontal pinion rigidly mounted on said vertical shaft, a suitably-journaled horizontal shaft adapted to transmit motion to mechanism other than said grinding-burr, a beveled gear mounted on said horizontal shaft, and a spur and bevel gear connecting said master-wheel with said horizontal pinion and said beveled gear, substantially as shown and described, and for the purpose set forth.

297,025. MAIL-BAG. THOS. H. SMITH, Bloomington, Ill. Filed Feb. 19, 1884. (No model.)

Claim.—1. The combination, in a bag, of a stationary hood or cover, rigid transversely, beneath which the flap of the bag is locked in position, with a locking-strap adapted to be likewise drawn beneath the hood or cover, thereby preventing the opening of the bag, substantially as described.



2. The combination, in a bag, of a stationary U-shaped cover, rigid transversely, provided with a longitudinal recess, and the flap of the bag provided with a strip adapted to rest in said longitudinal recess, with a locking-strap adapted to be drawn longitudinally beneath said hood, thereby preventing the opening of the bag except on the withdrawal of the strap, substantially as described.

3. The bag A, having its front or opening flap provided with a strip, H, adapted to engage and rest in the channel T, with a suitable locking device for preventing the withdrawal of the front of the bag from the hood, substantially as described.

4. The combination, in a bag, of a hood, C, provided with a channel, T, and the front flap of the bag provided with locking-strip E, and the strap F, provided with locking-strip H, substantially as described.

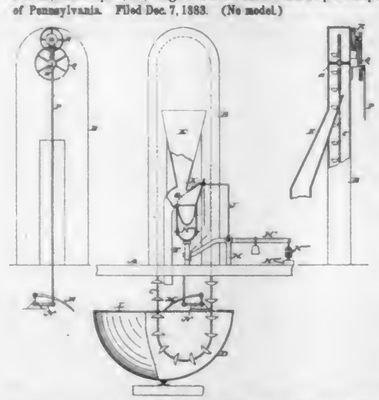
5. The combination of stationary rigid U-shaped straps or hooks permanently attached to one side of the top of a bag, provided with suitable locking devices, beneath which the flap, when closed, is locked in position, with a flexible locking-strap adapted to be drawn beneath the said straps or hooks, thereby preventing the opening of the bag, substantially as described.

297,026. STUMP-EXTRACTOR. WILLIAM SMITH, Tomah, Wis. Filed Feb. 26, 1884. (No model.)

Claim.—1. In a portable windlass, the combination, with the drum, of the upper and lower concave flanges, substantially as specified.

2. In a portable windlass, the combination, with the concave-flanged drum having the arm at its upper end, of the half-clevis and link forming the frame therefor, and mechanism for winding the drum, substantially as specified.

3. In a portable windlass, the combination, with the drum having the concave flanges at the upper and lower ends, the arm at the top, and the clevis forming the frame for the drum, of the center-bolt having the oblique loop at its upper end, and the operating-lever provided with the three links, whereby it may be connected to the arm and the oblique loop to operate the windlass, substantially as specified.



4. In a portable windlass, the combination, with the concave-flanged drum having the arm and oblique loop at its upper end, and supported in bearings in a suitable frame, of the rope and the pulley, having the pivoted guards for holding the rope in place, and an operating-lever for winding the drum, substantially as specified.

5. In a portable windlass, the combination, with the drum and clevis and mechanism for operating the drum, of the cross-plank secured to the under face of the half-clevis and forming a base for the machine, substantially as specified.

6. In a portable windlass, the combination, with the drum having the upper and lower concave flanges, the upper arm, and operating-lever, of a suitable frame forming bearings for the drum, substantially as specified.

297,027. WEIGHING AND SUPPLYING APPARATUS.

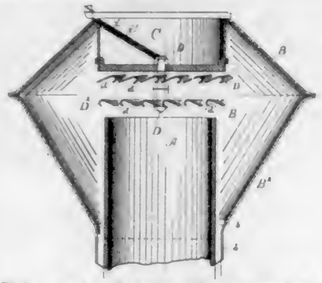
HENRY E. SNYDER, Philadelphia, Pa., assignor to the Weikel & Smith Spice Company, of Pennsylvania. Filed Dec. 7, 1883. (No model.)

Claim.—1. A hopper provided with a chute which is permanently uncovered, and an additional discharge throat or outlet, in combination with weighing devices which automatically cut off the supply of grain through said discharge throat or outlet whenever a certain quantity has been weighed, substantially as set forth.

2. A hopper provided with a permanently-open chute and an additional discharge throat or outlet, in combination with a plate, K, adapted to slide across said throat and clear it, a scale-pan arranged to receive the grain from said throat, and a scale-beam and connecting-rods through which the descent of said pan gradually moves said plate across said throat or outlet and closes the same, substantially as set forth.

3. A supply-pan and an endless conveyer for raising the material therefrom, in combination with a hopper which is fed by said conveyer and discharges into said pan, and automatic weighing devices, which are supplied through an independent outlet or discharge-throat of said hopper and operate to close the same when a certain quantity has been weighed, without closing the outlet whereby said hopper discharges into said supply-pan.

4. A supply-pan and an endless conveyer operating therein, in combination with means for imparting rotary motion to said pan, substantially as and for the purpose set forth.



5. A hopper provided with a chute which is permanently uncovered, and an additional discharge throat or outlet, in combination with weighing devices which automatically cut off the supply of grain through said discharge throat or outlet whenever a certain quantity has been weighed, and a counterbalance-weight controlling said devices and consisting of two sliding parts, operating substantially as set forth.

6. A hopper provided with a permanently-open chute and an additional discharge throat or outlet, in combination with a plate adapted to slide across said throat and close it, a scale-pan arranged to receive the grain from said throat, a scale-beam and connecting-rods through which the descent of said pan gradually moves said plate across said throat or outlet and closes the same, and a counterbalance-weight controlling said devices consisting of two sliding parts, substantially as and for the purpose set forth.

7. The combination, with an automatic weighing and supplying device, of a counterbalance-weight consisting of an upper constant part, H'''', and a lower part, H''''', one part being hollow and internally shouldered, and the other part having a connecting-stem formed with a T-head, substantially as and for the purpose set forth.

297,028. SPARK-ARRESTER.

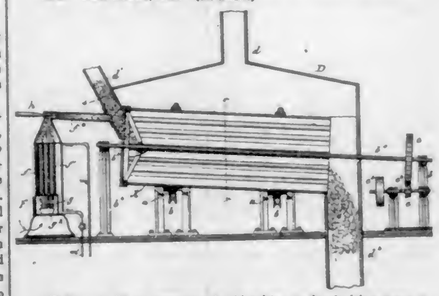
HARRY M. STAINFIELD, Bucyrus, Ohio. Filed May 2, 1883. (No model.)

Claim.—1. A spark-arrester having two vanes, one above the other, in the line of draft and loose upon their shaft.

2. A spark-arrester having two revolving vanes loose upon their shaft, the blades on one vane being at a reverse angle to the blades on the other vane, substantially as described.

3. In a spark-arrester, a vane having blades curled upon themselves to form recesses, substantially as described.

4. In a spark-arrester, a vane having blades provided with flanges d^2 and d^4, substantially as described.



5. In a spark-arrester, a vane having a blade provided with flanges d^3 and d^4, and a recess, d^2, substantially as described.

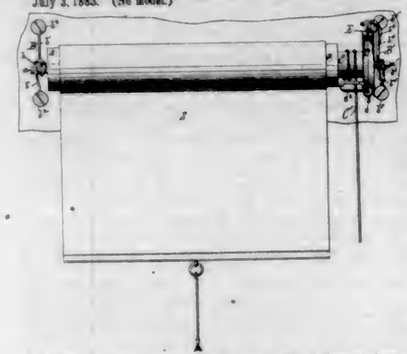
6. In a spark-arrester, the combination of a vane-post and a lubricator located outside the stack and connected with the post by a tube, substantially as described.

7. In a spark-arrester, the combination of a vane-post, a lubricator located outside the stack, and connected with the post by a tube inclosed within a tube, substantially as described.

297,029. METHOD OF AND APPARATUS FOR BLEACHING SUGAR.

OSCAR B. STILLMAN, Natick, and JOHN M. STILLMAN, Watertown, Mass. Filed Dec. 26, 1883. (No model.)

Claim.—1. In an apparatus for bleaching or decolorizing sugar, a chute or passage for the sugar, combined with an apparatus for the production of sulphurous-acid gas, and with a pipe to discharge the said gas into the sugar, substantially as described, to operate as and for the purposes set forth.

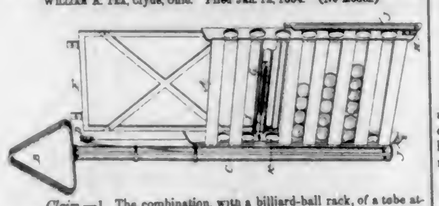


2. The chute *d*, for the passage of the crystallized or granular sugar, combined with the pipe f^7, to conduct sulphurous-acid gas into the said sugar, and with a pipe, *h*, to deliver steam into the pipe f^7, substantially as described.

3. A chute or conductor for the sugar, and rotary cylinder to receive the sugar from the said chute or conductor, combined with a pipe to conduct sulphurous-acid gas into the said sugar, and with an apparatus for the production of the said gas, as and for the purposes set forth.

4. In the art of manufacturing sugar, subjecting the crystallized or granular sugar, while in motion, to the action of sulphurous-acid gas, as and for the purpose described.

297,030. SHADE-FIXTURE.



HENRY E. STOVER, St. Louis, Mich. Filed July 3, 1883. (No model.)

Claim.—The combination, with the shade-roller A, journaled at *a a'* to run freely in bearings, as described, and provided with the barrel C and operating-cord C', together with the pulley D, of the bracket B, carrying the bearing b^3, and the friction-lever E, with its spring *e'*, arm *e*, and loop e^3, said bracket and lever being formed of a single piece of wire bent and turned upon itself to constitute said bearing, lever, spring, arm, and loop, as specified, and for the purpose set forth.

297,031. AUTOMATIC INCLINE POOL-BALL RACK AND SPOTTER.

WILLIAM A. TEA, Clyde, Ohio. Filed Jan. 12, 1884. (No model.)

Claim.—1. The combination, with a billiard-ball rack, of a tube attached to one side thereof, and means for raising and lowering the same, substantially as shown and described, whereby billiard-balls placed in the rack will be received in the tube and conducted to a table, as shown and described.

2. The combination, with a billiard-ball rack and a tube attached to one side thereof, of a triangular frame secured to the end of the tube, and means for raising and lowering the same, substantially as specified.

3. The combination, with a billiard-ball rack, A, provided with hinges I, and the tube C, attached thereto, of the frame F, hinged at one end to the rack at I, and at the other end to the wall, and the pulley D and weight and cord E, substantially as shown and described.

4. The combination, with the rack A, the tube C, the hinged frame F, the weight E, and pulley D, of the roller-hinges H on the rack, and the grooved ways J, as shown and described.

5. The combination, with the ball-rack A, the frame F, hinged thereto and to the wall, the roller-hinges H, the grooved ways J, and the tube C, of the brace-chains L, as shown and described.

6. The combination, with the rack A, hinged to swing, as described and the tube C, connected thereto, of the stop-door K and the spring G, for returning the same, as shown and described.

7. The combination, with the rack A, hinged to swing, as described, the tube C, attached thereto, and the stop-door K, hinged to the rack, of the two chains L, one connecting the rack and wall, and the other connecting the door K and the wall, as shown and described, the two chains being of such relative lengths that the rack A, when tipped down, will incline toward the tube C, and the door K will be held open, for the purpose specified.

297,032. SHUTTER-WORKER.

LEONARD TILTON, Brooklyn, N. Y. Filed Oct. 19, 1883. (No model.)

Claim.—1. The window-blind holder herein shown and described, consisting of the jointed arm A and stud B, and combined with means, substantially as described, for locking the sections of the arm A, at their pivotal points, at any desired position, as and for the purposes set forth.

2. The sections *a* and *a'*, hinged together and to the stud B, the stud being formed with notches *g'*, and the section *a* with notches *g*, in combination with the dogs G G', springs *l*, and cam F, all arranged to operate substantially as set forth.

297,032.

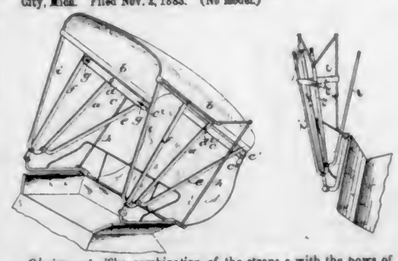
3. The section *a'* of the arm A, formed with the flanges *i i*, in combination with the section *a*, formed with the stop-lips *h h*, substantially as and for the purposes set forth.

4. The stud B, formed with lips *h' h'*, in combination with the section *a'* of the arm A, formed with the flanges *i i*, substantially as and for the purposes set forth.

5. The hollow section *a'* of the arm A, inclosing the sliding dogs G G', and springs *l l*, in combination with the cam F, arranged between the dogs, and adapted to be turned by crank I and locked by jam-nut J, substantially as described.

6. The cam F, arranged between the adjacent ends of the dogs G G', and formed with the stop-lips *g g*, substantially as and for the purposes set forth.

297,033. TERRET FOR HARNESS.



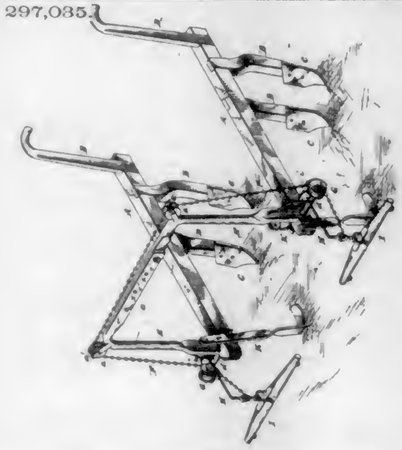
HARRY F. TOWNSEND and LEON A. TOWNSEND, Avon, Ill. Filed Oct. 13, 1883. (No model.)

Claim.—The combination of a terret having two perforated lips upon the lower end of one side, a lever curved to conform to the shape of the side of the terret and pivoted between the lips, and a spring bearing against the lower end of the lever and against the shank of the terret, as and for the purpose shown and set forth.

297,034. CARRIAGE-TOP FASTENER.

JOHN JACOB TRAVIS, Carson City, Mich. Filed Nov. 2, 1883. (No model.)

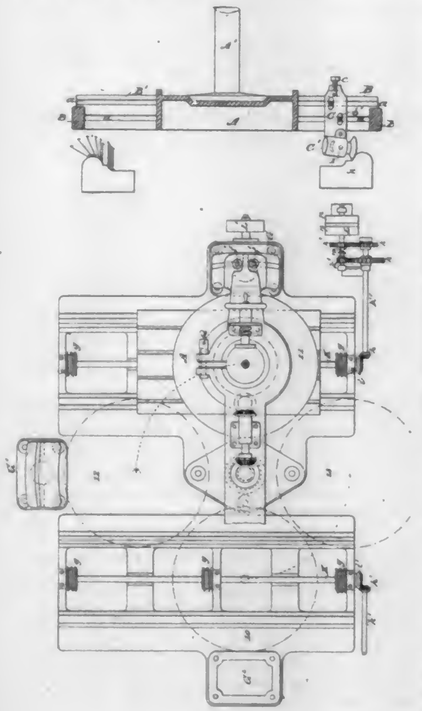
Claim.—1. The combination of the straps *c* with the bows of a carriage-top, said straps being attached at or near the middle to one bow *a*, and adapted to fasten around the bows and the braces *h*, to confine the bows when the top is folded down, substantially as described.



2. The straps *c*, attached at their middle to the bows *a*, and provided at their ends with button-holes, in combination with the buttons *g* on the bows *e f* at their upper ends, whereby the strap may serve as a brace, substantially as set forth.

297,035. CULTIVATOR.

MARTIN A. TRAVIS, Hamburg, Iowa. Filed Nov. 28, 1883. (No model.)



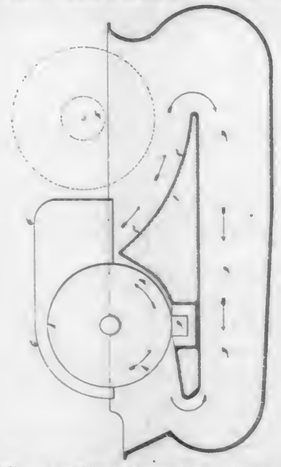
Claim.—The combination, in a cultivator, of the standards E E, adjustably secured together, and the beams A A and their attachments, the pulleys *a a*, the chain F, passing over the same, and the movable bars H H, passing through apertures in the plates *i i*, the bars having the ends of the chains attached to them, and the whiffletrees I, the bars by sliding back and forth serving to take up the slack of the chain as the standards are adjusted, and the chain permitting the whiffletrees to act together as a double-tree, substantially as specified.

297,035.

297,036. MACHINE FOR DRESSING STONE. FRANK TEIER, London, England. Filed Nov. 6, 1883. (No model.) Patented in England Jan. 30, 1883, No. 341.

Brief.—Rotating chucks carry tool-holders which carry rolling cutter-disks, said holders being adjustable vertically and horizontally on the chucks. The chucks are mounted in a swinging frame pivoted to one side of the track upon which the stone-supporting carriage runs, so that the chucks may be swung into position to cut either the top surface or the edge of a slab. Posts are located to support the outer end of the frame in either of its positions.

Claim.—1. In a stone-dressing machine, a cutter-carrying chuck or head having a series of arms for holding the cutter-carrying slides, said slides being adjustable toward and from the stone in a line parallel with the axis of vibration of the chuck, as set forth.

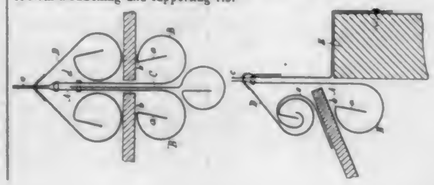


2. In a stone-dressing machine, a cutter-holding chuck or head consisting of a central spindle having arms radiating therefrom, and joined by an outer rim, in combination with cutter-carrying slides adapted to be vertically and horizontally adjusted on the arms, as set forth.

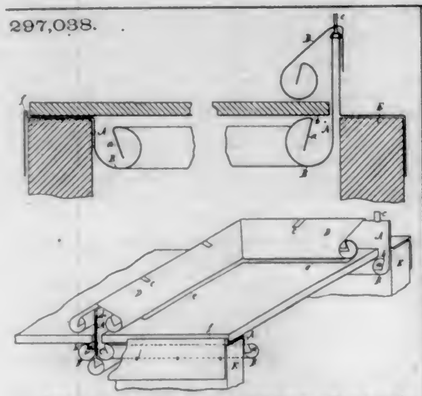
3. In a stone-dressing machine, a cutter-holding chuck having a series of slotted arms, to each of which are secured one or more slides, said slides being adjustable to and from the stone to be dressed in lines parallel with the axis of vibration, and also adjustable in lines at right angles to the line or axis of rotation, in combination with cutters and cutter-holders pivoted to the slides, said cutter-holders being adjustable in a circular direction around said pivotal point, as set forth.

4. As an improvement in the art of dressing stone with moldings or irregular surfaces thereon, a rotating chuck carrying a gang or gangs of cutter-carrying slides, said slides being adjustable on the chuck in vertical and horizontal planes, and to which are pivotally attached cutter-holders bearing independently-rotating cutters capable of adjustment around said pivotal point, whereby the cutters are adjusted and arranged to act on the stone at different angles and at varying depths, to give the required shape and finish to the surface of the stone by the continual rotation of the chuck, as set forth.

5. In a stone-dressing machine, a centrally-pivoted and horizontally-swinging beam supported at its ends (when in working position) by columns G G' G², said beam being provided with cutter-holding chucks, in combination with a vertical shaft passing up through the pivot of the beam, which is geared to the main driving-shaft at the bottom and to shafts at the top, for driving the cutter-holding chucks, as set forth.



297,037. MACHINE FOR PREPARING PULP FOR PAPER-MACHINES. WILLIAM UNTHERSTON, Leith, Scotland. Filed Jan. 28, 1884. (No model.) Patented in England Mar. 17, 1880, No. 1,150.

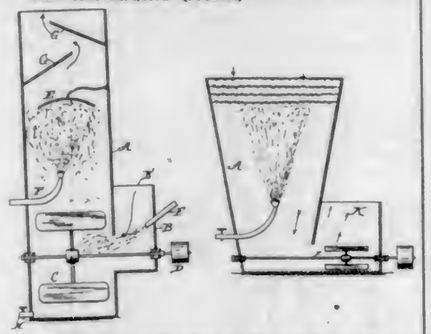


Claim.—A machine for preparing pulp, consisting of the roll A, bottom plate, B, and back-fall C, said parts being arranged to operate within a trough having a passage, D, beneath such parts, through which the pulp is returned for repeated treatment, as described.

297,038. SKYLIGHT. CHARLES A. VAILE, Baltimore, Md. Filed June 20, 1883. Renewed Mar. 17, 1884. (No model.)

Brief.—The glass supports and the bearing portion of the cover are of tubular form, the interior edges of the plates being bent downward to form a stiffening and supporting rib.

297,038.



Claim.—1. A skylight-bar of open tubular form, with an inwardly-projecting stiffening and water-conducting strip, substantially as specified.

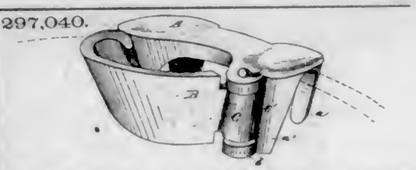
2. In combination with the open tubular portion of a skylight-bar, the sheet-lead strip e, combined with and arranged with reference to the said bar, substantially as and for the purpose specified.

3. In combination with the sheet A, bent so as to give two open tubular bearings for the glass plates, the stiffening-bar C, substantially as specified.

297,039. AIR-COOLING MACHINE. WILLIAM V. WALLACE, Boston, Mass. Filed Mar. 4, 1884. (No model.)

Claim.—1. The method herein described of cooling and moistening air in rooms or apartments, the same consisting in spraying or pouring water or other air-cooling liquid directly onto rapidly-revolving and positively-driven air-agitating surfaces, as set forth.

2. In a device for cooling and moistening air, the combination of a fan-blower or other air-agitating devices with sprays or jets of water let into the apartment in which the fans are located, or into the channel through which the air is forced, and onto the rapidly-revolving surfaces of the fan-blower, as set forth.

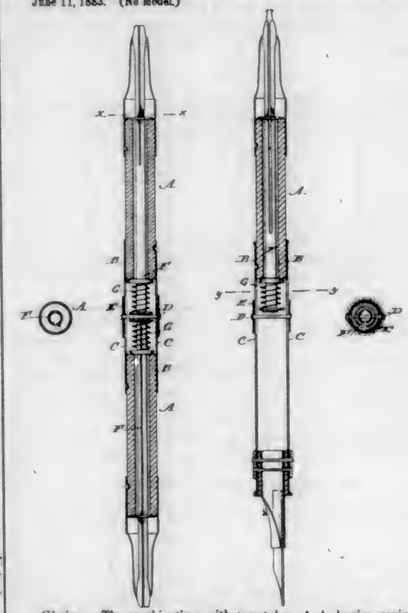


3. In a device for cooling and moistening the air of rooms and apartments, a fan-blower mounted in a suitable casing, having air inlets and outlets, the vanes or shaft of said fan-blower being provided with buckets adapted to be revolved by a stream of water coming in contact therewith, as set forth.

4. In a device for cooling and moistening the air of rooms or apartments, a fan-blower adapted to be revolved in a chamber in which sprays or jets of water are thrown, in combination with a series of spray-guards, whereby the free water is prevented from being thrown into the apartment, as set forth.

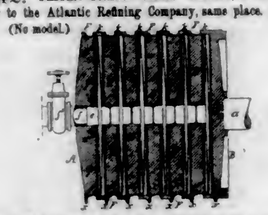
297,040. MOP-WRINGER. JAMES F. WALTER, Waterloo, Iowa, assignor to A. D. Ellis, same place. Filed Oct. 11, 1883. (No model.)

Claim.—1. As a new article of manufacture, the mop-wringer herein described, consisting of the castings A and B, hinged to each other, the casting A being provided with means for attachment to the rim of a bucket, and the curved tapering casting B provided at its free end with



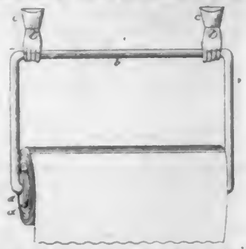
297,040.

a hook portion, C, having an upwardly-inclined lower edge, substantially as set forth.



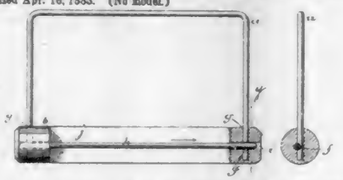
2. The improved mop-wringer herein described, consisting of the portion A, having downwardly-projecting arms *a a'* and projecting ears *b b*, through which passes a connecting-pintle, and the casting B, tapered from its upper edge downwardly, and provided with an eye, *c*, having a stop, *c'*, formed thereon, and at its opposite end an inwardly-curved portion, C, having its lower end beveled upwardly, substantially as described and shown.

297,041. PENCIL. GEORGE CHARLES WARD, Girard, Kans. Filed June 11, 1883. (No model.)



Claim.—The combination, with two tubes, A A, having spring-pressed pencil-holders F F, of a tube, B, having two longitudinal slots, C C, and a sliding sleeve, E, provided with the cross-pin D, as and for the purpose specified.

297,042. FILTER-PRESS. HENRY WARDEN, Philadelphia, Pa., assignor to the Atlantic Refining Company, same place. Filed May 24, 1883. (No model.)

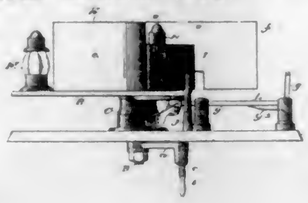


Claim.—The combination, in a filtering-press, of a series of grooved plates, one plate having a flange overlapping the periphery of the adjoining plate, with filtering-disks folded at and near their outer edges over the periphery of one plate and attached thereto, all substantially as set forth.

297,043. TOILET AND WRAPPING PAPER HOLDER. SETH WHEELER, Albany, N. Y. Filed Apr. 16, 1883. (No model.)

Claim.—As a new article of manufacture, a toilet-paper fixture composed of a bail or handle made of light wire bent to form laterally-yielding spring-arms, and provided with means for attachment to the ends of a central core, said spring-arms being of a length that will permit them to be grasped above the edge of the core for the purpose of expanding for removal from the core, and a suspension device, substantially as shown, connected with said bail, so as to permit a swinging movement of the bail when the roll of paper is suspended, substantially as described.

297,044. TOILET-PAPER FIXTURE. SETH WHEELER, Albany, N. Y. Filed Apr. 16, 1883. (No model.)

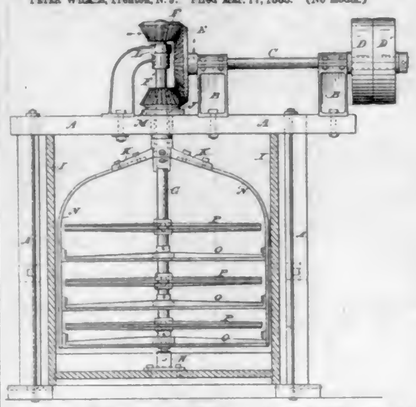


Claim.—A toilet-paper fixture composed of a bar provided with vertical and longitudinal slots near both ends and recessed between its ends, in combination with a bail-handle notched near both ends and entering the vertical slots from the periphery of the bar, and a transverse rod entering the longitudinal slots and the notches of the bail-handle, substantially as described.

297,045. WRAPPING OR TOILET PAPER FIXTURE. SETH WHEELER, Albany, N. Y. Filed Feb. 6, 1884. (No model.)

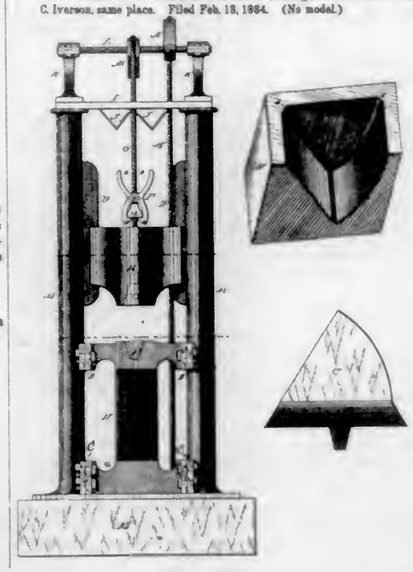
Claim.—In a toilet-paper fixture, the spring-handle having its ends bent to form hooks, in combination with the roller having vertical slots through its periphery to permit the passage of the hook ends of the handle, and the engagement of such ends with the roller, substantially as described.

297,046. NAUTICAL SIGNAL-LIGHT. MERRITT WHITE, North Adams, Mass. Filed Jan. 22, 1884. (No model.)



Claim.—1. In nautical signals, the combination of a revolving platform, colored lights upon the same, and a shield stationary relatively to said platform and lights, substantially as and for the purpose described.

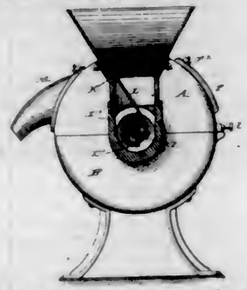
2. In nautical signals, the combination of a revolving platform, colored lights upon the same, cams attached to the same, and a steam-whistle having connection with said cams, substantially as and for the purposes described.



3. In nautical signals, the combination of a revolving platform, colored lights upon the same, cams attached to the same, a steam-whistle having connection with said cams, and a spring-detent handle for revolving and holding said platform in the desired position, all arranged and operating substantially as described.

297,047. BLUNGER FOR MIXING CLAY FOR POTTERS' USE. PETER WILCH, Trenton, N. J. Filed Mar. 17, 1883. (No model.)

Claim.—In combination with a suitable frame, A, and clay-tank I, the vertical shaft G, provided with cross-arms P, cage N, provided with cross-arms O, the shaft G passing centrally through both sets of arms, and adapted to be rotated in a direction opposite to that of the cage N, by means substantially as described, for rotating the cage and shaft, as hereinbefore set forth.

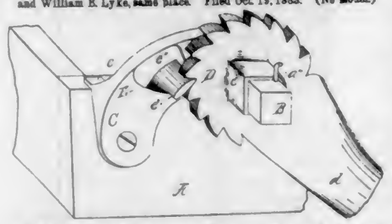


297,048. MACHINE FOR DOUBLE-SEAMING ELEVATOR-BUCKETS. CHARLES J. WILLIAMS, Milwaukee, Wis., assignor of one-half to John C. Iverson, same place. Filed Feb. 13, 1884. (No model.)

Claim.—1. The combination of the columns A, provided with the flanges B and C, and guideways D D, of the cross-blocks F, H, and G, cap-piece I, and journal-standards K K, shaft L, pulleys M and N, ropes O and A', and drop-block R, all substantially as and for the purpose specified.

2. In a drop-press, the combination of the former B', having beveled or rounded corners *b b*, and punch or block C', conforming in shape to the interior surface of the bucket to be swaged, substantially as and for the purpose specified.

297,049. GRINDING-MILL. JAMES P. WINCHELL, Springfield, Ohio. Filed Sept. 5, 1883. (No model.)



Claim.—1. In a grinding-mill, the combination, with the case A B, having opposite openings, N N, in its upper portion, of a removable tangential spout, and a plate for closing the opening opposite the attached spout, substantially as specified.

2. In a grinding-mill, the combination of a hopper having inclined walls, an inclined vibrating agitator-plate, and the crusher beneath the said hopper and agitator-plate, substantially as specified.

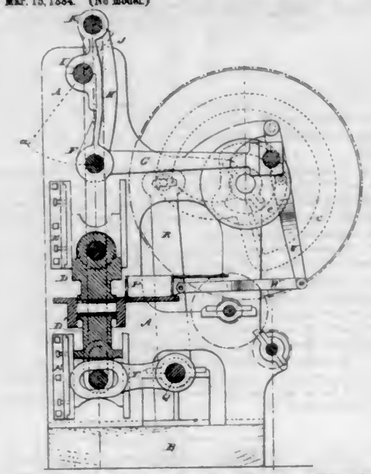
3. In a grinding-mill, the combination, with the shaft and the disk D, having the mortise *f* in its hub H, of the crusher I, having a tenon, *f'*, on one end and keyed near the other end to the shaft, substantially as specified.

297,050. WINDLASS. GEORGE W. ZIEGLER and GEORGE W. GRAVES, Norwalk, Ohio, assignors, by direct and mesne assignments, to said Graves and William B. Lyke, same place. Filed Oct. 19, 1883. (No model.)

Claim.—1. In hoisting devices, the combination, with the shaft and winding mechanism and pawl for holding the same against return movement, of a gudgeon or bearing adapted to bear the strain imposed upon the pawl, substantially as described.

2. In hoisting devices, the combination, with the shaft, constructed as described, of the collars *a a'''*, said collar *a'''* formed integral to the gudgeon, and said gudgeon formed substantially as and for the purpose set forth.

3. The shaft formed of different diameters, for the purpose described, in combination with the gudgeon, ratchet-wheel, and pawl, said pawl formed with the branch *e'*, which projects through an opening in the gudgeon, substantially as and for the purposes set forth.



4. The combination, with the shaft having its larger outer end provided with the concavity, of the ratchet-wheel having flanges around its bore on the outer face, recessed as described, and pin *a''*, said wheel having cast with it the crank-arm *d*, for the attachment thereto of a crank, substantially as set forth.

5. The combination, with the shaft and ratchet-wheel, of the gudgeon and pawl, said gudgeon being formed with the lugs *e e* and opening *e''*, and said pawl operating with the gudgeon, substantially as described.

6. The combination, with the gudgeon formed and secured to frame A, as described, of the pawl located and pivoted in the hollow face of said gudgeon, the ratchet-wheel, and shaft, all operating substantially in the manner described.

7. The combination, with the shaft and ratchet-wheel, of the gudgeon and pawl, said gudgeon having the hollowed face, and forming at the end a bearing for the pawl, said pawl pivoted therein and adapted to bear against the sides and bottom thereof, to relieve its pivotal point from strain.

297,051. BRICK-MACHINE. WILLIAM ANDROS, Keokuk, Iowa. Filed Mar. 15, 1884. (No model.)

Claim.—1. In a brick-machine, a toggle-pressure pivoted in the frame of the machine eccentrically to a line drawn through the center of said toggle, the upper section being provided with an extension to which the rods for operating the lower plunger are secured, as set forth.

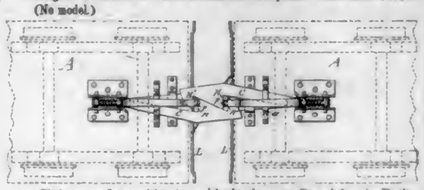
2. In a brick-machine, a toggle-pressure operated from its joint by devices substantially such as described, the upper section of which is pivoted eccentrically near its upper portion to the sides of the machine, while the upper end is provided with trunnions or arms, to which are secured the rods for operating the lower plunger, as set forth.

3. In a brick-machine, a toggle-pressure pivoted in the sides of the frame of the machine, as described, and to which the upper plunger is attached and adapted to be operated from its joint, and to the upper end of which are attached rods, which are secured to and connect the lower plunger with the free end of the toggle-pressure, whereby the upper plunger is adapted to be thrust downward and the lower plunger pulled upward simultaneously, as set forth.

4. In a brick-machine, a toggle-pressure pivoted eccentrically, as described, to the frame of the machine, and provided with an upwardly-extended portion, in combination with an operating-bar secured to the joint of the toggle, and with the bars for operating the lower plungers, as set forth.

5. In a brick-machine, a lower plunger, adapted to be raised and lowered, in combination with a rock-shaft operated as described, whereby the lower plunger is carried up and the brick is ejected from the mold, as set forth.

297,052. CAR-COUPLING. FREDERICK RALDT, Chester, Pa. Filed Feb. 20, 1884. (No model.)

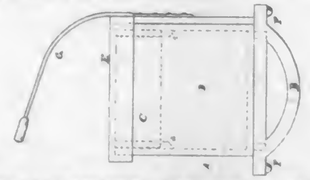


Claim.—1. A sectional cast-metal draw-bar having upper and lower plates, and intermediate skeleton web, C, and thimbles, substantially as described, riveted together, as and for the purpose set forth.

2. A sectional cast-metal draw-bar consisting of the plates A and B, skeleton casting C, and thimbles, all riveted together, substantially as set forth.

3. A sectional cast-metal draw-bar consisting of the plates A and B, skeleton castings C and D, and thimbles, all riveted together, substantially as set forth.

297,053. CAR-COUPLING. CHAS. O. BARNES, Baldwinsville, N. Y., assignor of one-half to Lucien Barnes, Sr., same place. Filed Mar. 6, 1884. (No model.)

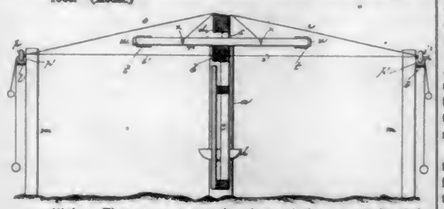


Claim.—1. In combination with the bumper D and its pin P, the lateral vibratory hook H, adapted to engage with the pin of the approaching car, beneath the draw-head thereof, substantially as shown and described.

2. In combination with the bumper D, the brace B, beneath said draw-bar, the pin P, extended through the brace, and the lateral vibratory coupling-bar C, having two hooks, H H', adapted to simultaneously engage, respectively, the two pins of the cars to be coupled, substantially in the manner set forth and shown.

3. In combination with the bumper D, the brace B, underneath said bumper, the coupling-pin P, extended through the brace, the lateral vibratory coupling-arm C, arranged between the bumper and brace, and provided with the brace-hook H and coupling-hook H', the flexible stirrup *a*, supporting and actuating the coupling-arm C, and the lever L, extended across the car, and having the arm *l*, connected with the aforesaid coupling-arm, substantially as described and shown.

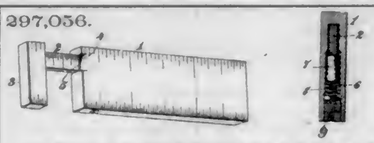
4. In combination with the lateral vibratory coupling-arm C and lever L, connected therewith, the supplemental lever M, connected to the top of the car and with the lever L, substantially as and for the purpose shown and set forth.



297,054. ASH-SIFTER. ELIZABETH BATESON, Detroit, Mich. Filed Sept. 8, 1883. (No model.)

Claim.—1. The combination of the receiving-receptacle provided with a cover, the sieve within the receptacle, the rockers below the bottom thereof, and the elastic stops outside of the receptacle, substantially as described.

2. The combination of the receiving-receptacle provided with the cover and operating-handles, the sieve within the receptacle, the rockers below the bottom of the receptacle, and the elastic stops outside of the receptacle, substantially as described.

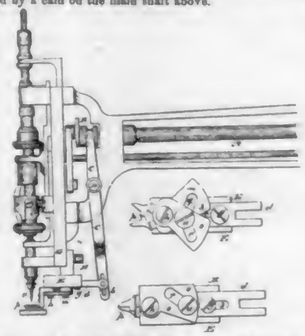


297,055. GATE. ROBERT F. BAUGHM, Lexington, Miss. Filed May 12, 1883. (Model.)

Claim.—The gate-post *a*, having the notched cross-arm A and the lifter *e*, and latch-wires for operating said lifter, in combination with a pivoted gate swinging vertically, provided with a cross-arm, *r*, carrying sliding latches at its ends, and a gravitating latch on the inner end rail of the gate, with latch-wires and opening-wires for operating the same, substantially as specified.

297,056. CALIPER-RULE. STEPHEN H. BELLOWS, Athol, Mass., assignor to the Standard Tool Co., same place. Filed Feb. 16, 1884. (No model.)

297,056.



Claim.—1. A caliper-rule composed of the rule and the slide carrying the caliper-head, the rule having its inner end at a point directly opposite the face of the slide beveled or recessed and brought to a practically sharp or thin edge for reading the graduations on the slide, and starting the latter outward by the finger-nail, substantially as described.

2. The combination, with the caliper-rule composed of the rule having a transverse orifice and the slide carrying the caliper-head and provided at its inner end portion with a recess or notch, of a gib or shoe bearing against the slide and a spring held in the orifice under tension to press the gib or shoe on the slide, substantially as described.

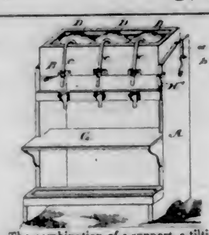
3. The combination, with the caliper-rule composed of a rule having a transverse orifice and the slide carrying the caliper-head, of a gib or shoe in the orifice, a spring pressing the gib or shoe on the slide, and the set-screw in the outer end of the orifice holding the spring under tension, substantially as described.

297,057. PROCESS OF AND CUTTING APPARATUS FOR SEWING AND EMBROIDERING. LEON BERTRAND, Paris, France, assignor to Emile Cornely, same place. Filed July 27, 1883. (No model.)

Brief.—The upwardly-drawn thread at the completion of each stitch is clipped off above the bed-plate by a pair of cutting-blades which are operated by a slide that is reciprocated by a lever whose upper end is actuated by a cam on the main shaft above.

Claim.—1. In the art of machine sewing and embroidering, the process consisting in first forming a stitch in the ordinary way, and, second, cutting the thread above the fabric after the completion of the said stitch and before the commencement of another, whereby a velvet or peluche seam is produced, substantially as described.

2. The combination, with the needle of a sewing and embroidering machine, of cutting apparatus arranged to operate in the path of the needle to sever the sewing-thread after the formation of a stitch, and connections for operating said cutting apparatus from a movable part of the machine, substantially as described.



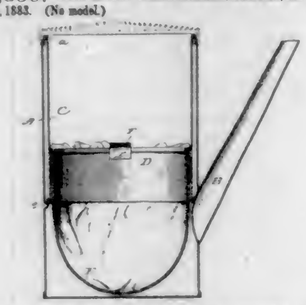
3. The combination, in an organized sewing and embroidering machine, with the needle-bar and its operating devices, of thread-cutting mechanism, arranged in close proximity to the cloth-plate, and connections for operating said mechanism from a movable part of the machine to sever the sewing-thread when the needle is clear of the warp, substantially as described.

4. The combination, with the sewing and embroidering machine, of the shears operating in the path of the needle, slides and levers, as specified, and operating means for closing said shears to cut the thread when the needle is above the cloth-plate, and for opening them to permit the descent of the needle, substantially as described.

5. The combination, in a sewing and embroidering machine, of the pivoted plates, the shear-blades carried thereby, the slide having a stud or pin working in oblique slots in said plates, and means for reciprocating said slide from a moving part of said machine, substantially as described.

297,058. APPARATUS FOR FILLING VESSELS. MARTIN L. BEST, Canton, Ohio, assignor of two-thirds to Jacob Miller and Levi L. Miller, both of same place. Filed Aug. 4, 1883. (No model.)

297,058.



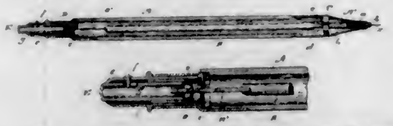
Claim.—1. The combination of a support, a tilting receptacle journaled therein, a stop for holding said receptacle in its raised position, and a stop for upholding it in its lowered position, substantially as described.

2. The combination of a support, a tilting receptacle journaled therein, a series of vessels within said receptacle, and a siphon leading from each vessel, substantially as described.

3. The combination of a support, a tilting receptacle journaled therein, a series of vessels within said receptacle, caps to each of said vessels, and a siphon leading from each vessel, substantially as described.

4. The combination of a support, a tilting receptacle journaled therein, a series of cups of different capacities communicating with one another and contained within said receptacle, and means for delivering the contents of said vessels from out of the same, substantially as described.

297,059. COFFEE-POT. FRED J. BICKNELL, Rockland, Me. Filed Oct. 31, 1883. (No model.)

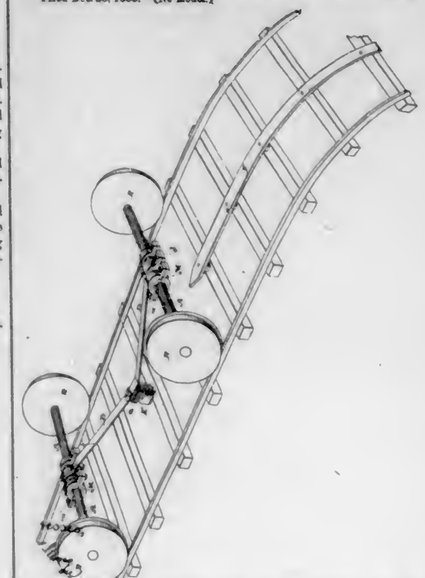


Claim.—1. An attachment to coffee-pots, consisting of a cylinder open at both ends and supported within the pot, the adjustable ring within the cylinder provided with the parts E and F, for the purpose set forth, and a straining substance, all as set forth.

2. The attachment to coffee-pots, consisting of a cylinder supported within the pot, and an adjustable ring within the cylinder provided with a handle, F, upon the upper side, and a curved hoop, E, upon the under side, substantially as described.

3. In combination with the inner cylinder, the ring having hoop E upon its under side, adapted to distend the straining material, and the handle F.

297,060. LEAD AND CRAYON HOLDER. CLAES W. BOMAN, New York, N. Y., assignor to Joseph Reckendorfer, same place. Filed May 1, 1883. (No model.)

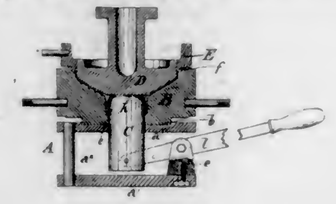


Claim.—1. The combination of the handle, the longitudinally-movable freely-sliding stem, the stop, the spring-closed stem-holding device, and the longitudinally-movable spring-controlled pressure-cap operating, when pushed forward, to force open the said device and release the stem, substantially as hereinbefore set forth.

2. The combination of the handle, the longitudinally-movable freely-sliding stem, the stop, the spring-closed stem-holding jaws, and the longitudinally-movable pressure-cap sliding between said jaws, operating, when pushed forward, to force apart said jaws, and actuated by said jaws to return to its original position when released from hand-pressure, substantially as set forth.

3. The handle, the longitudinally-movable freely-sliding lead-holding stem, the rotatable screw compressing-sleeve mounted thereon, and the stop attached to said sleeve and engaging the handle, substantially as described, in combination with the rotatable sleeve *e*, the spring-closed stem-holding jaws, and the pressure-cap, substantially as hereinbefore set forth.

297,061. SAFETY CAR-TRUCK. SAMUEL BROWN, San Francisco, Cal. Filed Dec. 28, 1883. (No model.)



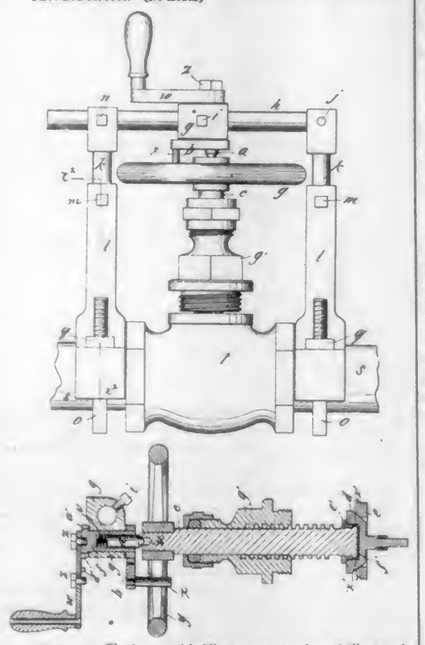
Claim.—1. In a safety car-truck, and in combination with the axles, the bar D, having boxes formed on each end, in which the axles are journaled, and the clamp or guard E, secured to said bar, substantially as herein described.

2. In a safety car-truck, and in combination with the axles, the bar D, the ends of which are formed to encircle the upper semi-circumference of the axles, the caps *d*, formed to encircle the lower semi-circumference, and bolted to the ends of the bar, whereby boxes are formed in which the axles are journaled, and the clamp or guard E, secured to said bar, substantially as herein described.

3. In a safety car-truck, the bar D, extending between the axles, which are journaled in its ends, as described, in combination with the clamp or guard E, bolted to said bar, and the intervening thin plates, *e*, between said bar and clamp, whereby the latter may be vertically adjusted, substantially as herein described.

4. In a safety car-truck, the axles A and the sleeves M, clamped and secured thereto, and formed, as shown, with shoulders *m*, in combination with the bar D, the ends of which form boxes or journals encircling the sleeves M of the axles, and the clamp or guard E, secured to said bar, substantially as herein described.

297,062. GLASS-MOLD AND THE PRODUCT THEREOF. WM. H. BRUNT, Baldwin, Allegheny County, assignor to Voigt, Ward & Co., Pittsburg, Pa. Filed Jan. 28, 1884. (No model.)



Claim.—1. In a glass-mold, the combination of the body portion B, having suitably-shaped recess and an uncontracted central vertical opening therein, the guide-ring E, the upper plunger, D, the lower plunger, C, having a suitably-shaped boss on its upper end, and mechanism for operating said plungers, substantially as set forth.

2. In a glass-mold, the combination of the body portion B, the guide-ring E, the solid upper plunger, D, the lower plunger, C, having its upper end beveled or cut away, as shown, and having suitably-shaped boss thereon, and mechanism for operating said plungers, substantially as set forth.

3. In a glass-mold, the combination of the body portion B, the guide-ring E, the upper plunger, D, and the lower plunger, C, said plungers meeting in horizontal plane, the upper plunger having a suitably-shaped boss on its upper end, substantially as set forth.

4. A shade-holder for lamps having a cylindrical or bowl-shaped body portion united to a suitably-shaped base or support, and having an internal flange at or near the junction of the base and body, forming an increased body of glass at that point, substantially as set forth.

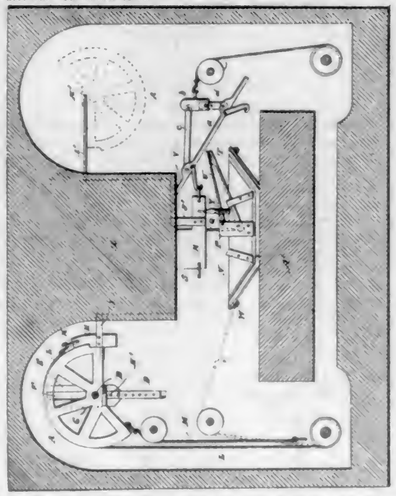
297,063. VALVE-GRINDER. HARRY W. BURLEIGH, Franklin, N. H. Filed Dec. 11, 1883. (No model.)

Claim.—1. The improved holding device for valve-grinding mechanism, consisting of clamp-stands *l*, having means for being clamped to the pipe, the rods *k*, fixed adjustably in said clamp-stands, and the shaft *h*, pivoted to one of the said clamp-stands and detachably secured to the other, substantially as described.

2. The combination of the adjustable block *g*, having the center-shaft *f*, and center *a*, with supporting-shaft *h*, adjustable rods *k*, and the clamp-stands *l*, said center-shaft *f* having the driving-arm *b* and a crank, *w*, or other means for driving it, substantially as described.

3. The crank *w*, having one or more holes for the attaching-screws *r*, and one or more studs *d'*, in combination with the center-shaft *f*, having the pinion *a'*, substantially as described.

4. The clamp-stands *l*, having sockets and binding-screws for the rods *k*, and adjustable clamping mechanism for the lower ends of said rods *k*, for connecting with the pipe *s* and the rods *k*, substantially as described.

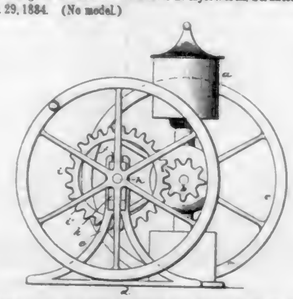


5. The flexible washer *f'*, in combination with the valve *d*, bush *s'* and stem *c*, for connecting the same, substantially as described.

6. The combination of the center-holding block *g*, tubular center shaft *f*, center *a*, and spring *v*, said shaft *f* having a driving crank or pinion and a driving-arm, *b*, and pin *x*, substantially as described

---

297,064. MINING APPARATUS. THOS. W. CAMPBELL, Valley Falls Kans. Filed Oct. 10, 1883. (No model.)



Brief.—Segments with grooved peripheries for operating chains are each provided with a bar perforated for securing it in a longitudinally-slotted casting, in which such bar is adjusted. The mass between the channels of the segments is acted on by a cutter on a reciprocated carriage pressed to work by a spring and lever, and having an "excavator-bar" connected to it.

Claim.—1. The combination, with the segment having a peripheral groove, of the flat perforated bar, to which said segment is journaled, the longitudinally-grooved cast-metal section, and means for adjusting the bar thereto, and the drive ropes and pulleys, the whole being adapted to be secured to the floor of the mine-drifts and operated by a suitable motor, substantially as specified.

2. The combination, with the carriage and the mechanism for moving the same, of the cutters and the spring and lever for holding the same to their work, and the excavator secured to the cutter-section, the whole arranged to operate substantially in the manner and for the purposes specified.

297,065. COFFEE-MILL MOTOR. ALBERT JUDSON CLARK, Carbondale, assignor of one-half to Judson D. Aylsworth, Scranton, Pa. Filed Feb. 29, 1884. (No model.)

Claim.—1. In a motor for coffee and spice mills, the combination, with the base provided with the bifurcated standards, of the combined fly and gear wheel having a suitable handle, and a fixed pinion on the end of the shaft of the mill-shaft, substantially as specified.

2. In a motor for coffee and spice mills, the combination, with the bifurcated standards on a suitable base, of the adjusting and securing blocks forming bearings in the bifurcations for the shaft of the combined fly and gear wheel, the combined fly and gear wheel provided with a handle, and an engaging-pinion on the mill-shaft, substantially as specified.

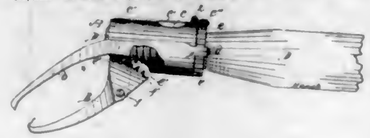
3. In a hand-mill, the combination, with the mill-frame provided with vertical standards at one end forming bearings for the shaft of the driving-wheel, of the pinion on the mill-shaft, and the combined fly and gear wheel provided with a suitable handle, substantially as specified.

297,066. SAFETY-VALVE AND MUFFLER. JOSEPH M. COALE, Baltimore, Md. Filed Jan. 17, 1884. (No model.)

Claim.—1. The combination of the valve proper, the diaphragm above the same, the auxiliary valve, and the tubular auxiliary valve hub or stem resting in a recess or socket in the valve proper, and formed with vent-holes for the escape of steam that may leak through into the chamber formed by the valve proper and diaphragm, as and for the purposes hereinbefore set forth.

2. The combination of the valve proper, A, the diaphragm C, the auxiliary valve B, the hub or stem B', provided with vent-holes R, the valve-spring, and the spring-case C, having outlets R', as and for the purposes hereinbefore set forth.

3. The spring-case G, carrying the muffler, and having outlets M, which open into the muffler, and outlets R', which have no communication with the muffler, in combination with the valve proper, A, the diaphragm C, the auxiliary valve B, and the hub or stem B', provided with vent-holes R, as and for the purposes hereinbefore set forth.



4. The combination, with the main and auxiliary valves, of the valve shell or body, and the adjusting-case having the lip W and the diaphragm C, as and for the purposes hereinbefore set forth.

5. The case D, adjustable on the valve shell or body, and provided with lip W and diaphragm C, in combination with the main and auxiliary valves, their controlling-spring, and means for adjusting the tension of said spring, substantially as hereinbefore set forth.

6. The valve shell or body and the case D, adjustable thereon, and having diaphragm C and lip W, in combination with the spring-case G, carried by said adjustable case, the main and auxiliary valves A B, the valve-controlling spring, and means for adjusting the tension of said spring.

7. The combination of the valve shell or body, the case D, adjustable thereon, and the spring-case G and muffler, carried by and movable with said case D, substantially as hereinbefore set forth.

297,067. MOP AND BRUSH HOLDER. WILBER F. CORNELIUS, Muncie, Ind. Filed Nov. 5, 1883. (No model.)

Claim.—1. In a mop and brush holder, the ferrule A, provided with lugs *b'''*, in combination with jaws B *b b'*, screw C, ratchet and pawl, and catches *d*.

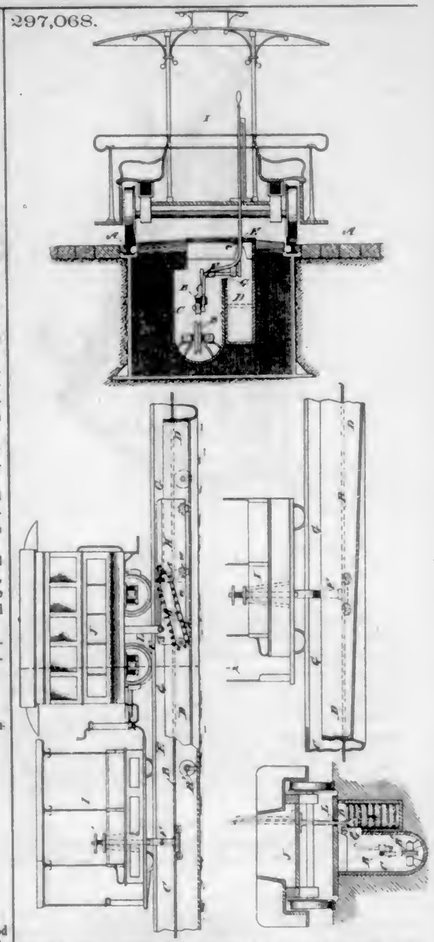
2. In a mop and brush holder, the ferrule A, having a spring-pawl, *c' c'''*, lugs 1 2, and catches *d*, in combination with the jaws and screw C.

3. The combination of the screw C, having ratchet *e*, and threads *e'*, with the catches *d* and ferrule A, having lugs 1 2, and spring-pawl *c' c'''*.

4. In a mop and brush holder, the combination of jaws B *b b'*, lugs *b'''*, screw C, handle D, ratchet *e*, pawl *c' c'''*, and lugs 1 and 2, all for the purpose set forth.

297,068. ENDLESS-CABLE-TRACTION RAILWAY. FREDERICK G. CORNING, Brooklyn, N. Y. Filed Jan. 19, 1884. (No model.)

Brief.—A supplemental tunnel located alongside the cable-tunnel and under the grip-slot receives the drip and other refuse from the street-surface, and is connected with said cable-tunnel by a continuous longitudinal slot, through which the grip enters the cable-tunnel. The refuse is removed from the supplemental tunnel by cleaning mechanism actuated by the cars.



Claim.—1. In an underground tunnel for endless-cable traction, the combination of a tube containing an endless cable, with a second tube, at the top of which is a vertical slot opening upward to the street, both tubes or tunnels being continuously connected by a horizontal slot or opening, and in combination with a gripping device passing through both the vertical and the horizontal slots, substantially as described.

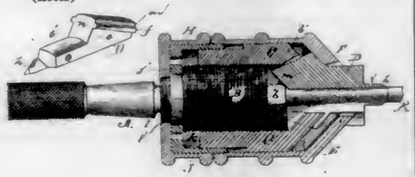
2. In an underground tunnel for endless-cable traction, the combination of tube C, containing the endless cable B, with a second tube, D, having an independent inclined bottom, at the top of which tube is a vertical slot, E, provided with lip *e*, said slot opening upward to the street, both tubes C and D being continuously connected by the horizontal slot G, and in combination with a gripping device passing through both the vertical and horizontal slots, substantially as described.

3. In an underground tunnel for endless-cable traction, a tube containing an endless cable and a second tube containing any suitable brush communicating by a vertical slot, opening upward, with the street, both tubes being communicating by a horizontal slot, in combination with a gripping device passing through both the vertical and horizontal slots, substantially as described.

4. In an underground tube or tunnel with a vertical slot in which an endless cable travels, the combination of a partition, P, in such tunnel, placed between the cable and the vertical slot, with a continuous horizontal slot or opening, G, between the edge of such partition and the top of the tube or tunnel, substantially as described.

297,068.

297,069. CULTIVATOR. THOMAS JEFFERSON CRAFT, Ellisville Depot, Miss. Filed Dec. 6, 1883. (No model.)

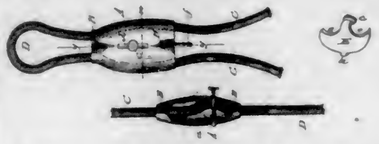


Claim.—1. The combination of the central beam, the triangular hollow casting, and the doubled outer beams, hinged at their doubled ends to the rear corners of the triangular casting, and secured at their inwardly-bent rear ends to the rear end of the central beam, as and for the purpose shown and set forth.

297,069.

2. The herein-described combined cultivator and gang-plow, consisting of the central beam, the triangular hollow casting, the outer doubled beams, hinged at their doubled ends to the rear corners of the triangular casting, and having slotted inwardly-bent rear ends sliding with their slots upon the rear reduced end of the central beam, and connected adjustably together by means of a nutted bolt passing through the slots, handles secured movably at their forward ends to the triangular casting, uprights pending from the rear portions of the handles and secured adjustably to the slotted end pieces by means of nutted bolts, and the braces hinged to the triangular casting, crossing each other, and hinged at their rear ends to the rear ends of the outer bars, as and for the purpose shown and set forth.

297,070. LATHE-CHUCK. GEORGE W. DAVIS, New Bedford, Mass., assignor of one-half to Ezekiel H. Noble, same place. Filed Dec. 13, 1882. (Model.)

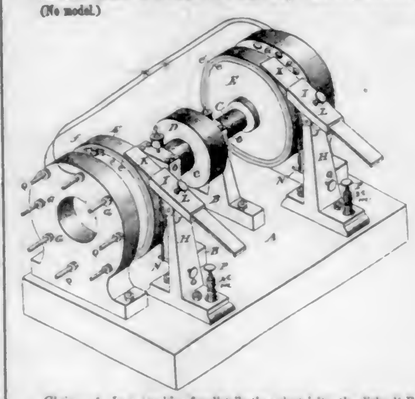


Claim.—1. The combination, in a lathe-chuck, of the stock having a threaded head provided with a front tapering portion, against which bears a series of cutting-dogs, a case traveling on the said head and adapted to exert a downward pressure on the dogs, and a shell concentric with the cap and clamping the dogs against the conical front portion of the head, and rigidly secured by engaging a threaded cap, against which bears the head, and which is re-enforced by a second cap secured on the stock, substantially as set forth.

2. The combination, in a lathe-check, of a case traveling on a threaded head and having a front conical portion, a series of openings near the center and radiating therefrom, and provided with grooves *d*, adapted to receive ribs on the body portions of the cutting-dogs which rest snugly in the said radiating openings, and a shell concentric with the said case and adapted to clamp the dogs against the said head and screw-threaded at its rear for engagement with a threaded cap, substantially as set forth.

3. The combination, in a lathe-chuck, of an interiorly-threaded case traveling on the threaded body of the head of the stock, and having a front conical portion provided with inclined grooved openings adapted to receive inclined body portions of a series of dogs ribbed as described, and a shell, substantially as set forth.

4. The combination, in a lathe-chuck, of a stock having a threaded head, B, a threaded case, C, traveling thereon, and having a conical portion provided with grooved openings inclined to receive inclined ribbed dogs, a shell, E, concentric with said case C, and screw-threaded at its rear to engage a threaded cap, H, against the head of which bears the shoulder *j* of the head, and a cap, J, secured to the neck, and re-enforcing the cap H, substantially as set forth.



297,071. MAIL-BAG FASTENER. WILLARD D. DORENUS, Washington, D. C., assignor to Frank Hodges, same place. Filed Mar. 26, 1884. (No model.)

Claim.—1. A device for fastening mail-bags, consisting of a short section of a tube provided with the depressed portions B, formed of one piece of metal, and a detent or clamp, E, adapted to fit within said tube-section, as set forth.

2. A device for fastening mail-bags, consisting of a short section of a tube having the depressed portions B, in combination with the detent E and rope or cord C.

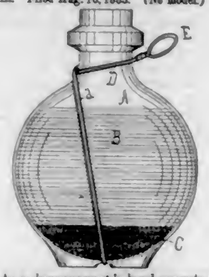
297,072. APPARATUS FOR DISTRIBUTING ELECTRICAL CURRENTS. GEORGE W. DURHOW, Portland, Oreg. Filed Apr. 12, 1883. (No model.)

Claim.—1. In a machine for distributing electricity, the disks E E, provided with rings *e e' e'* and springs *f f'*, rotating on a shaft, in combination with mounted disks F F' and contact-points G G', whereby an electric current can be divided up into as many circuits as there are contact-points, operating as shown, and for the purpose described.

2. In combination with platform A, standards B B *b b*, shaft C, having thereon disks E E *e e' e'*, provided with springs *f f'*, and mounted disks F F', having contact-points G G', distributing-brushes K K, pressing upon disks E E, and suitably mounted in standards H H', and adapted to be held firmly against disks E E by spiral springs N, for the purpose set forth.

3. In combination, disks E E, rotating upon shaft C and suitably connected, standards H H, brush-holders I, and distributing-brushes K K, adapted to receive and transmit an electric current from binding-post M to the contact-points G G' upon disks F, for the purpose set forth.

297,073. COUPLING FOR ROPES OR CABLES. GEORGE M. GREEN, Streator, Ill. Filed Jan. 3, 1884. (Model.)

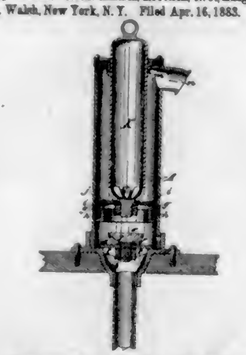


Claim.—The combination, with the socket A, provided with a loop or frame, B, and having longitudinal grooves *a* in the aperture and notches *b* at the inner end of the aperture, of the key C, having two opposite projections, *d*, at the inner end, and means for securing the rope at the outer end, and of the spring F, held in the frame B, substantially as herein shown and described.

297,074. PAINT. EDMUND H. HAGUE, Jackson, Mich., assignor of one-third to Walter Johnson, same place. Filed Oct. 13, 1883. (Specimens.)

Claim.—The herein-described composition of matter, to be used as a paint for preserving materials to which it is applied and rendering them fire-proof and water-proof, it consisting of the following materials, combined in substantially the proportions and under the conditions named, to wit: coal-tar, sulphur, china-clay, alum, salt, and black oxide of manganese, substantially as set forth.

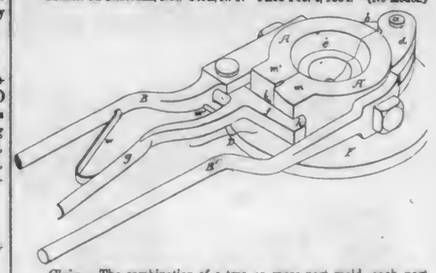
297,075. HAND-GRENADE FIRE-EXTINGUISHER. JOHN J. HARDEN, Chicago, Ill. Filed Aug. 10, 1883. (No model.)



Claim.—1. As an improvement in hand-grenade fire-extinguishers, the combination of the frangible walls of the grenade with the contained fire-extinguishing solution, and with movable solid bodies applied within the grenade, substantially as and for the purpose herein specified.

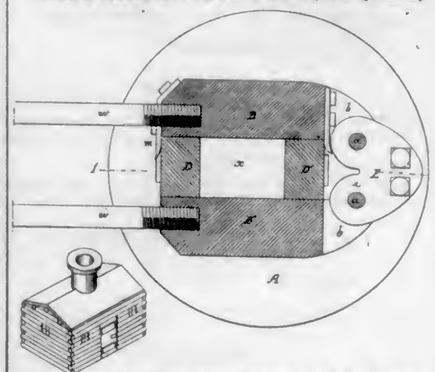
2. In a hand-grenade fire-extinguisher, the combination of a glass shell and a wire, metal band, or other substance having a greater heat-conducting power than glass, substantially as and for the purpose herein specified.

3. In a hand-grenade fire-extinguisher, the combination of the glass shell with a wire or metal band provided with a loop or hook, substantially as and for the purpose set forth.



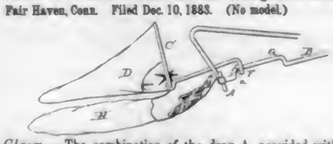
4. In a hand-grenade fire-extinguisher, the combination of a glass shell provided with notches, and a wire or metal band inserted in the grooves or notches, substantially as and for the purpose set forth.

297,076. PUMP. ROBT. HARDIE, Hoboken, N. J., assignor of one-half to John A. Walsh, New York, N. Y. Filed Apr. 16, 1883. (No model.)



Claim.—The combination, with the cylinder A, provided with a foot-valve, of the hollow rod or plunger having a rounded lower end formed integral with it, and provided with openings *l*, so that the rod or plunger may serve as an air-chamber, and also provided with an integral screw-threaded stud or projection, the piston or bucket *g*, screwed upon said stud or projection, and the flexible delivery-valve *j*, clamped between the piston or bucket and the integral end of said rod or plunger, the end of said rod or plunger forming a guard for said delivery-valve, substantially as described.

297,077. GLASS-MOLD. EMIL HERCKNER, Millville, N. J., assignor to John Mickle, same place, James Whitall, Robert P. Smith, Charles Roberts, and William H. Nicholson, Philadelphia, Pa., and Charles Albert Tatum and Francis M. Underhill, New York, N. Y. Filed Feb. 4, 1884. (No model.)

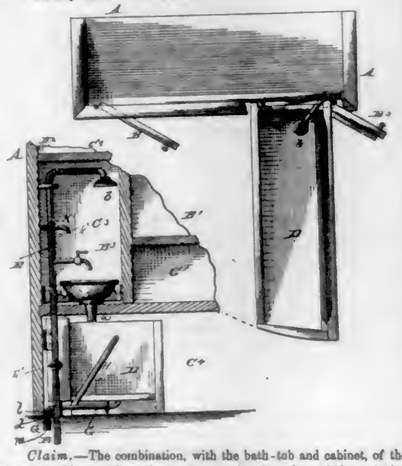


Claim.—The combination of a two or more part mold, each part having the usual handle, with a spring latch-lever having an arm adjoining the handle of one part of the mold and constructed to lock and release the other half of the mold, substantially as set forth.

297,078. GLASS-MOLD. EMIL HERCKNER, Millville, N. J., assignor to John Mickle, same place, James Whitall, Robert P. Smith, Charles Roberts, and William H. Nicholson, Philadelphia, Pa., and Charles Albert Tatum and Francis M. Underhill, New York, N. Y. Filed Feb. 4, 1884. (No model.)

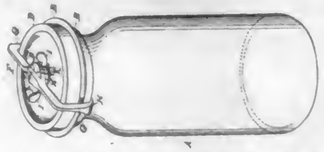
Claim.—The combination of movable side pieces, B B', of a glass-mold and a projection or projections on the same, with one or more movable self-retracting blocks D, forming part of the mold, and constructed to be operated by the said projection or projections, substantially as set forth.

297,079. APPARATUS FOR CATCHING STAR-FISH. J. FRANK HOMAN and FRANKLIN L. HOMAN, New Haven, assignors to Lancraft Bros., Fair Haven, Conn. Filed Dec. 10, 1883. (No model.)



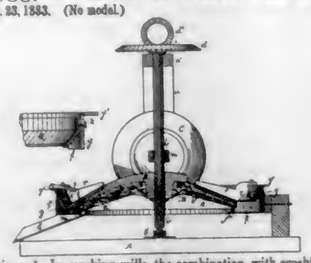
Claim.—The combination of the drag A, provided with means, substantially such as described, whereby it may be drawn over the surface of the oyster-bed, with an opened-mouthed receptacle, D, in rear of the drag, the mouth arranged to open above the plane of the drag, and so as to leave an open space downward between the drag and the mouth, substantially as described.

297,080. GARTER-CLASP. PHILIP KALISH, Chicago, Ill. Filed June 4, 1883. Renewed Mar. 6, 1884. (No model.)



Claim.—The clasp A B, whereof the part A is formed of the parts or jaws *a b*, which are movably united at one edge with a pin, *c*, and provided at the other with the fastening device *d e*.

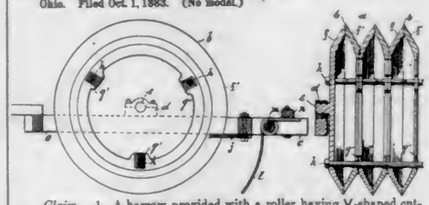
297,081. BATHING APPARATUS. GEROW KOONS, St. Louis, Mo. Filed May 25, 1883. (No model.)



Claim.—The combination, with the bath-tub and cabinet, of the supporting-hinge *c*, the swinging waste-pipe G, and eye *l*, the swiveled coupling *m*, the pipe E, and swiveled coupling E', and the shower-jet *b*, secured to the horizontal portion of the pipe E, substantially as specified.

297,082. FRUIT-JAR. PHILIP LYON and JOSEPH H. BOSSARD, East Stroudsburg, Pa. Filed Feb. 26, 1884. (No model.)

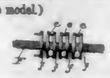
Claim.—The centrally-perforated transverse clamp-bar having lateral depending arms formed with inwardly-turned ends, and a central expanded portion having its under side formed by two semicircular inclined surfaces, and a turning disk having two semicircular inclined surfaces corresponding to those of the transverse bar, a pivot-pin long enough to allow the play of the cover extending upward loosely through the perforations of said bar, and lateral operating-lugs, substantially as specified.



297,083. CRUSHING-MILL. GEO. W. MORROW, Toronto, Ohio. Filed Aug. 23, 1883. (No model.)

Claim.—1. In crushing-mills, the combination, with crushing-rolls, of a table or pan and an annular skirt forming, in connection with the edge of the table, an annular discharge-opening for the crushed material, substantially as and for the purposes set forth.

2. In crushing-mills, the combination, with crushing-rolls, of a table or pan, an annular skirt forming, in connection with the edge of said table, an annular discharge-opening, and means for adjusting the skirt vertically to and from said table, to vary the size of the discharge-opening, substantially as set forth.

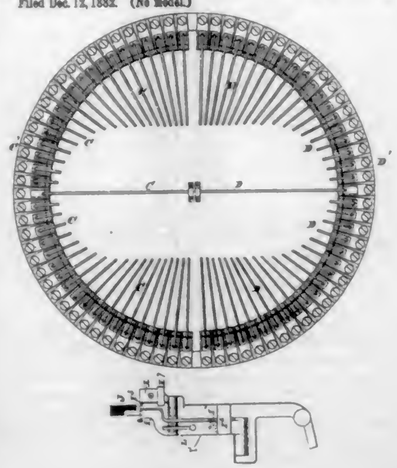


297,084. HARROW. JACOB F. MUHS and CHARLES MOLHO, Springfield, Ohio. Filed Oct. 1, 1883. (No model.)

Claim.—1. A harrow provided with a roller having V-shaped cutting-disks, each of said disks constructed with two dish-shaped parts that are united through the agency of coincident projections and cavities through which bolts pass to bind the entire series of disks together, substantially as and for the purpose specified.

2. A harrow provided with a roller having V-shaped cutting-disks, each constructed with two dish-shaped parts, and the entire series being bound together through the agency of bolts passing through their entire length, and provided with a clearing-plate having V-shaped parts that enter the cavities between the disks, substantially as and for the purpose specified.

297,085. FLEXIBLE SHAFT. JOHN G. NICHOLS, Halton, Kans. Filed Jan. 26, 1884. (No model.)



Claim.—1. A flexible coupling for shafts and other purposes, consisting of a series of disks arranged as described, flexibly connected together and to the ends of the shafts, as set forth.

2. A flexible coupling for shafts, consisting of a series of disks, the sides of which are arranged parallel to each other, said disks being flexibly connected together and held in alignment by a flexible support, as and for the purpose set forth.

3. A flexible coupling for shafts, consisting of a series of disks connected together, as described, and held in alignment by a central flexible support, as set forth.

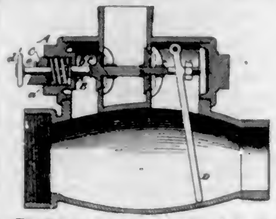
4. In a flexible coupling, the disks D, formed with open spaces or recesses, in which are secured the links *a* by means of pins *b* and band *d*, secured to the projecting portions of the disk, as set forth.

297,086. TYPE-WRITING MACHINE. HENRY OPPEN, St. Louis, Mo. Filed Dec. 12, 1883. (No model.)

Claim.—1. In a type-writing machine, two sets of type-carrying levers arranged, substantially as described, so that the types of each set will strike a center common to the levers of that set, in combination with suitable operating mechanism, as set forth.

2. In a type-writing machine, two sets of type-carrying levers arranged, substantially as described, so that the types of each set will strike a center common to the levers of that set and being hinged to semicircular bars placed a short distance apart, so that two letters can be printed at the same time—one from each set—substantially as set forth.

3. In a type-writing machine, two sets of type-carrying levers hinged to semicircular bars placed a short distance apart, so that two letters can be printed at the same time—one from each set—one set of the levers having upper and lower case letters and the other set having lower-case letters only, substantially as and for the purpose set forth.

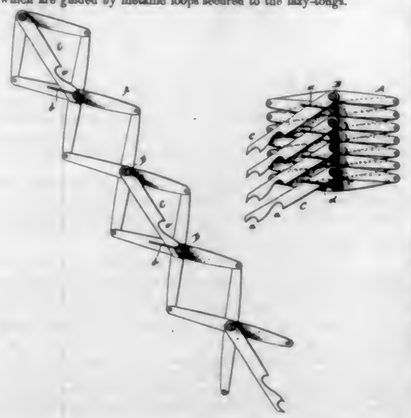


4. In a type-writing machine, the two sets of keys connecting with the two sets of type-carrying levers by means of transverse bars, substantially as set forth.

5. A type-writing machine having two independent series of type-carrying levers provided, respectively, with operating-keys, the finger-pieces of one set being placed near the corresponding finger-pieces of the other, substantially as shown and described.

6. In a type-writing machine, the two sets of keys connecting with two sets of type-carrying levers by means of transverse bars which are loose at both ends, and held from upward movement by plates secured to the base of the machine, substantially as shown and described, for the purpose set forth.

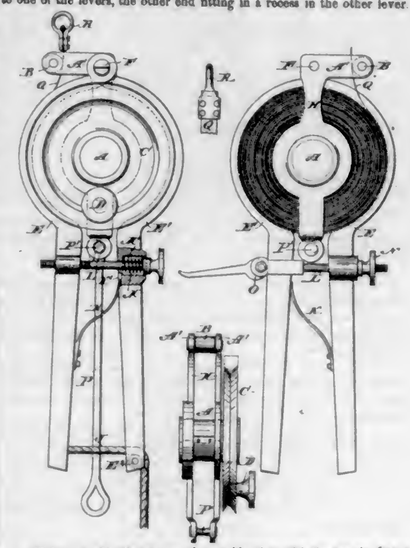
7. In a type-writing machine, the three-part dog for engaging with the rack of the carriage, in combination with two sets of keys arranged to operate the different parts of the dog, substantially as and for the purpose set forth.



297,087. AUTOMATIC RELIEF-VALVE FOR STEAM FIRE-ENGINES. JOHN E. PRENTY, Baltimore, Md. Filed Mar. 25, 1884. (No model.)

Claim.—The stem *b c d*, spring *a*, cap A, and plug C, in combination with the double puppet-valves and their stem, and swinging device D, all adjusted within the chamber B and body of the relief-valve, substantially as specified.

297,088. LADDER. CORYDON A. ROOT, Andover, Ohio, assignor of one-half to James L. Applegate, same place. Filed Feb. 18, 1884. (No model.)



Brief.—The alternate rounds of the lazy-tongs carry notched braces which are guided by metallic loops secured to the lazy-tongs.

Claim.—The improvement in ladders consisting of the combination, with two lazy-tongs forming the sides of the same, the rounds at each intersection of the lazy-tongs, and the notched braces pivoted to the ends of the alternate rounds, of the metallic loops or guides secured to the lazy-tongs, and adapted to restrict the play of the bars or braces, all the parts being arranged to operate substantially as and for the purpose described.

297,089. FIRE-ESCAPE. REUBEN C. RUTHERFORD, Quincy, Ill., assignor of one-third to James Woodruff, same place. Filed Aug. 16, 1883. (No model.)

Brief.—A fire-escape in which the levers which apply the brake-band are operated by a screw and nut. One end of a spring is secured to one of the levers, the other end fitting in a recess in the other lever.

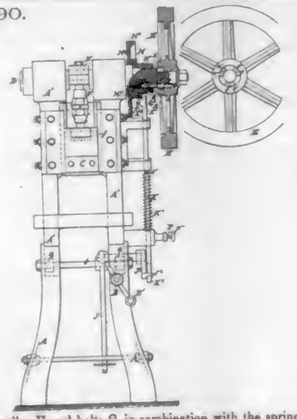
Claim.—1. In a fire-escape, the combination, with the angular frame H, of the roller B, the arbor A, the metal band, wire, or cable Q, the brake-wheel C, rigidly mounted on one end of the arbor, the brake-levers E E', the spring K, fastened to the lever E, and having its free end in a recess, K', in the lever E', and means for holding or pressing the brake-levers together, substantially as herein shown and described.

2. In a fire-escape, the combination, with the frame H, of the arbor A, the metal band, wire, or cable Q, the brake-wheel C on the arbor, the brake-levers E E', pivoted to the frame H, and the rope J, fastened to the lower end of the lever E, and passing over a pulley in the lower end of the lever E', substantially as herein shown and described.

3. In a fire-escape, the combination, with the frame H, of the arbor A, the metal band, wire, or cable Q, the brake-wheel C, the brake-levers E E', the screw-pintle L, the nut N, and the cam-lever O, substantially as herein shown and described.

4. In a fire-escape, the combination, with the plates H, having arms A', of the roller B, the arbor A, journaled in the plates H, the metallic band, cable, or wire Q, the brake-wheel C, and the brake-levers E E', substantially as herein shown and described.

297,090. PUNCHING-MACHINE. NORMAN C. STILES, Middletown, Conn. Filed Jan. 27, 1883. (No model.)



Claim.—1. The fixed support A and adjustable framing A', with suitable supporting means, *a*, and the die-carrier C, with means for operating it, in combination with each other and with the slide K, having curved arm K^2, receiving motion from a treadle mounted on the fixed portion, all arranged to serve substantially as herein specified.

2. The pins *e e'* of the female clutch, located in a recess formed by enlarging the bore of the fly-wheel, and adapted to serve substantially as herein specified.

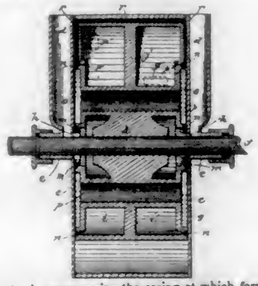
3. A clutch-pin having a straight cylindrical body, *e*, and a head, *e'*, bounded by radial and circumferential lines of the recess in the fly-wheel, substantially as herein specified.

4. The sliding collar H, sliding bolts G, and screws G', passing through longitudinal slots or recesses in the crank-shaft, and serving to

297,090.

unite the collar H and bolts G, in combination with the springs L, tending to throw the bolts G outward, substantially as herein specified.

5. In a punching-press substantially as described, the wedge or start-and-stop piece H^4, made with a double face, so as to operate in relation to the slide K with either direction of fly-wheel motion, substantially as herein specified.



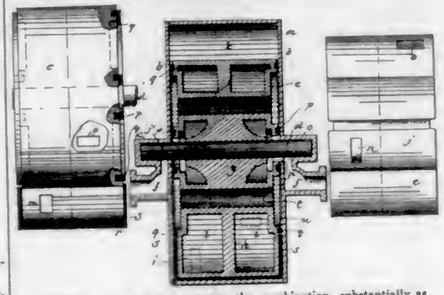
6. The radially-sliding piece K, its end comprising the abutment K', and having also the incline K^2, in combination with means, J J', for moving it at the will of the operator, and with the sliding collar H, face-cam H^1, and rim H^2, having a lip, H^3, all arranged for joint operation as herein specified.

7. The combination, with the shaft D, of the curved wedge-shaped bearing-piece R and a spring for holding the same against its bearing with a constant force in a correspondingly wedge-shaped recess in the framing, as and for the purposes herein specified.

8. In a punching-press having a suitable die-carrier, C, operated by the eccentric D', the compound connecting-rod having the eyes V' V^2, right and left screws V^3, and upper and lower threaded sleeves V^4 V^5, all arranged for joint operation as herein specified.

9. In combination with the frame A' and shaft D, the wedge-piece B, bushing T, spring t, and adjusting-screw t', as and for the purposes set forth.

297,091. ROTARY STEAM-ENGINE. FREDERICK SUTTER, Louisville, Ky., assignor of one-half to Adolph Reutlinger, same place. Filed July 24, 1883. (No model.)

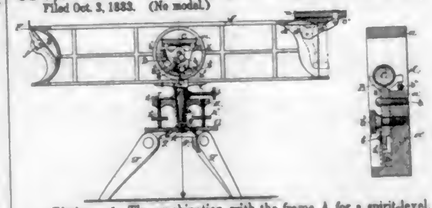


Claim.—1. A steam-engine the casing of which forms the steam-cylinder, the rotary piston divided centrally into two independent chambers having openings into the cylinder for the live and exhaust steam, respectively, a solid hub and shaft for said piston, the axial inlet for the live steam, and the axial outlet for the exhaust-steam, combined with the working-head on said piston co-operating with two abutments in the cylinder, which divide the cylinder into live and exhaust steam chambers, all constructed and arranged to operate substantially as and for the purpose set forth.

2. The combination, with the cylinder and piston, of abutments s s', normally seated against the piston and provided with operating-pistons, and a normally and constantly charged steam-pipe connecting the two, substantially as and for the purpose described.

3. The rotary piston having separated non-communicating induction and eduction ports or chambers, facial depressions, and transverse tubes connecting such depressions to equalize the pressure upon the said piston within its casing or cylinder, substantially as set forth.

4. The combination, with the cylinder and the two-chambered rotary piston therein, of the facial packing-rings in said piston, and steam-passages behind them, substantially as and for the purpose specified.



297,092. ROTARY WATER-METER. FREDERICK SUTTER, Louisville, Ky., assignor of one-half to Adolph Reutlinger, same place. Filed July 24, 1883. (Model.)

Claim.—1. In a water-meter, the combination, substantially as shown and described, of a cylinder, an inclosed concentric rotary piston divided into two separate non-communicating chambers, a water-way between the piston and cylinder, a head on such piston fitted water-tight in said water-way, valves in said water-way seated on the piston and operated by the piston-head for opening, and by gravity for closing, a shaft for the piston, tubular water-tight bosses forming boxes for said shaft, the recessed hub of the piston fitted to said shaft, and an inlet and outlet communicating with said chambers through the recessed hub, substantially as and for the purpose described.

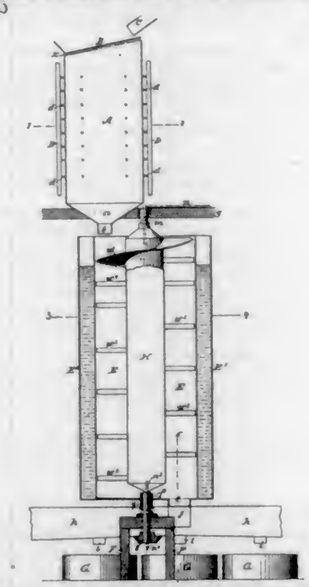
2. The piston divided into two non-communicating chambers, provided with ports independent of one another, an inlet and an outlet for each of said chambers, a recessed hub, through which the supply is introduced and the exhaust discharged, a cylinder and tubular bosses in which said piston and its shaft are inclosed water-tight, a water-way between the cylinder and piston, in which the piston-head is rotated water-tight, and with which the piston-chamber ports communicate, and packings for securing the piston water-tight within the cylinder, substantially as set forth.

297,098. LEVELING-INSTRUMENT. LEVI C. STROWD, Albany, N. Y. Filed Oct. 3, 1883. (No model.)

Claim.—1. The combination, with the frame A for a spirit-level, having a central seat, a', as herein set forth, and the graduated quadrant D, of the carrier B, pivoted to the seat a', and provided with arms b' for containing the spirit-level tube C, the said carrier having the adjusting-screws b^3, binding-screw b^3, and adjustable pointer b^4, all constructed and arranged to operate as herein specified.

2. The combination, with a spirit-level frame, A, having the sights E and F attached thereto, substantially as set forth, of a center-pin, I, provided with flanges i' and clamping-screw i^2, whereby the said spirit-level frame is attached to and adapted to revolve in a supporting-stand, as and for the purpose herein specified.

3. In a supporting-stand for a spirit-level frame, A, provided with sights E and F, as herein set forth, the combination, with the graduated table H, provided with a central socket, h, and supported on adjusting-screws h^2, as herein described, of the center-pin I and arm J, the latter being adjustably connected to said center-pin, as and for the purpose herein specified.



4. The combination, with the graduated table H, provided with the studs or pins h^3, of the center-pin I, having a movable arm or index, J, attachable thereto, for the purpose of limiting the rotatory movement of the center-pin I to the part of the circle intervening between the pins h^3, as and for the purpose herein specified.

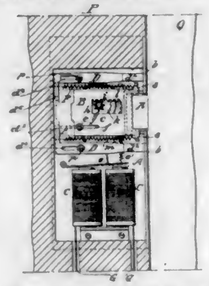
297,094. BILL-OF-FARE INDICATOR. EUGENE S. SUTTON, Wildwood, Wis. Filed Sept. 8, 1883. (No model.)

Claim.—A bill-of-fare indicator composed of the perforated sheets secured together and provided with the stationary printed strips b, the intervening seats c, the guard-strips e e, the removable slide-strips d, printed as described, the slide-pins i, and the alternate removable pins k, substantially as described.

297,095. WASHING RAW SUGAR AND APPARATUS THEREFOR. JOHN H. TUCKER, Philadelphia, Pa. Filed Nov. 21, 1883. (No model.)

Claim.—1. The mode herein described of mixing raw sugar with water or sirup, the said mode consisting of forcing fine sprays of said water or sirup against and into a falling shower of finely-divided raw sugar, substantially as set forth.

2. The process herein described of first obtaining a heated magma of raw sugar and water or raw sugar and sirup, and then subjecting it to the action of a centrifugal machine.



3. The process herein described of treating raw sugar, the said process consisting of the following branches—namely, first, sifting the sugar so as to remove therefrom chips and other foreign matters; second, mixing with the sugar water or sirup; third, heating and agitating the magma of sugar and water or sugar and sirup; and, fourth, subjecting it to the action of a centrifugal machine, substantially as set forth.

4. The combination of a mixing-vessel, A, having numerous lateral openings, with devices for injecting fine spray through the said openings, substantially as set forth.

5. The combination of the mixing-vessel A with the agitated screen B, substantially as described.

6. The combination of the steam or water heated tank E with the steam or water heated rotating cylinder H and its stirring-arms w'.

297,096. ELECTRIC DOOR-KEEPER. ALBERT C. WORRELL, New York, N. Y. Filed Oct. 29, 1883. (No model.)

Claim.—1. The combination, with the keeper casing or shell A, provided with the recess a, of a sliding keeper provided with a rack-spring, pressed and sliding bolts connected to the keeper by springs, a train of gearing, one pinion of which meshes with the rack of the keeper, a spring-pressed pawl, and an electro-magnet for operating the pawl, substantially as herein shown and described.

2. The combination, with the sliding keeper B, of the spring-pressed sliding beveled bolts D, the springs F, connecting the bolts and keeper together, and mechanism for locking and releasing the keeper, substantially as herein shown and described.

3. The sliding keeper B, having rack i, meshing with pinion j, in combination with pawls k' o, and intermediate gearing for locking the keeper B in its forward position, substantially as and for the purposes set forth.

4. The sliding bolts D, formed with arms d^4, in combination with sliding keeper B and springs E F, arranged to operate substantially as and for the purposes set forth.

5. The liberating-keeper for doors, herein shown and described, consisting of the recessed shell A, sliding keeper B, having rack i, electro-magnets C, beveled bolts D, and springs E F, in combination with pawls o k, gear-wheels l m n, pinion j, and ratchet k', all arranged to operate substantially as and for the purposes described.

297,097. MANUFACTURE OF SHEET-IRON. W. DEWEES WOOD, Pittsburg, Pa. Filed Dec. 5, 1883. (No specimens.)

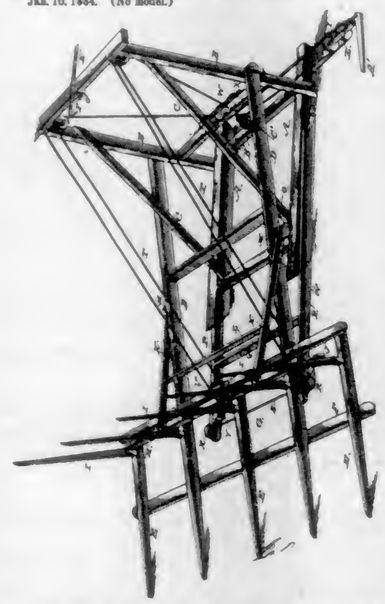
Claim.—1. As an improvement in the method of manufacturing sheet-iron set forth in Patent No. 291,260, simultaneously reviving and carbonizing the surface of the sheet by the conjoint application thereto of charcoal, and a mixture of graphite with suitable oleaginous or resinous matter, substantially as described.

2. As a step in the manufacture of planished sheet-iron, applying to the oxidized surface of the sheet, preliminary to a reviving operation, a mixture of graphite and oleaginous or resinous matter along with pulverized charcoal, substantially as set forth.

297,098. APPLICATION OF CELLULOID FOR ENAMELING TEXTILE FABRICS, &c. WILLIAM H. WOOD and JOHN H. STEVENS, Newark, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. Filed Mar. 11, 1884. (No specimens.)

Claim.—1. The within-described process of enameling, which consists in causing the adhesion to the surface to be enameled of a sheet of material the base of which is pyroxyline, by, first, coating the surface with a suitable cement containing an oxidizable or drying oil; second, drying the cement, and, third, attaching the pyroxyline sheet by heat and pressure.

2. The within-described process of enameling, which consists in, first, coating one of the surfaces of the pyroxyline sheet or veneer with a suitable cement containing an oxidizable or drying oil; second, drying the cement, and, third, attaching the pyroxyline sheet by the application of heat and pressure, substantially as set forth.



3. The within-described process of enameling, which consists in, first, coating the surface to be enameled with a suitable cement containing an oxidizable or drying oil; second, drying the cement, and, third, attaching a sheet of seasoned material the base of which is pyroxyline, substantially as set forth.

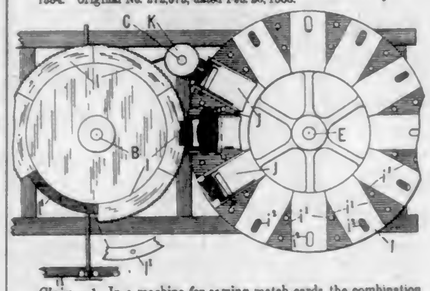
4. The method of enameling material in the form of sheets hereinbefore described, which consists in causing the adhesion of a sheet of material the base of which is pyroxyline to enameled cloth or oil-cloth, by bringing the pyroxyline sheet in contact with the coated surface of the enameled cloth or oil-cloth, and subjecting the two to heat and pressure, substantially as described.

5. The method of enameling material in the form of sheets hereinbefore described, which consists in, first, coating one of the surfaces of a sheet of pyroxyline material with a suitable cement; second, drying the cement, and, third, effecting the adhesion of the pyroxyline sheet or veneer to the surface to be enameled by the application of heat and pressure, substantially as described.

6. The process herein described of enameling cloth, leather, or textile fabrics by means of sheets or veneer of pyroxyline material, which consists in effecting the adhesion of the sheet or veneer of pyroxyline material by subjecting it to heat and pressure while in contact with a dried surface of a cement containing oxidizable or drying oil.

297,099. HAY-STACKER. JOHN R. WRIGHT, Wheeling, Mo. Filed Jan. 10, 1884. (No model.)

Claim.—1. The combination of the carrier-arms, means for elevating them, the frame hinged upon the upper side of the carrier-arms, the arms hinged to the rear side of the hinged frame connected by a cross-bar, and having the inclined notches in their lower edges, the bails upon the outer sides of the carrier-arms, and the catches or pawls hinged upon their upper ends, as and for the purpose shown and set forth.



2. The combination of the frame, the draft-rope attached to the upper ends of the frame at both ends, the lifting-arms having pulleys at their outer ends, the pulleys at the upper ends of the uprights, the three pulleys upon the cross-piece at the lower portion of the frame, the block having the single-tree attached to it, and the swiveled block or pulley having the doubled end of the rope passing over it, as and for the purpose shown and set forth.

3. The combination of the uprights connected at their upper ends by a cross-piece, the lifting-arms having the transverse shaft at their outer ends, the catch-lever pivoted to the cross-piece at the upper ends of the uprights, a set-screw at the forward side of the cross-piece, and the slotted plate sliding adjustably upon said set-screw, as and for the purpose shown and set forth.

4. The hay-stacker consisting of the skids, the uprights, the carrier-arms pivoted upon the uprights near their lower ends, the lifting-arms pivoted upon the skids near their rear ends, the frame hinged upon the upper side of the carrier and having means for adjusting it, the pulleys at the ends of the lifting-arms and at the ends of the uprights, the three pulleys at the lower rear portion of the frame, the block having two pulleys and the single-tree, the swiveled pulley, and the rope passing over the pulleys and secured at both ends to the upper ends of the uprights, all constructed and arranged as and for the purpose shown and set forth.

REISSUES.

10,468. MACHINE FOR SAWING MATCH-CARDS. GILBERT FLEWWELLING and GILBERT J. HARER, Hampton, New Brunswick, Canada, assignors to the Diamond Match Company, of Connecticut. Filed Feb. 26, 1884. Original No. 272,675, dated Feb. 20, 1883.

Claim.—1. In a machine for sawing match-cards, the combination of the following elements: first, a revolving table having a series of independent holders for the card-blanks; second, a gang of circular slitting-saws; and, third, cam mechanism, substantially as described, adapted to cause the holders at the proper time to thrust the card-blanks into the line of the saws' action, and to withdraw them therefrom, substantially as described.

2. In a machine for sawing match-cards, a revolving table with a series of card-blank holders having a capacity for radial movement upon the table, and cam mechanism, substantially as described, for moving the holders to present the blanks to the mechanism for acting upon the same.

3. In a machine for sawing match-cards, a revolving table with a series of card-blank holders adapted to hold the card-blanks with their ends in a concave line, and cam mechanism, substantially as described, for moving the holders to present the blanks to the slitting-saws, as described.

4. In a machine for sawing match-cards, the combination of the following elements: a revolving table having a series of independent holders for the card-blanks, a gang of circular pointing-saws, a gang of circular slitting-saws, and cam mechanism, substantially as described, for moving the card-blanks into and out of the line of action of the slitting-saws.

5. The combination, with the horizontal disk I, arranged on shaft E, and carrying the card-blank holders J, of the clamp-bar j^2, pivoted at j^4, the mechanism j^3 j^5 j^7, and the notches j^6, whereby the blanks may be held in the holders, as described.

6. The combination, with the disk I, provided with the movable blank-holders, of the saws mounted on the top of a shaft, c, and the segment-saws *l*, attached to the rim of disk I, and having washers l', whereby the blocks are first grooved and then slitted the required depth, as described.

7. In combination with the holders carrying roller-studs and sliding in disk I, the detachable piece i' and the grooved cam M, arranged under said disk on a support, as and for the purpose described.

10,469. TREATING AND MOLDING PYROXYLINE. JOHN W. HYATT, Jr., Newark, and ISAIAH S. HYATT, Morristown, N. J., assignors by mesne assignments, to the Celluloid Manufacturing Company, of New York. Filed Mar. 10, 1884. Original No. 105,338, dated July 12, 1870; Reissue No. 5,928, dated June 23, 1874.

Claim.—1. The process of preparing pyroxyline, consisting of grinding the pyroxyline into a pulp, and after mingling therewith a solvent subjecting the mixture to heat and pressure, substantially as and for the purpose described.

2. The use of finely-comminuted camphor gum mixed with pyroxyline pulp, and rendered a solvent thereof by the application of heat, substantially as described.

3. The treatment of pyroxyline pulp containing camphor mixed therewith in a finely-divided condition by subjecting the same to pressure in molds and continuing the pressure until the mold and its contents are cooled, substantially as described.

N. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the District of Columbia.

MARVIN v. LILLIE.

Decided May 31, 1867.

1. It is against the spirit and letter of the law to grant an independent patent to an applicant for an invention shown and described, though not claimed, in a prior patent issued to the same person.
2. The pretext that no claim was made to the invention in the original patent will not avail, since the law provides for the amending of patents by enlargement or restriction, or even by division of the subject-matter.
3. No interference can lie except as between claimants of the same invention. If an applicant claims that which is shown in a previous patent, the patentee should be notified of it and an opportunity first offered to him to lay claim to the invention.

APPEAL from the Commissioner of Patents.

OLIN, *J.:*

This is nominally an interference case in which the question of priority alone should be at issue; but the appeal is taken on grounds which, if sustained, vitiate the proceedings under the interference. It is proper, therefore, that I should inquire into these grounds.

It appears from the papers in the case, and it is not denied by the counsel for the appellee, that the invention now sought to be patented and claimed in the application in interference is shown and described in the patent issued to L. Lillie, the appellee, on August 8, 1865. Such being the case, I am of opinion that an application for an independent patent cannot be entertained. It is contrary to the spirit and, I believe, the letter of the law to grant a new patent to an applicant who has already obtained one for the same invention. The pretext that he did not specifically claim the device he might have claimed in the original patent will not avail, since the law provides for the amending of patents by enlargement or restriction, or even by division of the subject-matter of any patent at any time during the term for which it is granted. The first reason of appeal is therefore sustained.

As to the second reason of appeal: On comparison of the claims of Marvin and of Lillie no conflict is apparent. Marvin claims a combination of devices which is not claimed by Lillie; but the construction given to Lillie's claim is such as to embrace a feature shown but not claimed by Marvin. This interference, therefore, is declared between two parties who do not claim the same thing.

In my opinion no interference can lie except as between claimants of the same invention. If, as in this instance, an applicant claims that which is shown in a previous patent, the patentee should be notified of it and an opportunity first offered to him to lay claim to the invention. This seems to me to be the safe rule; for the patentee may either acknowledge that the particular feature in question is not his invention, but that of the claimant, and if so there would be no occasion for an interference; or he may show that the thing had been in public and common use for many years, and therefore had become public property; or he may assert his right to it by filing in the regular form a claim, and then an interference would be in order, not otherwise.

The second reason of appeal is sustained so far as the first clause is concerned. In view of the fundamental errors pointed out in the initiatory proceeding in this case, I deem it unnecessary to say anything on the question submitted under the third reason of appeal.

Upon the whole I am of opinion that the decision of the Commissioner of Patents in deciding the interference between Lillie and Marvin in favor of Lillie is erroneous; and I do, this 31st day of May, 1867, sustain the appellant's first and second reasons of appeal, and reverse the judgment of the Commissioner; and I do further adjudge and order that the said interference be dissolved, and that the application of the said Lillie be finally rejected.

U. S. Circuit Court—District of California.

CAHN v. WONG TOWN ON.

Decided February 4, 1884.

COMBINATION OF SEPARATE DEVICES—SUB-COMBINATION.

The fact that a device comprising several patentable elements has been patented as a whole will not prevent the patentee from afterward securing a patent for a combination of any number of the elements less than the whole, provided he applies for it before the lesser combination has been two years in public use.

Mr. M. A. Wheaton for the complainant.
Mr. J. L. Boone, contra.

SAWYER, *J., (orally.)*

This action is upon a patent. The patent consists of lapping over two pieces of leather in making the seam of a boot or any other work of the kind, running a line of rivets along, and then a line of stitching on each side of the line of rivets, so as to make a compact, tight seam. The plea sets up that the patentee in this case on a prior occasion procured a patent, and that this other and prior patent is for the same thing with the addition of a piece of india-rubber inserted between the two pieces of leather. The strip of india-rubber having been inserted, a line of rivets is run along with two lines of stitching—one on each side of the line of rivets—in the same manner as in the second patent. The defendant claims that the second patent is not a new invention; that it is merely a combination of a

part of the elements of the first patent, or of the prior invention, and therefore that the second patent is void as not covering a new invention. I think probably that would be the case if the patentee were a different inventor. If the patentee in the prior patent had been a different person from the patentee in the second, I am inclined to think so. But the prior patentee is the same man, and doubtless if he had made the invention at the time he obtained his first patent he might have got a patent for the sub-combination, omitting one element, the slip of india-rubber; and it does not appear in the plea that this second invention has been in public use or on sale for more than two years, whereby it would be abandoned to the public. The inventor failed, therefore, if he is the inventor of both at the same time, to obtain a patent for all he was entitled to. If he was the inventor at that time, he was entitled to patent the second or sub-combination of elements, omitting the inserted strip of india-rubber, as well as the first combining all the elements. He might, perhaps, have got a reissue covering both if his invention of the sub-combination is sufficiently indicated in the specification of the first patent; but he has chosen to obtain an independent patent for the sub-combination. If he invented it at the same time with the other, he might undoubtedly have obtained a patent in the first instance. I think if it was patentable with the additional element of the indin-rubber, the sub-combination without the addition of the india-rubber, invented at the same time, would be patentable. Justice Field says in the *Giant Powder Case* (4 Fed. Rep., 720; 5 Fed. Rep., 197) that this is the proper mode of proceeding when there is another invention for which an independent patent might have been obtained but has been omitted. If he was the inventor of both, he was entitled to patent both—the sub-combination without the strip of india-rubber as well as the entire combination of the lapping of the leather and the intervention of a piece of indla-rubber to make the seam tighter, and better still in combination with the line of rivets and line of stitching on each side of it. He being the first person to invent both, I think it was patentable as to both. He doubtless did invent the sub-combination as well as the entire combination at the same time. He embraced the sub-combination in the last patent without the additional element intervening; and it does not appear that it was on sale for two years before the application for the last patent. I think the plea, then, should be overruled. And it is so ordered.

U. S. Circuit Court—District of New Jersey.

DOYLE *v.* SPAULDING *et al.* ILLINGWORTH *v.* SAME.

Decided March 15, 1884.

1. The use or knowledge of the use of an invention in a foreign country by persons residing in this country will not defeat a patent which has here been granted to a *bona fide* patentee, who at the time was ignorant of the invention or its use abroad.
2. Letters Patent No. 166,700, granted August 17, 1875, to Illingworth, and No. 99,299, granted February 1, 1870, to Patrick Doyle, construed, sustained, and held to be infringed by machines used under Letters Patent No. 240,727, granted April 26, 1881, to Spaulding *et al.*, as assignees of Alfred E. Jones.

Mr. J. C. Clayton for the complainants.

Mr. Francis Forbes, with whom was *Mr. A. Q. Keasbey*, for the defendants.

NIXON, *D. J.*:

These two cases will be considered together for reasons which will hereinafter appear.

On March 5, 1881, the complainant Illingworth commenced a suit in this court against the defendants for infringement of Letters Patent No. 166,700, dated August 17, 1875, for improvement in molds for ingots.

The defendants answered, setting up, among other things, that said letters patent were void (1) on account of prior knowledge and use of the alleged invention; (2) because every substantial and material part of the invention was described and claimed in Letters Patent No. 99,299, and granted to one Patrick Doyle, February 1, 1870, for improvement in molds for making combined ingots of steel and iron, and in English Letters Patent No. 3,801, issued to William Moore by the Queen of Great Britain and Ireland, dated November 21, 1873, and sealed May 19, 1874; and (3) denying the right of the complainant to recover because the defendants were the assignees and owners of Letters Patent No. 240,727, granted to one Alfred E. Jones, and were entitled to use the invention therein described and shown, notwithstanding the letters patent of complainant on which the suit was bronght.

It appears in the testimony that for several years previous to the filing of the bill two of the defendants, Fitzsimmons and Jennings, were in the employ of the complainant's firm, and they became familiar with the use of molds made under the Doyle patent, which is set up as anticipating the alleged invention of Illingworth. It also appears that the co nplainant used the Doyle patent for several years previous to 1875 in the manufacture of iron and steel ingots, the inventor, Doyle, during the time being in business with the complainant; that the above patent was obtained by Illingworth in view of the fact that Doyle was about going out of the firm, after which it was supposed that the continued use of his patent would not be allowed, and that he went out and remained away from the complainant from 1875 to 1880, when he returned and became the superintendent of his works.

On the 7th of May, 1881, Patrick Doyle began his suit against the defendants for the infringement of the letters patent which had been set up in the former action as an anticipation of the Illingworth patent.

The answer of the defendants denies (1) that Doyle was the original and first inventor of the improvements therein claimed, and (2) alleges that every substantial and material part of the invention was known to several persons now residing in this country, and by whom it had been used in Sheffield, England, during their residence there. Pending the taking of testimony in these suits, two applications were made to the court by the respective parties—one by the defendants in the Illingworth suit, asking that they might be allowed to amend their answer by inserting the allegation that the invention claimed by Illingworth was known to certain persons residing in this country, who used it in the city of Sheffield, England, before coming hither, and the other by the complainant in the Doyle suit, who moved to strike out the said allegation in the answer filed therein. The question involves the interpretation of the clause "not known or used by others in this country" in section 4886 of the Revised Statutes, which first appeared in section 24 of the act of

July 8, 1870, and which had never received judicial construction.

Being willing to afford the parties an opportunity without embarrassment to correct any mistake which the court might fall into in deciding a matter of first impression, we allowed the allegation to stand in the answer in the Doyle suit and to be inserted in the Illingworth answer, and directed the parties to make their proofs of the facts and to present their views more fully at the final hearing. (See *Illingworth* v. *Spaulding et al.*, 9 Fed. Rep., 611.)

After a careful consideration of the three sections of patent act which bear upon the subject—sections 4886, 4920, and 4923 of Revised Statutes—we are of the opinion that the use or a knowledge of the use of an invention in a foreign country by persons residing in this country will not defeat a patent which has here been granted to a *bona fide* patentee, who at the time was ignorant of the existence of the invention or its use abroad.

When the parties began to take the proofs they united in a stipulation that the evidence should be entitled in both causes and that the two should be argued together. The defendants also admitted in writing in each of the cases that before the commencement of the suits, and since the granting of the letters patent, respectively, they had manufactured combined ingots of iron and steel in the following manner and for the following purposes;

I.

By means of a mold made in conformity to Letters Patent of the United States No. 240,727, granted to them April 26, 1881, as assignees of Alfred E. Jones, a copy of which is hereto annexed, marked "Complainant's Exhibit Jones' Patent."

II.

By means of a mold made with two covers, in all respects like that shown in the above-named letters patent, except that there were two covers instead of one, and the slide was omitted.

The covers are so made that a part of the cover first used projects into the molds

The process is as follows: The mold being clamped together the first metal to be cast is poured into it, and when sufficiently set the cover is removed and a second one, perfectly flat, is inserted in its place. When this is done there remains a space between the newly-cast metal and the side or cover of the mold, into which is cast the remaining part of the ingot.

The mold is shown in the model Complainant's Exhibit "E," when both covers are used and the slide is omitted, one cover having a projection into the mold and the other being flat.

III.

By means of a mold of three parts, each part being composed, as usual, in two-part molds of three sides rising from a closed base.

The operation of the mold is as follows:

The two parts of the mold are joined together in the usual manner by rings and wedges, and an ingot is cast therein in the usual way.

Immediately that the metal is set one side of the mold is removed, and another, a little larger, is fixed by rings and wedges in the place of the side removed.

Into the space thus made, adjacent to the glowing ingot of metal, the molten metal to complete the ingot is poured. When sufficiently cooled the combined ingot is removed, as is usually done in ingot-molds of two parts.

This mold is represented by Complainant's Exhibit "F." The size and proportions of the parts however are not correct: only the arrangement and operation of the parts are intended to be illustrated.

IV.

By means of a mold of two parts, in which one of the parts is like the ordinary two-parts mold—viz., with three sides and a bottom—the other part being made flat on one side and with a projection on the other so arranged as to project between the sides and into the other part when the two are joined together.

The operating of the mold is as follows:

The two parts of the mold being joined together by rings and wedges in the usual way, (the projecting part of one side extending into the recess in the other,) the metal is cast into it, and when the metal is set, the side with the projection is removed and turned so that its flat side is toward the center of the mold. There is thus left an open space in the mold, into which is cast the metal which is intended to complete the ingot.

The combined ingot is removed in the ordinary way of removing single ingots.

This mold is represented by Complainant's Exhibit "G."

The same limitation is made in regard to this exhibit as to Exhibit "F" above.

V.

By means of a mold similar to that last described, with the exception that instead of one cover there are two, one being flat, and one having a projection on its inner surface, as just described. The operation is the same as of Exhibit "G," with the exception that instead of turning the cover so that the projection shall be outermost, the flat cover is used. This mold is represented by Exhibit "H."

The same limitation is made to this exhibit as to Exhibit "F" above.

Newark, N. J., October 8, 1881.

FRANCIS FORBES,
Solicitor for the defendants in above causes.

The subject-matter of the controversy has reference to the use of molds in casting combined ingots of iron and steel. The patent oldest in date for the employment of mechanism for such a purpose was granted to Patrick Doyle on February 1, 1870, and numbered 99,299. The patentee says that his invention relates to improvements in molds for making ingots of iron and steel in a manner so as to dispose of the one metal on one or more sides of the other and to secure a perfect union of the two, and that it consists of a vertical mold of four or other number of plain sides, one or more of which may be detachable and clamped to the other by strong bands in which a strong thick plate of metal is arranged to fit near one side from top to bottom, snugly to occupy a part of the space when the metal of which the greater part of the ingot is to be composed is poured in, and to remain until the same has solidified sufficiently to retain its position, when it is withdrawn, leaving a space for the other metal, which, being poured in, unites perfectly with the first and forms the required composition ingot.

In introducing his specifications the patentee speaks of his invention as an "improved" mold for making combined iron and steel ingots, thereby implying that other molds were in use of which he regarded his as an improvement. Not only the scope of this patent but the validity of the subsequent issues to Illingworth and Jones must be determined by the state of the art at the time when the Doyle patent was granted. The evidence on this subject is meagre. After looking through the testimony with care, we fail to find anything relating to the state of the art, except the statement of Mr. Illingworth that he had been engaged in the steel business for seventeen years; that prior to the Doyle invention he had never seen any molds or other mechanism with which skate-metal, which was a combination of steel and iron, could be made; that the only mode of manufacturing such a combination of which he had any knowledge was to weld together the iron and steel into one bar and then rolling it out, and that this was the only method then in use at his works. Accepting this as the state of the art at this time, it must be conceded that there was novelty and value in the Doyle improvement. It was a step from the mere mechanical combination by welding to a chemical one resulting from the fusion and union of the two metals when in a heated state. It was the introduction of the variable cavity, whereby the amount of the one metal or the other could be accurately adjusted and obtained by the exercise of ordinary mechanical skill.

We are confirmed in our view of the Doyle patent by the fact that as late as 1873 a patent was granted in England to William Moore for substantially the same device for making combined ingots of iron and steel, securing the variable cavity by the use of a slide,

which would hardly have been granted if such a method of casting ingots had previously been in use in England, as the defendant so earnestly contended.

On the argument the counsel for the defendants insisted that the complainant had failed to prove any infringement. The reason why specific proof was not offered was, doubtless, owing to the circumstance that the defendants admitted the performance of acts and the use of instrumentalities which the complainant assumed would be sufficient to satisfy the court of the fact of infringement. For instance, the defendants filed in the cases an admission that they had manufactured combined ingots of iron and steel by means of a mold made in conformity to the Letters Patent No. 240,727, granted to them April 26, 1881, as assignees of Alfred E. Jones. If we understand the argument of counsel, it is that there was a failure of expert testimony to inform the court whether or not such an act was an infringement of the several patents of the complainants. We fail to see how experts' testimony would be of any service. Numerous experts could undoubtedly have been found both by the complainant and the defendants who would respectively maintain the views of their employers on a question of that sort; but their evidence would not greatly help the court in deciding what is simply a question of mechanical equivalents. Having in our hands the respective letters patent, the models, and the molds used, we trust it will not be set down as presumption to add that we have quite as much confidence in our own judgment as we should have in the opinion of experts whether the use of the one was an infringement of the claims of either of the others.

It need not be claimed that Doyle was the first person who used molds in casting ingots of iron or steel; but the evidence shows that he was the first who manufactured combined ingots of these metals by the use of mechanism which produced a variable cavity in the molds. The several patents of Illingworth and Jones reach the same result as to the variable cavity; but Illingworth has changed, and, as we think, improved, the mechanism. In the Doyle patent the cavity for one of the metals is made by the use of an iron or steel slide, and in the Illingworth by two covers, one with a plain or straight surface and the other recessed.

If such a substituted instrumentality of the mechanism is not a mere equivalent for the metal slide of Doyle, the patent may be held good for the improvement, although it is valueless except in combination with Doyle's invention, and can no more be used without his consent than Doyle can use Illingworth's improvement without his consent.

The first admission of the defendants is their use of molds made in conformity to the Jones letters patent. We regard this as a clear infringement of the Doyle patent.

Their second, third, fourth, and fifth admissions embrace the use of instrumentalities which not only infringe the Doyle invention, but also the improvement of the Illingworth patent. There are differences in construction and mode of operation shown; but these are not radical or independent enough to take them out of the catagory of mechanical equivalents.

Let a decree be entered in favor of the complainants in both cases for an injunction, and the usual order of reference be made for an account.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., April 16, 1884.

SIR: I am directed by the Secretary to inform you that he has ordered that Lindsay Steele, of Chester, Randolph county, Illinois, be not recognized from and after this date as attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,

AMOS HADLEY,
Acting Chief Clerk.

The Commissioner of Patents.

DESIGNS.

14,965.—PENCIL-CASE.—*Le Roy W. Fairchild*, New York, N. Y. Application filed February 25, 1884. Term of patent 3½ years.

14,966.—OIL-STOVE.—*Robert Ham*, Troy, N. Y., assignor to *The Standard Oil Store Company*, same place. Application filed March 7, 1884. Term of patent 7 years.

14,967.—FINGER-RING.—*Harvey Huestis*, Providence, R. I. Application filed March 10, 1884. Term of patent 7 years.

14,968.—PEN-WIPER.—*Leopold Kahn*, New York, N. Y. Application filed March 8, 1884. Term of patent 3½ years.

14,969.—ORNAMENTATION OF HARDWARE.—*Arthur Langerfeld*, New Britain, Conn., assignor to *P. & F. Corbin*, same place. Application filed March 3, 1884. Term of patent 14 years.

14,970.—CARPET.—*Edward Poole*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed February 19, 1884. Term of patent 3½ years.

14,971.—AXLE-YOKE.—*Henry K. Porter*, Boston, Mass. Application filed July 21, 1883. Term of patent 14 years.

14,972.—SASH-FASTENER FRAME.—*William E. Sparks*, New Britain, Conn., assignor to *The Kempshall Manufacturing Company*, same place. Application filed September 17, 1883. Term of patent 7 years.

14,973.—DRAWING-SQUARE.—*Langdon Shock Thompson*, Lafayette, Ind. Application filed March 1, 1884. Term of patent 7 years.

14,974.—PAPER.—*Samuel W. Wilson*, New York, N. Y. Application filed March 1, 1884. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

11,114.—POWDERED GLUE.—*Bernard Cannon* and *William Cannon*, Lincoln, county of Lincoln, England, and *Edward Cannon, Sr.*, and *Edward Cannon, Jr.*, Dublin, county of Dublin, Ireland. Application filed October 4, 1883.

"The representation of cannons, in combination with the surname and fac-simile signature of the firm-name of the registranta."

11,115.—POWDERED GELATINE.—*Bernard Cannon* and *William Cannon*, Lincoln, county of Lincoln, England, and *Edward Cannon, Sr.*, and *Edward Cannon, Jr.*, Dublin, county of Dublin, Ireland. Application filed October 4, 1883.

"The surname and fac-simile signature of registrants' firm."

11,116.—CONCENTRATED PREPARATION OF SIZE.—*Bernard Cannon* and *William Cannon*, Lincoln, county of Lincoln, England, and *Edward Cannon, Sr.*, and *Edward Cannon, Jr.*, Dublin, county of Dublin, Ireland. Application filed October 4, 1883.
"The surname and fac-simile signature of the firm-name of the registrants."

11,117.—DRUGS AND CHEMICALS.—*William S. Powell*, Baltimore, Md. Application filed March 5, 1884.
"The arbitrarily-selected letter 'P,' with the word 'PURITY.'"

11,118.—MANUFACTURED CHEWING-TOBACCO.—*Harden H. Reynolds*, Winston, N. C. Application filed February 16, 1884.
"The letters and word 'ELEPHANT' and the figure of an elephant."

11,119.—CEMENT FOR CEMENTING IRON SURFACES TOGETHER.—*James H. Carrington*, New York, N. Y. Application filed March 26, 1884.
"The word 'VULCAN.'"

11,120.—MEDICAL COMPOUND FOR THE CURE OF AGUES AND FEVERS.—*Charles W. Goodhue*, New York, N. Y. Application filed March 4, 1884.
"The words 'DR. SUTTON'S.'"

11,121.—WOOLEN TEXTILES, INCLUDING YARNS, CASSIMERES, FLANNELS, JEANS, AND LINSEYS.—*The Zanesville Woolen Manufacturing Company*, Zanesville, Ohio. Application filed March 21, 1884.
"The letter 'Z.'"

11,122.—CERTAIN PLASTIC COMPOSITION AND ARTICLES MADE THEREOF.—*John G. Kearsing*, Newark, N. J. Application filed March 18, 1884.
"The word 'DURANOID.'"

11,123.—COUGH-CANDY DROPS.—*Adolph C. Meyer*, Baltimore, Md. Application filed March 18, 1884.
"The arbitrary word-symbol 'DR. BULL'S' and the fac-simile signatures of 'A. C. MEYER & CO.' and 'JOHN W. BULL.'"

11,124.—SOLID AND FLUID MEDICINAL PREPARATIONS.—*Adolph C. Meyer*, Baltimore, Md. Application filed March 18, 1884.
"A device as follows: In light lettering on a dark ground, and occupying an arc of about three-fourths of a circle, are the words 'DR. BULL'S FAMILY MEDICINES.' Beneath is a ribbon, which completes and extends a little beyond the circle on each side. The central part of the device represents a bull's head and neck."

11,125.—COUGH-SIRUP.—*Nathan F. Philo*, Jersey City, N. J. Application filed February 23, 1884.
"The arbitrarily-selected word 'MOHAWK.'"

11,126.—MELISSA-WATER.—*Henry Renouard & Co.*, Paris, France. Application filed November 2, 1883.
"The representation of a bottle bearing the words 'EAU DES CARMES.'"

11,127.—PREPARATION FOR PROMOTING THE GROWTH OF THE HAIR.—*William Henry Sayre*, Newark, N. J. Application filed March 1, 1884.
"The word-symbol 'QUINMARTHION.'"

11,128.—BLACK AND COLORED SILKS.—*Shaen & Fithian*, New York, N. Y. Application filed March 21, 1884.
"The word 'CYCLOPS.'"

11,129.—TEA AND COFFEE.—*Ferdinand von Ocen* and *Theodore von Ocen*, Charleston, S. C. Application filed March 10, 1884.
"The monogram 'T & C E,' entwined with sprigs of the tea-plant, which incline toward the left, and with sprigs of the coffee-plant inclining toward the right."

11,130.—REFINED LARD.—*The W. J. Wilcox Company*, New York, N. Y. Application filed February 23, 1884.
"A picture of the Elector or the word 'ELECTOR,' or both."

11,131.—SMOKING AND CHEWING TOBACCO, CIGARS, CIGARETTES, CHEROOTS, AND SNUFF.—*F. W. Felgner & Son*, Baltimore, Md. Application filed March 20, 1884.
"The words 'MERCHANT'S DISPATCH.'"

11,132.—CIGARS, CIGARETTES, CHEROOTS, CHEWING-TOBACCO, AND SNUFF.—*F. W. Felgner & Son*, Baltimore, Md. Application filed March 29, 1884.
"The letters 'F W F & S' in the form of a monogram, the border around the same, and the words 'HERBE DE LA REINE.'"

11,133.—CHEWING AND SMOKING TOBACCO, SNUFF, AND CIGARS, CIGARETTES, OR CHEROOTS.—*F. W. Felgner & Son*, Baltimore, Md. Application filed March 29, 1884.
"The words 'MINER'S CHOICE.'"

11,134.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed March 26, 1884.
"The word-symbol 'OLD STAND BY' and the pictorial representation of a sailor in the act of steering with a wheel."

11,135.—CIGARS.—*Sebastian Azcano y Meana*, Havana, Cuba. Application filed February 11, 1884.
"The words 'FLOR DE LAS VILLAS.'"

11,136.—PLUG AND TWIST TOBACCO.—*Richard Joshua Reynolds*, Winston, N. C. Application filed March 25, 1884.
"The words 'ELEANOR CALHOUN.'"

11,137.—PLUG AND TWIST TOBACCO.—*Richard Joshua Reynolds*, Winston, N. C. Application filed March 25, 1884.
"The arbitrary word 'SCHNAPPS.'"

11,138.—PLUG AND TWIST TOBACCO.—*Richard Joshua Reynolds*, Winston, N. C. Application filed March 25, 1884.
"The arbitrary word 'CAROMEL.'"

11,139.—PLUG, FINE-CUT, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Herman Segnitz & Co.*, Milwaukee, Wis. Application filed March 19, 1884.
"The word-symbol 'ELEVEN-TEEN.'"

LABELS.

4,098.—Title: "WIECZOREK'S DIALYSED PERRATED OR IODO-PERRATED COD-LIVER OIL, 1:1000."—*Anthony Wieczorek*, New York, N. Y. Application filed March 26, 1884.

Declaration between the United States of America and the Kingdom of Italy—Reciprocal Protection of Marks of Manufacture and Trade.

Concluded June 1, 1882. Ratification advised by the Senate February 25, 1884. Proclaimed March 19, 1884.

BY THE PRESIDENT OF THE UNITED STATES OF AMERICA

A PROCLAMATION.

Whereas a declaration between the United States and Italy for the reciprocal protection of marks of manufacture and trade in the two countries was concluded and signed by their Plenipotentiaries at Washington on the 1st day of June, 1882, the original of which declaration is word for word as follows:

DECLARATION.

The Government of the United States of America and the Government of His Majesty the King of Italy, wishing to provide for the reciprocal protection of the marks of manufacture and trade, have agreed as follows:

The citizens of each of the high contracting parties shall enjoy, in the dominions and possessions of the other, the same rights as belong to native citizens, or as are now granted or may hereafter be granted to the subjects or citizens of the most favored nation, in everything relating to property in trade-marks and trade-labels.

It is understood that any person who desires to obtain the aforesaid protection must fulfill the formalities required by the laws of the respective countries.

In witness whereof the undersigned, having been duly authorized to this effect, have signed the present declaration, and have affixed thereto the seal of their arms.

Done in duplicate original at Washington this first day of June, one thousand eight hundred and eighty-two.

FRED'K T. FRELINGHUYSEN. [SEAL.]
FAVA. [SEAL.]

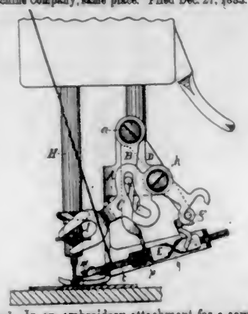
And whereas the said declaration has been duly ratified:

Now, therefore, I, Chester A. Arthur, President of the United States, have caused the said declaration to be made public, to the end that the same and every clause and part thereof may be observed and fulfilled with good faith by the United States and the citizens thereof.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done at the city of Washington this nineteenth day of March, in the year of our Lord one thousand eight hundred and [SEAL.] eighty-four, and of the Independence of the United States the one hundred and eighth.

CHESTER A. ARTHUR.



By the President:
FRED'K T. FRELINGHUYSEN,
Secretary of State.

[*Note.*—Inasmuch as the act of Congress entitled "An act relating to the registration of trade-marks," approved August 5, 1882, gives the right of trade-mark registry to subjects of any foreign country which by law admits the like right for citizens of the United States, this declaration is held to be an establishment of the fact that such reciprocal privilege exists, and is therefore effective from June 1, 1882, the date of its signature.]

PATENTS

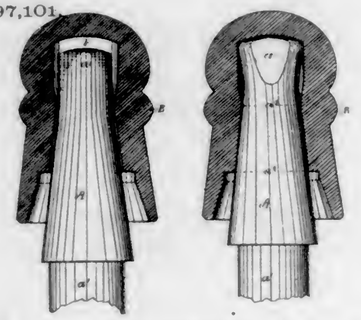
GRANTED APR. 22, 1884.

297,100. EMBROIDERING ATTACHMENT FOR SEWING-MACHINES. GEORGE WELLS BAKER, Cleveland, Ohio, assignor to the White Sewing Machine Company, same place. Filed Dec. 27, 1883. (No model.)

Claim.—1. In an embroidery attachment for a sewing-machine, the combination, with a spiral shaft, a lever constructed to engage and reciprocate said shaft, and a second lever constructed to engage the spiral portion of the shaft and impart an oscillating rotary motion thereto, of a third vibrating lever constructed to engage and be actuated by the sewing-machine and connected to both the first and second levers, and adapted to vibrate the same, substantially as set forth.

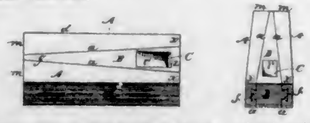
2. In an embroidering attachment for a sewing-machine, the combination, with a looper-shaft and means for imparting an oscillating rotary motion thereto, of a vibrating lever constructed to engage and reciprocate the looper-shaft, and a lever constructed and arranged to be actuated by the sewing-machine, and connected to said vibrating lever and adapted to actuate the same, substantially as set forth.

3. In an embroidering attachment for a sewing-machine, the combination, with a looper-shaft having a spiral portion, and means for reciprocating said shaft, of a vibrating lever constructed to engage the spiral portion of the looper-shaft, and a separate lever constructed and arranged to be vibrated by the sewing-machine, and connected with the vibrating lever, and adapted to actuate the same and impart an oscillating rotary motion to the looper-shaft, substantially as set forth.



4. In an embroidering attachment for sewing-machines, the combination, with a looper-shaft and a lever constructed and arranged to be actuated by the needle-bar, of two intermediate levers connected at one end to said needle-bar-actuated lever, the free ends of said levers being connected to the looper-shaft, one of the levers serving to reciprocate the shaft and the other to impart an oscillating rotary motion thereto, substantially as set forth.

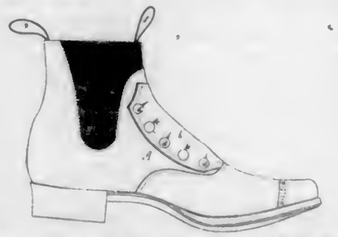
297,101. INSULATOR FOR TELEGRAPH-WIRES. LUTHER C. BALDWIN and JOHN C. THURSTON, Manchester, N. H. Filed Oct. 18, 1883. (No model.)



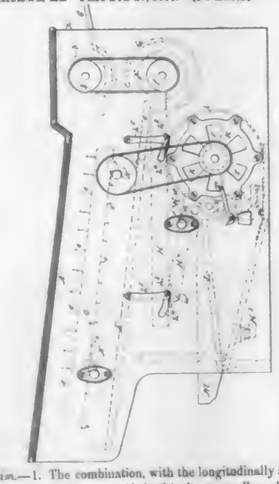
Claim.—1. A cup of non-conducting material having its interior shaped substantially as described, in combination with a pin which, when partially inserted, allows the cup to turn, and when fully inserted forms a bearing for and prevents the cup from turning, substantially as set forth.

2. A cup of non-conducting material having its interior formed into an upper chamber with flat sides, a middle circular chamber, and a lower tapering chamber oval at one end and circular at the other, in combination with a supporting-pin having a knob with flat sides at one end, its other end adapted to be secured to an arm or post, and a cylindrical tapering part between these ends, substantially as and for the purpose set forth.

297,101.



297,102. QUOIN. MICHAEL C. BARRY, Salem, Mass. Filed Mar. 7, 1883. (No model.)



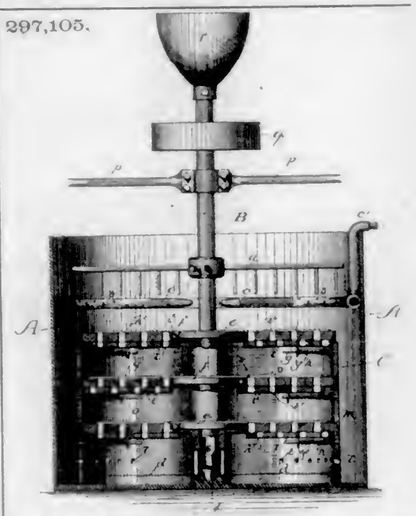
Claim.—As a new article of manufacture, a printer's quoin composed of two side blocks tapered longitudinally on one side, and provided with dovetail grooves on their tapered sides, and a central wedge-shaped block or key provided on its sides with dovetail tongues adapted to fit the dovetail grooves of the side blocks, and on its upper face with a recess having an incline sloping upward toward its narrow end for the bearing of the shooting-stick when locking the form, and a more abrupt incline or shoulder toward the larger end for the bearing of the shooting-stick when unlocking the form, the said side blocks and key being of uniform thickness, substantially as described.

297,103. SHOE. ISAIAH ADDITON BEALS, Brockton, Mass. Filed Jan. 31, 1884. (No model.)

Claim.—A shoe having in the leg and ankle portion of its upper an elastic gore, and the said leg portion closed down its front to or about to the instep, and such instep provided with a fly, and separable fastenings therefor, to secure it at its lower part to the instep, all being substantially as set forth.

297,104. CLOVER THRASHER AND HULLER. CHARLES A. BEELE, Hagerstown, Md. Filed Dec. 27, 1883. (No model.)

Claim.—1. The combination, with the longitudinally and vertically reciprocating carrier-bars provided with the upwardly and downwardly projecting pins, of the open frame having longitudinal passages for said carrier-bars to play through, the inclined lugs q q, secured to the under side of the open frame, the friction-rollers upon which said inclined lugs rest, and the cams q^2 q^2 on the cross-shafts, for acting upon the lugs and imparting to the frame an upward and forward movement, and the platform arranged below the carrier-bars, substantially as described.



2. The combination, with the fan and the fan-casing, of the stationary plates provided with openings at the ends of said casing, and with the inwardly-projecting boss or hub, and the swinging plates mounted on the said boss or hub, and provided with openings and with projecting wings, to catch the blast, substantially as described.

3. The combination, with the fan and the fan-casing, of the stationary plates provided with the openings, and with the inwardly-projecting boss or hub having the recess for the bearing of the swinging plates, and the swinging plates provided with the openings and wings, and having the knife-edge bearing for resting in the recess of the hub of the stationary plates, substantially as described.

4. The combination of the conveyer, arranged to drop seed upon the sieve, with the sieve, the fan, and the adjustable deflector, consisting of the parallel slats and swinging supports, all adapted to be simultaneously adjusted, so as to direct the blast in parallel lines, but at different angles with respect to the sieve, substantially as described.

297,105. PROCESS OF AND APPARATUS FOR SEPARATING METALS FROM THEIR ORES. ABEL H. BLISS, Chicago, Ill. Filed Jan. 16, 1884. (No model.)

297,105.

Claim.—1. The process herein described of separating metals from their ores, which consists in introducing the ore in a triturated condition into a body of mercury below the surface of the same, and then successively stopping and releasing it, once or oftener, in its upward progress through the mercury, substantially as described.

2. In an apparatus for separating metals from their ores, the combination of the following elements: a vessel, A, for containing mercury, means for charging the ore in a triturated condition into the mercury below the surface of the same, a hollow body, C, within the vessel A, having a diameter less than that of the vessel, whereby a space exists between the two, and containing one or more compartments, and opening at or near its base into the annular chamber, and mechanism for opening and closing the tops of the compartments, substantially as described.

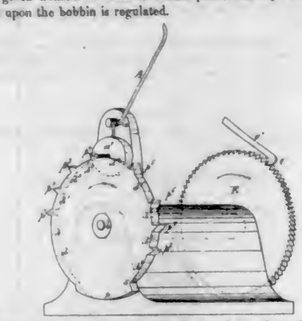
3. In an apparatus for separating metals from their ores, the combination, with a vessel for containing mercury, and with means for charging the ore in a triturated condition into the said vessel near its base, of mechanism for alternately stopping and releasing the ore in its progress upward through the mercury, all substantially as described.

4. In an apparatus for separating metals from their ores, the combination, with a vessel for containing mercury, and with means for charging the ore in a triturated condition into the said vessel near its base, of mechanism for alternately stopping and releasing the ore in its upward progress through the mercury, and mechanism for creating a downward current in that portion of the mercury through which the ore rises, all substantially as described.

5. In an apparatus for separating metals from their ores, the combination, with a vessel, A, for containing mercury, of the rotary stand-pipe B, having a hopper at its upper end, one or more openings near its lower end, and means for evolving it, a hollow body, C, within the vessel, of smaller diameter than the vessel, whereby an annular space exists between the two, and opening at or near its base into the said annular space, and containing one or more sets of compartments intercommunicating in vertical series, and mechanism operated automatically by the rotation of the stand-pipe for opening and closing communication between the compartments in vertical series consecutively, substantially as described.

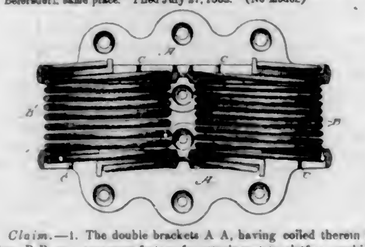
6. In an apparatus for separating metals from their ores, the combination of the following elements: a vessel for containing mercury, a rotary stand-pipe supported within the said vessel, and having one or more discharge-openings near its lower end and a hopper at its top, means for permitting the said stand-pipe to be revolved, a hollow body, C, of smaller diameter than the vessel and standing around the stand-pipe within the vessel, and opening at or near its base into the space surrounding it, said body being formed in sections superposed one upon another, and divided by partitions into compartments having openings in their tops, sliding plates l in contact with the tops of the compartments, and provided with openings to register with those in the said tops, and mechanism for sliding the said plates back and forth through the revolution of the stand-pipe, comprising cams o upon the stand-pipe, and spring mechanism acting in opposition to the cams, substantially as described.

297,106. DEVICE FOR HOLDING PENCILS AND OTHER OBJECTS. CLARK W. BOMAN, New York, N. Y., assignor to Joseph Reckendorfer, same place. Filed May 19, 1883. (No model.)



Claim.—1. The combination of the handle or sheath, the tubular receiver provided with notches, the slotted guide-tube connected with the slotted receiver by a pin-and-helical-slot connection, substantially as described, the spring and the follower, with a stop to limit the outward movement of the follower, intending to claim none of these parts separately, but all of them in combination, when made and operating substantially as hereinbefore set forth.

2. A follower provided with a stop pin or lug and grasping or holding device, in combination with a slotted guide-tube, a tubular slotted and notched receiver connected therewith by a pin-and-helical-slot connection, substantially as described, and a coiled spring, intending to claim none of these parts separately, but only the combination of all of them, when constructed and operating as set forth.

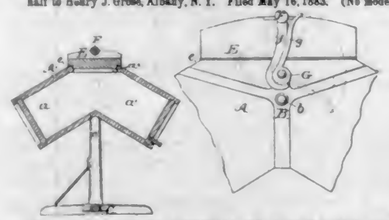


297,107. COP-BUILDING MECHANISM. JOHN BOND and GEORGE SMETHURST, Maynard, Mass. Filed Mar. 23, 1883. (No model.)

Brief.—By mechanism shown the ring-rail is caused to repeat its stroke a given number of times at certain parts, whereby the laying of the yarn upon the bobbin is regulated.

Claim.—The combination, with the pawl A and mechanism for raising and lowering the ring-rail, of mechanism for controlling the pawl, adapted to be connected to and operated by said rail-operating mechanism, whereby the stroke of the ring-rail is repeated and the yarn laid on the same part of the cop, as and for the purpose set forth.

297,108. SPRING ATTACHMENT FOR PLATFORM ROCKING CHAIRS. WILLIAM I. BUNKER, Chicago, Ill., assignor of one-half to Jacob Beiersdorf, same place. Filed July 27, 1883. (No model.)

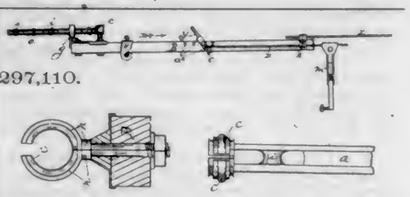


Claim.—1. The double brackets A A, having coiled therein the springs B B, as a new manufacture for attachment to platform rocking-chairs, substantially as and for the purpose described.

2. In a platform rocking-chair, the combination, with the rocker and base-rail, of the brackets A A and the coil-springs B B', one of said springs being constructed of lighter wire than the other, substantially as described, and for the purpose set forth.

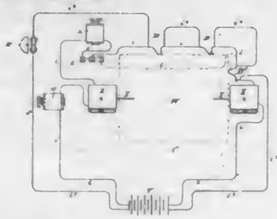
3. The combination, in a platform rocking-chair, of the brackets A A and coil-wire spring B, said brackets provided with a lug, C, substantially as described, and for the purpose set forth.

297,109. CHURN. JOHN H. BURCK, North Hoosic, assignor of one-half to Henry J. Gross, Albany, N. Y. Filed May 16, 1883. (No model.)



Claim.—In a churn, the combination, with a cream-holding receptacle provided with eccentrics G, as herein described, of the cover E, provided with a shaft, F, having pendent hooks f, adapted to engage with the eccentrics G and secure said cover in place, as herein specified.

297,110. CHECK-ROW ATTACHMENT FOR SEED-PLANTERS. FRANK W. CALAR, Joliet, Ill. Filed Jan. 20, 1883. (No model.)



Claim.—1. In a check-row attachment for seed-planters, the combination of the beam B, having the row of holes a^2, oscillating yokes y y, pitmen z z, clasp e, drop-lever m, standard c, slotted curved rotating guides a, hinged between the jaws n n, and having a series of friction-rollers, i, and guide-rest g, having the slot in its upper end for the reception of the guide a, all adapted to operate in the manner and for the purpose set forth.

297,110.

2. In the check-row attachment described, the jaws n n, having the slot c between their upper ends, in combination with the swinging guides a, having a corresponding slot in their inner end inclosed by said jaws and adapted to receive the wire w through said corresponding slots, as and for the purpose set forth.

297,111. PRINTING-MACHINE. ANDREW CAMPBELL, Brooklyn, assignor to John and Edmund McLoughlin, both of New York, N. Y. Filed July 27, 1883. (No model.)

Claim.—1. In a printing machine or press, means, substantially as described, whereby the proper placing of the sheet up to the front guides closes breaks in an electric circuit, which excites an electro-magnet, which controls the mechanism that closes the grippers, substantially as set forth.

2. In a printing machine or press, a front guide constructed in the form of a circuit closer and breaker, and arranged in an electric circuit, substantially as described, whereby the proper placing of the sheet closes the circuit thereat, for the purposes specified.

3. In a printing machine or press, the combination of mechanism, substantially as described, for actuating the grippers, means, substantially as described, for electrically controlling the operation of said mechanism for actuating the grippers, an electric generator, wires forming the electric circuit, and front guides constructed in the form of circuit closers and breakers, substantially as described, whereby the proper placing of the sheet to the guides closes breaks in the electric circuit, and thus controls the operation of the mechanism for actuating the grippers, all arranged substantially as set forth.

4. In a printing machine or press, the combination of mechanism, substantially as described, for actuating the front guides, means, substantially as described, for electrically controlling the operation of said mechanism for actuating the front guides, an electric generator, wires forming an electric circuit, and front guides constructed in the form of circuit closers and breakers, substantially as described, whereby the proper placing of the sheet to the guides closes breaks in the electric circuit, and thus controls the operation of the front guides, substantially as and for the purposes set forth.

5. In a printing machine or press, the combination of means, substantially as described, for rotating the cam-shaft 9, means, substantially as described, for electrically controlling the operation of said mechanism for rotating the cam-shaft, an electric generator, wires forming the electric circuit, and front guides constructed in the form of circuit closers and breakers, substantially as described, whereby the proper placing of the sheet to the guides closes breaks in the electric circuit, and thus controls the mechanism for operating cam-shaft 9, substantially as and for the purposes set forth.

6. In a printing machine or press wherein the proper placing of the sheets to the front and side guides electrically controls the gripper-actuating mechanism, each front and side guide constructed in the form of a circuit closer and breaker, substantially as described, whereby the proper placing of the sheet up to all of the guides is necessary in order to close the breaks in the circuit at the guides, substantially as and for the purposes set forth.

7. In a printing machine or press wherein the proper placing of the sheet to the front guides electrically controls the operation of the

press mechanism, and wherein there is a break in the electric circuit at each front guide adapted to be closed by the proper placing of the sheet, the combination of a circuit breaking and closing device, substantially as described, arranged at some point in the circuit, and mechanism, substantially as described, arranged to close said break in the circuit after the breaks at the front guides are closed, and switch or shunt the current before the circuit is broken at said guides by their backward movement, whereby a spark at the front guides is avoided, substantially as set forth.

8. In a printing machine or press wherein the proper placing of the sheet to the front guides electrically controls the mechanism for actuating the front guides, an electrical switch constructed and operated by mechanism, substantially as described, arranged to switch the front guides out of the electric circuit a moment before they withdraw, whereby the breaking of the circuit consequent on their withdrawal will not affect the electrical control of the mechanism, substantially as described.

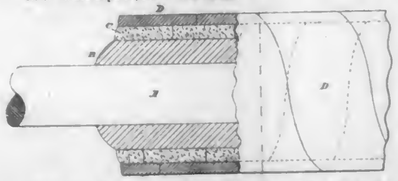
9. A front or side guide of a printing machine or press, comprising a plate, *d*, provided with contacts *g g*, a plate, *f*, hinged thereto, and provided with a contact, *j*, and a spring, *k*, to keep the contacts separate normally, substantially as set forth.

10. The combination, with the side guide, D', constructed substantially as shown, of the plate *x'*, provided with a recess to receive the free end of the plate *f* of the guide, substantially as set forth.

11. The mechanism for actuating the grippers, comprising the closing-stud and its spring, the disk B', provided with the cam *n*, the wheel B, provided with the lug *q*, the shaft *s*, bearing arms *r* and *t*, the lever M, with arms *y* and *z*, the magnet L, its lever *v*, provided with hook *a'*, and its retracting-spring, and the gripper-shaft provided with cam H, all combined and arranged to operate substantially as set forth.

12. The mechanism for actuating the grippers, constructed substantially as described, in combination with the front and side guides, constructed substantially as described, the electric generator, and the circuit-wires *i i*, all constructed and arranged to operate substantially as set forth.

13. The combination of the front guides constructed substantially as described, the generator, the circuit-wires *i' i'* and *i''*, disk B', provided with cam *a'*, the slide *d'*, contact-piece *g'*, conductors $h' h^2 h^3$, and the spring *f''*, all arranged to operate substantially as set forth.



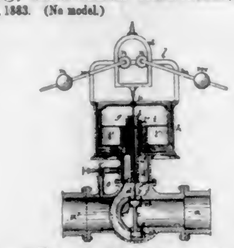
14. A printing machine or press provided with front and side guides constructed to form circuit-closers and breakers, substantially as described, and with an electric annunciator-circuit containing an electric annunciator and generator, and arranged to be broken and closed at the said guides, substantially as set forth.

15. The combination, in a printing-press, of the front and side guides, constructed substantially as shown, the generator, the electric annunciator and its circuit having breaks at said guides, the main circuit with breaks also at said guides, the switch device S, constructed substantially as described, the switch-wire *i'*, the electro-magnet L and its armature-lever, the disk B', bearing the operating-cams and levers *r t*, the said levers and cams, the lever M, the electro-magnet O and its armature-lever, the lever Q, the disk N, and the wheel S, provided with a pawl, *j*, all constructed and arranged to operate substantially as set forth.

16. In a printing machine or press, the front and side guides D D D', constructed substantially as shown, the electric generator and the wires of the main circuit, a mechanical circuit-closing device, S, and the fingers Y Y, and their operating mechanism, the magnets which actuate said fingers being in the main circuit, whereby, when said circuit is completed, the fingers will be thrown down, substantially as set forth.

17. In a printing machine or press, the combination of the time-wheel B and the disk B', the latter provided with the cams for actuating the grippers and front guides, with mechanism, substantially as described, controlled by the proper feeding of the sheet to the guides, for compelling the said disk to rotate with the time-wheel, whereby the said disk is compelled to rotate and perform its functions only when the sheet is properly fed, all constructed and arranged to operate substantially as set forth.

297,112. FORM-ROLLER FOR PRINTING. ANDREW CAMPBELL, Brooklyn, assignor to John and Edmund McLoughlin, both of New York, N. Y. Filed Sept. 10, 1883. (No model.)



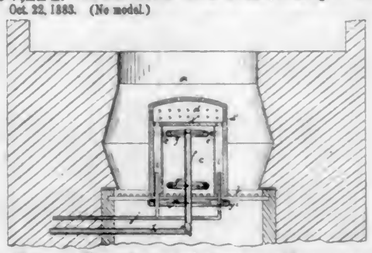
Claim.—1. A printer's roller provided with a leather cover, and a cushion of cork arranged under and next to said leather, substantially as shown and described.

2. A printer's roller comprising a metal stock, a wooden core, a cork cushion, and a leather cover arranged next to the cork, substantially as described and shown.

3. A printer's roller comprising a stock and core, a cork cushion, C, wrapped spirally around and secured to said core, and a leather cover, D, wrapped around and secured to the cork cushion C, substantially as set forth.

4. A printer's roller comprising a metal stock, a wooden core, B, secured thereto, a cork cushion, C, wrapped spirally around and secured to said core, and a leather cover, D, wrapped spirally around and secured to the cushion C, substantially as set forth.

297,113. GAS-GOVERNOR. JOHN S. CONNELLY, Pittsburg, Pa. Filed Nov. 3, 1883. (No model.)



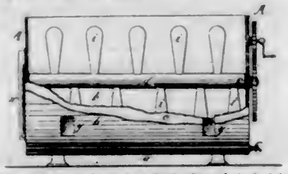
Claim.—1. The combination, in a gas-governor, of a float and valve, with a valve-stem connected to said float and having a friction-roller at its upper end, and a pivoted weight-lever having a curved arm extending at an angle therefrom, or from the journal thereof, which curved arm bears on the said roller, so as to cause the pressure of the lever to be always exerted in the direct vertical plane of the valve-stem as it falls and rises, substantially as and for the purposes described.

2. The combination, in a gas-governor, of a valve-stem, float, and a disk-valve having the part which first enters the seat tapered slightly and the part below the taper cylindrical, the tapered part being very long relatively to the cylindrical part, with a cylindrical valve-seat, so that the valve shall have a long run in its seat before closing or fully opening, substantially as and for the purposes described.

3. The combination, in a gas-governor, of a valve for regulating the flow of gas from the supply to the service main, with a pipe or by-pass extending around the valve and communicating with the valve-chamber on opposite sides of the valve-seat, for the purpose of enabling the valve to be adjusted, so as to be affected by a very slight change of pressure in the service-main, substantially as and for the purposes described.

4. The combination, in a gas-governor, of the valve-stem *d*, having a friction-roller, d^3, pivoted weighted lever *m*, and bent arm m^2, substantially as and for the purposes described.

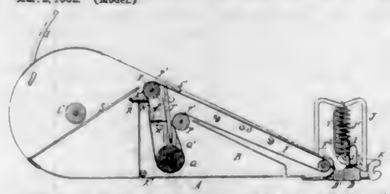
297,114. GLASS-FURNACE. JAMES DALZELL, Pittsburg, Pa. Filed Oct. 22, 1883. (No model.)



Claim.—1. The construction and arrangement of the devices herein described, consisting of a perforated burner situated in the eye of a glass-furnace, below the bench, having an air-supply orifice, and a gas-supply pipe arranged to admit natural gas within the burner, substantially as and for the purpose specified.

2. The construction and arrangement of the devices herein described, consisting of a perforated burner situated in the eye of a glass-furnace, below the level of the bench, having an air-supply orifice, and a gas-supply pipe arranged to admit natural gas within the burner, and a perforated air-chamber arranged above the burner and having an air-supply pipe leading thereto, substantially as and for the purpose specified.

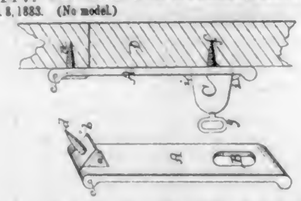
3. The combination, in a glass-melting furnace, of a gas-burner arranged in the central part of the fire-chamber or eye, and having a space between the same and the walls of the eye, so that the drip of the pots shall fall in the space, and not on the burner, substantially as and for the purposes specified.



4. The combination, in a glass-melting furnace, of a gas-burner arranged within the central part of the eye, and having a cap or casing interposed between the gas-pipes and the crown of the furnace, substantially as and for the purpose specified.

297,115. EGG AND SUGAR BEATER. CHARLES DEX, Buffalo, N. Y. Filed Sept. 24, 1883. (No model.)

Claim.—The combination of the horizontal shaft *d*, having projections or whippers *i i i*, with the box or receptacle A' A' A', having the rounded bottom *a*, with jacket or apartment *b b*, all constructed substantially as and for the purposes described.

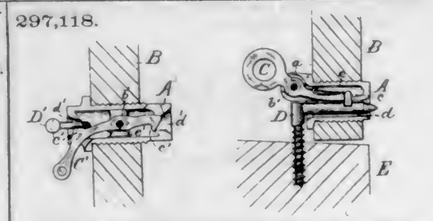


297,116. MAILING-MACHINE. ROBERT DEX, Buffalo, N. Y. Filed Mar. 2, 1882. (Model.)

Claim.—1. In an addressing-machine, the bearings P' Q' for the several rollers employed, arranged on the inside surfaces of the shell A, and proportioned as described relative to the diameters of the respective rollers, in order that the belt may travel close to the sides of the shell without liability of contact with the bearings, substantially as shown and described.

2. In combination with the paste-distributer H of a mailing-machine of the kind described, the sliding plate R, arranged contiguous thereto, and adapted to move horizontally to increase or diminish the area of the serration of said distributer for the purpose of correspondingly permitting a greater or less amount of paste to be applied to the web, substantially as described.

297,117. HASP-LOCK. DAVID H. DONALDSON, Buffalo, N. Y. Filed Oct. 8, 1883. (No model.)



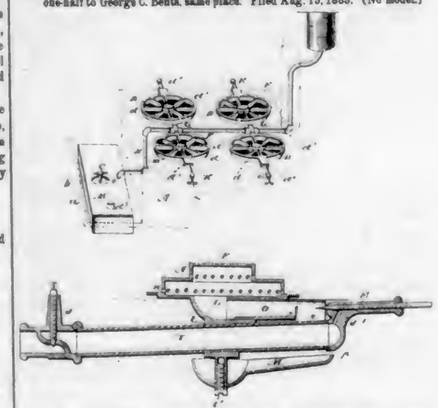
Claim.—1. The combination of the hasp A, having the recess *a* in its upper inner surface, and the hinged or swinging piece *b*, setting therein and holding a screw or bolt, *d*, to fasten it to a door or other place, substantially as specified.

2. A hasp and lock consisting of the hasp A, having the recess *a* in its upper inner surface, and the hinged or swinging piece *b*, setting therein and holding a screw or bolt, *d*, to fasten it to a door or other part, an oblong opening, B, in the hasp A, and an oblong bulb-lock, C, having the screw-point *f*, adapted to be inserted directly in the wood by turning the bulb C, substantially as set forth.

297,118. SHUTTER-FASTENER. WM. E. DOOLITTLE and D. EDWARD DOOLITTLE, New Britain, Conn. Filed Jan. 14, 1884. (No model.)

Claim.—1. A blind-fastener consisting of a case having a socket extending through the case and bell-mouthed at each end, and also of a spring-actuated latch having an integral operating-handle outside of the case and an engaging hook inside of the case, and also of a keeper for engaging the latch at a point within the socket, the whole being constructed and operating together substantially as described.

297,118.

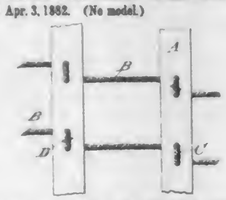


2. The herein-described blind-fastener, consisting of the case provided with a latch and spring-chamber, the latch and spring arranged therein, and the socket bell-mouthed at each end and extending through the case by the side of the spring-chamber, and in the same general direction as the length of the latch, substantially as described, and for the purpose specified.

297,119. BED-PAN. JULIA E. DRAKELEY, Madison, Wis. Filed Nov. 3, 1883. (No model.)

Claim.—The combination of the pan P, provided with the extra flange *f*, with the annular rubber air-cushion A, substantially and for the purposes as described.

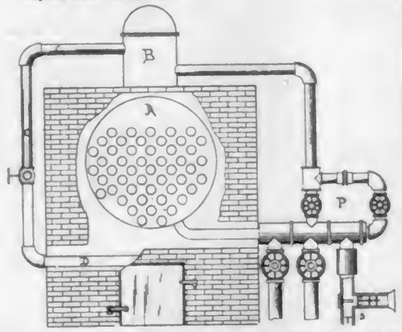
297,120. VAPOR-STOVE. FAY O. FARWELL, Cresco, Iowa, assignor of one-half to George C. Benta, same place. Filed Aug. 15, 1883. (No model.)



Claim.—1. In combination with an ordinary cooking-stove, a supply-tank placed in the ash-box of the same, a pump situated in the supply-tank and forming a part thereof, burners situated in or under the pot-holes of the stove-top, a single supply-pipe attached to the tank, and intermediate connecting-pipes between the burners and the main supply-pipe, substantially as set forth.

2. In combination with an ordinary cooking-stove, an oil-supply tank situated in the ash-box thereof, and provided with a pump for forcing the oil up to the burner, skeleton plates situated within the pot-holes and supported by the stove-cover, vapor-burners supported on the skeleton plates, a main supply-pipe, and intermediate connecting-pipes connecting the burners with the main supply-pipe, substantially as set forth.

3. The combination, with skeleton plates situated within the pot-holes of an ordinary cook-stove, and supported by the cover thereof, said plates being provided with lateral shields d^2, of vapor-burners supported on said skeleton plates and provided with screw-valves, which latter rest under the shields, a supply-tank, a main supply-pipe, and branch pipes connecting the burners and main pipe, substantially as set forth.



4. The combination, with the tube I, screw-valve coupling J, screw-valve, and drip-cup, of the screw-valve E, the split tube O, constructed as described, and the cap N, all of the above parts combined and adapted to operate as described.

297,121. FLY-NET FOR HORSES. DIETRICH FRICKBRICK, Milwaukee Wis. Filed Apr. 3, 1882. (No model.)

Claim.—In that class of fly-nets in which the cords are secured to transversely-arranged bars in perforations, the combination, with such bars and cords, of the U-shaped staples inserted through said bars from their lower surface, and having their respective arms extending above and around the looped portion of said cords between the perforations above the upper surface of the bars as adapted to prevent the cords from slipping in the perforations or the bars from slipping upon the cords, substantially as and for the purpose specified.

297,122. SMOKE-CONSUMER. WILLIAM L. FITCH, Chicago, Ill. Filed July 19, 1883. (No model.)

Claim.—1. The method of consuming smoke, which consists in discharging from the boiler superheated air and steam onto and into the smoke as it rises from the surface of the fire.

2. The method of consuming smoke, which consists in discharging from the boiler mixed superheated air and steam in a spray extending over the surface of the fire onto and into the smoke as it rises therefrom.

3. The method of supplying air to a smoke-consumer, which consists in first introducing it into the steam-boiler along with the feed-water, and thence conducting it to the consumer to be discharged onto the smoke.

297,123. WATCH-CASE SPRING. WALTER H. FITZ GERALD and GEORGE C. SMITH, Chicago, Ill. Filed Aug. 6, 1883. (No model.)

Claim.—1. The combination, with a watch-case, of the bow-shaped catch-spring F, provided with a catch at its middle, and having its ends loosely resting against the rim between the rim and the center and free to slide over the perimeter of the rim while the spring is being operated, substantially as described.

2. The combination, with a watch-case, of the bow-shaped catch-spring F, provided with a catch at its middle, and having its ends bent reversely to the main bend of the spring and loosely resting against the rim between the latter and the center, substantially as described.

3. The combination, in a watch-case having a hinged front, of the lift-spring H, located between the center and the rim, and pivoted at a point between its ends to the latter, and means for holding one end of the spring when the opposite end thereof is depressed by the hinged front, substantially as described.

4. The combination, with a watch-case having a hinged front, of the bow-shaped catch-spring F, having a catch at or near its middle, and arranged between the rim and the center with its ends free to slide along the rim when the spring is operated, said spring being provided with an opening through which the stem passes, substantially as described.

5. The combination, in a watch-case having a hinged front, of the lift-spring located between the center and the rim, and pivoted at a point between its ends to the latter, said rim being provided with a stud or abutment for holding one end of the spring when the opposite end thereof is depressed by the hinged front, whereby the spring shall be capable of flexion at both sides of its pivot, substantially as described.

297,124. WATCH-CASE. WALTER H. FITZ GERALD, Chicago, Ill. Filed Jan. 7, 1884. (No model.)

Claim.—1. A watch-case provided with a movement-holding rim screwed into the center of the case, substantially as described.

2. A watch-case center having at or near one of its edges an internally-threaded portion adapted to receive a threaded portion of a movement-holding rim, substantially as described.

3. The combination, in a watch-case, of an internally screw-threaded center with an externally screw-threaded movement-holding rim adapted to be screwed in the said center, substantially as described.

4. The combination, in a watch-case, of an internally screw-threaded center with an externally screw-threaded movement-holding rim screwed in the said center, with a part of its screw-threaded perimeter extending beyond the center to receive a lid, substantially as described.

5. The combination, in a watch-case, of an internally screw-threaded rim fitting in the center and extending beyond the inner edge thereof, so as to expose a portion of its screw-threaded perimeter, and a lid screwed onto the exposed screw-threaded perimeter of the rim, substantially as described.

6. A watch-case center, in combination with a movement-holding rim provided with a screw-threaded portion adapted to be connected with the case-center, and having a bearing against a seat on the said center, substantially as described.

7. A watch-case center, in combination with a movement-holding rim provided with a screw-threaded portion adapted to be connected at one end with the case-center, and at its opposite end having a bearing on a seat on the watch-case center, substantially as described.

8. A movement-holding rim for a watch-case, adapted to contain the movement, and provided at one edge with a threaded portion adapted to be screwed into the center or body of the case, and at the opposite edge adapted to bear on a seat formed in the case-center, and to receive a detachable bezel or cover, substantially as described.

9. In a stem setting and winding watch-case, the case-center provided with a back having a screw or equivalent connection with the case-center, in combination with a movement-holding rim provided with a screw-threaded portion adapted to be connected with the case-center, and a detachable bezel, substantially as described.

10. A movement-holding rim for a watch-case, provided at one edge with an externally-threaded portion adapted to be screwed into an internally screw-threaded portion of the case-center, and at its opposite edge provided with a shoulder adapted to rest on a seat formed in the case-center, substantially as described.

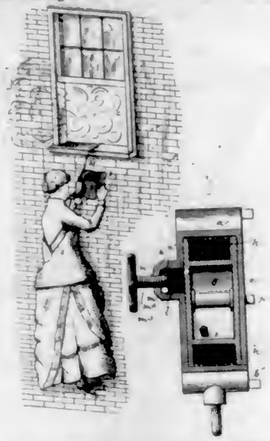
11. A watch-case center having at one edge an internally-threaded portion adapted to receive a threaded portion on a movement-holding rim, and an externally-threaded portion adapted to engage a threaded back or cover, said center being also provided with a seat adapted to receive a shoulder on the movement-holding rim, substantially as described.

12. A watch-case center having at one edge an internally-threaded portion adapted to receive a threaded portion on a movement-holding rim, and at its opposite edge provided with a seat on which the movement-holding rim seats when the said rim is in place within the case-center, substantially as described.

297,125. SAW-HANDLE. PERRY FRAHER, Mount Summit, Ind. Filed May 26, 1883. (No model.)

WITHDRAWN.

Claim.—1. In a saw-handle, a T-shaped loop-bolt formed in a single piece, adapted to encircle or clasp the end of the saw-plate, and means for securing the same to said saw-plate, whereby the handle is set at right angles with the cut of the saw, instead of in line therewith, substantially as set forth.



2. In a saw-handle, the combination of the usual handle, the washer upon the lower end of said handle, the T-shaped loop-bolt formed in one piece with the arms at substantially right angles with the shank, and said shank extending up through said washer into said handle, where it engages with a suitable fastening therein, substantially as set forth.

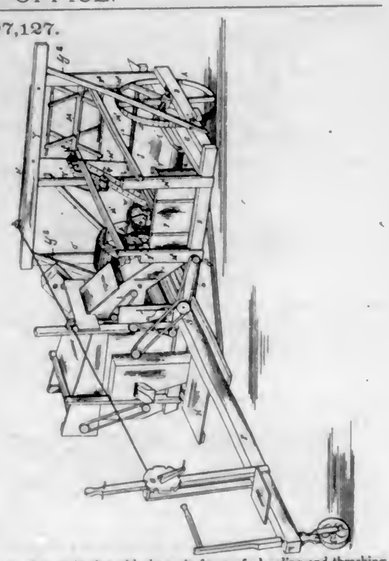
3. The combination of the saw-handle A, the washer B upon the lower end of said handle, having slots in its lower face, and a T-shaped loop-bolt, C, formed in one piece, the shank of which is adapted to enter a longitudinal hole in the lower end of the handle, and means for securing the bolt in said hole, whereby said handle may be securely clamped to said saw, substantially as set forth.

4. The combination, with the saw-handle A, of a conical washer, B, at the lower end of said handle, said washer being slotted upon its lower face, and a T-shaped loop-bolt, made in one piece, and having a screw-threaded shank adapted to engage with a nut arranged in a longitudinal perforation in the end of said handle, substantially as described, and for the purposes specified.

297,126. PORTABLE FIRE-ESCAPE. FRANCIS INGERSOLL FREEMAN, Warren, Ohio. Filed Feb. 7, 1884. (No model.)

Brief.—A rectangular depression in one of the outer walls of the casing contains a rubber brake-block operated to bear against the casing by a hand-screw bearing thereon.

Claim.—In a fire-escape, the combination, with a two-part casing, the body portion of which is provided with a rectangular depression in its side wall, said depression having a threaded opening through its outer wall, of a finely-threaded screw seated in said opening, and provided on its outer end with a hand-wheel, a rubber friction-brake seated in said rectangular depression in the side wall, and a revolving flanged drum carrying the cable, substantially as specified.



297,127. COMBINED HEADER AND THRASHER. SAML. L. GAINES, Stockton, Cal. Filed Apr. 28, 1883. (No model.)

Claim.—1. A frame adapted for a combined heading and thrashing machine, said frame consisting of the transverse beams D D', longitudinal beams B C E E' E², rearwardly-extending beam F, and platform H, extending at right angles to the line of draft, substantially as described.

2. A frame composed of the transverse beams D D', longitudinal beams B C E E' E², and rearwardly-extending beam F, in combination with suitable supporting-wheels, and driving-wheel A', mounted in said frame, and connecting-gearing consisting of the axle *a*, shafts *d* and *g*, gears *b*, *c*, *e*, *f*, *d'*, *l*, and *g'*, cam K, and pivoted connecting-rod K', substantially as set forth.

3. In combination with the main frame of a heading and thrashing machine, the heading and conveying frame I, I', and I², roller J', having a pivoted shaft for said heading and conveying frame, roller J², apron J, cam K, pivoted lever K', a cutter mechanism operated by said lever, and suitable driving and adjusting mechanism, substantially as specified.

297,127.

4. In combination with the main frame of a heading and thrashing machine, the frame I, I', and I², roller J', having a pivotal shaft, conveyer J, cam K, pivoted lever K', a cutter mechanism operated by said lever, conveyer O, located at the rear of conveyer J, and mechanism for actuating said conveyers and cutting mechanism, substantially as set forth.

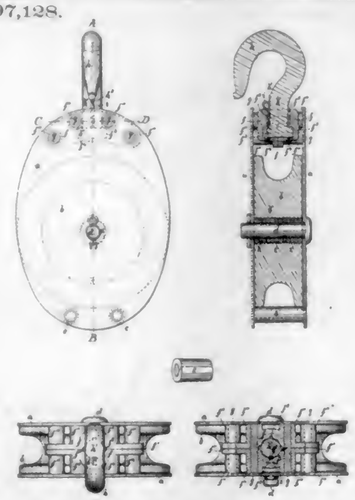
5. In combination with the main frame of a heading and thrashing machine, the heading and conveying frame, substantially as described, pivotally secured at its rear end to the main frame, conveyer J, cam K, pivoted lever K', a cutting mechanism operated by said lever, conveyer O, located at the rear of conveyer J, and at right angles thereto, auxiliary conveyer P, and mechanism for operating said conveyer, substantially as shown and described.

6. The combination of a cutter mechanism, conveyer J, conveyer O, located at the rear of conveyer J, and extending at right angles thereto, auxiliary conveyer P, located to one side of conveyer O, and being auxiliary thereto, and suitable operating mechanism, substantially as shown.

7. In combination with the main frame, a conveyer-frame pivoted therein at its rear end, having a cutting mechanism at its front end and a suitable vertical adjusting mechanism, and a reel-frame pivoted to the main frame and flexibly connected to the conveyer-frame, for the purpose set forth, substantially as described.

8. In combination with the main frame, a conveyer-frame pivoted therein at its rear end, having a cutting mechanism at its front end, and a suitable vertical adjusting mechanism, a reel-frame pivoted to the main frame and flexibly connected to the conveyer-frame, and conveyer O, located at the rear of conveyer J, and extending at right angles thereto, substantially as specified.

9. In combination with the main frame, a conveyer-frame pivoted therein at its rear end, having a cutting mechanism at its front end, and a suitable vertical adjusting mechanism, a reel-frame pivoted to the main frame and flexibly connected to the conveyer-frame, conveyer O, located to the rear of conveyer J, and extending at right angles thereto, and vertical conveyer P, located at one side of the conveyer O, and auxiliary thereto, substantially as set forth.



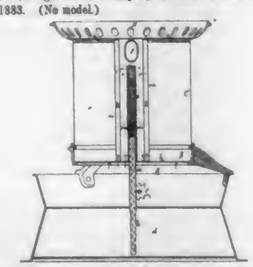
10. The combination of the main frame, a conveyer-frame pivoted therein at its rear end, a cutting mechanism at the front end of the conveyer-frame, windlass G, mounted on the main frame, and rope N, extending therefrom to the pivoted conveyer-frame for the purpose of vertically adjusting said frame, substantially as shown and described.

297,128. PULLEY-BLOCK. DANIEL M. GARRETT, Boston, Mass., assignor to the Whitman & Barnes Manufacturing Company, Akron, Ohio. Filed Jan. 19, 1884. (No model.)

Claim.—1. The pulley *b*, having a central screw-threaded or equivalent perforation, *b'*, in combination with the perforated rawhide washers *c c*, cemented together and secured within the said perforation *b'*, in a manner substantially as herein set forth and described.

2. In a pulley-block, the upper end piece made in two halves, *f f*, secured to sides *a a*, and having semi-annular internal grooves, *f² f²*, and flanges *f' f'*, adapted to retain in position the shank *h'* and head *h''* of the hook *h*, as set forth.

297,128.



3. In a pulley-block, the hook A, its shank A', and lower annular head, A'', all made in one continuous solid piece, combined with an end piece for securing such hook, said end piece being made in two halves, $f f$, riveted to sides $a a$, as set forth.

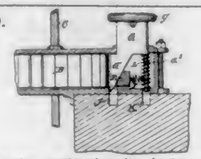
4. The end piece for holding the hook in a pulley-block, as described, made in two halves, $f f$, provided with tubular projections f'' f'', and secured to sides $a a$ by means of rivets $g g$, as and for the purpose set forth.

5. In a pulley-block, one or more grooves, f^5 A^5, in the respective bearing and shank for the hook, combined with detachable locking-pin i, or equivalent locking device for locking the hook to its block, as and for the purpose set forth.

297,129. APPARATUS FOR HEATING. DANIEL MCBRIDE GRAHAM, Chicago, Ill., assignor to the Company of Vulcan, New York, N. Y. Filed June 5, 1883. (No model.)

Claim.—1. The combination of the foraminous chimney *e* and air-distributer *f*, and their air-supplying conduits, with the lamp A, all being arranged substantially as set forth.

2. The combination of the foraminous chimney *e* and air-distributer *f*, and their air-supplying conduits, with the lamp A, all being adapted and to operate substantially as set forth.



3. The combination of the cup B, perforated in its bottom, the dome C, perforated in its top, and the perforated ring D, with the lamp A, the foraminous chimney *e*, and air-distributer *f*, and their air-supplying conduits, arranged as set forth.

4. The combination of the cup B, perforated in its bottom, the drum C, perforated in its top, and the perforated ring D, with the lamp A, the foraminous chimney *e*, and air-distributer *f*, and their air-supplying conduits, all being adapted and to operate substantially as represented.

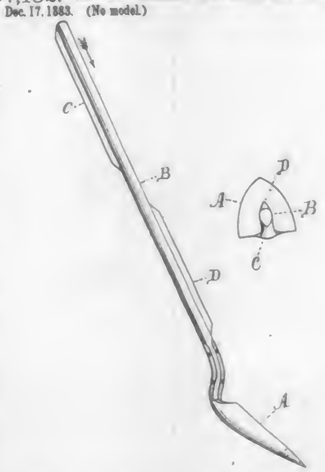
297,130. CAR-BRAKE ATTACHMENT. ELI M. HOLCOMB, Bay Springs, and FREDERICK E. MILLER, Evaline, Mich.; said Holcomb assignor to said Miller. Filed Aug. 27, 1883. (No model.)

Claim.—1. The combination, with a ratchet-wheel and a spring-pressed pawl having a beveled side, of a vertically-sliding and spring-

297,130.

pressed plate having a wedge-shaped projection resting against the beveled side of the pawl, substantially as herein shown and described.

2. The combination, with the ratchet-wheel B, the spring-pressed pawl E F, having a beveled side, and the casing A, inclosing the same, provided with a slot in its top and a slot and aperture in its bottom, of the plate G, provided with the wedge G′ and prong G^2, and the spring L, substantially as herein shown and described.



3. The combination, with a ratchet mounted on a brake-shaft and contained in a casing, of a pawl pressed against the edge of the wheel by a suitable spring, and a plate held to move vertically in the casing and provided with a wedge adapted to act on the pawl, and with a downwardly-projecting prong surrounded by a spring for pressing it and the plate upward, substantially as herein shown and described.

297,131. COATING COMPOUND FOR WIRE-DRAWING. ALONZO F. HOYLE, Worcester, Mass. Filed Oct. 19, 1883. (No specimens.)

Claim.—1. The improved coating for wire herein described, the same consisting of lime-water and sugar, compounded substantially as and in the proportions set forth.

2. In a compound for coating wire preparatory to drawing the same, the combination of lime and sugar, substantially as specified.

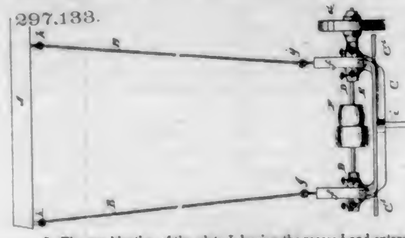
297,132. SHOVEL. FREDERICK W. HUDSON, Leominster, Mass. Filed Dec. 17, 1883. (No model.)

Claim.—1. In a round shovel-handle, the projection D, formed upon the upper side thereof and upon that end nearest the blade, for the purpose herein shown and described.

2. In a round shovel-handle, the projection C, formed upon the under side thereof and upon that end of the handle farthest from the blade, for the purpose herein shown and described.

3. A round shovel-handle provided with the projections D and C, substantially as shown and described.

297,133. DEVICE FOR SUSPENDING MACHINERY. JOSEPH D. HUNTINGTON, Chicago, Ill. Filed Mar. 4, 1884. (No model.)



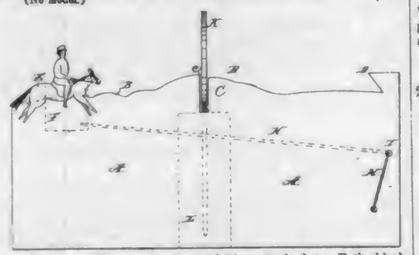
Claim.—1. The combination of the frame C and brackets *f* with the suspending-rods B, substantially as specified.

2. The combination of the frame C and bar H with the plate I, substantially as described.

3. The combination of the frame C and brackets *f* with the rods B, bar H, and plate I, substantially as set forth.

4. The combination of the plate I, springs *a*, and bolts *d* with the plate J, substantially as specified.

297,133.

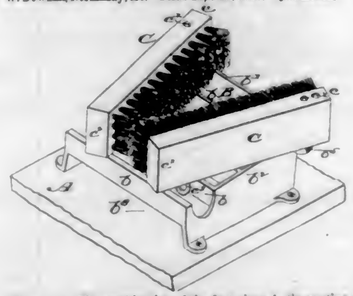


5. The combination of the plate I, having the recess *b* and enlarged opening *c*, with the spring *a* and bolt *d*, substantially as described.

6. The combination of the frame C and brackets or yokes *f* with the springs *a*, bolts *g*, and rods B, substantially as specified.

7. The combination and arrangement of the frame C, shaft E, and pulleys F with the rods B, single supplanting-bar H, and yielding plate I, substantially as described.

297,134. TOY. LOUIS KELLER, New York, N. Y. Filed Oct. 11, 1883. (No model.)

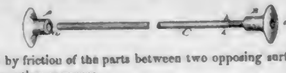


Claim.—1. The combination of the base A, the horse E, the block F, the cord H, and the ring K, substantially as and for the purposes set forth.

2. The combination of the base A, the block F, the horse E, and the cord H, substantially as and for the purposes set forth.

3. The ring K, having an opening at one side thereof and covered with paper, so as to simulate a complete ring, substantially as and for the purposes set forth.

297,135. BOOT-CLEANER. JOHN C. KUPFERLE, St. Louis, and JOSEPH W. DOWLER, Normandy, Mo. Filed Sept. 22, 1883. (No model.)



Claim.—1. The combination of the foot-piece A, the grating B, and the brushes C C, said grating consisting of the scrapers *b b* and the side pieces, b^2 b^2, and having an opening or openings, b^2 b^2, as and for the purpose described.

2. The combination of the foot-piece or base A, the grating B, and the brushes C C, said brushes at one end being pivoted, and having their free ends elastically connected by the spring D, beneath the plate b^2, and said grating having the opening or openings b^2 b^2, substantially as described.

297,136. EXTENSION SUSPENSORY ROD. CHARLES LA DOW, Albany, N. Y. Filed Jan. 23, 1884. (No model.)

Claim.—1. The combination of the extension-rod with its socket-button and nut, substantially as described, for maintaining the same self-

sustained by friction of the parts between two opposing surfaces for suspensory or other purposes.

2. The combination of the extension-rod with its socket-button and nut and rubber pads, substantially as described.

297,137. CHECK-HOLDER AND BAG-FASTENER. CHAS. LEAVITT, Cleveland, Ohio. Filed Dec. 17, 1883. (No model.)

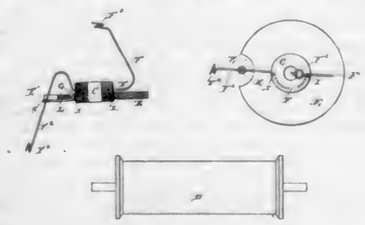
Claim.—1. A combined check-holder and bag-fastener, consisting, essentially, of a frame provided at its ends with webs or projections to support the check in front, a cross-plate for holding the check in contact with the webs or projections, a screw projecting from the rear face of the cross-plate, and a clamping-nut for holding the ends of the cord, all of the above parts combined as described.

2. In a combined check-holder and bag-fastener, the combination, with the frame provided with the webs *a*, cross-bar B, screw *b*, and grooves *c d*, of a thumb-nut adapted to hold the cord within the grooves and prevent it from slipping, substantially as set forth.

297,138. COUNTER FOR FACILITATING THE TRANSFER OF COIN. ALBERT LEGO and HENRI DUPAU, Grasse, (Alpes-Maritimes,) France. Filed Mar. 15, 1884. (No model.) Patented in France Sept. 29, 1883, No. 157,758, and in Luxemburg Feb. 4, 1884, No. 358.

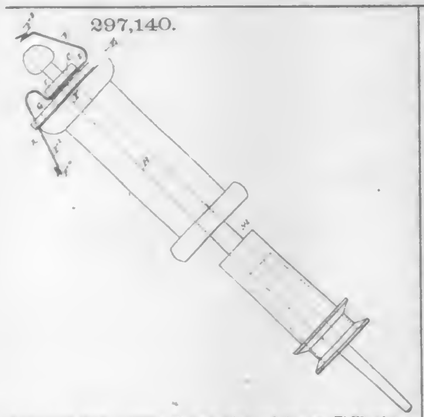
Claim.—In an apparatus for facilitating the transfer of coin between the public and shop-keepers, bankers, cashiers, and any other persons, the arrangement of a flat tray of approximately-circular form, provided with mouths for the delivery of coin, the said tray resting upon a rod consisting of two parts pivoted on each side of the axis of the tray and supported by springs, in the manner hereinbefore shown and described.

297,139. LIQUID PAINT. GEORGE T. LEWIS, Philadelphia, Pa. Filed Dec. 6, 1882. (No specimens.)



Claim.—A liquid paint consisting of sublimed white lead, oil, and an alkaline solution of resin, combined substantially as and in the proportions specified.

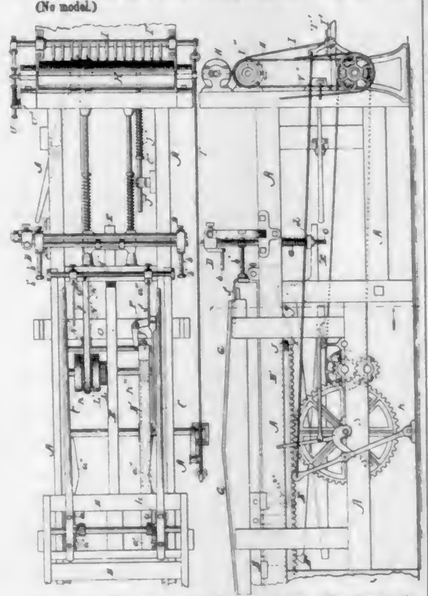
297,140. FLIER FOR TWISTING SILK. HIPPOLYTE LIAUTIER, Scranton, Pa. Filed Sept. 7, 1883. (No model.)



Brief.—The flier consists of a hub having a groove in its periphery, in which the wire arms are held by pins, and having a disk at its base, with a cut-away portion in which a shank having an eye on its outer end is secured. The lower wire arm passes through the eye, and is thus held from its tendency to move outward caused by its elasticity and the centrifugal force exerted upon it.

Claim.—1. The combination of the flier-block, the balance-disk, and the arms F′ F^2, the upper portion of the block being made to project above the top of the disk, for the attachment of the arms, substantially as shown.

2. The combination of the flier-block, a balance-disk connected



297,140.

thereto, and having a recess, E', in its edge, and the arms F' F², substantially as described.

3. The combination of the flier C, having groove G, with the disk E, having cut E', wire arms F' and F², pins I, and shank L, having the eye K, substantially as shown and described.

297,141. MACHINE FOR TURNING BAGS. SAMUEL T. LOCKWOOD, Chicago, Ill., assignor to Davis J. Whiting, same place. Filed Mar. 3, 1883. (No model.)

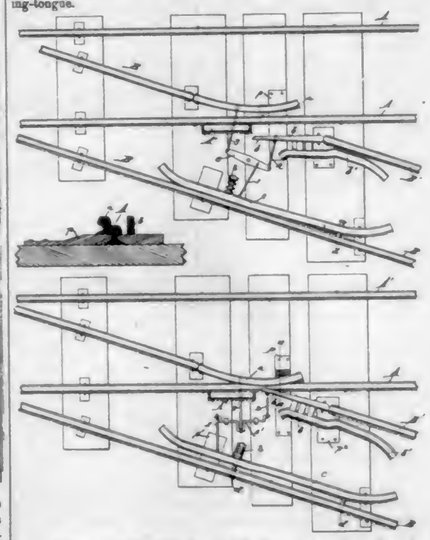
Claim.—1. The combination of separable bag-holding fingers, the reciprocating bag-turners, and the rotary stripping-rollers, with means for supporting and operating the said fingers, for reciprocating the bag-turners, and for rotating the said rollers, for the purposes set forth.

2. The combination of the bag-holding fingers *b b'*, means for supporting the said fingers, the reciprocating bag-turners C C, the tilting cam or lever E, and the traveler F, with means for operating the said bag-holding fingers *b'* from said cam or lever, and for reciprocating the said bag-turners and traveler, for the purposes set forth.

3. The combination of the fixed fingers *b b*, the movable fingers *b' b'*, means for supporting the fingers *b b*, means for carrying the fingers *b' b'*, and the springs *e e*, with the reciprocating bag-turners C C, the cam E, the traveler F, a supporting-frame, and means for operating the said several parts in conjunction with each other, for the purposes set forth.

4. The combination of fingers *b b'*, adapted and arranged to hold open the mouth of the bag, supports for said fingers, a bar, and rods connecting the said bar with the supports of fingers *b'*, with a reciprocating bag-turner, a tilting cam or lever for operating the said fingers *b'*, and extending underneath the said bar, a traveler, F, for actuating the said cam, and a table for supporting the bags, substantially as and for the purposes set forth.

5. The combination of the bag-supporter or table G, with the bag-holding fingers *b b* and *b' b'*, arranged, substantially as shown and described, with relation to the supporter G, the reciprocating pivoted bag-turners C C, located underneath the supporter G, and arranged to pass between the separable fingers *b b* and *b' b'*, the cam or lever E, means for supporting the said fingers, and operating them from the cam or lever E, and means for operating the said bag-turners and cam, substantially as and for the purposes set forth.



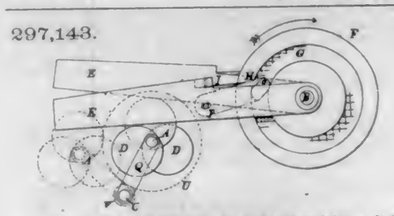
6. The combination of the fixed fingers *b b*, a support for the said fingers, the fingers *b' b'*, the horizontal rod *b''*, the vertically-movable rods *c c*, the cross-bar *d*, and a support for rods connected with the fingers *b' b'*, with the tilting cam or lever E, extending underneath the cross-bar *d*, a reciprocating bag-turner, the traveler F, and means for reciprocating the said turner and traveler, substantially as and for the purposes set forth.

7. The combination, with the bag-turning mechanism, of the stripping-rollers H H, means for rotating the said rollers, and a bag-supporter, G, arranged substantially as shown and described, for the purposes set forth.

8. The combination of the laterally-expansible and reciprocating arms C C, the separable fingers *b b'*, the stripping-rollers H H, and the springs *a' a'*, means for expanding the said arms, for supporting and separating the said fingers, and for rotating the said rollers, all operating in connection with each other, and driving-gearing for reciprocating the said arms, for the purposes set forth.

297,142. RAILWAY-FROG. DANIEL H. MAHONEY, Olney, Ill. Filed Aug. 21, 1883. (No model.)

Brief.—Upon the opposite sides of one of the main rails and at one of the siding-rails are located pivotal sections connected by a crank-shaft and connecting-links, with a guard-rail pivoted to the other siding-rail. The pivotal section outside of the main rails is provided with an actuating-tongue.



Claim.—1. In combination with the main rails A A', siding-rails B B', and pivotal sections *a b*, the pivoted guard-rail *c*, and crank-shaft and connecting-links, arranged and operating substantially as and for the purpose set forth.

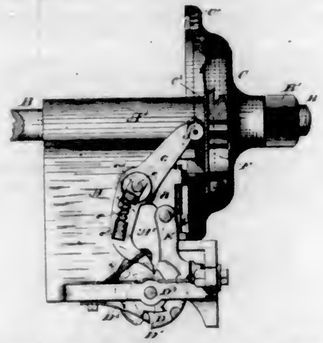
2. In an automatic railway-frog, the pivotal sections *a b*, the latter being provided with the actuating-tongue *b'*, in combination with the guard-rail *c*, and a transmitting-lever (or crank-shaft) and connecting-links, substantially as and for the purpose specified.

297,143. VARIABLE SPEED DEVICE. WALTER F MARKS, Chapinville, N. Y. Filed Sept. 6, 1883. (No model.)

297,143.

Claim.—1. The combination, with the driving and driven shafts A and B, of a series of two or more clutches and clutch-levers applied to the driven shaft, and mechanism for imparting variable motion to the levers, substantially as and for the purposes set forth.

2. The combination, with the relatively adjustable driving and driven shafts A and B, of a series of two or more clutches and clutch-levers applied to the driven shafts, and mechanism for imparting variable motion to the levers, substantially as and for the purposes set forth.



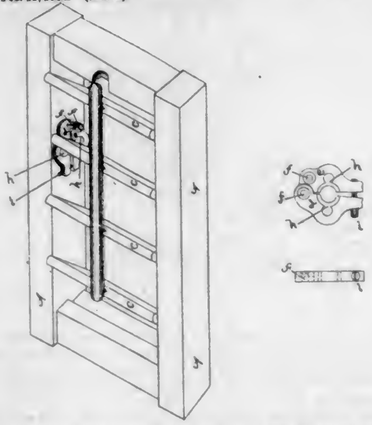
3. The combination, with the shafts C and B, of the intermediate adjustable shaft, A, a series of clutches and clutch-levers applied to the driven shaft B, and mechanism attached to the intermediate shaft to impart variable motion to the clutch-levers, substantially as and for the purposes set forth.

4. The combination, with the shaft A, provided with cams or eccentrics D D, supporting-arm Q, shaft C, and gears U V, of the driven shaft B, arranged to be rotated at a variable speed by clutches and clutch-levers operated from the shaft A, substantially as and for the purposes described.

5. The combination, with the relatively adjustable driving and driven shafts A and B, of a series clutches and clutch-levers applied to the driven shaft, and a corresponding series of cams on the driving-shaft, and the shaft C, arranged to transmit motion to the driving-shaft by connecting mechanism, substantially as and for the purposes set forth.

6. The combination, with the driven shaft B, arranged to revolve in fixed bearings, and provided with a series of clutches and clutch-levers, of the adjustable driving-shaft A, arranged to be moved to and fro to vary the movement of the clutch-levers, substantially as and for the purposes set forth.

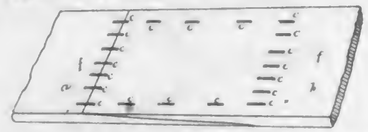
297,144. CORD-HOLDER FOR GRAIN-BINDERS. ROBT. W. MARKS, Chicago, Ill., assignor to William Deering, same place. Filed Apr. 13, 1883. (Model.)



Claim.—1. The combination of the ratchet-wheel, the lever having a longitudinal and vibratory movement, and adapted to engage the teeth of the said ratchet-wheel to produce intermittent rotation thereof, and means for moving the said lever, substantially as described.

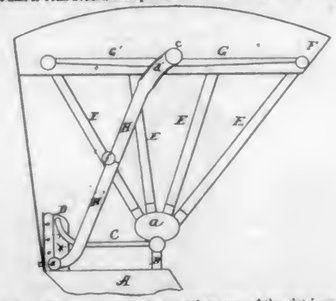
2. The combination of the ratchet-wheel, the lever having a longitudinal and vibratory movement, and adapted to engage the teeth of the said ratchet-wheel to produce intermittent rotation thereof, and the wheel C, having the cam-track adapted to produce the described vibratory and longitudinal movements of the said lever, substantially as described.

3. The vibratory and endwise-movable lever G, combined with the cam-wheel C, for producing the described movements of the lever, substantially as described.



4. The combination of the vibratory and endwise-movable lever, the cam-wheel C, for giving said lever the described movements to move the cord-holding ratchet-wheel, and the spring *e*, for returning the said lever to the position for re-engagement with the ratchet-wheel, substantially as described.

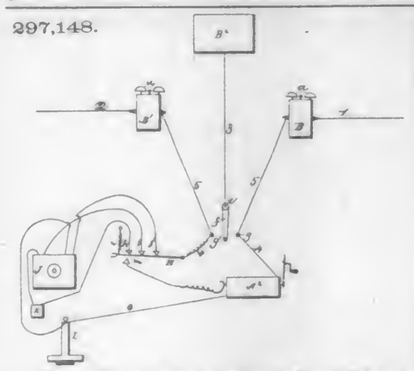
297,145. BLIND-STOP. THOMAS MASSEY, Pawtucket, R. I. Filed Feb. 13, 1884. (Model.)



Claim.—In combination with the slats and stiles of swivel blinds and shutters, a compression-clamp composed of the right and left hand parts *d e*, having central and beveled receptacles for the beveled linings *h h*, and fastened together and to the stile by the two screws *f f*, the said beveled linings *h h* fitted to the slat-trunnion, as set forth, and the set-screw *i*, for the purpose of adjusting the pressure of the clamp, as desired, all in the manner substantially as shown and described.

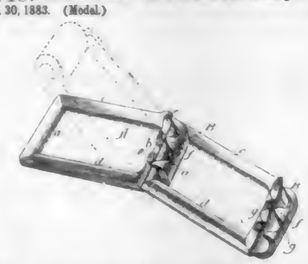
297,146. BELT-FASTENER. EDWARD MAYNE, Boston, Mass. Filed Feb. 14, 1884. (No model.)

Claim.—The combination, with the scarfed ends of a belt, of two transverse rows of staples arranged to straddle and unite the joints and longitudinal rows of staples at the edges of the belt, substantially as and for the purposes set forth.



297,147. CARRIAGE-TOP. HENRY MCCURRY, Fulton, Ill., assignor of one-half to John Stuart, same place. Filed Jan. 14, 1884. (No model.)

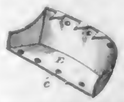
Claim.—The combination, in a carriage-top, of the slat-irons *a*, the support-bars *d*, the standards E, all pivoted to the slat-irons, the top braces, G G', jointed together at *c*, and the upright main braces H H', pivoted to the support-bars *d*, and to the joints *c* of the top braces, and connected together by the knuckle-joints *f*, adapted to break forward, and all constructed and arranged substantially as and for the purposes described.



297,148. TELEPHONE CALL AND SWITCH BOX. EDWIN H. MCFALL, Memphis, Tenn. Filed Mar. 29, 1883. (No model.)

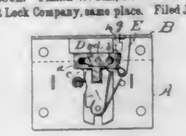
297,148.

Claim.—The combination, in a telephone call and switch box, of two magnet-bells, B B', connected to the line-wires and to the contact-points *g g'*, which in turn are connected to the generator and telephone-transmitter, respectively, and a switch-lever, *f*, arranged between the contact-points and having a ground-connection, substantially as herein shown and described, whereby either side can be cut out, and still the bells remain in the circuit of the cut-out side and the circuit not made dependent on the switch for continuity, as set forth.



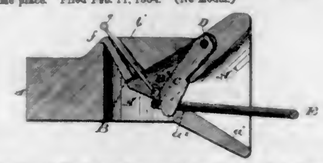
297,149. DRIVE-CHAIN. DENNIS D. MCKERNAN, Chicago, Ill. Filed Aug. 30, 1883. (Model.)

Claim.—1. A drive-chain link provided with a transverse horizontal opening forming an open spiral way, said way being formed by alternate projections on the hook and contiguous end bar, substantially as described.



2. A drive-chain link provided with an open spiral way between the hook and contiguous end bar, and having one or both of its side bars angular in cross-section, substantially as described.

297,150. HEEL-PLATE FOR BOOTS OR SHOES. STEPHEN D. MERRW, Peabody, Kans. Filed Oct. 15, 1883. (No model.)



Claim.—As an improved article of manufacture, the herein-described heel-plate, shaped to conform to portions of the side and bottom of the heel of a boot or shoe, and provided along the edge of the bottom portion with screw-holes and nail-holes for the fastening devices, and at the edge of the side portion with screw-holes and interned sharp integral points D, adapted to be driven into the side of the heel to retain the side in position on the heel, substantially as shown and described.

297,151. LOCK. FRANK W. MIX, New Britain, Conn., assignor to the Corbin Cabinet Lock Company, same place. Filed Jan. 11, 1884. (Model.)

Claim.—The combination of the bolt D, provided with a shoulder, H, the fences *a a*, mounted upon the bolt and adapted to be set relatively to the tumblers of the lock, and the stop E, accessible from the outside of the lock-case and acting upon the shoulder of the bolt, substantially as described, and for the purpose specified.

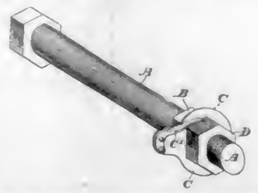
297,152. CAR-COUPLING. ROBERT T. MORRISON, Jr., Medina, Ohio, assignor of one-half to George D. Billings and Abner B. Bishop, both of same place. Filed Feb. 11, 1884. (No model.)

Claim.—1. The pivoted weight B, provided with the cover *b*, and the chamber B', adapted to receive the coupling-pin and the opening *b'*, substantially as set forth.

2. The combination, with the draw-head, of a coupling-pin pivoted at its upper end to the draw-head, a weight also pivoted to the draw-head and provided with a groove in which the coupling-pin rests, and a chain or other device attached to the free end of the coupling-pin and passing upwardly through the weight, substantially as set forth.

3. The combination, with a draw-head, of the coupling-pin pivoted to the draw-head, the weight B, pivoted to the draw-head and provided with a groove in which the coupling-pin rests, and with a seat, *a*, adapted to rest on the link and hold it in position to engage the coupling-pin of the approaching draw-head, substantially as set forth.

4. The combination, with the coupling-pin C, arranged as aforesaid, of the rod F, provided with the arms F' and *f* and the connections G and *g*, substantially as set forth.

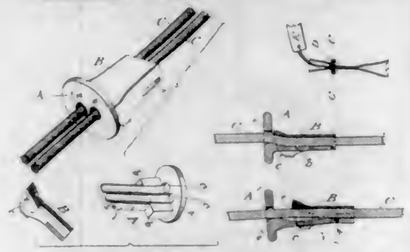


297,153. COUPLING SHAFTING. ALFRED MUIR, Manchester, County of Lancaster, England. Filed Dec. 19, 1883. (No model.) Patented in England Oct. 12, 1883, No. 4,865.

Claim.—1. A coupling for sections of shafts and other bodies, consisting of interlocking projections and recesses formed in the proximate ends thereof, in combination with a stud fitted into central recesses in said ends, and pins extending transversely through said sections and stud on each side of the joint, the surface of said sections being flush and unbroken.

2. A shaft-coupling or coupling for other bodies, consisting of sections having their proximate ends formed with interlocking projections and recesses, said projections and recesses being bounded at the sides by radial lines, substantially as set forth.

297,154. LOCKING-WASHER FOR JAM-NUTS. AUGUSTUS P. NEBLE, Edinburg, Ind., assignor of one-half to Charles W. Neible, same place. Filed Jan. 9, 1884. (No model.)



Claim.—1. The combination of a bolt having only a single style of thread, an ordinary nut, a jam-nut, and a washer interposed between said nuts, and provided with engaging devices which engage with said nuts by reason of their own formation, whereby when said nuts are turned up they are secured against independent movement.

2. The combination of the bolt, the nut therefor provided with holes, a washer provided on one side with studs or pins adapted to enter said holes, and on the other with a pawl, and a jam-nut adapted to engage with and be held in position by said pawl.

3. The combination, with the nut and jam-nut of a bolt, of a washer adapted to engage with and be held by said nut, and a pawl adapted to engage with and hold said jam-nut, said jam-nut being serrated upon one or more sides for this purpose, substantially as set forth.

297,155. MAIL-BAG FASTENING. ENOCH OSGOOD, Washington, D.C. Filed Jan. 30, 1884. (No model.)

Claim.—1. A clasp made in two parts—the body A and its slide B—with longitudinal grooves cut the whole length of the body A, and having a head with two holes through it for the cords C C to pass, a short flange or catch, *b*, on either side of the grooves running to the head, the grooves extending from the lower ends of the catches *b b* to the head, cut inclined, as shown, under the cord C at *b*, for the purposes substantially as herein set forth.

2. The slide B, made with two grooves cut in its entire length, to correspond with and to fit the inclined grooves in the body A, the receding part of the grooves in the large end of the slide B being made rough at *e* to hold the cord C from slipping over it, and having an inside catch, *c*, as shown, to pass or slip over the catches *b b* on the body A, for the purposes substantially as set forth.

3. The hook D, made with a shank that will pass through both parts of the mouth of the bag and hook on the cord C on the opposite outside, and to hold it, together with the clasp A and B, substantially as herein set forth.

297,156. BOOT OR SHOE. FRED PACKARD, Brockton, Mass. Filed Feb. 18, 1884. (No model.)

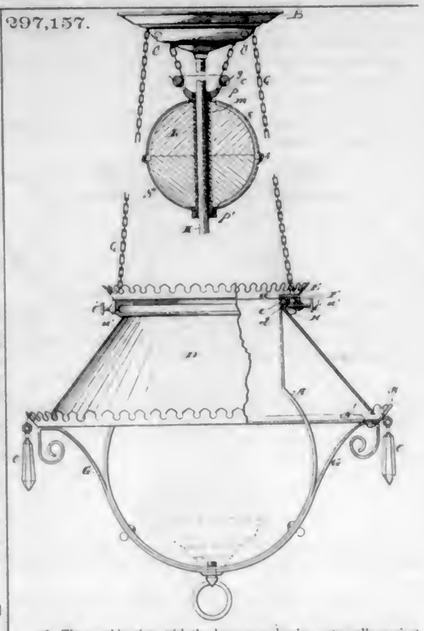
Claim.—1. In a button-gaiter, a button-piece having its outer edge turned over and provided with a cord or stay-piece, the same being interposed between the folded edge of the button-piece and the outer ends of the button-holes, substantially as shown, and for the purpose described.

2. A boot or shoe having a turned-over, snipped or notched and corded edge, whereby the said edge may be turned to form corners without wrinkles, substantially as described.

3. In a boot or shoe, a top piece and a button-hole piece provided with a cord or stay-piece, combined with a vamp stitched to the said top piece and button-hole piece, the end of the cord or stay-piece being crossed by the stitches uniting the said parts, substantially as described.

297,157. EXTENSION-LAMP. DEXTER W. PARKER and LEWIS F. GRISWOLD, Meriden, Conn.; said Griswold assignor to the Charles Parker Company, same place. Filed Oct. 16, 1883. (No model.)

Claim.—1. An extension lamp-fixture provided with supporting devices for the neck of a shade, and a ring which surrounds and protects the lower edge of the shade, but is not supported thereby.



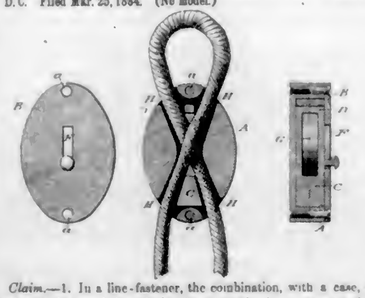
2. An extension lamp-fixture provided with a crown-ring, shade-supporting devices attached to said crown-ring, and an additional separable ring which surrounds and protects the neck of the shade and occupies the place of the lower part of the ordinary crown-ring, substantially as set forth.

3. A lamp-harp having its ends extended above the top of the shade and bent down outside of the same, in combination with a crown-ring and devices attached to said arms outside of said shade, and adapted to grasp or clamp the upper part of the latter, substantially as set forth.

4. The combination, with the harp-arms having outwardly-projecting hooked upper ends provided with binding-screws, of the crown-ring provided with openings for the passage of said hooked portions, substantially as set forth.

5. The combination, with the harp-arms having outwardly-projecting hooked upper ends provided with binding-screws, of means of supporting said arms, and the neck-ring H, having holes for the passage of said screws.

297,157.

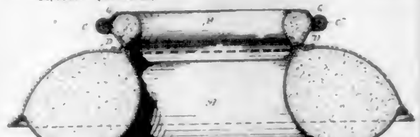


6. The combination, with the harp-arms having outwardly-projecting hooked upper ends provided with binding-screws, of the crown-ring provided with openings for the passage of said hooked portions, and the neck-ring arranged within the hooks and provided with holes for the binding-screws to pass through, substantially as set forth.

7. The counter-weight composed of a solid core having an axial passage, a smooth tube lining said passage, and having protruding ends, the hemispherical shells inclosing said core, and having openings through which the ends of said tube protrude, and a nut screwed on one of the ends of the said tube, a device being on the other end of said tube which confines the core and shell thereto, substantially as shown.

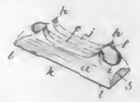
8. The combination, with the shells and a tube extending through the same, of nuts screwed on the protruding ends of said tube, the upper nut being provided with means for attaching the same to suspending devices, substantially as set forth.

9. The combination, with the counterweight-core, of the tube arranged through the same and having protruding ends, the shell inclosing the core and having central openings for the tube ends, and the nuts screwed upon said ends, the upper nut being cup-shaped and perforated to receive the chain-hooks, substantially as set forth.



297,158. ROPE OR LINE CLASP. ALBERT L. PITNEY, Washington, D.C. Filed Mar. 25, 1884. (No model.)

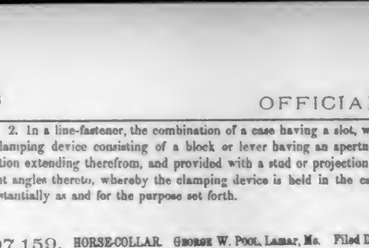
Claim.—1. In a line-fastener, the combination, with a case, of a clamping device consisting of a block or lever having an apertured portion extending therefrom, substantially as described, whereby the cords passing through and under the opening in the extension move the clamping device when a strain is brought upon the cords, substantially as and for the purpose set forth.



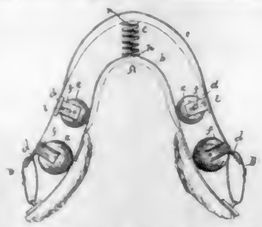
2. In a line-fastener, the combination of a case having a slot, with a clamping device consisting of a block or lever having an apertured portion extending therefrom, and provided with a stud or projection at right angles thereto, whereby the clamping device is held in the case, substantially as and for the purpose set forth.

297,159. HORSE-COLLAR. GEORGE W. POOL, Lamar, Mo. Filed Dec. 14, 1883. (No model.)

Claim.—The combination of the collar A, the rim B, and the smaller rim C, the rim C being secured to the rim B by means of the two seams D G, whereby the rim C can be detached without injury to the collar, substantially as shown and described.



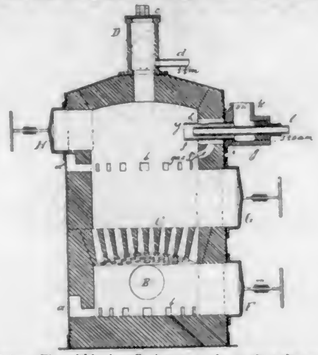
297,160. AXLE-YOKE. HENRY K. PORTER, Boston, Mass. Filed July 21, 1883. (No model.)



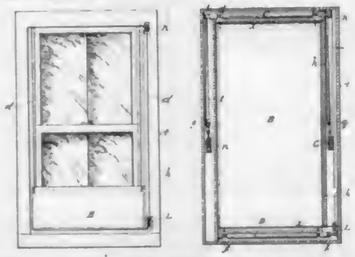
Claim.—1. An axle-yoke having a longitudinal groove formed in the upper side thereof, between the clip-receiving holes, substantially as specified.

2. In axle-yokes formed with an upper concave line or face adapted to receive and fit to the rounded portion of the axle, the upper face of that part of the yoke which extends beyond the axle formed with a descending concave line, substantially as specified.

297,161. RIDING-SADDLE. JAS. L. POWELL, Summerville, Mo. Filed Dec. 27, 1883. (No model.)



Claim.—1. In a riding-saddle, the combination, with the tree A, of the seat provided with the front and rear bow-shaped spring-stirps, *c c*, the spiral springs interposed between the tree and seat, as described, the friction-rollers, and the seat stay-straps, all substantially as and for the purpose set forth



2. In a riding-saddle, the combination, with the tree, constructed as described, and provided with the friction-roller bearing-plates, of the seat having its intermediate longitudinal strips, *d d*, provided with means for connecting the stirrup-straps, the friction-rollers, vertical spiral springs, the lateral stay-straps, and the central longitudinal cross-straps, all adapted to operate substantially as and for the purposes specified.

297,162. PROCESS OF GENERATING GAS. HENRY PRATT and JOHN J. RYAN, Chicago, Ill. Filed Aug. 24, 1883. (No model.)

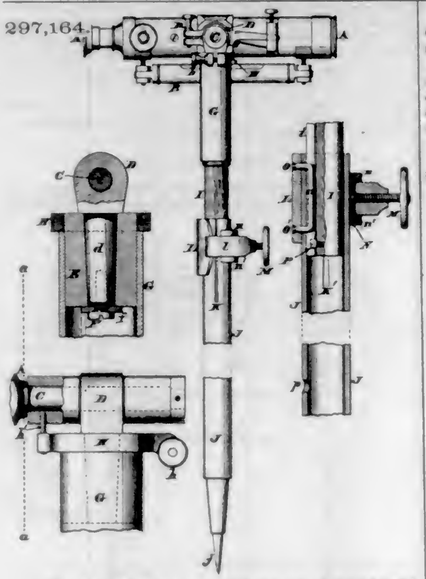
Claim.—The within-described process of manufacturing gas, which consists in superheating and decomposing steam by passing it down through incandescent or highly-heated fuel, then passing the resulting gases through a second body of heated fuel for converting any contained carbonic acid into carbonic oxide, then drawing the gases into an injector and commingling them with volatile hydrocarbons, and then discharging them over the fire-bed.

297,163. CURTAIN-FIXTURE. THOMAS L. QUIGLEY, Boston, Mass., assignor to himself and Charles F. Quigley, same place. Filed Apr. 16, 1883. (No model.)

Claim.—1. The improved curtain-fixture herein described, the same consisting of the rollers D C, cords *t h*, sheave-blocks *g q*, weights G *n*, pulleys K L, and cords *f d*, constructed, combined, and arranged to operate with the curtain B, substantially as set forth.

2. In a curtain-fixture, the spring N, sheave-block H, and fixed pulley M, in combination with the cord A and rollers C D, arranged to operate substantially as and for the purpose set forth.

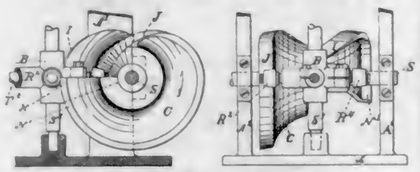
3. The combination of a window-casing provided in its outer face with cord-holes and with slots for the exposure of pulleys and passage of the shade, rollers housed within said casing proper, a shade connected to said rollers, and means for raising and lowering said shade.



4. The combination of a window-casing provided in its outer face with cord-holes and with slots for the exposure of pulleys and passage of the shade, rollers housed within said casing proper, a shade connected to said rollers, a cord, one end of which is connected directly or indirectly with one of said rollers, a weight connected to said cord and suspended within the window-casing, and means for raising or lowering said shade.

5. The combination of a window-casing provided in its outer face with cord-holes and with slots for the exposure of pulleys and passage of the shade, rollers housed within said casing proper, a shade connected to said rollers, a cord, one end of which is connected with the casing and the other end with the upper roller, a counterbalance-weight connected to said cord and suspended within said casing proper, an actuating-cord, which is connected at one end to said casing, and passes over both rollers and over an intermediate pulley, and is connected at the other end to one of said rollers, and a tension device connected to said cord.

297,164. SURVEYOR'S LEVEL. THEODORE F. RANDOLPH, Cincinnati, Ohio. Filed Oct. 16, 1883. (No model.)

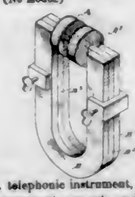


Claim.—1. The combination, in a leveling-instrument, of telescope A, journal C, bearing D, spindle *d*, socket E, clamp-ring H, screw *h*, and pin *h'*, which pin couples said bearing D and ring H in the manner described, and for the purpose set forth

297,164.

2. The combination, in a surveyor's instrument, of grooved staff I *i*, slotted tubular leg J K K', stirrup L *l l'*, gib N *n n'*, screw M, and key *o* O O', which latter is fastened to said stirrup L and traverses the groove *i*, for the purpose described.

297,165. MECHANISM FOR CONVERTING MOTION. FRANCIS H. RICHARDS, Springfield, Mass. Filed Mar. 10, 1884. (No model.)

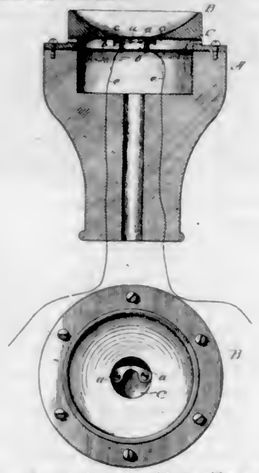


Claim.—1. The cam C and a series of arms, combined and operating substantially as described.

2. A cam, C, and a series of arms having adjustable tapered ends, combined and operating substantially as described.

3. A cam, C, and a series of arms having adjustable tapered rollers, combined and operating substantially as described.

297,166. TELEPHONE. JAMES HARRIS ROGERS, New York, N. Y. Filed Apr. 5, 1883. (No model.)



Claim.—1. In a telephonic instrument, substantially such as described, two or more permanent magnets, and an interposed soft-iron piece clamped between them, and having its two polar ends projecting toward and into very close proximity to one another, but out of contact, substantially as and for the purpose described.

2. The combination, with the permanent magnets B B^2, of the soft-iron piece B^3, clamped between them, and having its two polar ends projecting toward and brought into close proximity with one another, and the coils A A^2, mounted on the piece B^3.

3. The combination, with the permanent horseshoe-magnets B B^2, of the soft-iron piece B^3, made in two or more parts, and coils of wire surrounding said piece B^3 at one or more points.

4. In a telephonic instrument the two polar ends or edges of whose magnet project toward and into close proximity with one another, the combination, with such magnet, of a sectional spool applied to a cylindrical portion thereof, whereby the coil of wire for such magnet may be wound upon the spool in the ordinary way.

297,167. TELEPHONE. JAMES HARRIS ROGERS, New York, N. Y. Filed Dec. 26, 1883. (No model.)

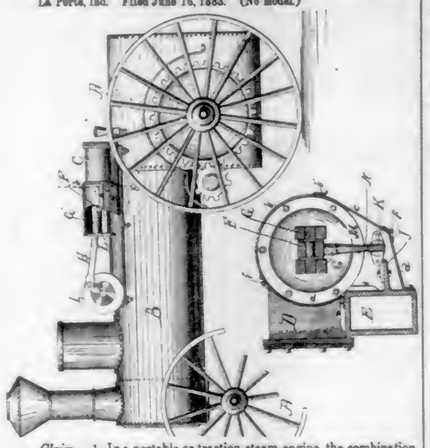
Claim.—1. In a telephone adapted for use either as a transmitter or receiver, the diaphragm, in combination with two electrodes mounted thereon in direct contact with each other, such electrodes being adjustable independently of the diaphragm and of each other, and electrical connections, substantially as described and shown.

2. In a telephone adapted for use either as a transmitter or receiver, the diaphragm, in combination with the standards, the screw carbon-holders, the independently-adjustable electrodes held in direct contact with each other, and electrical connections, substantially as described.

297,168. TELEPHONE. JAMES HARRIS ROGERS, New York, N. Y. Filed Dec. 26, 1883. (No model.)

Claim.—1. In a telephone, the combination of the diaphragm, the electrode-standards mounted thereon, a single electrode having a retaining-flange resting loosely on said standards, and electrical connections, substantially as described.

2. In a telephone, the combination of the diaphragm, the grooved electrode-standards mounted thereon in close proximity, a loose electrode resting upon the standards having a retaining-flange, and electrical connections, substantially as described.

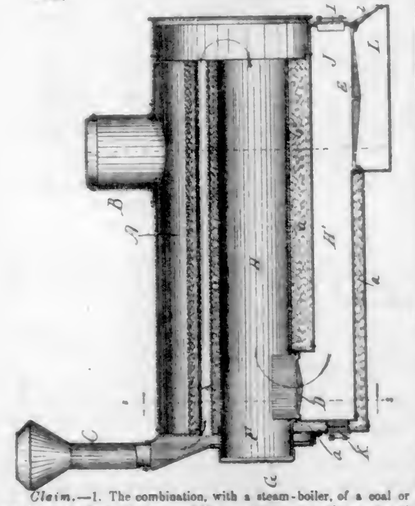


3. In a telephone, the combination of the diaphragm, the grooved electrode-standards mounted thereon, the loose electrode resting upon the standards, and a removable retaining-ring upon the loose electrode, substantially as described.

4. In a telephone, the combination of the diaphragm, the grooved electrode-standards mounted thereon, and the loose electrode resting upon the standards, having a ring of soft rubber, substantially as described.

5. In a telephone, the combination of the recessed body of the telephone, the diaphragm, the grooved electrode-standards upon the diaphragm, a loose electrode resting upon the standards, and a ring upon said electrode, constructed to fill the space between the standards, and also to bear upon the bottom of the recess in the telephone, substantially as described.

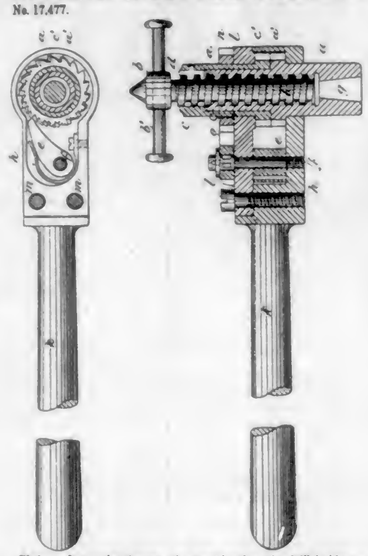
6. As a new article of manufacture, an electrode of cylindrical form, and having a central circular flange or ring, substantially as described.



297,169. PORTABLE AND TRACTION ENGINE. MENRAD RUMELY, La Porte, Ind. Filed June 16, 1883. (No model.)

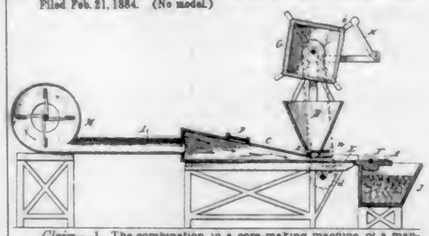
Claim.—1. In a portable or traction steam-engine, the combination, with the wheels and boiler supported thereon, of the steam-cylinder, its piston, cross-head, and slides, arranged between and above the wheels and supported on said boiler, and a hinged covering inclosing said cross-head and slides, adapted to open out to afford ready access to the same, substantially as specified

2. In a portable or traction steam-engine, the combination, with the wheels A and boiler B, supported on the same, of steam-cylinder C, steam-chest D, heater E, pump-plunger K, cross-head F, and slides G G, all arranged between and above said wheels and supported on said boiler, and coverings *a*, *b*, *c*, and *d*, hinged together and inclosing said cross-head, slides, and pump-plunger, substantially as specified.



297,170. COMBINED STRAW AND COAL OR WOOD BURNING ENGINE. MENRAD RUMELY, La Porte, Ind. Filed June 16, 1883. (No model.)

Claim.—1. The combination, with a steam-boiler, of a coal or wood burning grate, fire-box, and flues, and a straw-burning grate and fire-box arranged beneath the former and at the opposite end of the boiler, and having a main flue connecting through the coal or wood burning grate and fire-box with their flues, said fire-boxes and main flue being lined with water-compartments connecting with the boiler, substantially as specified.



2. In a combined straw and coal or wood burning engine, the combination of the boiler with a coal or wood burning grate, D, fire-box F, and flues H and A, said fire-box F being arranged at one end of the boiler and surrounded with water-compartments *a a a*, connected with the boiler, a straw-burning grate, E, and fire-box J, arranged beneath said coal-grate D and at the opposite end of the boiler, and having a main flue, H', connecting through said grate D and fire-box F with main flue H, said fire-box J being lined on its sides with water-compartments, and flue H being surrounded with water-compartments *a*, connected with the boiler, substantially as specified.

297,171. RATCHET-DRILL. CASPAR SCHUMACHER, Kalk, Germany. Filed Dec. 21, 1882. (No model.) Patented in Germany July 21, 1881. No. 17,477.

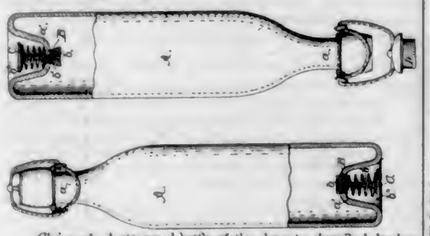
Claim.—In ratchet-braces, the combination of a drill-holder, *a*, provided with internal screw-thread, and with ratchet-teeth *a'*, with a screw-spindle, *b*, and adjusting-sleeve *c*, secured to the screw-spindle, and having ratchet-teeth *c'*, spring-pawl *e*, hand-lever *k*, ratchet-wheel *n*, secured to the adjusting-sleeve *c'*, and having at least one tooth less than the sleeve *c*, and a pawl, *o*, adapted to be put in and out of gear with the wheel *n*, substantially as and for the purpose described.

297,172. MACHINE FOR MAKING GREEN-SAND CORES. JAMES SCOLL, Jersey City, N. J., assignor of one-half to Samuel Vance, same place. Filed Feb. 21, 1884. (No model.)

Claim.—1. The combination, in a core-making machine, of a mandrel and means for turning the same, a tube arranged with its end opposite the mandrel and communicating with a blowing apparatus, and means, substantially as described, for feeding green sand regularly into the tube, substantially as set forth.

2. The combination of the mandrel, tube communicating with the blowing apparatus, and hopper arranged above and communicating with the tube, substantially as specified.

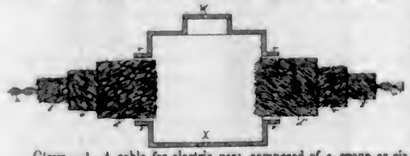
3. The combination of the mandrel, tube, blowing apparatus, hopper, and riddle arranged above the hopper, for the purpose set forth.



4. The combination, with the mandrel, blowing apparatus, and hopper, of a riddle and hammer arranged to strike the riddle at intervals, substantially as specified.

297,173. HAT AND COAT HOOK. FRANK SELIGER, New York, N. Y. Filed Oct. 19, 1883. (No model.)

Claim.—The combination of plate *a*, having hook *c*, prongs *e*, and shoulder *d*, with the arm *b*, having knob *g*, substantially as herein shown and described.



297,174. BOTTLE. THEODORE L. SEYMOUR, Albany, N. Y. Filed June 8, 1883. (No model.)

Claim.—1. A stoppered bottle of the character described, having in its bottom a vent-aperture controlled by an automatically-closing valve, as and for the purpose specified.

2. A stoppered bottle of the character described, having in its bottom a vent-aperture controlled by an automatically-closing valve, and means exterior to the bottle for operating said valve, as and for the purpose specified.

297,175. INSULATED ELECTRIC CONDUCTOR OR CABLE. SIDNEY F. SHELBOURNE, New York, N. Y. Filed June 11, 1883. (No model.)

Claim.—1. A cable for electric uses, composed of a group or circumferential series of insulated conductors, or strands of conductors, each series in outward progression resting by the several insulations of its wires upon the next interior series, and passing in spirals opposite in direction to those of such interior series, for the purpose and substantially as described.

2. An electric cable composed of strands of insulated conductors interwoven with each other in pairs, and arranged in circumferential layers or series, each outward series passing in spirals of opposite direction to those of the adjacent interior series, as and for the purpose set forth.

3. The electric conducting-line made up of cable-sections, each section formed of groups or strands of conductors arranged in circumferential series, as described, the spiral of the strands or series in one section passing in opposite spirals to those of the corresponding strands or series in the adjoining section, and being united variably in the test-boxes, as set forth.

297,176. ANTI-INDUCTION ELECTRIC CONDUCTOR. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Aug. 18, 1883. (No model.)

Claim.—1. An insulated conductor for electric uses, combined with a conductive layer or coating of pulverized magnetic oxide of iron surrounding and inclosing its insulation as an induction-shield, substantially as described.

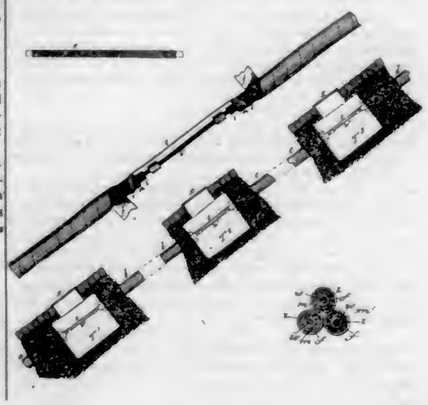
2. The black oxide of iron or equivalent substance, mixed with any suitable material in the form of paste, and applied as a coat or layer surrounding the insulation covering the wire or other electric conductor, substantially as described, and for the purpose of resisting conduction and dividing induction between adjacent conductors, as herein set forth.

3. In combination with an insulated conductor covered with a metallic coating or induction-guard, an outer covering of insulation inclosing such induction-guard for the purpose of separating it conductively from the like coatings of adjacent conductors, as and for the purpose herein described.

4. The combination in series of the following elements: first, a wire or other electric conductor; second, an insulating material covering and inclosing said wire; third, an induction-shield or conductor covering and inclosing such insulating material, and composed of a metal or pulverulent paramagnetic substance; fourth, surrounding and inclosing such metal or paramagnetic substance, a coating or wrapping of insulating material, substantially as and for the purpose set forth.

297,177. ELECTRIC CABLE. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Aug. 18, 1883. (No model.)

Claim.—1. A series of strands for an electric cable, each composed of two or more separately-insulated conductors formed into a helix about each other, and arranged in succeeding divisions within a line or lines of cable, so that the spirals of the strand in any one division are reversed in direction with reference to the spirals of the connecting strand or conductors in the preceding division, for the purpose of balancing the currents of induction, as herein set forth.

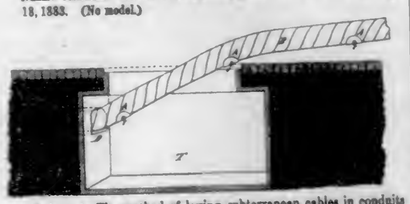


2. Two or more helical strands of separately-insulated conductors, arranged about each other helically, substantially as described.

3. An electric cable composed of two or more helical strands of insulated conductors in which the helices of any two strands laterally adjacent in the same division are of opposite direction or spiral, substantially as and for the purpose set forth.

4. An electric cable composed of layers or series of helical strands in which the strands are arranged in series of opposite spirals around each other, for the purpose and in manner as described.

5. The adjacent divisions of an electric cable composed of several series of helical strands of insulated conductors, in combination with each other, so that the spirals of the same series of strands in the cable shall be of opposite spiral direction in the adjacent divisions, substantially as and for the purpose described



297,178. MEANS FOR CONTROLLING AND LIMITING INDUCTION. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Aug. 18, 1883. (No model.)

Claim.—1. A sectional cable, in combination with the test-boxes in which the cable-sections are united, and the conducting-strips, or its equivalent, joining the induction-shields of said united sections, for the purpose of unifying the currents of induction between the sending and receiving points of communication, substantially as described.

2. In combination with the test-boxes of an underground sectional cable and the conductive connection of the individual induction-shields of the several conductors composing such sections of the cable with each other in pairs across such test-boxes, the outer insulation of the induction-shield of each of the several conductors, by which it is inclosed and separated from conductive contact with each and all of the others laterally, as and for the purpose herein set forth.

297,179. METHOD OF AND MEANS FOR LAYING SUBTERRANEAN CABLES. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Aug. 18, 1883. (No model.)

Claim.—1. The method of laying subterranean cables in conduits herein described, consisting in drawing into such conduits the cables at test or draw boxes placed beneath the pavement by means of a wire, draw-rope, chain, or rod extending through such conduit, and in fastening under such cables as they enter said conduits, at convenient intervals, a series of trucks or rollers, for the purpose of aiding the passage of the cable within the conduit and preventing its abrasion or injury against the walls of such conduit.

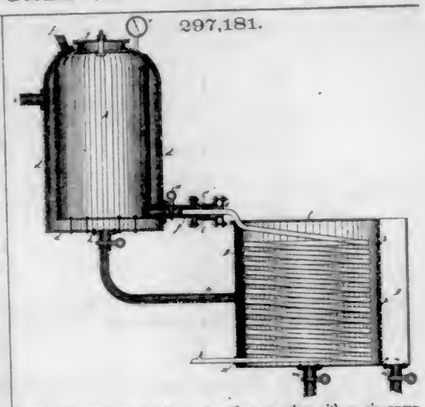
2. A truck or roller consisting of a curved semi-cylindrical plate of metal having small caster-wheels on bearings or trunnions fastened or cast upon the convex surfaces of such curved plates, for the purpose of supporting and easing the passage of subterranean cables within their conduits, substantially as described.

3. The combination of a subterranean cable with small trucks or rollers at spaced intervals attached to it, substantially as and for the purpose set forth.

4. The combination, with a subterranean cable, of trucks or rollers placed at intervals thereon, and the coating or layer of adhesive material on the cable-contact surfaces of said trucks, as and for the purpose set forth.

5. The combination of an arched and flat-bottomed conduit, a subterranean electric cable, and trucks or rollers for supporting the cable above the plane surface or floor of such conduit, for the purpose of preventing its injury or abrasion in passing along the conduit, substantially as described.

297,180. SUBMARINE-TELEGRAPH CABLE. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Sept. 8, 1883. (No model.)

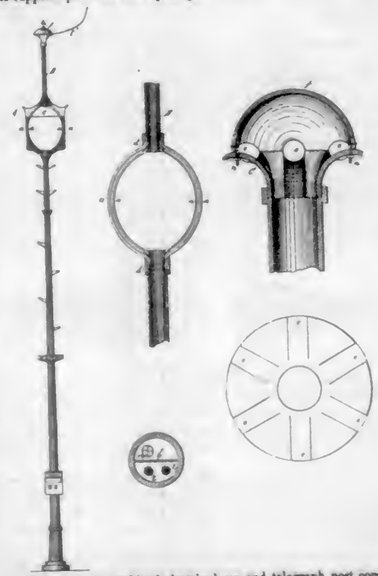


Claim.—A submarine and subterranean electric cable composed of three conductors insulated from each other, one central and the others annular about it, combined so that the central or first annular forms the signal-conductor, and the ends of the remaining two are connected together, completing an induction-guard circuit, as herein set forth.

297,181. METHOD OF AND APPARATUS FOR INSULATING ELECTRIC CABLES. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Sept. 8, 1883. (No model.)

Claim.—1. The process, substantially as herein described, of obtaining a complete saturation and solid insulation within the fibers covering conductors or electric cables drawn into metal tubes, consisting in first removing the air particles from such fibers, simultaneously applying heat thereto; then saturating such fibers and filling the same and the inclosing-tube with melted insulating material; then gradually cooling said tube, commencing at the end remote from the supply of insulating material, the liquid portion of such material being kept under pressure within the tube, to supply the place of shrinkage on cooling.

2. An apparatus for insulating electric cables, consisting in the combination of a steam-jacketed insulation-holder, with stuffing-box outlet, a heating and cooling tank or chamber for containing the cable-inclosing tube, connected with the steam-space of the insulation-holder, and fitted



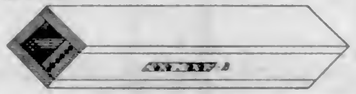
297,181.

with a regulated water inflow and outflow, together with an air-pump, with stuffing-box attached to remote end of such cable-containing tube, substantially as and for the purpose set forth.

297,182. COMBINED ELECTRIC-LIGHT AND TELEGRAPH POST. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Sept. 8, 1883. (No model.)

Brief.—Consists of a hollow metallic post containing electric conductors separated by a metallic division. The post has an open segment for an electric lamp, with curved metallic tubes and a hollow upward extension. The latter has a curved flaring head-piece, with radial curved cable-supports provided with openings.

Claim.—1. A combined electric-lamp and telegraph post consisting of a hollow iron column of usual construction, an open or divided segment, A, for an electric lamp, and the hollow upward extension B, for carrying within it telegraph wires or cables, substantially as and for the purpose set forth.



2. The lamp-frame A, composed of cast-iron ornamental work and one or more curved wrought-metal tubes, as shown at *a a a a*, arranged together substantially as described, and for the purpose set forth.

3. In a hollow metal column for telegraph conductors or cables, the curved flaring head-piece C, containing radial divisions formed as curved supporting-rests for said cables, and provided with radial openings as outlets for the same, substantially as described.

4. In a column or hollow post for containing electric conductors,

the combination of electric-light cables or conductors with telephone-cables, when separated from each other by a metallic division constructed in and forming part of said hollow post, for the purpose of preventing inductive effects between such cables, substantially as herein set forth.

297,183. CONDUIT AND ATTACHMENT FOR ELECTRIC CONDUCTORS. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Dec. 11, 1883. (No model.)

Claim.—1. An underground conduit for electric conductors having grooved pieces in the sides thereof, forming, by the matching together of said grooved pieces face to face, a vertical line of passages for single conductors, said conduit having in addition thereto a central passage or passages to contain groups or assemblages of conductors, substantially as described.

2. A conduit for electrical purposes, constructed with a central passage or passages for through-wires and side passages for single local wires, with elongated lateral openings reaching said side passages, and a plate or cover for each of such openings, having itself two or more localized openings, as st forth.

3. A subterranean electric conduit having elongated lateral openings to the longitudinal passages within the conduit, in combination with a plate or cover for each of such openings, having two or more outlets through it for the ends of the conductors when divided and diverted, such elongated lateral openings being made longitudinally upon the conduit, substantially as and for the purpose set forth.

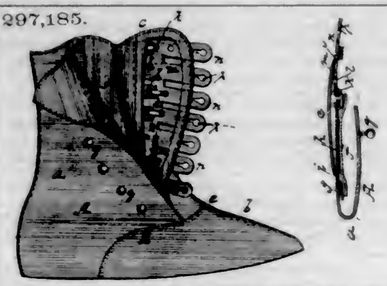
4. The electric conduit having main passage A, side passages, *a*, *b*, *c*, *d*, *e*, and *f*, and in connection with such side passages a metal plate or attachment, B, with nipples surrounding the openings *m*, *n*, *p*, and *k*, and screw-threads *t t* on such nipples, substantially as described.

297,184. PROTECTING ELECTRIC CONDUCTORS FROM INDUCTION. SIDNEY F. SHELBOURNE, New York, N. Y. Filed Dec. 11, 1883. (No model.)

Claim.—1. In electric cables in which the conductors have metallic induction-shields surrounding their insulation, an additional or outer insulation for each of such induction-shields, in combination with the electrical connection of such induction-shields in pairs at the ends of the cable-section or line of cables, substantially as and for the purpose set forth.

2. The combination of insulated induction-shields relatively exterior, in pairs or limited groups, with each other, said shields being connected at the ends of an electric cable or line of cable-sections, forming completed metallic induction-circuits within such cable or line of cable-sections and insulated from the earth, substantially as described.

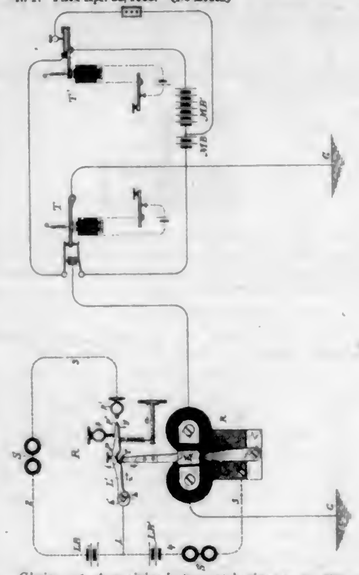
3. In electric cables composed of two or more sections, the combination of the conductors with each other in pairs, said conductors being united by the electrical connection of their induction-shields at the junction of the sections, so that the induction-shield of one may serve, in whole or part, for protecting one or more other conductors in the same cable, each induction-shield in such manner forming one of a pair in circuit, and connected in succession linearly with linear portions of the shield of one or more other conductors within the cable, substantially as set forth.



4. Two or more insulated conductors with insulated induction-shields, said shields being electrically united at their ends in pairs in a line of cable-sections, the shields forming a closed metallic induction-circuit, or linear succession of such circuits, between the conductors, as and for the purpose set forth.

297,185. SHOE-UPPER. WARREN G. SLATER, Fremont, Mich., assignor of three-fourths to James R. Odell, Sam Odell, and S. P. Barnhard, all of same place. Filed Feb. 15, 1884. (No model.)

Claim.—1. The shoe-upper provided with the instep or front piece, *c*, stitched at its lower end only to said upper, and having the slits *i* to receive the straps A, and the slits *o* to receive the tongues *n*, said tongues adjustably attached to the straps, and the latter secured at the opposite ends to the shoe-upper, substantially as described.



2. The shoe-upper having secured thereto one end of the straps A, the latter adapted to pass through the slits in the front portion, *c*, and adjustably connected to the tongue-strap *m*, the tongues passing through the slits *o*, and having the button-holes *p* to connect with the buttons *q* on the shoe, substantially as described, and for the purpose specified.

297,185.

3. The shoe-upper capable of adjustment, substantially as described, consisting of the portions *a b c*, straps A, and tongues *n*, the whole operating as and for the purpose set forth.

297,186. QUADRUPLEX TELEGRAPH. GERRITT SMITH, Astoria, N. Y. Filed Apr. 28, 1883. (No model.)

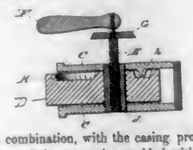
Claim.—1. A receiving-instrument having one armature, and an auxiliary shuttle-lever in continuous mechanical contact therewith and controlled thereby, responsive to changes in the polarity and in the strength of line-current, either or both.

2. A receiving-instrument composed of an electro-magnet and having one armature, and an auxiliary shuttle-lever in continuous mechanical contact therewith and controlled thereby, responsive to changes in the polarity and in the strength of line-current, either or both, and capable by combined action of assuming four different positions.

3. A receiving-instrument composed of an electro-magnet having one armature, and an auxiliary lever in contact therewith, responsive to changes in the polarity and in the strength of line-current, either or both, in combination with two independent sounding or recording instruments.

4. The combination, in a diplex telegraph, of two independent keys or transmitters, a main battery or batteries controlled by said keys, a main line, a relay having an armature-bar, and an auxiliary lever in continuous mechanical contact therewith and controlled thereby, and two independent sounders of recording instruments.

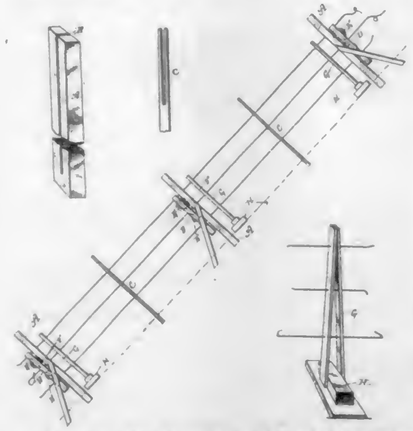
5. A key or transmitter arranged to vary the strength of line-current, a key or transmitter arranged to vary the polarity of the current controlled by the first key or transmitter, a receiving-relay having one armature, and an auxiliary lever responsive to changes in the strength and in the polarity of line-current, either or both, and two independent sounding or recording instruments.



6. A main-line receiving-instrument having one armature-bar responsive both to changes in polarity and variations in the strength of

main-line current, an auxiliary lever in contact therewith, and two receiving-sounders with their local circuits so arranged that upon a change of polarity in the main-line current one of said sounders will alone respond, and upon a change in the strength of said main-line current the second of said sounders will alone respond.

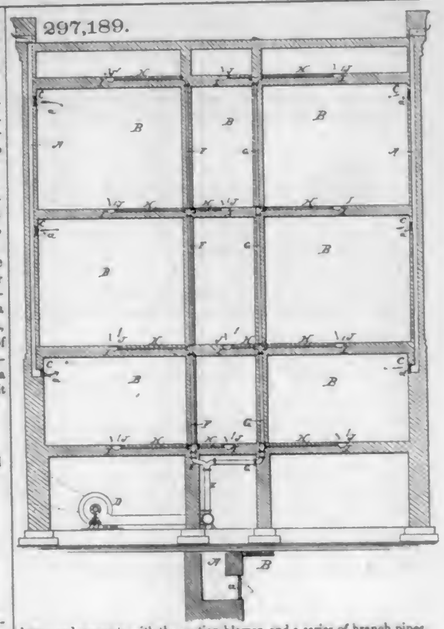
7. A main-line receiving-instrument having one armature-lever responsive either to changes of polarity or changes of strength in the main-line current, in connection with a pivoted lever capable of motion in four directions, and having an electrical terminal connection with each of two local circuits for operating separate receiving-sounders, and two contact-points, forming, respectively, the opposite terminal of said local circuits, whereby, upon a change of polarity in the main-line current, said armature-lever will complete one local circuit, and upon a change of strength in said current said armature-lever will complete a second local circuit, substantially as described.



8. A main-line receiving-instrument responsive to changes in the polarity and to changes of strength in the main-line current, either or both, two receiving-sounders with their local circuits, a movable electrical connection common to one terminal of both of said local circuits, a movable contact-point forming the second terminal of one local circuit, and a fixed contact-point, forming the second terminal of the second of said local circuits, whereby, upon a change in the polarity of the main-line current, one local circuit will be completed or broken, and upon a change in the strength of said main-line current the other local circuit will be completed or broken, substantially as described.

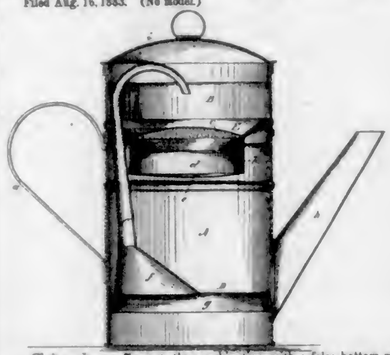
297,187. SASH-HOLDER. WILLIAM O. SMITH, Norwalk, Ohio. Filed Aug. 3, 1883. (Model.)

Claim.—The combination, with the casing provided with an inwardly-projecting lug, of the eccentric provided with a groove, H, the hub rigidly secured to the eccentric, the spindle E, plate G, and handle F, all of the above parts combined as described.



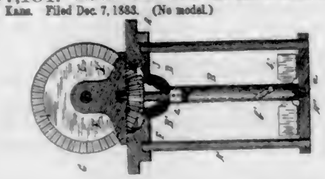
297,188. FLOOD-FENCE. JOHN SNIDER, Fountainstown, Ind. Filed Dec. 8, 1883. (Model.)

Claim.—In a fence, the combination of the slotted posts, the panels of the fence, the slides provided with rollers, and the posts which have floats secured to their lower ends, substantially as described.



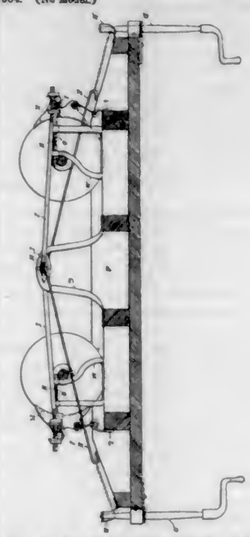
297,189. MEANS OF VENTILATION. MARSHALL B. STAFFORD, New York, N. Y. Filed May 3, 1883. (No model.)

Claim.—An improved means for ventilating buildings and equalizing the temperature therein, which consists of the fresh-air flue A, leading from the roof and connected with the upper part of the apartments by flues C, having automatically-operating valves *a a*, suction-blower D, a foul-air pipe which extends upward through the building, and whose



lower end connects with the suction-blower, and a series of branch pipes, H, which lead from the foul-air pipe to the lower part of the separate apartments, and are provided at their mouth with registers J, substantially as set forth.

297,190. COFFEE-POT. BENJAMIN F. STAGGS, Hendersonville, N. C. Filed Aug. 16, 1883. (No model.)

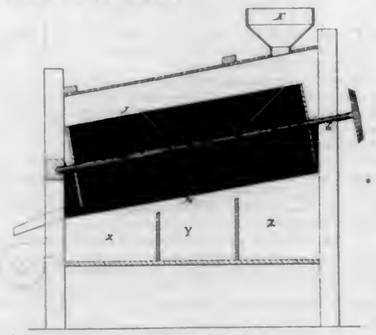


Claim.—In a coffee-pot, the combination, with a false bottom provided with a suitable tube for the passage of the boiling water, of a receptacle for the coffee, into which the upper end of the tube extends, said receptacle having a funnel-shaped vessel and a convex perforated bottom, and a cloth strainer connected to a ring depending from the vessel, substantially as and for the purpose set forth.

297,191. CHURN. ORAN F. STEED and EZRA A. NIXON, Little River, Kans. Filed Dec. 7, 1883. (No model.)

Claim.—The combination of the shaft B B', carrying gear-wheel J, the bowl-shaped shield D, churn-cover A, having gear-wheel cavity F, the pillow-blocks E, and driving mechanism G C, substantially as specified.

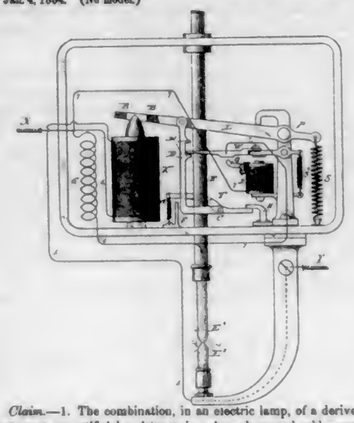
297,192. CAR-BRAKE. JOHN STROEKER, Jr., Mobile, Ala. Filed Jan. 17, 1884. (No model.)



Claim.—1. In a car-brake, the combination, with the center bar connected with a lever at one end and adapted to be actuated by the draw-bar, and terminating at the other in bifurcated extensions, of the brake-bar adjustably secured to said extensions, and the movable guide-rod flexibly connected thereto and fitted in guides, and the spring and adjusting-nut, whereby the shoes are guided to the wheels and their normal position relatively to the wheels governed.

2. In a car-brake, the combination, with the brake-bar, of the guide-bar connected thereto, provided with a spring and an adjusting-nut, and mounted in fixed guides, whereby the normal position of the brake-shoes relatively to the wheels is governed.

3. In a car-break, the combination, with the brake-bars flexibly connected to the frame-work, and the guide-rods flexibly connected thereto, provided with springs and adjusting-nuts, and mounted in guides depending from the frame, of the bifurcated center bars adjustably connected to the brake-bars near the ends of the latter and to the lever mounted in a depending bracket, and the draw-bars, chains, and brake-rods.



297,193. PROCESS OF TREATING COTTON-SEED. THOS. TAYLOR, Washington, D. C., assignor of one-third to James E. Fitch, same place. Filed Nov. 26, 1883. (No model.)

Claim.—1. A process of treating cotton-seed, consisting in subjecting the seed to the action of a solution of sulphuric acid of commerce and water, in the proportions of about one part, by measure, of the acid and from two parts to six parts, by measure, of water, and then to a mechanical rubbing action to remove the fiber from the seed, substantially as described

2. A process of treating cotton-seed, consisting in subjecting the seed to the action of a solution of sulphuric acid and water, in about the proportions named, then to an alkaline bath, then to a bath of water, and finally to a mechanical rubbing or abrading action to remove the fiber, substantially as described.

297,194. ELECTRIC-ARC LAMP. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 4, 1884. (No model.)

Claim.—1. The combination, in an electric lamp, of a derived-circuit magnet, an artificial resistance in a branch around said magnet, to cause said magnet to be energized when the current begins to flow, and a shunting device for automatically cutting out said resistance, as and for the purpose set forth.

2. The combination, in an electric lamp, of a derived-circuit magnet controlling the feed-regulating armature, an artificial resistance in the carbon branch, and means for automatically shunting said resistance when the magnet has acquired a predetermined power, substantially as set forth.

3. The combination, in an electric lamp, of a derived-circuit magnet, an artificial resistance in the carbon-circuit, means for permitting the carbons to come together when the lever of the feed-regulating mechanism is abnormally retracted, and a shunting device for shunting said resistance when the feed-regulating lever has been moved to a predetermined point by the magnet in its abnormally-strengthened condition.

4. In an electric-arc lamp, the combination of a derived-circuit magnet for controlling the feeding and separating mechanism, an artificial resistance in a branch around said magnet, a shunting device for shunting the magnet at a predetermined point in the movement of the feed mechanism, and means for holding said shunting device stationary during the operation of the lamp.

5. In an electric lamp, the combination of a derived-circuit magnet for controlling the feeding and separating mechanism, an artificial resistance arranged in the manner described, so as to cause a flow of current in the magnet at starting the lamp, a shunting device for shunting said resistance automatically, as described, and an electro-magnet in the shunt-circuit for holding said shunt closed during normal operation of the lamp.

6. In an electric-arc lamp, the combination of a derived-circuit magnet, an artificial resistance in the carbon branch around the same, a circuit-controller actuated when the lamp mechanism has been moved to a predetermined point, whereby said resistance may be shunted out of circuit, and an electro-magnet in the cut-out circuit for holding the circuit-controller in position to keep the shunted-out circuit closed.

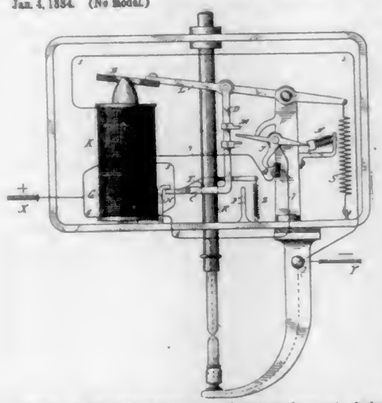
7. The combination, in an electric lamp, of a derived-circuit magnet, a feed-controlling and carbon-separating lever actuated thereby, an artificial resistance in a branch around the magnet, and a shunting device which in one position of the lever places said resistance in circuit, and in another position shunts it.

8. The combination, in an electric lamp, of a derived-circuit magnet, feed-controlling mechanism that releases the carbon when the magnet's armature is abnormally retracted, as well as when the magnet's strength is increased by an increase of arc-resistance requiring a feed, an artificial resistance in a branch around the magnet, closed when the mag-

net's armature is in an extreme retracted position, and means for shunting said resistance and holding it shunted while the armature is in normal or feed-regulating position.

9. The combination, in an electric lamp, of a derived-circuit magnet, an artificial resistance in a branch around the same, feed-regulating mechanism provided with releasing stops or detents which permit the carbon to feed both when the feed-regulating armature is abnormally retracted and when it is attracted to the required degree, and means for cutting out said resistance automatically at a predetermined point in the armature's movement.

10. The combination, in an electric lamp, of a derived-circuit feed-regulating coil of high resistance, an artificial resistance in a branch around said coil, for forcing current into the coil at the start, and a circuit-controller for automatically throwing the artificial resistance out of action, as and for the purpose described.



11. The combination, in an electric lamp, of a derived-circuit magnet, a feed mechanism actuated thereby and released in its two extreme positions, an artificial resistance in a branch around the magnet, and an automatic shunting device, as and for the purpose described.

12. In an electric-arc lamp, a derived-circuit magnet, feed-regulating mechanism brought into operative position by said magnet when sufficiently energized, an artificial resistance in a branch around said magnet, and means for automatically shunting said resistance, as and for the purpose described.

13. The combination, in an electric lamp, of a derived-circuit feed-controlling magnet, an artificial resistance in a branch around the same, a circuit-controller governing the flow of current through the artificial resistance and actuated by the feed-regulating lever, and a magnet for holding said circuit-controller stationary while the lamp is in operation.

14. The combination, in an electric lamp, of a derived-circuit feed-regulating magnet, an artificial resistance in a branch around the same, a shunt-circuit closer for automatically shunting said resistance when the lamp mechanism has been brought to feed-regulating position, and a device energized by the lamp-current for keeping said cut-out circuit closed.

297,195. ELECTRIC-ARC LAMP. ELIHU THOMSON, LYNN, MASS., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 4, 1884. (No model.)

Claim.—1. The combination, in an electric-arc lamp, of a derived-circuit coil or magnet of high resistance, feed-regulating mechanism controlled thereby, and released upon an extreme reverse movement of the magnet core or armature, as well as upon a forward movement thereof in the normal operation of the lamp, and means for assisting the derived-circuit magnet in bringing the feed mechanism into normal operating position, as and for the purpose described.

2. The combination, in an electric-arc lamp, of a feed mechanism and derived-circuit magnet controlling the same, a starting or assisting coil in the circuit with the carbons, and means for rendering said coil inactive and holding it out of action while the carbons are burning, as and for the purpose described.

3. The combination, in an electric-arc lamp, of a starting-coil in the circuit through the carbons, releasing devices to permit the carbon to descend freely when the lamp is out of action, and a switch or circuit-controller for rendering the starting-coil inactive as soon as the lamp begins to burn, as and for the purpose described.

4. In an electric-arc lamp, the combination, with the feed mechanism, of means for permitting a release of the carbon both when the feed-controlling armature is attracted and when it is retracted, as and for the purpose described.

5. In an electric-arc lamp, the combination of a derived-circuit magnet of high resistance around the carbons, a starting coil or magnet in circuit with the carbons when the lamp is out of action, and a switch or circuit-controller for shunting said coil when the lamp is started, and holding it cut out so long as the lamp shall continue in operation.

6. In an electric lamp, the combination, with a derived-circuit magnet and feed-regulating mechanism released to produce a feed when the magnet's strength increases with an increase of arc, of auxiliary releasing devices which permit the carbon to feed when the magnet is de-energized, devices for bringing the feed mechanism at starting into normal or operating position to lift the carbon and form the arc, and means for throwing said devices out of operation, whereby the feed mechanism may be left to the control of the high-resistance derived-circuit magnet.

7. The combination, in an electric lamp whose carbons are normally or at the start in contact, of a derived-circuit magnet of high resistance in a branch around the carbons, feed mechanism controlled thereby, a starting coil or magnet in circuit with the carbons, to assist the derived-circuit magnet in starting the lamp, and a switch or circuit-controller for shunting said coil and holding it shunted, so that the lamp may operate under the control of the derived-circuit magnet independently of said coil.

8. The combination, substantially as described, of a derived-circuit magnet, a feed mechanism having an auxiliary stop or detent for permitting the carbons to come together when the magnet-armature is abnormally retracted, as well as when it is drawn forward by the increase of current in the derived-circuit magnet, a coil or magnet in circuit with the carbons for assisting the derived-circuit magnet, and means for shunting said coil when the feed mechanism has been moved to a predetermined point.

9. In an electric-arc lamp whose mechanism is controlled by a derived-circuit magnet only in the feed-controlling operation, the combination of a starting-circuit, a circuit closer or controller actuated by the magnet-armature in its movement to extreme position, and a spring bearing on said circuit-closer, so as to act upon it at an angle in either of its positions, and to thus hold the contacts open or closed independently of the lever when moving in a limited range.

10. The combination, in an electric lamp, of a derived-circuit magnet, a clamp or clutch controlled thereby, stops or detents for releasing the clutch at either extreme of movement, a coil or magnet for assisting the derived-circuit magnet at starting, and means for automatically preventing an operative flow of current in said coil when the derived-circuit-magnet armature has been moved to a predetermined point.

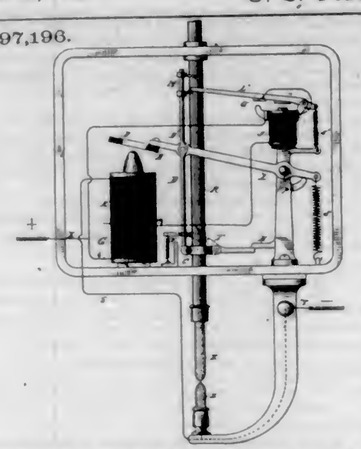
11. The combination, in an electric lamp, of a derived-circuit magnet whose coil is in a branch of high resistance around the carbons, a starting-coil wound on the same core with said derived-circuit coil and in circuit with the carbons, and a switch or circuit-controller for controlling or cutting off the flow of current in said latter coils, whereby, after the lamp is started, it may be left to burn under the sole control of the derived-circuit coil.

12. The combination, in an electric lamp, of a clamp or clutch and two releasing-stops for the latter, arranged in the manner described, to release the carbon or carbon-carrier in either of the extreme positions of the clutch.

13. The combination, in an electric lamp, of the clamp or clutch having the clamping toe or jaw T and two stops, arranged in the manner described, to release the toe on an upward or downward movement of the clutch to a determinate extent.

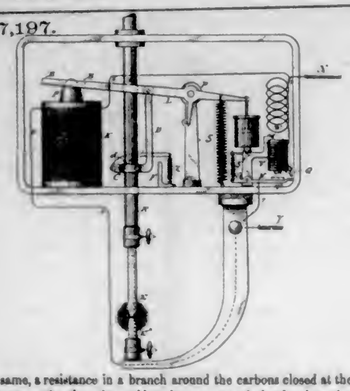
14. The combination, in an electric lamp, of a high-resistance derived-circuit feed-regulating magnet, an auxiliary coil in circuit with the carbons for moving the feed-regulating mechanism to a point from which, when retracted, it may raise the upper carbon, and means for automatically shunting said coil and holding it shunted, so that the operations of forming the arc and controlling the feed may progress under the control of the derived-circuit magnet only.

297,196. ELECTRIC-ARC LAMP. ELIHU THOMSON, LYNN, MASS., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 4, 1884. (No model.)



Claim.—1. The combination, in an electric lamp, of a starting circuit or coil, a shunting device therefor actuated by the regulating-lever, and a magnet or coil or other device affected by electric current whose circuit is governed by said shunting device for holding the shunt-circuit closed while the lamp is in operation.

2. The combination, in an electric lamp, of a starting coil or magnet in the carbon circuit, a shunting device for shunting said coil when the feed mechanism has been brought to normal or feed-regulating position, and an electro-magnetic coil in the shunt-circuit for holding said shunt-circuit closed.



3. The combination, in an electric lamp, of a starting coil or magnet in the carbon circuit, a shunting device for shunting said coil when the feed mechanism has been brought to a predetermined position, and a coil or magnet in the shunting-circuit for acting on said shunting device and keeping the shunting-circuit closed while the lamp is in operation.

4. The combination, in an electric lamp, of a derived-circuit regulating-magnet, an assisting-coil for assisting the same in pulling the regulating-lever from an extreme retracted position to a normal or feed-regulating position, a shunting device for shunting said coil when the lever has reached a predetermined position, and a magnet or coil in the shunt-circuit for holding the latter closed, as and for the purpose described.

297,196.

297,197.

5. The combination, in an electric lamp, of a high-resistance derived-circuit magnet, feed-regulating mechanism having stops or releasing devices which release the same at either extreme of movement, a starting coil or circuit, means for rendering said coil or circuit ineffective when the feed-regulating armature is moved from an extreme retracted position, and a magnet or coil for keeping said coil or circuit inoperative, as and for the purpose described.

6. The combination, in an electric lamp, of a high-resistance derived-circuit feed-regulating magnet, an auxiliary coil in circuit with the carbons for moving the feed-regulating mechanism to a point from which it may, when retracted, raise the upper carbon, means for automatically cutting out said coil and holding it cut out, so that the operations of forming the arc and controlling the feed may progress under the control of the derived-circuit magnet only, and a coil or magnet in the cut-out circuit for holding the cut-out circuit closed.

7. The combination, in an electric lamp, of a feed-regulating-magnet core carrying two coils—one in a derived circuit of high resistance around the carbons and the other in a circuit with the carbons—means for shunting said latter coil when it shall have brought the feed-regulating mechanism into normal position for separating the carbons, and a magnet in the shunt-circuit for holding said shunt-circuit closed.

8. The combination, in an electric lamp, of a feed-regulating-magnet core carrying two coils—one in a derived circuit around the carbons and the other in a circuit with the carbons—feed-regulating mechanism which permits a release of the carbon when no current is circulating in the derived-circuit coils, as well as when said coils carry an increased proportion of current due to lengthening of the arc, a circuit controller or switch actuated directly or indirectly by the feed-regulating lever when the same is operated by means of the coil in the carbon circuit, for cutting out said coil when the feed-regulating devices reach their extreme of movement, and an electro-magnet in the cut-out circuit for acting on the circuit-controller and keeping it in proper position while the current flows through the carbons.

9. The combination, in an electric lamp, of the two coils K G, wound and connected as described, an armature-lever actuated by the core of said coils, a clutch carried by said lever, and provided with upper and lower releasing-stops, a cut-out circuit-closer for shunting said coil G, means for mechanically acting on said circuit-closer when the armature-lever is drawn forward and when it is abnormally retracted, so as to open or close the cut-out circuit, and a coil in the cut-out circuit, and acting on said circuit-closer, as and for the purpose described.

10. The combination, in an electric lamp whose carbons are at the start in contact, of a starting-coil in circuit with said carbons, and means for automatically shunting or cutting out said coil when the feed mechanism has been brought by the action of said coil into the proper feed-regulating or carbon-separating position, and a magnet in the cut-out circuit for holding the same closed, as and for the purpose described.

297,197. ELECTRIC-ARC LAMP. ELIHU THOMSON, LYNN, MASS., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 5, 1884. (No model.)

Claim.—1. The combination, in an electric lamp, of feed mechanism, a derived-circuit magnet of high resistance regulating or controlling the same, a resistance in a branch around the carbons closed at the start, and means for throwing said resistance out of circuit when the lamp mechanism has been brought into operative position.

2. The combination, in an electric-arc lamp, of a high-resistance derived-circuit magnet, feed mechanism controlled thereby, a resistance somewhat greater than the normal arc in a branch around the carbons for forcing current into the high-resistance derived circuit to start the lamp, and a circuit-breaker for breaking the circuit of said resistance when the lamp mechanism has been brought into operative position, so as to leave the lamp to the controlling action of the derived-circuit magnet only.

3. The combination, in an electric lamp, of a high-resistance derived-circuit magnet, a retractor for the armature-lever thereof, feed-regulating mechanism controlled by said lever, a resistance somewhat greater than the normal arc in a branch around the carbons, and means for breaking said branch and keeping it broken when the current passes through the carbons, so that the lamp may continue in operation by the action of the derived-circuit magnet only.

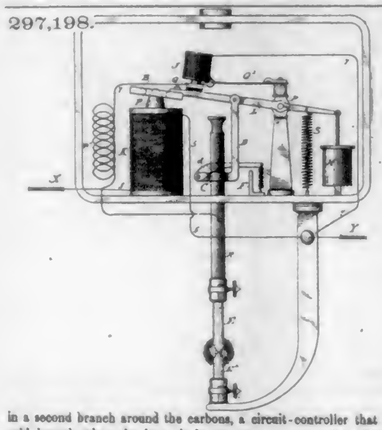
4. The combination, in an electric lamp whose carbon circuit is broken when the lamp is out of action, of a high-resistance derived-circuit magnet, feed mechanism controlled thereby, a resistance in a branch around the carbons, and means for breaking said branch when the feed mechanism has been brought into normal or feed-regulating position, as and for the purpose described.

5. The combination, in an electric lamp, of a high-resistance derived circuit containing means for regulating the position of the carbons, a carbon circuit open when the lamp is out of action, a resistance in a branch around the carbons, and a circuit-controller therefor actuated by a magnet in the carbon circuit, as and for the purpose described.

6. The combination, in an electric lamp, of a regulating-lever, L, a high-resistance or derived-circuit magnet, and a retractor acting upon said lever in opposite directions, feed-regulating mechanism that holds the carbons apart when the lever is retracted to an extreme position, a resistance in a branch around the carbons, and means for breaking said branch and holding it broken when current flows through the carbons.

7. The combination, in an electric lamp whose carbons are separated at the start, of a high-resistance derived-circuit magnet, feed mechanism controlled thereby, and a resistance in a branch around the carbons for forcing current into the high-resistance magnet, so that it may have power to start the lamp.

8. An electric lamp constructed to have three conducting-paths—one through the carbons, one through the high-resistance-controlling magnet, and a third through a resistance greater than that of the arc—as and for the purposes described.



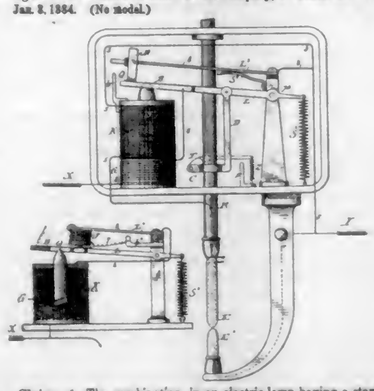
9. The combination, in an electric lamp having a high-resistance derived circuit carrying the regulating-current, of a second branch around the carbons containing a resistance preferably greater than the normal arc, and closed at starting of the lamp, and means for bringing the lamp mechanism into operation, placed in the high-resistance circuit and energized by the abnormal flow of current produced therein by the presence of the second resistance branch.

297,198. ELECTRIC-ARC LAMP. ELIHU THOMSON, LYNN, MASS., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 5, 1884. (No model.)

Claim.—1. The combination, in an electric lamp, of a high-resistance derived-circuit magnet and retractor therefor, feed-regulating mechanism controlled thereby, a resistance in a branch around the carbons, and a circuit-controller actuated by the regulating-lever, as and for the purpose described.

2. In an electric lamp, the combination of a high-resistance derived-circuit magnet, a feed-regulating lever controlled thereby, a resistance

297,198.



in a second branch around the carbons, a circuit-controller that closes said branch when the lever is in an extreme retracted position, and means for keeping said branch closed while the lever is moving from such position to its proper position for permitting a release of the carbons.

3. The combination, in an electric lamp, of a high-resistance derived-circuit magnet, a feed-regulating mechanism controlled thereby, a resistance branch around the carbons closed by the regulating-lever when retracted to an extreme position, and a magnet in said branch for keeping the branch closed until contact of the carbons is effected.

4. The combination, in an electric lamp, of a high-resistance feed-regulating magnet in a derived circuit around the carbons, a resistance in a second branch around the carbons, a spring-retracted circuit-closer for said branch that closes the branch when the feed mechanism is retracted to an abnormal extent, and a magnet in the branch and mounted on said circuit-closer for compelling the circuit-closer to move with the lever and keep the branch closed during forward movement of the lever.

5. The combination, in an electric-arc lamp having a derived circuit of high resistance carrying the regulating-current, of an extra branch containing a resistance, means in the regulating derived circuit for bringing the lamp mechanism into operative position under the action of current forced into said circuit by the presence of the resistance in the extra branch, a circuit-controller for said branch arranged in the path of the regulator-lever or other portion of the lamp mechanism moving therewith, and a magnet adapted to move with the circuit-closing points for preserving the extra branch during forward movement of the lever from the extreme retracted position.

297,199. ELECTRIC-ARC LAMP. ELIHU THOMSON, LYNN, MASS., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 3, 1884. (No model.)

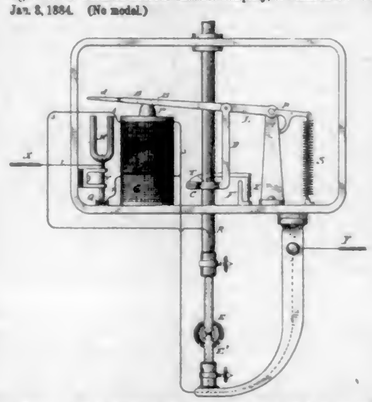
Claim.—1. The combination, in an electric lamp having a starting coil or circuit, of a switch or circuit-controller and a magnet and armature for keeping the contacts of the circuit-controller set during the forward movement of the feed-regulating mechanism from an extreme retracted position to a feed-regulating position.

2. The combination, in an electric lamp having a starting coil or circuit, as described, of a circuit-controller or switch that closes the starting-circuit when the feed-regulating lever is in an extreme retracted position, a magnet and armature for keeping the contacts closed during forward movement of the lever, and a detent or stop for opening the switch-contacts at a predetermined point in the movement of the feed-regulating mechanism.

3. The combination, in an electric lamp, of a starting coil or circuit, a circuit-controller or switch therefor, and a magnet for holding said switch-contacts in unchanged relation during forward movement of the lamp mechanism from an extreme retracted position, said magnet being wound with coils connected with the lamp-circuits.

4. The combination, in an electric lamp, of a starting coil or circuit, a switch or circuit-controller therefor, and a magnet for holding the switch-contacts in unchanged relation until the lamp mechanism has been brought to feed-regulating position, said magnet being wound with coils in the starting-circuit of the lamp.

5. The combination, in an electric lamp, of a starting coil or circuit, a switch or circuit-controller therefor whose contacts are closed when the regulating-lever of the lamp is retracted to an extreme position, a magnet for keeping the switch-contacts in unchanged relation during forward movement of the regulating-lever, and mechanism for separating the armatures from its magnet, as and for the purpose described.



6. The combination, in an electric lamp, of a starting coil or circuit, a switch or circuit-controller therefor, and a magnet and armature movable with the switch and lamp mechanism for keeping the parts of said switch in unchanged electrical relation.

7. The combination, in an electric lamp, of a starting coil or circuit, a switch or circuit-controller therefor, and a magnet and armature, one carried by the feed mechanism and the other by the circuit-controller, so that the contacts of the latter may be kept in unchanged electrical relation during an extended movement of the feed mechanism.

8. The combination, in an electric lamp, of a starting coil or circuit, a switch or circuit-controller, one part of which is movable independently of the lamp mechanism, while the other moves with said mechanism, a magnet and armature for keeping said parts in unchanged electrical relation, and a spring or other retractor for separating the parts of the circuit-controller when the armature is freed from the magnet.

9. The combination, in an electric lamp, of a starting coil or circuit, a switch or circuit-controller therefor, and a magnet for keeping the contacts of said controller in unchanged electrical relation during forward movement of the lamp-regulating devices from a retracted position, said magnet's coils being in a branch around the carbons.

297,200. ELECTRIC-ARC LAMP. ELIHU THOMSON, LYNN, MASS., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 3, 1884. (No model.)

Claim.—1. The combination, in an electric-arc lamp, of a starting circuit or coil, a circuit-controller or switch therefor, and a magnet and armature for operating said switch, one carried by the lamp mechanism or devices moving therewith and the other by the switch, said magnet and armature being arranged, in the manner described, so that they will be brought into operative proximity when the lamp mechanism has been moved to a predetermined extent by the action of the starting circuit or coil.

2. The combination, in an electric lamp provided with a starting circuit or coil closed when the lamp is out of action, of a circuit-controller and a magnet and armature for actuating the same, arranged, in the manner described, so as to be brought within attractive distance of each other on the forward movement of the regulating-lever from an extreme retracted position.

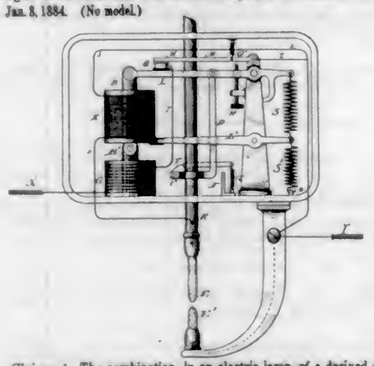
3. The combination, with the regulating or feed-controlling armature-lever and the switch V, of a magnet and armature, one carried by the lever and the other by the switch, and arranged, in the manner described, so as to be brought into proximity by the forward movement of the lever under the action of the feed-regulating lever, as and for the purpose described.

4. The combination, substantially as described, in an electric lamp, of a switch or circuit-controller controlling the starting-circuit, and a magnet and armature for operating the circuit-controller when they have been brought into suitable proximity by the movement of the lamp mechanism toward feed-regulating position, said magnet being wound with coils in the lamp-circuit, so that it may continue to act upon the circuit-controller while the lamp is in operation.

5. The combination, in an electric lamp having a starting circuit or coil, as described, of a circuit-controller or switch and a magnet and armature, one carried by the lamp mechanism and the other by the circuit-controller, the coils of said magnet being in the carbon-circuit, as and for the purpose described.

6. The combination, in an electric lamp having a starting circuit or coil, as described, of a circuit-controller or switch, a magnet and armature, one moving with the lamp mechanism and the other carried by the switch, and arranged, in the manner described, to be brought into proximity by the movement of the lamp mechanism under the influence of the starting-circuit, and a coil for said magnet placed in the circuit with the carbons.

7. The combination, in an electric lamp, of a feed-regulating derived circuit of high resistance, a feed-regulating lever controlled thereby, a starting circuit or coil, a switch or circuit-controller therefor, and an armature and magnet, one carried by the lever and the other by the switch, and arranged, in the manner described, so as to be out of proximity when the lever is retracted, but to be brought into proximity by the movement of the lever to feed-regulating position.



8. The combination, substantially as described, of the switch controlling the starting-circuit, the magnet whose coils are in the carbon-circuit, and the armature carried by the switch or the lamp mechanism for holding the switch elevated or out of position for closing the starting-circuit while the lamp continues in operation.

9. The combination, in an electric lamp, of a feed-regulating magnet whose coils are in a high-resistance derived circuit, an auxiliary branch around the carbons containing an artificial resistance, a circuit-controller for said branch, carrying a magnet or its equivalent, as described, an armature, and an armature or magnet carried by the lamp mechanism, and arranged to act upon the circuit-controller when said lamp mechanism shall have moved to a predetermined extent under the action of the current forced into the derived circuit by the artificial resistance.

10. The combination, in an electric lamp having a starting coil or circuit, as described, of a circuit-controller therefor, and a magnet movable with the lamp mechanism, for holding the contacts of said controller in unchanged electrical relation during operation of the lamp, said magnet being wound with coils connected to the lamp-circuit.

11. The combination, in an electric lamp having a starting coil or circuit, as described, of a circuit-controller or switch therefor, and a magnet and armature movable with the lamp mechanism, for holding the switch-contacts in unchanged electrical relation during operation of the lamp, said magnet being wound with coils in the principal circuit.

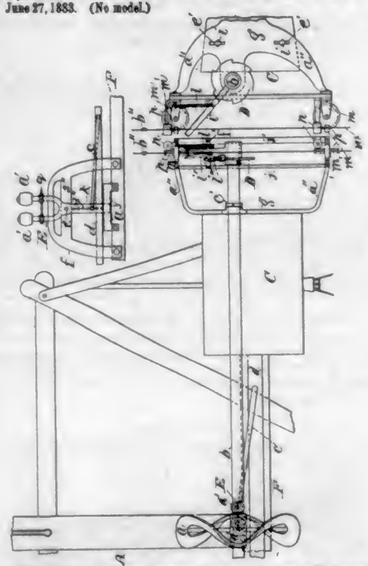
297,201. ELECTRIC-ARC LAMP. ELIHU THOMSON, LYNN, MASS., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 3, 1884. (No model.)

Claim.—1. The combination, in an electric lamp, of a derived circuit of high resistance carrying the feed-regulating current, feed-regulating mechanism controlled thereby, a retractor acting in opposition to the effects of the feed-regulating current, and an electro-magnet for diminishing the retracting force when the lamp starts, as and for the purpose described.

2. The combination, in an electric lamp, of a feed-regulating armature-lever, a retracting-spring therefor, an electro-magnet for slackening said spring when the current is turned on, and means for rendering said electro-magnet ineffective when the lamp mechanism has been brought to normal or proper feed-regulating position.

3. The combination, in an electric lamp, of a high-resistance derived-circuit magnet mounted on a movable support, a feed-regulating lever controlled by said magnet, and an electro-magnet that acts on said support and simultaneously lowers said support and diminishes the retracting force acting on the feed-regulating lever.

4. The combination, in an electric lamp, of a feed-regulating magnet mounted on a movable support, an armature for said magnet having a retractor connected with said support, a starting electro-magnetic coil for simultaneously lowering said support and slackening the retractor, and means for cutting out said coil when the lamp mechanism has been brought to feed-regulating position.



5. The combination, in an electric lamp, of a feed-regulating lever, a high-resistance derived-circuit magnet acting thereon, an auxiliary or starting magnet, and a retractor for the feed-regulating mechanism connected with the armature-lever of the starting-magnet.

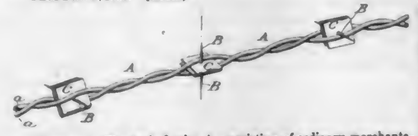
6. The combination, in an electric lamp, of a starting electro-magnet, a high-resistance derived-circuit magnet mounted on the armature-lever for the starting-magnet on one side of its fulcrum, and a retracting-spring for the feed-regulating armature-lever connected with the armature-lever for the starting-magnet on the other side of the fulcrum.

7. The combination, in an electric-arc lamp, of a high-resistance derived-circuit magnet, an electro-magnet whose coils carry current when the lamp starts for lowering said high-resistance magnet, and means for cutting out the coils of the starting-magnet when the lamp mechanism has been brought into operative position.

8. The combination, in an electric lamp, of a feed-regulating lever and a starting-magnet having an armature connected with the feed-regulating lever through the retractor for the latter, as and for the purpose described.

297,202. CHECK-ROWER. JOHN J. TUTTLE, Springfield, Ohio. Filed June 27, 1883. (No model.)

Claim.—1. In a check-rower, the combination, with a revolvable shaft having the double-spiral male cam on the center of the same engaging with an adjustable oscillating fork provided with rollers, and pivoted over the slide-lever of a corn-planter, a ratchet-wheel rigidly attached to said shaft, and a pivoted spring-fork having a spring-latch engaging with the teeth of said ratchet-wheel for operating the check-rower, of the adjustable bracket having the upwardly and outwardly bent limbs, the cross-bars connecting the same, and the bearing-pulleys and guide-rollers arranged as shown, and adapted to be operated as set forth.

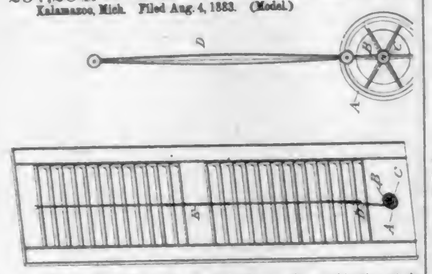


2. The combination, with the seed-boxes and the main cross-bar of

the planter, of the brackets having the upwardly-bent and outwardly-extended limbs, the cross-bars connecting the same, said brackets being adapted to support the revoluble shaft and its auxiliary operative devices, and having the horizontal slots extending through the body of the same, whereby they are made adjustable (in connection with bolts securing them to the ends of the seed-hoppers and the main cross-bar) toward the front and rear of the planter, as set forth.

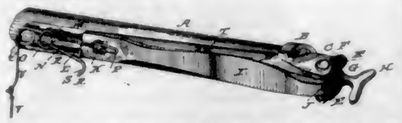
3. In a check-rower wire, a hollow button of ellipse shape having a cleft extending longitudinally through the axial line of the same from one end to the middle of said button, said cleft being wider at the outer end to allow of the insertion of the wire sections, and adapted to be closed to retain the eye ends of said wire sections and swivel them within the button, as set forth.

4. In a check-rower, a hollow button of ellipse shape having an open cleft extending from one end through it to the middle of the same for the insertion of the ring ends of the wire sections, and adapted to be closed over the same, and having its inner cavity flat at the ends around the wire-hole to allow the ring end of said wire (having a square abutting end) to turn freely within said cavity, and to prevent it from kinking when operated or in coiling for transportation.



297,203. BARBED FENCE. HENRY M. UNDERWOOD, Waukegan, Ill. Filed Dec. 24, 1883. (Model.)

Claim.—1. The barbed wire A, consisting of ordinary merchantable tacks, B B, secured within the doubled plate C between the two strands *a a* of said wire A, substantially as shown and described.



2. The combination, with the folded warning-plate C, of the headed barbs B, inserted therein, the barbs piercing the warning-plate, and having their heads secured between its folded sides.

297,204. BLIND-SLAT LOCK AND OPERATOR. ISAAK VAN KERSEN, Kalamazoo, Mich. Filed Aug. 4, 1883. (Model.)

Claim.—In a blind-slat stop and adjuster, the combination of the friction crank-wheel A, having a friction-spring, B, and a center-screw, C, by which the crank-wheel A is fastened to the frame and pressed to the spring B to a desired friction on the crank-wheel, and the rod D, connecting the slat-bar with the crank-wheel, substantially as described, for the purpose specified.

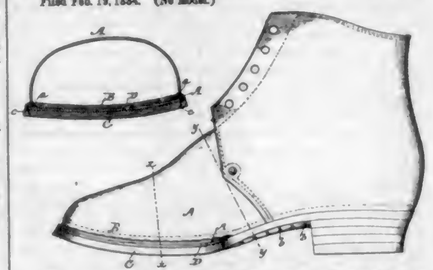
297,205. HORSE-DETACHER. ISAAC A. WESSON, Wingo, Ky. Filed Jan. 15, 1884. (No model.)

Claim.—1. The combination of the single-tree, the socket having the outwardly-projecting lips having enlargements at their outer ends, and the pivoted hook having means for retaining and releasing it, as and for the purpose shown and set forth.

2. The combination of the single-tree, the socket having outwardly-projecting lips provided with the pivotal pin, and the inwardly-extending socket-bar having the longitudinally-grooved enlargement at its inner end, provided with the eye, the hook having T-head perforated central portion and inwardly-extending hook-bar having a transverse slot at its inner end, the rearwardly-projecting eye passing through the said slot, the elastic cushion, and the spring-key, as and for the purpose shown and set forth.

3. The spring-key having one end doubled, central coil, and outwardly-bent end, in combination with the inner eye, the outer eye, and the slotted hook-bar, as and for the purpose shown and set forth.

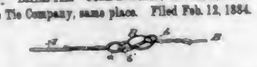
297,206. PROCESS OF PREPARING OR TREATING COMPOSITION OR MATERIAL TO BE USED IN MAKING PLAQUES. JOHN J. WEST, Chicago, Ill. Filed Oct. 24, 1883. (Specimens.)



Claim.—1. In the manufacture of casts for decoration in oil-colors, the process of preventing the checking, cracking, or peeling off of the oil-paint applied for decoration, which process consists in applying to the dry cast a coating of oil-varnish, substantially as and for the purposes specified.

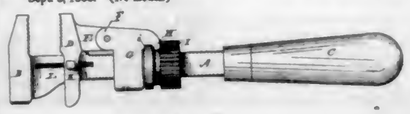
2. In the manufacture of casts for decoration in oil-colors, the process of preventing the checking, cracking, or peeling off of the oil-paint applied for decoration, which process consists in applying to the dry cast a coating of oil-varnish, allowing the said coating to become dry, and then painting the same with white zinc ground in oil, substantially as and for the purposes specified.

3. A composition for the manufacture of casts for decoration in oil-colors, which composition consists of an absorbent material coated in its hard and dry state with oil-varnish, and afterward painted with white zinc ground in oil, substantially as and for the purposes specified.

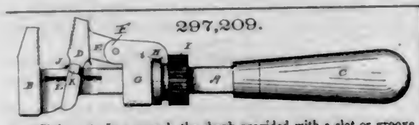


4. A cast made from absorbent material brushed in its hard and dry state with oil-varnish, and afterward painted with white zinc ground in oil, substantially as and for the purposes specified.

297,207. BOOT OR SHOE. WILLIAM H. WETMORE, Raleigh, N. C. Filed Feb. 19, 1884. (No model.)



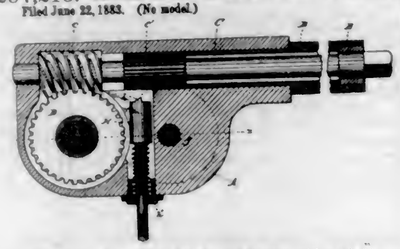
Claim.—The improved boot or shoe described, the same having the upper united around the front to the side or edge of the inner sole by stitches passing through the upper and diagonally through the inner sole from the side or edge to the bottom, and to the outer sole by stitches passing through the upper in close proximity to and parallel with those of the first seam and through the outer sole, and having the said upper turned in at the shank between the outer and inner soles, and there fastened by cable-screws or equivalent fastening devices, the margin of the upper around the front of the boot or shoe being turned outward below the upright portion, which is fastened to the edge or side of the inner sole, substantially as set forth.



297,208. BALE-TIE. JOSEPH WHITE, Cleveland, Ohio, assignor to the Tyler Bale Tie Company, same place. Filed Feb. 12, 1884. (No model.)

Claim.—In a wire bale-tie one end of which is provided with the loops *b* and B′ and intermediate shank, *b*′, the said loop *b* being passed through the loop B′, forming a hook, while the opposite end, thereof is provided with a single loop, *a*, which latter is adapted to be passed through the loop B′ over the loop *b*, and rest against the hook formed by the shank *b*′, all of the above parts operating as described.

297,209. WRENCH. THOMAS FOSTER WHITE, Salem, Kans. Filed Sept. 3, 1883. (No model.)



Claim.—1. In a wrench, the shank provided with a slot or groove in its side, in combination with the sliding jaw pivoted or jointed to a sliding sleeve, and a pointed screw or rod working through the side of the jaw and engaging with the slot or groove, as and for the purpose set forth.

2. In a wrench, the shank A, carrying stationary jaw B, and provided with a longitudinal groove in its side, in combination with the sliding jaw pivoted or jointed to a sliding sleeve, and having a pointed screw or rod engaging with the longitudinal groove, and a spring secured to the shank and bearing against the inner face of the sliding jaw, substantially as and for the purpose set forth.

3. In a wrench, the shank A, provided with a longitudinal groove or slot in its side, in combination with the sliding jaw formed with a rearward extension, a sleeve provided with a forward extension, which is pivoted or jointed to the said rearward extension, a pointed screw or rod working through the sliding jaw and engaging with the groove in the shank, and a spring bearing against the inner face of the sliding jaw, as and for the purpose set forth.

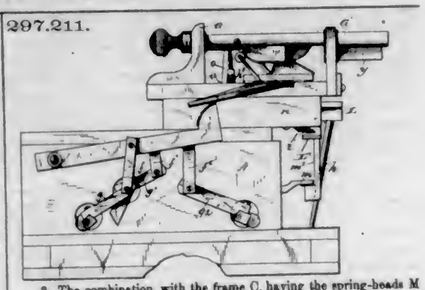
297,210. RATCHET-DRILL. PARDON A. WHITNEY, Cleveland, Ohio. Filed June 22, 1883. (No model.)

Claim.—1. In a ratchet-drill, the combination, with a suitable casing and handle, of a drill-socket, a worm-wheel rigidly secured thereto, a revolving shaft, and a worm secured to the shaft, substantially as set forth.

2. The combination, with a suitable casing and handle, of a shaft passing longitudinally through the handle, and provided with a worm, a worm-wheel journaled within the casing and meshing with the worm, a drill-socket rigidly secured to the worm-wheel, the part E, screw F, and mechanism for transmitting the motion of the worm-wheel to the part E, substantially as set forth.

3. In a ratchet-drill, the combination, with a casing and handle, and a shaft journaled within the casing and provided with a worm, of a gear meshing with the worm, a drill chuck or socket rigidly secured to the worm-gear, and a pawl and ratchet for holding the shaft against movement in one direction, substantially as set forth.

4. In a ratchet-drill, the combination, with the casing, handle, shaft, the latter being provided with a worm and ratchet-wheel, a worm-gear, and drill chuck or socket, of a spring-actuated detent adapted to be turned so as to engage the ratchet-wheel on either side of the shaft, substantially as set forth.



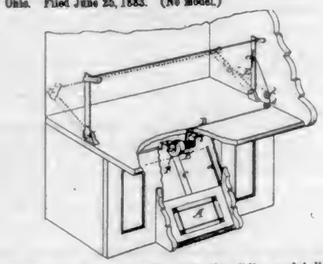
5. The combination, with the handle and casing, of the shaft provided with a worm, a worm-wheel meshing with the worm, a drill-socket rigidly secured to the worm-wheel, the pinion D′, the part E, the pinions G and G′, and the screw F, all of the above parts combined and adapted to operate as described.

297,211. REED-ORGAN STOP-ACTION. ORSON C. WHITNEY, Cleveland, Ohio. Filed July 24, 1882. (Model.)

Claim.—1. The combination, with the frame A, having the pivoted lever *a*, of the frame C, having the rod *k*, secured in a groove in said frame, and provided with an arm, *w*, resting loosely on said lever, said rod made in bail form and having rollers c^3 c^4, and the uprights G G′ on frame C, in which play the stop-rods F F′, provided with blocks *q* of different sizes, whereby the mute d^2 is partially or entirely opened alternately by said stops, as shown and described.

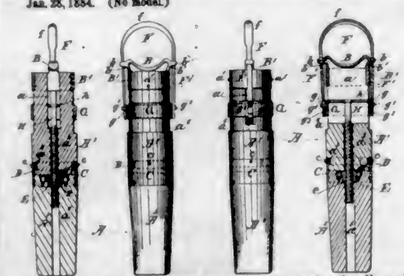
2. The combination, with the frame A, having the vertical pins *o*, provided with grooves or slits, of the frame C, having perforations to engage said pins, and provided with upwardly-turned spring-catches k^3, adapted to be sprung into the grooves or slits of the pins to secure the two frames together, as shown and described, and for the purpose set forth.

297,211.



3. The combination, with the frame C, having the spring-heads M M′, provided with pins a^4 a^5, of the frame A, having the levers L L′, engaging said pins, the former provided with the pin *h*, connected to the tremolo, and the latter provided with an arm, *m*′, attached to an arm, *m*, of the swell, and the stop-rods F^3 F^3′, adapted to engage the spring-heads to operate the said tremolo and swell, as shown and described.

4. The combination, with the frame A, having the levers e e' e^2, pivoted to one side thereof, and provided with links f f' f'' and arm g g' g^2, connected to the links and to the mutes d d' d^2, of the frame C, having uprights G G′, provided with openings g g' for the stop-rods F F′ F^4 F^5, having blocks, the rods k k' k^2, provided with rollers c^3 c^4 c^5 c^6, and the arms w w' w^2, resting on said levers, said stops F^4 F^5 independently operating the mutes d d', and the stops F F′ operating the bail-rod *k*, whereby the valve *d* is partially or entirely thrown open, as set forth.



5. The pins a^4 and a^5, secured to the spring-heads M and M′ on the frame C, in combination with the swell and tremolo-valve lever and the draw-stops F^3 F^3′, as shown and described.

297,212. CABINET-ORGAN CASE. ORSON C. WHITNEY, Cleveland, Ohio. Filed June 25, 1883. (No model.)

Claim.—The combination, with the sliding pedal-lid A and the bracketed double roller B B′, the former carrying one end of the strap C, the other end thereof being attached to the pedal-lid, of the tilting frame E, having the adjustable cord D, which passes over pulleys *d*, and is connected with the roller B′, as shown and specified.

297,213. ENGRAVER'S TOOL. WM. WILDT, Richmond, Va. Filed Jan. 28, 1884. (No model.)

Claim.—1. An engraver's tool composed of a stock or handle made in two sections, arranged for rotation one upon the other, and in combination therewith of holding devices consisting of a stationary support or table and a retaining device secured to and adjustable upon one of the handle-sections for securing the object to said stationary support, said adjustable holding device being made detachable from the handle-sec-

tion, and a screw connected with said holding device and operated from either one or the other handle-section, for the purposes specified.

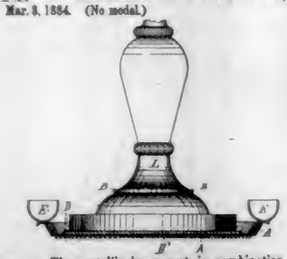
2. An engraver's tool composed of a stock or handle made in two sections, arranged for rotation one upon the other, and in combination therewith of a stationary support or table detachably connected with said handle or stock for supporting the object, a retaining device secured to and adjustable upon one of the handle-sections for securing the object to or holding the same on said support or table, said holding device being likewise made detachable from the handle or stock, and a screw-rod connected with the adjustable holding device and operated from one or the other handle-section, for the purposes specified.

3. An engraver's tool composed of a stock or handle made in two sections, arranged to rotate one upon the other, and in combination therewith of interchangeable stationary supports or rests, interchangeable retaining or holding devices for securing the object to said supports or rests, and a screw connected with the interchangeable holding devices for operating the same by the rotation of either handle-section, for the purpose specified.

4. The handle A, composed of the section A', provided with the annular groove a^3, and the section A^2, provided with the sleeve C, and in combination therewith of the split ring D and suitable devices for rigidly connecting the sleeve C with said ring, as described, for the purpose specified.

5. The combination, with the handle-section A', having slot *a* and an axial passage, a^3, the handle-section A^2, having a like passage, and a threaded bearing, E, said sections being rotatable one on the other, of the sleeve G, arranged to slide on section A', and the screw-rod H, rigidly connected to sleeve G, and operating in bearing E, whereby said sleeve may be adjusted vertically by the rotation of either handle-section, as described, for the purpose specified.

6. The combination, with the two-part handle A, constructed for operation as described, a stationary support or table secured to the upper end thereof, and a retaining or holding device secured to and adjustable vertically on the upper handle-section and above said stationary support, of the sleeve G, connected with the holding device, and screw-rod H, rigidly connected to the retaining or holding device, said parts being arranged for co-operation as described, for the purposes specified.



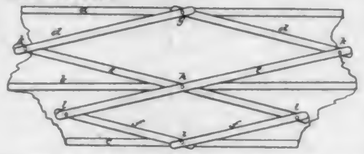
7. The combination, with the two-part handle A, constructed for operation as described, and interchangeable stationary support or table adapted to be secured to the upper end of said handle, and an interchangeable retaining or holding device adapted for vertical adjustment above said stationary support, of the sleeve G, detachably connected with the adjustable holding device, and the screw-rod H, rigidly connected with the sleeve G, said parts being arranged for co-operation as described, for the purpose specified.

8. The combination, with the two-part handle A, constructed for operation as described, the stationary segmental and grooved support B, secured to the upper end of said handle, and the U-shaped retaining or holding device F, having its segmental portion *f* grooved also, said device being adjustable vertically above the stationary support, of the sleeve G, connected to said holding device F, and the screw-rod H, connected with and operating the sleeve G, said parts being arranged for co-operation as described, for the purpose specified.

9. The combination, with the vertically-adjustable retaining or holding device, the legs or arms of which are provided with apertures f' f'', as described, of the sleeve G, provided with pins g g^3, substantially as described, for the purpose specified.

10. The combination, with the two-part handle A, constructed for operation as described, the stationary support or table B, secured to the end thereof, the slotted guide bearings or lugs *b*, and the retaining or holding device F, the legs F' of which move in and are guided by said lugs *b*, of the sleeve G, connected with said legs F', and the screw-rod H, connected with the sleeve G, said parts being arranged for co-operation as described, for the purpose specified.

297,214. METALLIC LAMP-MAT. THEODORE F. WOOD, Vernon, N. J. Filed Mar. 3, 1884. (No model.)



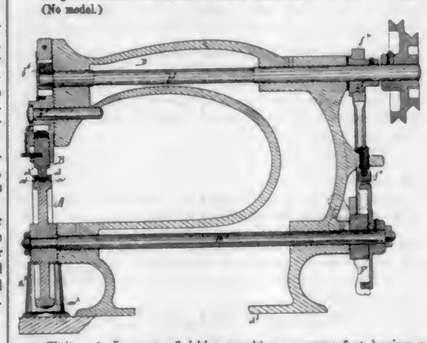
Claim.—1. The metallic lamp-mat, in combination with a wire clamp to secure the mat to a lamp-foot, substantially as shown and described.

2. The metallic lamp-mat in combination with a clamp to secure it to a lamp-foot, and springs to secure a removable pad, D, inside the mat, as and for the purpose set forth.

3. The metallic lamp-mat provided with a clamp to secure it to the lamp-foot, and with the pads D and D' secured inside and outside of its bottom, as and for the purpose set forth.

4. The combination, with the metallic lamp-mat having a clamp to secure it to a lamp-foot, of the match-boxes E, substantially as and for the purpose set forth.

297,215. KITE. WILLIAM C. WOOD, New York, N. Y. Filed Oct. 2, 1883. (No model.)

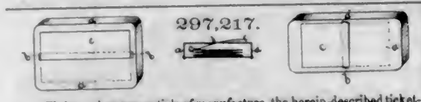


Claim.—1. A kite-frame consisting of a series of transverse and substantially parallel bars, and a series of distending-bars pivoted together at their ends and intermediately to the transverse bars, substantially as shown and described, whereby the frame is adapted to be folded together, or distended for use.

2. A kite composed of a folding frame consisting of a series of transverse and substantially parallel bars, and a series of distending-bars pivoted together at their ends and intermediately to the transverse bars, substantially as shown and described, means for holding the frame in distended position, and a covering of paper or other fabric, as and for the purpose described.

3. A kite-frame composed of a series of transverse and substantially parallel bars, a series of distending-bars pivoted together at their ends and intermediately to the transverse bars, a string or cord at each side of the frame secured to the transverse bars and extending from end to end of the kite, and means for holding the frame in distended position, all as and for the purpose described.

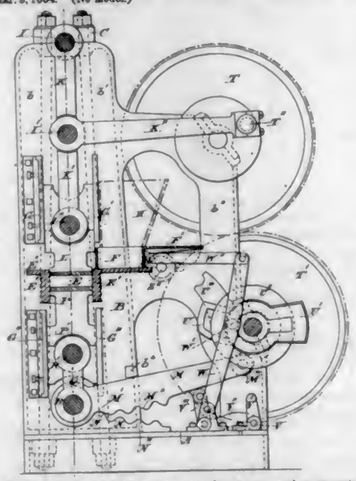
297,216. SEAM-FINISHING MACHINE. CHAS. WOODMAN, Chelsea, assignor of one-half to Charles S. Fifield, Boston, Mass. Filed Jan. 7, 1884. (No model.)



Claim.—1. In a seam-finishing machine, a presser-foot having a groove to receive and guide the seam, and two pressers, *d d'*, in combination with a rubbing-tool adapted to reciprocate between the two pressers, and a support for the stock or material, substantially as set forth.

2. In a seam-finishing machine, a rubbing-tool having two working-faces, one above the other, the higher face being located to act first on the seam, in combination with a presser-foot and support for the material, substantially as and for the purpose set forth.

3. In a machine for finishing a welted seam, a welt-trimming knife adjustable on its support, as described, and having its support detachably connected, in combination with seam-supporting devices, substantially as and for the purpose set forth.



4. The improved seam-finishing machine hereinbefore described, consisting of the support, the double presser-foot, and the reciprocating tool for rubbing the seam, all arranged and combined substantially as set forth.

297,217. CASE FOR TICKETS. PHILIPS ABBOTT, Brooklyn, N. Y. Filed Feb. 12, 1884. (No model.)

Claim.—As a new article of manufacture, the herein-described ticket-holder, consisting of a box or case having a ticket-delivery slot or passage formed in the top or bottom thereof and substantially midway between those edges of the face which are parallel with said slot, whereby said case may hold a strip of tickets folded in zigzag form, with one-half of the ticket on the extremity of said strip projecting from said slot to facilitate its extraction, said projecting half being held substantially parallel with the surface of the case and contained within the boundaries thereof, as set forth.

297,218. BRICK-MACHINE. WILLIAM ANDRUS, Keokuk, Iowa. Filed Mar. 3, 1884. (No model.)

Claim.—1. In a brick-machine, one lever arranged to operate one or more brick-pressing plungers, and combined with a cam having in its circuit portions arranged to act upon such single lever and give through it to the plungers a series of actions to compress the brick, to move the brick slowly in the molds, to push the brick out of the molds, to hold the brick out of the molds for removal, and to draw the plungers back to the bottom of the molds again.

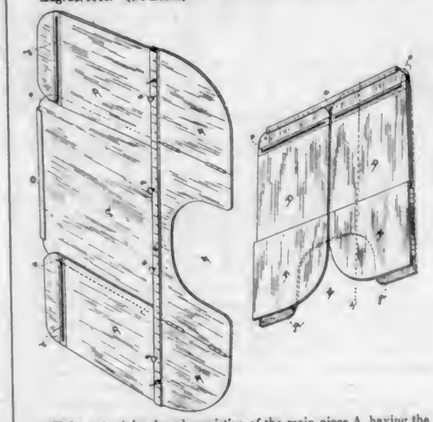
2. In a brick-machine, a lever arranged to operate one or more brick-pressing plungers, and provided with two or more fulcrums arranged for alternate action—one for use in pressing the brick, and one or more for pushing the brick out of the molds—and located nearer to the first or driving end of the lever.

3. In a brick-machine, the lever M, arranged to operate two or more plungers to compress the brick, and provided with fulcrums M' M'' between the driving and driven pivots, for use in alternate or serial order.

4. In a brick-machine, the combination of means to operate opposing sets of plungers to press the brick, such means consisting of a crank, pitman, and knuckle-jointed parts to operate one set of plungers, and of a cam and lever to operate the other set, the whole arranged to press the brick, and then by the same lever to push them out of the molds.

5. In a brick-machine having two wheels, T T', driven alike, for operating opposing sets of pressing-plungers, the combination of a crank and pitman and knuckle-jointed parts connecting from one wheel to one set of plungers, with a cam and lever connecting from the other wheel to the other set of plungers, the whole arranged so the cam and single lever will act both to compress the brick and then push them out of the molds.

6. The combination of the lever M, provided with two fulcrums for alternate use, and parts R Q R', with the knuckle-jointed parts arranged to operate opposing sets of plungers for compressing the brick.



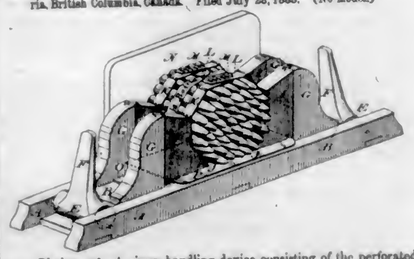
7. The combination of the lever M, provided with two fulcrums for alternate use, and parts R Q R', with the knuckle-jointed parts arranged to operate opposing sets of plungers, and so that the several joints between the joints I R will come into one straight line at the point of greatest pressure on the brick.

8. The improved process of making brick which consists in filling molds with pulverized clay and compressing it by opposing plungers moving together, then releasing the brick from pressure, and while so released moving them in the molds, then re-pressing the brick with a greater pressure than at first before discharging them from the molds.

9. The rock-shaft V, with its two arms, V' V'', combined with operating part U''', and arranged to move lever M to draw down the lower plungers.

10. In a brick-machine, the combination of mold filler-box F with its covered slideways and bent supporting-hangers, arranged substantially as and for the purpose set forth.

297,219. LAP-BOARD. ADAM L. ANTHONY, Placerville, Cal. Filed Aug. 22, 1883. (No model.)

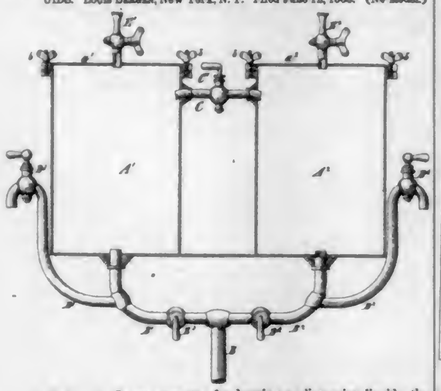


Claim.—1. A lap-board consisting of the main piece A, having the cut-out portion E, the corner-pieces B B, hinged thereto and adapted to be folded thereon, and the side leaves, D D, sliding upon the corner and main pieces, substantially as herein described.

2. The main piece A, having the upper and lower ways or guides, c and *a*, and the hinged lower corners, B B, having ways or guides *b*, continuing the line of guide *a*, in combination with the side leaves, D D, sliding in guides *b*, *c*, and *a*, arranged and operating substantially as herein described.

3. The main piece A, having upper and lower ways or guides, c and *a*, and the hinged lower corners, B B, having ways or guides *b*, continuing the line of guides *a*, in combination with the side leaves, D D, sliding in guides *b*, *c*, and *a*, and the means for directing and limiting their extension, consisting of the slots *d d'* in said side leaves, and the pins *e* in the main piece A, fitting through said slots, all arranged and operating substantially as herein described.

297,220. CIGAR-BUNDLING MACHINE. HENRY F. BEHNSEN, Victoria, British Columbia, Canada. Filed July 28, 1883. (No model.)



Claim.—1. A cigar-bundling device consisting of the perforated standards G, mounted upon horizontally-moving blocks B, and a means for causing them to approach to and recede from each other, consisting of the eccentric E, having a lever-arm, F, and spring D, coiled around the rod C, in combination with plates K and L, hinged to the tops of said standards, and hooks or latches, by which they may be united to hold the bundle while being compressed, substantially as herein described.

2. In a cigar-bundling device, the base A, provided with slots, and the slides B, perforated longitudinally, in which is supported central rod, C, having a spiral spring, D, whereby the blocks are forced apart, in

combination with the eccentric E, having the handle F, the perforated standards G, pin H, secured to the inwardly-beveled pieces I, provided with the inwardly-inclined extension J, the hinged jointed plates K and L, provided with hooks and notches, and the gage or stop plate N, all substantially as shown, and for the purposes described.

297,221. APPARATUS FOR DISPENSING AND DRAWING LIQUIDS. LOUIS BERGER, New York, N.Y. Filed June 12, 1883. (No model.)

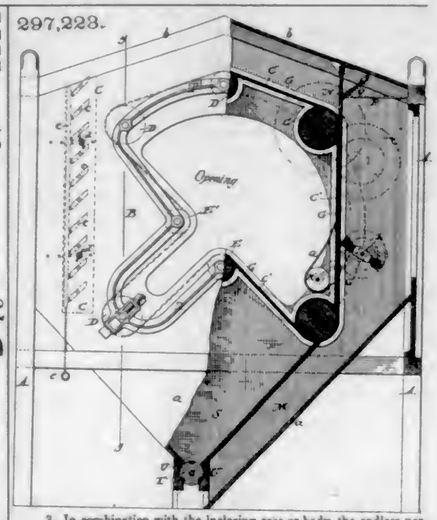
Claim.—1. In an apparatus for drawing or dispensing liquids, the combination of two vessel or compartments, pipes leading to the vessels or compartments from a receptacle containing the liquid, a pipe or passage establishing communication between the two vessels or compartments, and provided with a valve or cock, and vents or gas-escapes in the upper part of the vessels or compartments, substantially as specified.

2. In an apparatus for drawing or dispensing liquids, the combination of the vessels A′ A², pipes B′ B², provided with cocks B³ B⁴, the pipe C, provided with the cock C′, the pipes D′ D², provided with cocks or faucets D³ D⁴, and the vents or gas-escapes E′ E², substantially as specified.

297,222. TRANSPOSITION KEY-BOARD FOR MUSICAL INSTRUMENTS. WILLIAM BOHRER, Montreal, Quebec, Canada, assignor to Walter Richard Elmesherst, same place. Filed Sept. 29, 1883. (No model.)

Claim.—1. In a transposition key-board, the combination of a stationary frame set over the key-board of the piano or organ, and carrying pins or bolts corresponding to the keys of the same, and a sliding-frame carrying keys acting, when struck, through said transmitting-pins in the stationary frame upon the keys of the key-board proper, all substantially as herein set forth, and for the purposes described.

2. In a transposition key-board, a bar carried in a frame separate from the key-board proper and set over it, said bar having even and level upper surface and carrying transmitting-pins normally not in contact with the keys of the sliding frame, all substantially as herein set forth, and for the purposes described.



3. In a transposition key-board, the combination, with a rigid frame set over the same and separable therefrom, in which is carried intermediate transmitting mechanism, of a sliding bank of keys pivoted to a back piece or pieces attached to rear of such stationary frame, as and for the purposes set forth.

297,223. DUST-ARRESTING MACHINE. JOHN S. BRANDSTARTER, Liverpool, County of Lancaster, England. Filed Mar. 21, 1883. (No model.) Patented in England Nov. 17, 1882, No. 5,367, and in France Nov. 13, 1882, No. 152,136.

Claim.—1. In an air-purifying or dust-arresting machine, the combination of the endless belt of pervious material, a series of rolls sustaining the same, an inclosing case or body, and elastic packing closing the space between the edges of the belt and the interior surface of the body, substantially as described, whereby the leakage of air past the edges of the belt is prevented.

2. In a dust-arresting machine, the combination of an external case or body, an internal endless belt of pervious material, and flanges or ribs applied to the inner surface of the body and embracing the edges of the belt.

297,223.

3. In combination with the inclosing case or body, the endless pervious belt, flanges, or guides, between which the edges of the belt are carried, driving-chains applied to the edges of the belt, and elastic packing applied to the guides and acting against the belt, substantially as described, whereby the edges of the belt are carried uniformly and positively and the leakage of air past them prevented.

4. In a dust-arresting machine, an endless belt of pervious material, combined with a series of sustaining-rolls, the central roll at the upper end being located at a greater elevation than its companions, whereby the upper surface of the belt is given a downward inclination in both directions, as and for the purpose described.

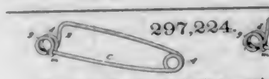
5. In a dust-arresting machine, the combination of the endless belt of pervious material, the two external rolls, and the five internal rolls, arranged in the relative position described and shown.

6. In a dust-arresting machine, the combination of the endless pervious belt of flexible material, the receiver Q, having at its lower edge a scraper to act upon the belt, and the conveyer R, arranged as described, whereby the material adhering to the inner surface of the belt is detached and removed from the machine.

7. The external body or casing, in combination with the endless pervious belt, the spout M, to receive material from the rear side of said belt, and a valve, N, closing communication between said spout and the front of the apparatus.

8. In a dust-arresting machine, the combination of the external body, the internal endless pervious belt arranged to permit the passage of air from its exterior surface inward, and the rotary brush, arranged, as described, to act upon the exterior surface of the belt, and a chamber closed from communication with the inflowing air.

9. In combination with the body, the endless belt, and the supporting-rolls, the flanges or guides attached to the inside of the body, and following the inner surface of the pervious belt, and encircling the sustaining rolls or polleys, in the manner described and shown.

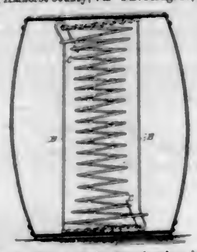


10. In a dust-arresting machine, the combination of the external case or body provided with openings in its sides, the internal belt encircling said opening, the belt-sustaining rolls, and external metallic frames, T′, each constructed complete of one piece, and applied to the outside of the body to sustain the journals of all the rolls on that side of the machine.

11. In a dust-arresting machine embracing an exterior case or body and an internal screen, a frame located in the mouth or inlet of said chamber and provided with a series of blades or deflectors, said frame being arranged and combined with means, substantially as described, adapted to permit its adjustment to different positions, whereby the series of deflectors, as a whole, may be adjusted to suit the different directions from which the air may enter the machine.

12. In a dust-arresting machine, the endless pervious belt and driving-chains attached to its edges, in combination with the supporting-roll, and with the sprocket-wheels concentric with said roll, the wheels having their pitch-lines outside of or beyond the periphery of the roll, as and for the purpose described.

297,224. SAFETY-PIN. WM. J. BROADBENT, Belleville, N.J. Filed May 19, 1883. (No model.)

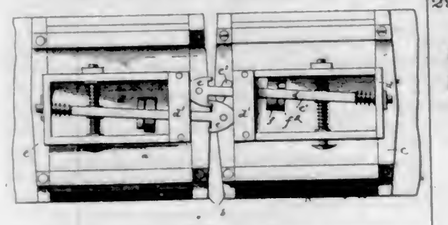


297,224.

Claim.—1. A safety-pin having a catch composed of two rings or coils, and a connecting portion, substantially as described, forming a bearing or rest on the rear of the coil for the pin when locked, and so formed that the point of the pin, when locked, will lie between two rings and be protected thereby, as set forth.

2. In a safety-pin, the combination of the part B, bent at right angles near its end, and then bent into two rings or coils side by side, and with the connecting bearing or rest *m* on the rear of the coil, a spring, A, and a pointed portion, C, adapted to be received between the said rings and locked in position by the bearing or rest *m*, as described.

297,225. VENTILATION OF BARRELS AND BOXES. JAMES WILLIAM BROOK, Amherst County, Va. Filed Aug. 17, 1883. (No model.)



Claim.—1. The combination of a barrel or box in which some perishable article is to be packed with a spring which is placed therein, to allow air to circulate freely through the article, substantially as shown.

2. The combination of a barrel or box to be used in the packing of perishable articles with the spring which is placed therein, the ends of the spring being enlarged, substantially as described.

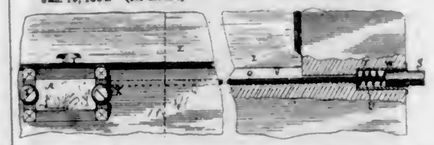
3. A coil to be used for the purpose specified, provided with large coils or circles at the ends, and provided with hooks or guards to prevent the coil from being extended too much, substantially as set forth.

297,226. CAR-COUPLING. DAVID BROWER and JAMES DUNLAP, Bowerston, Ohio. Filed Feb. 28, 1884. (No model.)

Claim.—1. In an automatic car-coupling, the combination, with the supporting-frame, of the laterally-operating coupling-head provided with the pivoted shifter-block and operating-wheel on the same shaft, the tension-spring, and mechanism for operating the same, substantially as specified.

2. In an automatic car-coupling, the combination, with the framing having the transverse bolt provided with coil-springs and washers, and the elongated slot in the rear piece of said framing, of the coupling-head having the arrow-head, the enlarged portion provided with the rectangular slots in which work the pivoted shifter-block and the operating-wheel on opposite ends of the same shaft, the shouldered stem, the coiled spring between the shoulder and the rear piece of the framing, the pin and washer for holding the head in place, and the chain and hand-wheel for operating the parts, substantially as specified.

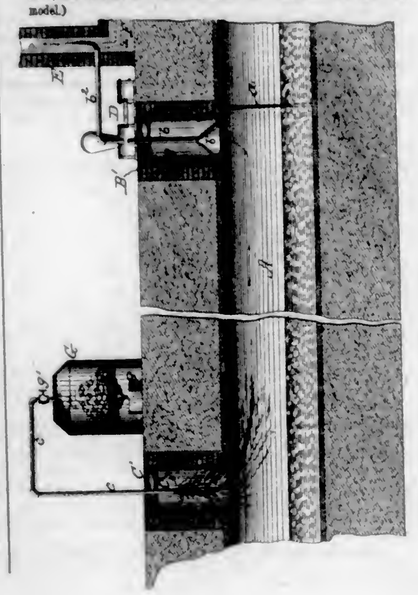
3. In a car-coupling, the combination, with framing having the rear piece slotted rectangularly for the reception of the rear end of the coupling-head, and the transverse bolt passed through the sides of the framing and through the coupling-head, of the coupling-head provided with the arrow-head, the enlarged portion provided with the pivoted shifter-block and the operating-wheel on the same shaft therewith, at the opposite end thereof, the tension-spring for controlling the wheel and the chain leading therefrom, and mechanism for operating the same, substantially as specified.



297,227. LEVELING AND PLUMBING INSTRUMENT. OLIVER H. P. BROWN, Clarksville, Ark. Filed Mar. 1, 1884. (No model.)

Claim.—1. In a combined plumb and level, the combination of set-screw *g*, working in threaded plate *h*, secured on the back of cup *b*, and bearing in its jewel *j* the lower end of pivot *e*, with set-screw *i*, working in a female screw in frame *d*, and bearing in its jewel *j* the upper end of pivot *e*, both adapted to work together, all substantially as shown, and for the purposes set forth.

2. In a combined plumb and level, the combination of set-screw *g*, working in threaded plate *h*, secured on the back of cup *b*, and bearing in its upper end the lower end of pivot *e*, with set-screw *i*, working in a female screw in frame *d*, and bearing in its lower end the upper end of pivot *e*, and face *c*, set in the bottom of cup *b*, weighted plumb *f*, and its finger, all substantially as shown and described, and for the purposes set forth.

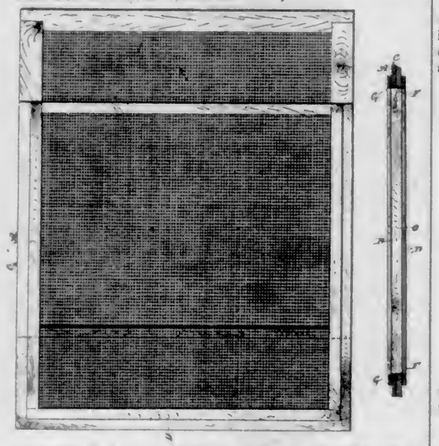


297,228. SASH-FASTENER. FRANCIS M. CASE, Denver, Colo. Filed Jan. 19, 1884. (No model.)

Claim.—1. In a window-fastening, a bell-crank, F, working on a fulcrum, B, a two-armed slide, D, arranged immediately over the fulcrum B, and having one of its arms engaging with the bell-crank F, in combination with a bolt, also engaging with the bell-crank, substantially as and for the purposes described.

2. In a window-fastening, a slide, D, having thumb-piece E, and a long and a short arm, the bell-crank F, having a stud, H, on which the short arm of the slide rests, and turning on a pivot arranged centrally under the slide, and a bolt connected to said bell-crank, in combination with a casing forming, with one of its sides and the central pivot, a guide for the slide, substantially as described.

297,229. DISINFECTING SEWERS. EDWARD Z. COLLINGS, Camden, N. J., and CHARLES F. PIKE, Philadelphia, Pa. Filed Mar. 12, 1883. (No model.)

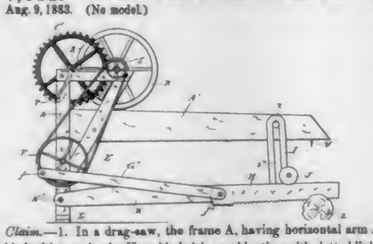


Claim.—1. The combination, with a sewer having man-holes, of a disinfecting apparatus consisting of a generator having a pipe extending into one man-hole, and a pump or exhaust placed at the other man-hole, substantially as described.

2. The combination, with a sewer having man-holes and a plate, *a*, of a disinfecting apparatus consisting of a generator having a pipe extending into the man-hole, and a pump or exhaust placed at the other man-hole, substantially as described.

3. In combination with a sewer, a gas-generator and suction appliances having pipe *b*, with flaring end *b'*, substantially as shown and described.

297,230. WINDOW-SCREEN. HOUSTON KENTON COTTON, Mount Vernon, Ohio. Filed Oct. 15, 1883. (No model.)

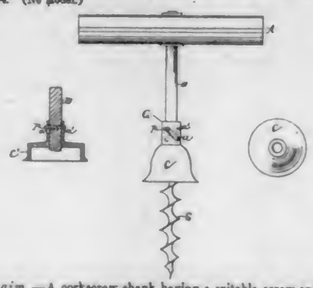


Brief.—An extensible window-screen formed of two parts, having metallic clips sliding in grooves and holding the two frames together, and having a barb projecting from the upper edge of the stationary part, which holds the frame in the window.

Claim.—1. The combination, in a screen, of the stationary part A, provided with the flange O at one end, and with a sharp point or projection upon its upper edge, for catching in the sash, with the movable part D, and the slides F, which are applied to the inner edges of the frames, so as not to interfere with the movement of the part D, the upper edge of which is beveled away, substantially as shown and described.

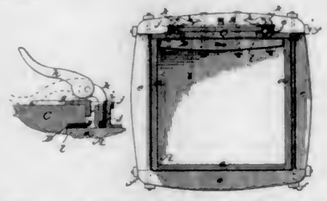
2. The combination, in a screen, of stationary part A, provided with the sharp points C, to engage with the sash or sill, and the movable part D, constructed and operating substantially as described.

297,231. DRAG-SAW. FRANK A. CRAWSHAW, Willshire, Ohio. Filed Aug. 9, 1883. (No model.)



Claim.—1. In a drag-saw, the frame A, having horizontal arm A', provided with metal point U, and bolt *i*, in combination with slotted link I, pin I', pivoted arm K, and slide M, having vertical arm M', adapted to support the friction-roller J, as described, and for the purposes set forth.

2. In a drag-saw, the frame A A', spur-wheels C and Q, shaft B', fly-wheel B, pulley S, belt E, pulley F, and oscillating arm K, having slide M, provided with arm M', adapted to support friction-wheel J, in combination with pitman G, slide N, and saw H, as described, and for the purposes set forth.



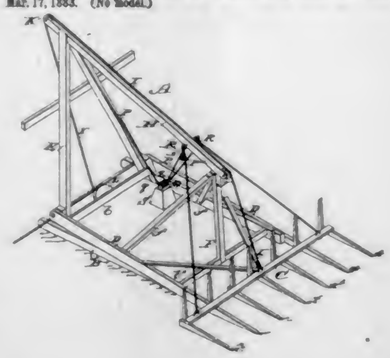
3. In a drag-saw, the slide M, having arm M', friction-roller J, slotted link I, and bolt *i*, in combination with slide N and saw H, as shown and described, and for the purposes set forth.

297,232. CORKSCREW. THOMAS CURLEY, Troy, N. Y. Filed Feb. 21, 1884. (No model.)

Claim.—A corkscrew-shank having a suitable screw and handle, and provided with a projecting stop, P, in combination with cap C, having a sleeve, G, adapted to loosely fit said shank, and provided with one or more slots or grooves, *a a'*, adapted to receive said stop, substantially as described, and for the purposes set forth.

297,233. CHURN. DAVID W. CURTIS, Fort Atkinson, Wis., assignor of one-half to Oscar S. Cornish, same place. Filed Aug. 1, 1883. (No model.)

Claim.—1. In combination with a churn-body and a cover applied thereto, an eccentric clamping-lever pivoted directly to an adjustable threaded stem, substantially as shown.

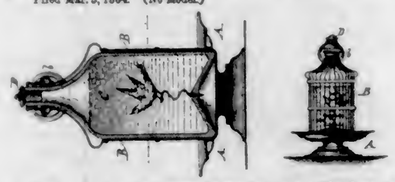


2. In combination with a churn-body, A, and a cover, C, applied thereto, adjustable clamping devices consisting of threaded sockets *j*, secured to the body, threaded stems *k*, screwed into said sockets, and eccentric levers *k*, pivoted directly to the stems *k*, substantially as shown.

3. The herein-described churn-body A, provided with opening *l*, outside braces or cross-bars, *e*, and inside braces or cross-bars, *m*, substantially as and for the purpose explained.

4. In combination with the churn-body A, the outside braces, *e*, inside braces, *m*, and bolts passing through the inside and the outside braces and the intermediate body, substantially as and for the purpose set forth.

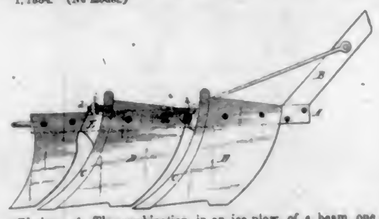
5. In combination with a churn-body having an opening, *l*, cross-braces or supports *m*, applied to the inner face and firmly secured to the side or head in which the opening is made, whereby the side or head is prevented from warping.



297,234. HAY-RICKING DEVICE. REES O. DAVIS, Milan, Mo. Filed Mar. 17, 1883. (No model.)

Claim.—1. The combination, in a hay-ricker, of the base B, the fork C, the arms D D, the uprights E F, the plate H, the rope I, the rope P P' P', the counter-balance S, the sheave Q, and the sheaves R R, substantially as described.

2. The combination, in a hay-ricker, of the base B, the fork C, the arms D D, the uprights E F, the plate H, the rope P P' P', the counter-balance S, and the sheaves Q and R R, substantially as described.



297,235. PERFUMERY-STAND. VINCENT DEKUTH, Brooklyn, N. Y. Filed Mar. 3, 1884. (No model.)

Claim.—1. A perfumery-stand formed of a supporting-base, a detachable wire body, B, a perfumery-bottle supported on the stand inside of the wire body, and means whereby the body is attached to the base, substantially as and for the purpose set forth.

2. The combination of a supporting-base, A, a wire body, B, having an opening in the top part, and a perfumery-bottle supported on the base in the wire body, the neck of said bottle being extended through the open top of the wire body and closed by an ornamental stopper or cap, substantially as set forth.

297,236. ICE-PLOW. HERMAN F. DERNELL, Athens, N. Y. Filed Mar. 1, 1884. (No model.)

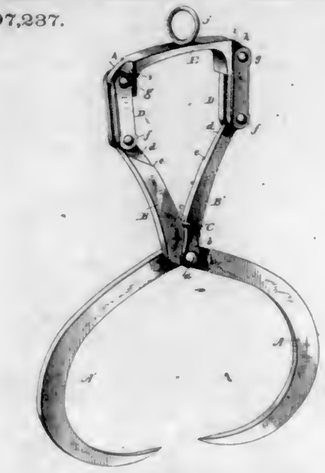
Claim.—1. The combination, in an ice-plow, of a beam, one or more plates or supports, D, connected thereto and having forward curved edges, and cutter-bars C, with bearing-edges conforming to curves slightly greater than the edge bearings upon the supports, substantially as described.

2. The curved cutter-bars having their rear bearings upon the forward edges of supporting-plates having greater curves and secured to the beam, in combination with devices for bending the cutter-bars back against their bearings, substantially as described.

3. The combination of the cutter-bars and supporting-plates, the curve of the edges of the bars differing from that of the edges of the plates, and the bearings of the bars and plates having corresponding grooves and projections, substantially as described

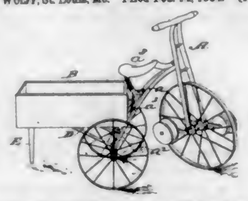
4. The combination of the beam A, differently-curved cutter-bar C, wedge E, and means for forcing the latter between the rear inclined edge of the plate D and the edge of the cutter, substantially as described.

5. The combination of the beam A, plate D, having an inclined rear edge, curved cutter-bar C, wedge arranged between the rear edge of the plate and the adjacent cutter-bar, screw-pin *c* upon the wedge, and nut *d*, substantially as described.



6. The combination of the plate D and bar C, one having a dovetailed edge rib fitting a corresponding groove in the other, substantially as described.

297,237. ICE-TONGS. JOHN S. DOLLINGER, Covington, Ohio. Filed Mar. 15, 1884. (No model.)

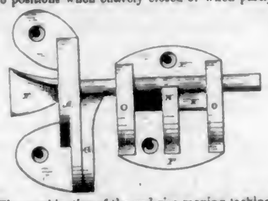


Claim.—1. The combination, in an ice-tongs or grapple, of jaws pivoted together by a pivot-bolt, *a*, and a yoke secured by said pivot-bolt and interposed between the extensions of said jaws above said pivot-bolt, substantially as and for the purpose set forth.

2. The combination, in an ice-tongs or grapple, of jaws pivoted together by a pivot-bolt, a yoke secured by said pivot-bolt, and interposed between extensions of the jaws above said pivot-bolt, the upper end of said extensions shouldered and tongued, a horizontal yoke shouldered and tongued, and connecting-links pivotally attached to said tongues and limited in their movement by said shoulders, substantially as set forth.

297,237.

297,238. VELOCIPEDE ATTACHMENT. FREDERICK J. W. DOPP and GEORGE WOLFF, St. Louis, Mo. Filed Feb. 14, 1884. (No model.)



Claim.—1. The combination, substantially as described, of the velocipede A, the detachable seat B, and the hinged leg F.

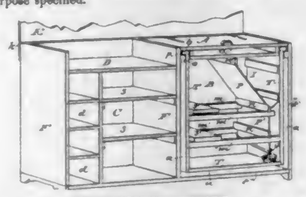
2. The combination of the velocipede A, the seat B, and the leg E.

3. The combination, as described, of the velocipede A, having the rods *a' a'*, with the detachable seat having the hook C and braces D D.

297,239. LOCK FOR SLIDING DOORS. JAMES HENRY DOUGHERTY, Whistler, Ala. Filed Apr. 30, 1883. (Model.)

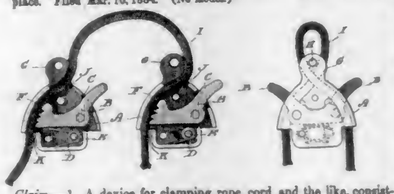
Brief.—By the construction claimed a sliding door may be locked in either of two positions when entirely closed or when partly open.

Claim.—The combination of the endwise-moving locking-bolt, provided with the locking-arm G, and the projection H, with the locking-frame A, and the support having a flange upon each of its edges, and a central flange, in between which flanges the projection H is made to catch, substantially as described.



297,240. CUPBOARD. ALONZO DOW and LEWIS H. GORHAM, Wooster, Ohio. Filed Mar. 10, 1884. (No model.)

Claim.—1. In a cupboard, the combination, with the box B, open at the top, having lid A and supporting-strip *c*, of the removable inner box, T, provided with marginal rim *b*, forming with the box B the continuous dead-air space *a*, with the double wall, substantially as shown and described, and for the purpose specified.

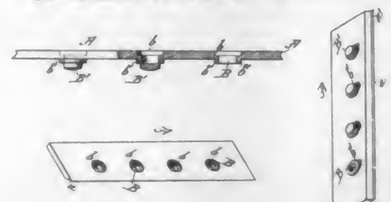


2. In combination with the inner box, T, the detachable ice-pan P, with condensing-sheet P', supporting-strips *m n*, and shelves *s'*, substantially as set forth.

3. In combination with the cupboard C and box B, the detachable shelves, constructed as shown—to wit, with back board E, double brackets *g*, and shelf H, the back board E arranged to form, with the brackets *g* and shelf H, the supporting-angles K and K', respectively, substantially as set forth.

4. In a cupboard, the combination, with cupboard-apartment C, of the refrigerator-apartment B, constructed as shown and described, and the detachable shelves provided with back board E, double brackets *g*, and supporting-angles K K', substantially as shown and described, and for the purpose specified.

297,241. CLAMP FOR ROPES, CORDS, &c. FREDERICK EGGE, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed Mar. 10, 1884. (No model.)

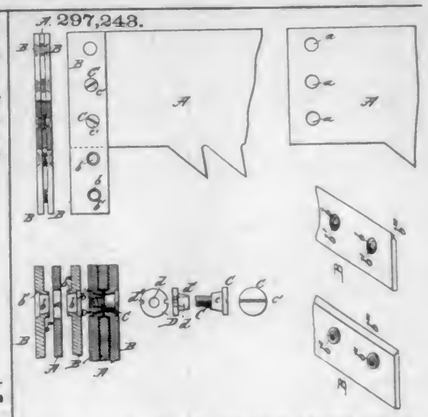


Claim.—1. A device for clamping rope, cord, and the like, consisting of two shells having pivoted therein spring-pawls, with heel ends projecting outwardly therefrom, said shells being provided with openings, as described, and having a pin or post between their forward portions, whereby the cord may be introduced from opposite sides of said post through said openings, and between the pawls and the sides of the shells, substantially as described.

2. In a clamp for cord, rope, and the like, the shells having pivoted therein pawls B, with their heel ends projecting through openings C in the shells, and with springs D, bearing against the lower portions of the pawls, said shells being provided with openings J K, for the passage of the cord, and with post H between their forward portions, substantially as set forth.

3. In a clamp for cord, rope, &c., the pawls arranged within the shells—one above the other—and adapted to secure the cords at opposite sides of the clamp, whereby said cord may be crossed and passed through the clamp without any abrupt bend, substantially as described.

297,242. TAB-PLATE FOR SAWS. JAS. E. EMERSON, Beaver Falls, Pa. Filed Mar. 10, 1884. (No model.)

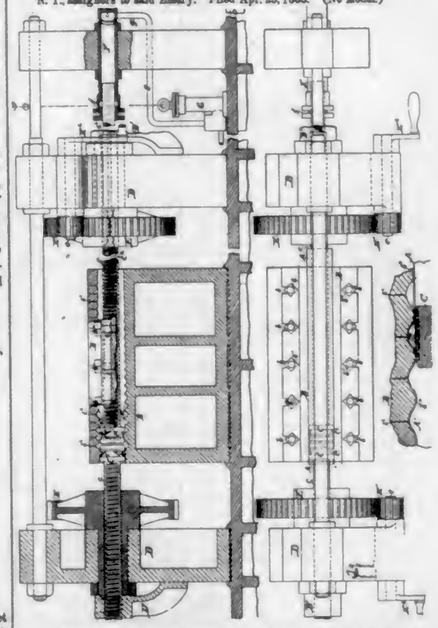


Claim.—The tab-plates A, as an article of manufacture, having rivet or screw holes B, countersinks *b*, inwardly-projecting flanges or rings *b'*, and beveled edge *a*, substantially as described.

297,243. SAW-TAB. JAS. E. EMERSON, Beaver Falls, Pa. Filed Mar. 10, 1884. (No model.)

Claim.—1. The tab-plates B B, having bolt-holes *b*, countersinks *b'*, inwardly-projecting flanges or rings *b''*, and beveled edges *b'''*, in combination with a saw-plate, A, substantially as and for the purposes described.

2. The combination of tab-plates B, having inwardly-projecting flanges *b''*, with a saw-plate, A, having holes *a* of such size that they



297,243.

fit over and around the flanges *b''*, which flanges alone receive and support the strain of the saw, substantially as described.

3. The combination of the screw-bolt C, having the neck *c*, and headed screw-nut D, having neck *d'*, with the tab-plates B, having holes *b* and the inwardly-projecting flanges *b''*, substantially as described.

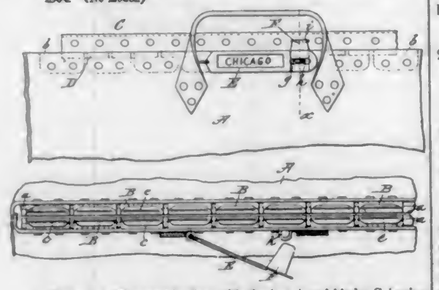
297,244. METHOD OF AND APPARATUS FOR CORRUGATING TUBES. CHARLES E. EMERY, Brooklyn, and A. HENRY GENTNER, New York, N. Y., assignors to said Emery. Filed Apr. 25, 1883. (No model.)

Claim.—1. The method described of giving a desired form to metallic tubes, which consists in inclosing the tubes in a proper former, and then applying hydraulic pressure to the interior of successive sections of said tubes, as herein specified.

2. The method described of producing corrugations in tubes, which consists in inclosing the same in a former, and then applying hydraulic pressure to the interior of the successive lengths of such tubes, and allowing the uncorrugated portion to be drawn longitudinally to supply the material for the corrugations successively, as set forth.

3. As an apparatus for annularly corrugating tubes, the divisible form B *b*, and the removable fastenings *b'*, pistons C, operated singly or

together, to increase or diminish the capacity of the chamber, the pump G, for inducing a strong hydraulic pressure, and a passage, c^3, for conducting the water under pressure to the interior of the tube, all combined and arranged for joint operation, substantially as and for the purposes herein specified.



4. The divisible form B, having internal annular corrugations diminishing in depth toward one end, in combination with pistons C, operated singly or together, to increase or diminish the capacity of the chamber, means for introducing water under pressure, and means for inducing the gradual retreat of a piston C, all arranged to serve as herein specified.

5. The form B, having annular corrugations and vent-holes b^3, in combination with means for introducing hydraulic pressure in the interior of an inclosed tube, and pistons C, fitting tightly within the tube and operated singly or together to increase or diminish the capacity of the chamber, all substantially as and for the purposes herein specified.

6. The divisible form B *b*, with suitable fastenings therefor, the pump G, sleeve F, having stuffing-box *f*, the pistons C, operated singly or together to increase or diminish the capacity of the chamber, and gears E E', for moving the pistons, all combined and arranged to operate substantially as herein specified.

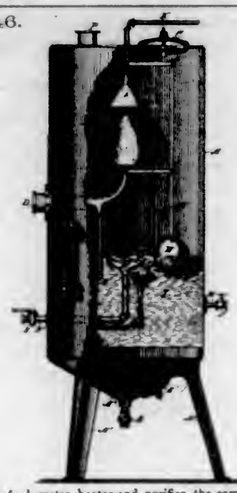
7. In a machine for shaping tubes, the duplicate pistons C, and means for introducing and operating them, in combination with a divided form, B, and suitable fastenings, means for introducing hydraulic pressure in the space between the pistons, and means for allowing the pistons to move apart while the pressure is on, all substantially as and for the purposes herein specified.

297,245. MAIL-BAG FASTENING. MARTIN V. B. ETHERIDGE, Boston, assignor of one-half to Henry E. Waite, Newton, Mass. Filed Mar. 10, 1884. (No model.)

Claim.—1. The combination, with the bag A and binder C, having slot *i*, of the hasp E, provided with a lug, F, for entering said slot, and means for securing the hasp, substantially as described.

2. The combination, with the bag A, having strips *a a* within its mouth, and flanged locking-ways B B, attached thereto, the mouth of the bag being extended above said strips to cover the sides of the locking-ways, of a flexible binder, C, having hood *f* and locking-ways D D, substantially as described.

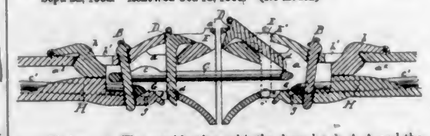
3. The combination, with the bag A, having strips *a a*, secured within its mouth, of the flanged locking-ways B B, supported by said strips and provided with lips *c c* and swells *e e*, and the flexible binder C, having locking-ways D D, substantially as described.



4. The combination, with a mail-bag having flanged locking ways or plates B B and staple A, and a binder, C, provided with flanged locking-plates D D and slot *i*, of the hasp and tag-holder E, having slot *g* and lug F, and means for securing the hasp, substantially as described.

297,246. FEED-WATER HEATER. ROLAND G. EWER, Brooklyn, N. Y., assignor to Ella L. Ewer, same place. Filed Sept. 27, 1883. (No model.)

Claim.—1. A feed-water heater and purifier constructed substantially as herein shown and described, consisting of shell A, provided with blow-off cock and man-holes, upward-curving bell-mouthed steam-pipe D, water-supply pipe K, provided with conical nozzle and water-distributer, water-pipe valve adapted to be adjusted by connection with a ball-float, float H, and valve-connecting rods, skimming-pan and pipe, and hot-water-delivery pipe, all arranged and operating substantially as set forth.



2. In a feed-water heater and purifier, the combination, with the steam-pipe D, having a bell-mouth opening upward in the vertical axis of the heater, of the water-pipe K, having a conical nozzle opening downward over the mouth of the said steam-pipe, substantially as herein shown and described, whereby the steam and the supply-water may be brought into more intimate contact, as set forth.

297,246.

3. In a feed-water heater and purifier, the combination, with the steam-pipe D and water-pipe K, opening opposite each other, of the drop-pipe D', substantially as and for the purpose described.

297,247. CAR-COUPLING. GEORGE FORBES, New York, N. Y. Filed Sept. 22, 1883. Renewed Oct. 13, 1883. (No model.)

Claim.—1. The combination, with the draw-heads A A and the sharp-pointed coupling-link C, weighted at the inner end, so as to adapt it to remain in a horizontal position while in the act of coupling, of the L-shaped loose gravitating catch-block D, the pin or widened part *d*, and of the peculiar-shaped openings E *e* and the shoulders E' *a'*, adapted to sustain the catch-block D and to cause it to be automatically lifted from its normal position and its upper end slid forward and downward along the bed or bearing formed by the slot E when acted upon by the coupling-link C, and they are also adapted to prevent the catch-block D from falling out of the draw-head, substantially as described.

2. The combination, with the draw-head A and with the interior chamber a^2 and weighted reserve link C', of the inclined groove G, adapted to allow the forward end of the link C' to sink flush with the bottom of the interior chamber of the draw-head, and of the cushion F, whereby the rear end of the link is elevated, substantially as described.

3. The combination, with the draw-head A and with the interior chamber a^2 and weighted reserve link C', of the inclined groove G, adapted to allow the forward end of the link C' to sink flush with the bottom of the interior chamber of the draw-head, of the stay H and openings *g*, and of the cushion F, as and for purpose specified.

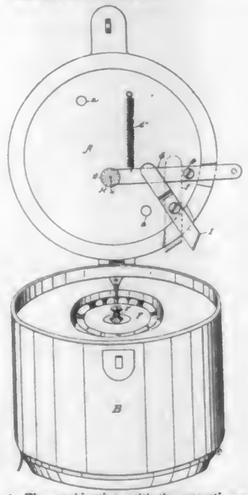
4. The combination, with the draw-head A and with the interior chamber a^2 and weighted reserve link C', of the inclined groove G, adapted to allow the forward end of the link C' to sink flush with the bottom of the interior chamber of the draw-head, of the stay H, pivoted block *h*, and slot *h'*, substantially as described.

5. In a draw-head, A, the combination, with the forward interior chamber *a* and rear chamber a^2 and reserve link C', of the stay H and pivoted block *h*, forming a closed partition between the chambers *a* and a^2, being thereby adapted to prevent a link from entering too far and to allow the reserve link C' to be withdrawn, as described.

6. The combination, with a draw-head, of the pivoted block or stay *h* and the slot *h'*, substantially as and for the purpose described.

7. The combination, in a draw-head, A, with a weighted link, C, of the stay H, pivoted block *h*, inclined groove G, reserve link C', and pin B, adapted to prevent any longitudinal movement of the link C, substantially as set forth.

8. The combination, in a draw-head, A, with a chamber, *a*, and loose gravitating catch-block D, and pin *d*, of the slots or openings E and *e*, with widened portions E^2 and e^2 at their entrance into the chamber, as described.



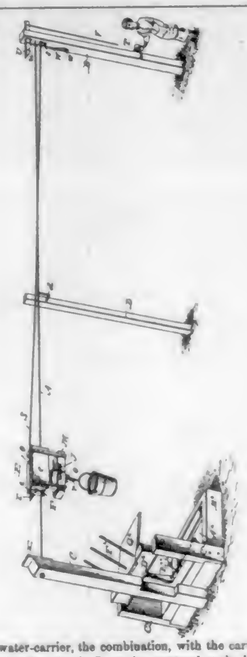
9. The draw-head A, constructed with the interior chambers *a* and *a*², and with a widened open throat, whereby the top of the draw-head is left thick, the sides and bottom being thin, its front face also having beveled edges, as and for the purpose set forth.

10. The combination of the bar N, lever M, brackets O', and plate O, substantially as described.

11. The combination, with the bar N and crank N', of the lever M, brackets O', and plate O, substantially as set forth.

12. The combination, with the draw-head A and loose gravitating catch-block D, of the bar N, chain *n'*, lever M, and eyes *n*, as specified.

297,248. **AUTOMATIC TIME-REGISTER.** GAY. W. FOSTER, New York, N. Y. Filed Feb. 8, 1883. (Model.)



Claim.—1. The combination, with the operating mechanism of a clock or other time-piece, of a recording-dial mounted on the rear end of the hour-hand shaft and revolving therewith, and a lever provided with a pencil-point or marker, so arranged that said point or marker shall rest upon and press against the face of the recording-dial and produce a continuous record thereon of the times and time at which the lever is moved or operated, substantially as shown and described.

2. The combination, with a clock or other time-piece provided with an ordinary dial, and a secondary or recording dial mounted on the rear end of the hour-hand shaft, of a lever, G, provided with marking or indicating means arranged to record continuously upon such secondary dial, and a check or stop lever, I, substantially as and for the purpose set forth.

3. A clock or time-piece provided with a secondary recording-dial mounted as described, a marking-lever so arranged as to continuously record upon the secondary dial, and a check or stop lever, I, in combination with a door-knob or other door-operating means, and suitable connecting mechanism, substantially as and for the purpose set forth.

297,249. **WATER ELEVATOR AND CARRIER.** ROBERT J. FOSTER and JOHN W. COLLIE, Viola, Ark. Filed June 25, 1883. (No model.)

Claim.—1. In a water-carrier, the combination, with the carriage E, of the T-shaped pivoted latch, provided with hooks i i^2 at one end and with a shank, J, curving outward at the bottom, so as to connect with an extension of clasp L, said clasp consisting of two pivoted arms curved to fit around the conical block O, substantially as set forth.

2. In a water-carrier, the combination, with the wire or cable A, the plate *x*, secured to post C, and the latch U, pivoted to post B, and adapted to catch over a notch, *t*, formed in one end of the carriage, of the carriage E, having the T-shaped latch I pivoted therein and provided with hooks i i^2, the shank J, carving outward at the bottom, so as to connect with an extension of clasp L, said clasp consisting of two connected pivoted arms, the frame M, suspended from the carriage and formed with an opening, *m*, the rope S, and conical block O, to which the rope is attached, said parts arranged and operating substantially as shown and described.

3. In a water-carrier, the combination, with the carriage E, of the latch I, formed with a shank, J, carving outward at the bottom, and a clasp fitted within a recess in the lower frame, M, and provided with an extension, *l*, said shank connecting with said extension, as set forth.

297,249.

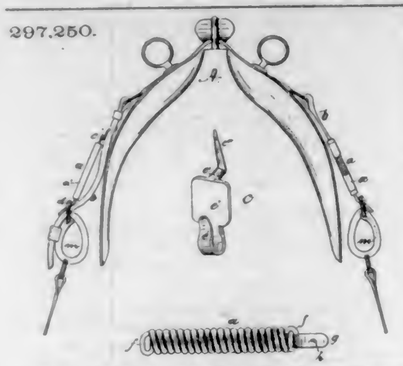
4. In a water-carrier, the combination, with the carriage E, of the latch I, formed with a shank, J, carving outward at the bottom, a clasp, L, fitted within a recess of frame M, and formed of two pivoted arms connected together, one arm being free at one end, and an extension, *l*, formed on one of said arms, said shank connecting with said extension, as set forth.

5. In a water-carrier, the combination, with the carriage E, formed in sections *e e*, of the latch I, working in a groove between the sections, a frame, M, suspended by bars from the carriage and provided with an opening, *m*, a clasp, L, fitted within a recess in said frame and covered by a guide-board, Q, a conical block, O, adapted to pass through the opening *m* in the frame to an opening in the guide-board, and a shank, J, of latch I, connecting with an extension, *l*, of the clasp, for the purpose set forth.

6. In a water-carrier, the combination, with the carriage E, formed with a notch, *t*, and provided with a T-shaped latch pivoted therein, the shank of said latch connecting with a clasp below said carriage, of a latch, U, pivoted to a post near the house, said latch formed with a hook adapted to catch in the notch *t*, and serving by its weight to elevate the T-shaped latch, for the purpose set forth.

7. A latch pivoted to a post near the house, and provided with a hook at one end adapted to catch in a notch, *t*, in the carriage, said latch serving by its weight to elevate a T-shaped latch journaled in the carriage, and thereby release the bucket, as set forth.

8. In a water-carrier, the well-door journaled in a frame above the well or cistern, operating devices connecting with said door, and having an extension and a series of fingers, said extension being operated by the descent of the bucket and the fingers by the ascent of the bucket, as set forth.



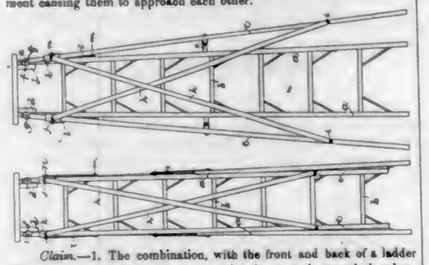
9. In a water-carrier, the combination, with the well-door journaled in a frame above the well or cistern, of a board pivoted to standards erected on said frame, a series of fingers projecting from the board, an extension depending at or about right angles to the said board, and means for connecting the well-door and board together, for the purpose set forth.

10. The combination, with the conical block O, of a clasp for retaining the same, consisting of two pivoted arms connected together, one of said arms being free and the other being connected with the operating mechanism, as set forth.

297,250. **HARNESS-SADDLE.** ALVAH W. FRASER, Newark, N. J. Filed Aug. 15, 1883. (No model.)

Claim.—1. In a harness-saddle, a hook or catching device adapted to receive and hold the spring, said spring *c*, billet *g*, and buckle *d*, all arranged and operating in combination with the back-band *b* and tug-loop *m*, as set forth.

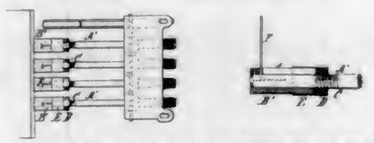
297,250.



2. In combination, the saddle A, back-band *b*, spring *c*, provided with covering *a'*, adjustable support *c*, having the supporting portion *e*, extension *e'*, portion *e''*, and prolongation *e'''*, the billet *g*, buckle *d*, and tug-loop *m*, all arranged and operating in combination as set forth and shown.

3. In a harness-saddle, the combination of the back-bands *b*, tug-loops *m*, and springs *a*, secured at one of their ends to the tug-loops and at their opposite ends to the back-bands, substantially as shown and described.

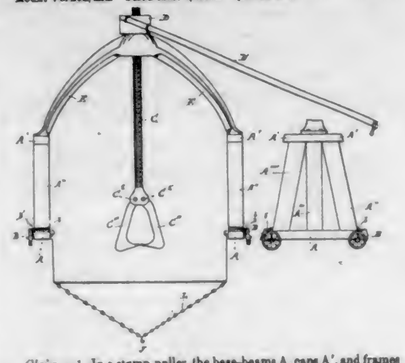
297,251. **LADDER.** CHARLES FREELL, Boston, Mass. Filed Feb. 16, 1884. (No model.)



Brief.—Consists of front and rear standards hinged together at the top, and provided with jointed stay-rods, and mechanism whereby the rear standards are moved apart laterally when closed, a reverse movement causing them to approach each other.

Claim.—1. The combination, with the front and back of a ladder hinged together at the top and adapted to be opened out and closed together, of mechanism constructed and arranged to automatically expand or spread the standards of the back in a lateral direction when opened out from the front, and to automatically contract or draw together said standards when the front and back are closed together, substantially as specified.

2. The combination, with front standards, *a a*, and back standards, *c c*, hinged together and provided with stay-rods *s*, of sleeves *k*, rods *l*, and braces *h*, all arranged to operate substantially as specified.

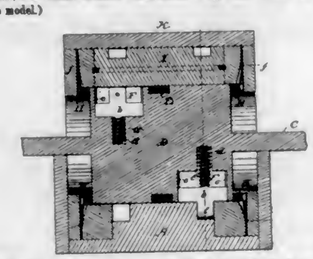


297,252. **STOP-MOTION DEVICE FOR SPOOLING-MACHINES.** JOHN GARNER, Philadelphia, Pa. Filed Mar. 27, 1883. (No model.)

Claim.—1. The combination of the detector-lever A, provided with screw-threads C, with the nut D and india-rubber tube or tip B', substantially as and for the purpose specified.

2. The combination of the india-rubber tube or tip B' and metal sleeve E with the lever A, provided with screw-threads C and nut D, substantially as and for the purpose shown and described.

297,253. **STUMP-PULLER.** GEO. M. GRABERT and THOS. J. DEVORE, Mount Vernon, Ind. Filed Mar. 4, 1884. (No model.)

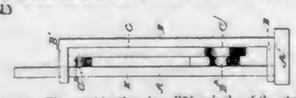


Claim.—1. In a stump-puller, the base-beams A, caps A', and frames A'' A''' A'''', secured to each other by arch-piece E, in combination with screw-rod C, having hooks C''' attached thereto, and nut D, having lever D', as described, and for the purposes set forth.

2. In a stump-puller, in combination with base-pieces A, caps A', frames A'' A''' A'''', arch-piece E, and screw C, having hooks C''', nut D, and lever D', the adjustable wheels B, as described, and for the purposes set forth.

3. In a stump-puller, the combination of base-beams A, having stops H, pawls A, and boxes *b*, with elbow-axles B'' B' and wheels B, substantially as described, and for the purposes set forth.

297,254. **ROTARY ENGINE.** GEORGE L. GRIFFIN, WILLIAM AURELIUS SHOUP, and JAMES ROBERT CADE, Harrisburg, Tex. Filed Dec. 15, 1883. (No model.)



Claim.—1. In a rotary engine, a piston or cylinder formed with a chamber or pocket, F, having one of its walls vertical and the other inclined, in combination with a sliding valve fitted therein and adapted to be thrust outward by means of a spring, substantially as and for the purpose set forth.

2. In a rotary engine, the combination, with the casing formed on its inner periphery with grooves constituting steam-passages, a revolving piston provided with chambers or pockets to which are fitted spring sliding valves and a cut-off with inclined spring-arms, substantially as and for the purpose set forth.

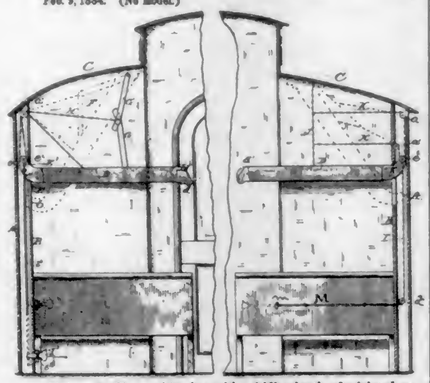
3. The improved rotary engine herein described, consisting, essentially, of the casing formed with steam-passages, revolving piston, and divided into two sections by means of the packing-ring, and provided with spring sliding valves fitted into pockets thereof, end packing-rings, cut-off with spring-arms arranged on opposite sides thereof, and arranged within the steam-passages of the casing, and cap-plate, with induction and eduction ports.

297,255. **LIFTING-JACK.** JOHN B. HALBERT, Maitland, assignor of one-half to Edward R. Trofford, Sanford, Fla. Filed Feb. 23, 1884. (No model.)

Claim.—1. The combination, in a lifting-jack, of the standard, the elevating-frame, and the eccentric, substantially as and for the purposes set forth.

2. In a lifting-jack, the base provided with a standard and the elevating-frame movable vertically on said standard, combined with the elevating-eccentric, arranged and operating substantially as and for the purposes set forth.

3. In a lifting-jack having a standard and elevating-frame, the eccentric having its ring pivotally secured to one of said parts and its disk pivoted eccentrically to the other, substantially as set forth.



4. In a lifting-jack, the combination, with the standard, of the elevating-frame having its horizontal arms slotted to fit said standard, and the eccentric, substantially as set forth.

5. The combination, substantially as herein described, of the base provided with a tapered or inclined mortise, A^3, and having a standard, as described, the elevating-frame having horizontal arms and provided on its lower side with a foot fitted to said slot A^3, and the eccentric, substantially as and for the purposes specified.

6. The herein-described lifting-jack composed of the base, the standard mounted thereon, the elevating-frame, the eccentric-ring pivoted to the standard, and the disk pivoted to the elevating-frame and provided with a lever-socket and lifting into the eccentric-ring, substantially as set forth.

7. In a lifting-jack, the combination of the base, the standard mounted on the base, the elevating-frame having its horizontal arms secured and movable vertically on the standard, the eccentric-disk pivoted on the elevating-frame, and the ring fitting over said disk and having the upper end of its rod or bar bent at right angles and journaled in the standard, substantially as set forth.

297,256. FOLDING BERTH. HENRY S. HALE, Philadelphia, Pa. Filed Feb. 9, 1884. (No model.)

Claim.—1. The combination, with a folding berth, of a jointed supporting-link pivoted at its lower end to the berth, a support for the upper end of the link, a chain connected at one end to the jointed link, and means for pulling the chain toward the vertical plane of the inner edge of the berth, substantially as set forth.

2. The combination, with a folding berth, of a jointed link pivoted at its lower end to the berth, a support for the upper end of the link, and means for moving the central part of the link toward the vertical plane of the inner edge of the berth, substantially as set forth.

3. The combination, with a folding berth, of a jointed link pivoted at its lower end to the berth, means for supporting the upper end of the jointed link, means for supporting the inner edge of the berth, and permitting it to rise and fall, and means for moving the central part of the jointed link toward the vertical plane of the inner edge of the berth, substantially as set forth.

4. The combination, with a folding berth, of a jointed link attached at its lower end to the berth, a support for the upper end of the link, a support for the inner edge of the berth which permits it to rise and fall, a chain connected at one end to the jointed link and at its opposite end to the inner edge of the berth, and a pulley for supporting the chain between its ends, substantially as set forth.

5. The combination, with a folding berth, of a jointed link connected at its lower end to the berth, a support for the upper end of the link, a support for the inner edge of the berth, a chain connected at one end to the jointed link and at its opposite end to a weight, and a pulley for supporting the chain between its ends, substantially as set forth.

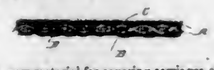
6. The combination, with a folding berth, of a jointed link connected at its lower end to the berth, a support for the upper end of the link, a chain connected at one end to the jointed link and at its opposite end to the inner edge of the berth, a pulley for supporting the chain between its ends, a rising and falling weight, and a chain connecting the weight with the jointed link, substantially as set forth.

7. The combination, with a folding berth, of a jointed link, a chain connected at one end to the berth, at its opposite end to the jointed link, and at its doubled end to the inner edge of the berth, and a pulley for supporting the chain between its doubled ends and its ends which are attached to the jointed link and berth, substantially as set forth.

8. The combination, with a folding berth, of a jointed link pivoted at its lower end to the berth, means for supporting the upper end of the jointed link, means for supporting the inner edge of the berth, and means for moving the central portion of the jointed link away from a line which intersects the pivot at the lower end of the link and the point at which the link is attached to the partition at the end of the berth, substantially as set forth.

9. The combination, with a folding berth, of a pivotal support between its outer and inner edges, the vertical link I, connected with the inner edge of the berth, and devices for locking the vertical link in position to hold the berth in its inclined position, substantially as set forth.

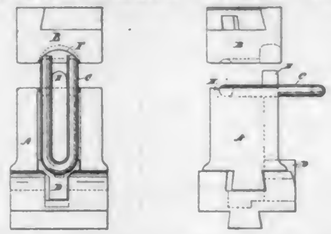
10. The combination, with a folding berth having end rails projecting through the inner wall of the car, of a pivotal support between the outer and inner edges of the berth, and a locking mechanism connected to the end of a side rail between the inner and outer walls of the car, for locking the berth in a horizontal position, substantially as set forth.



11. The combination, with a folding berth having end rails projecting through the inner wall of the car, of a pivotal support between the outer and inner edges of the berth, a longitudinal rod supported at its end in the end rails, between the outer and inner walls of the car, a vertical bar, I, connected to the longitudinal rod, and the locking-latch I', substantially as set forth.

12. The combination, with a folding berth, of a pivotal support between its outer and inner edges, and a locking mechanism connected with its inner edge to lock the berth in a horizontal position, substantially as set forth.

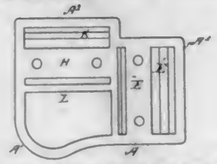
13. The combination, with a folding berth, of pivotal supports between its outer and inner edges, and a locking mechanism connected with its inner edge and adapted to lock the berth in a horizontal position, and also in an inclined position, substantially as set forth.



297,257. MATERIAL FOR COVERING CARRIAGES. EDWARD W. HARRAL, Fairfield, Conn. Filed Mar. 21, 1884. (No model.)

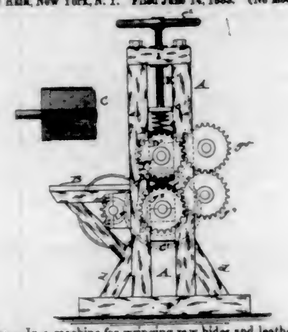
Brief.—Improvement on the invention in Letters Patent No. 280,309, dated June 26, 1883.

Claim.—A new material for covering carriages and analogous uses, consisting of a cotton fabric having upon one side a facing of wool, which is forced into the interstices of the threads, and upon the opposite side a facing of water-proof material, which enters said interstices, taking firm hold both on the threads and the back of the facing, substantially as described.



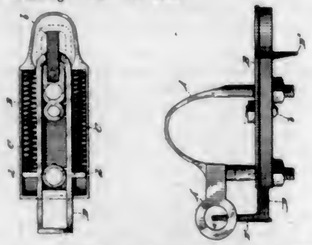
297,258. APPARATUS FOR MAKING RINGS, COUPLING-LINKS, &c. SILAS HARRIS, San Francisco, Cal. Filed Oct. 30, 1883. (No model.)

Claim.—1. An apparatus for forming rings, links, &c., consisting of a bottom die channeled upon its front vertical face and upon its horizontal face, and having the arch E between the sides of the vertical channel, in combination with a top die having an arched face in line above the vertical channel of the lower die, and a horizontal channel corresponding with the horizontal channel of the lower die, substantially as herein described.



2. An apparatus for forming links, rings, &c., consisting of a lower die channeled upon its front vertical face and upon its horizontal face, and having a shallow supplemental chamber, H, around the curved channel in the horizontal face, in combination with an upper die having a vertical arch corresponding with the vertical channels of the lower die, and a horizontal channel which registers with that of the lower die, substantially as herein described.

297,259. HALTER-FASTENER. MICHAEL C. HATER, Boston, Mass. Filed Jan. 7, 1884. (No model.)



Claim.—In a halter, a metallic fastener cast in one piece, consisting of the line-bars A' A^2 A^3, the fastening-bars E and H, and the retaining-bars K, L, and E', all arranged to operate together substantially as described, and for the purpose set forth.

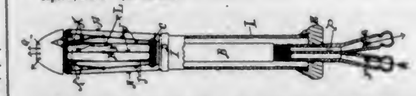
297,260. MACHINE FOR WRINGING RAW HIDES AND LEATHER. ANTON REIN, New York, N. Y. Filed June 14, 1883. (No model.)

Claim.—In a machine for wringing raw hides and leather, the rolls C and D, in combination with friction-coverings consisting of ropes wound around said rolls, mechanism for operating said rolls, and a supporting-frame, substantially as described.

297,261. THILL-COUPLING. SAUNDERS HURRELL, Jr., Mount Vernon, Ohio. Filed Aug. 11, 1883. (No model.)

Claim.—1. In a thill-coupler, the combination, with a suitable clip having a chambered base provided with a cover, B', of the spring-actuated slide D, provided with projections D' D^2, substantially as set forth.

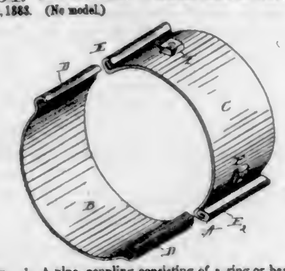
2. In a thill-coupler, the combination, with a clip and a suitable shaft-eye, of a spring-actuated slide adapted to hold the shaft-eye against its bolt, and the spring b', all of the above parts combined and adapted to operate as described.



3. The combination, with the clip and shaft-eye, of the chambered clip-tie B, the stop or catch b', the slide D, provided with arms d, and the springs C, all of the above parts combined and adapted to operate as described.

297,262. BOX-FASTENER. THOMAS HUMPHREYS, Salford, County of Lancaster, England. Filed Nov. 12, 1883. (Model.) Patented in England Sept. 6, 1883, No. 4,292.

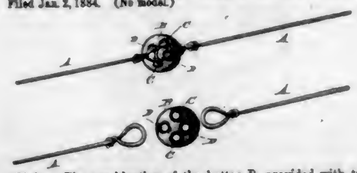
Claim.—In a fastening for baskets, cases, and other articles, a slotted tube attached to the cover of the basket, in combination with hooks attached to the body of the basket and adapted to enter said slots, a movable rod arranged within said tube and adapted to engage by partial rotation with said hooks, and a locking device which prevents said rod from moving after engaging with said hooks, substantially as set forth.



297,263. SYRINGE. JOHN BINGHAM HUNT, Delaware, Ohio. Filed Apr. 2, 1883. (No model.)

Claim.—1. In a vaginal syringe, two concentric tubes, B I, in combination with hand-nut E, collar C, adjustable arms J J, shoulders M M, braces K K, and diaphragm H, whereby an adjustable dam or reservoir is produced within the vagina, substantially as specified.

2. In a vaginal syringe, the combination, with two concentric tubes, B I, nozzle A, and pipes F G, of hand-nut E, collar C, adjustable arms J J, shoulders M M, braces K K, and diaphragm H, substantially as specified.

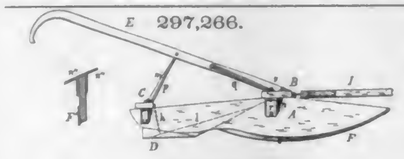


297,264. PIPE-COUPLING. THEODORE HUNT, St. Louis, Mo. Filed Nov. 6, 1883. (No model.)

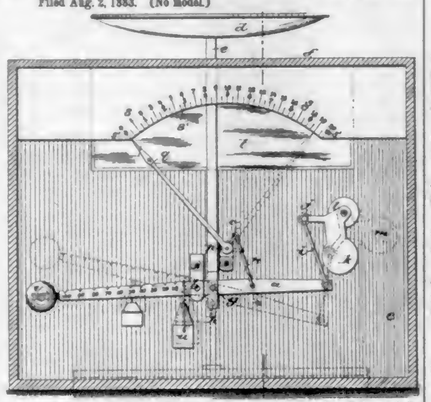
Claim.—1. A pipe-coupling consisting of a ring or band comprising two parts or sections formed of elastic material, one of said sections being provided at its ends with inturned book-shaped flanges, and the other section being provided at its ends with outturned flanges, re-enforced by bending the metal of the flange upon itself, said inturned and outturned flanges being adapted to engage each other when said ring or band sections are sprung together, substantially as specified.

2. A pipe-coupling comprising two half rings or bands provided at their ends with suitable catches adapted to engage each other when the said sections are sprung together, one of the said sections being provided on its outer side, near its ends, with studs or projections, substantially as and for the purpose set forth.

297,265. CHECK-ROW WIRE. WILLIAM F. JOHNSON, Sterling, Ill., assignor to George S. Tracy and Thomas A. Galt, both of same place. Filed Jan. 2, 1884. (No model.)



Claim.—The combination of the button B, provided with two or more holes through its disk, and the sections A A, the ends of such sections being looped together, and the central portion of such button being interposed between the engaging ends of such sections, substantially as shown, and for the purpose described.

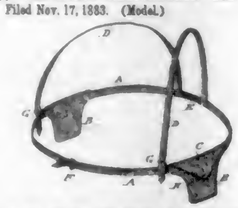


297,266. POTATO-COVERER. FRANK G. JUNEY, Victor, N. Y. Filed Jan. 24, 1883. (No model.)

Claim.—The combination, with the mold-boards A A', provided with shares F F', of the cross-bars B and C, and the yielding coverer D, formed of sheet metal of suitable thickness, and having its rear edges extended laterally beyond the mold-boards, substantially as and for the purposes specified.

297,266.

297,267. PENDULUM-SCALE. HENRY CLAY KEELER, Ogden, Utah. Filed Aug. 2, 1883. (No model.)

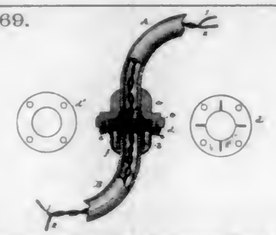


Claim.—1. The combination, in a weighing-scale, of the weigh-beam *a*, having the multiplying-weight *u*, balance-weight *v*, and pendulum-weight *k*, and the supporting-bar *o*, having the scoop *d*, and the platform-lever connecting extension *h*, substantially as described.

2. In a weighing-scale having the pointer *q*, for recording the weights on a dial, the said dial having separate dial-scales for the scoop and platform, in combination with a double weigh-beam, substantially as described.

3. The weigh-beam *a*, journaled in the main frame, the weight *k*, journaled in the frame at *l*, and provided with arm *j*, and the rod *i*, connecting-arms *a* and *j*, in combination with the index or pointer *q*, independently journaled in the frame, and provided with the crank-arm *o* and the rod *w*, connecting arm *o* with arm *a*, as and for the purpose specified.

297,268. TRAVELER'S TREASURE-BELT. ADA H. KEPLEY, Effingham, Ill. Filed Nov. 17, 1883. (Model.)



Claim.—A belt for carrying money or other valuables, consisting of a yielding belt or band adapted to be secured around the body, provided with pockets, as described, and having shoulder-straps, the belt or band provided with buckles, whereby the belt and straps may be adjusted, all substantially as set forth.

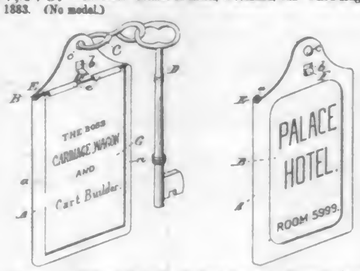
297,269. ELECTRIC-LIGHT FIXTURE. PHILIP H. KLEIN, Jr., New York, N. Y., assignor to Bergmann & Co., same place. Filed Dec. 12, 1883. (No model.)

Claim.—1. The combination of a jointed or swinging bracket having open wireways through its joints and continuous flexible electrical conductors extending through said bracket from end to end, substantially as set forth.

2. The combination of a jointed or swinging bracket having open wireways through its joints and two continuous flexible separately-insulated electrical conductors extending through said bracket from end to end, substantially as set forth.

297,269.

3. The combination of a jointed or swinging bracket having open wireways through its joints, continuous flexible electrical conductors passing through said bracket from end to end, and means for preventing the bracket-arms from making a complete revolution, substantially as set forth.



4. In an electrical swinging bracket, the combination of two parts, one turning within the other, and the flexible plate holding them together, substantially as set forth.

5. In an electrical swinging bracket, the combination of the cap on one part, the flanged sleeve on the other, fitting into said cap, and the flexible plate holding them together, substantially as set forth.

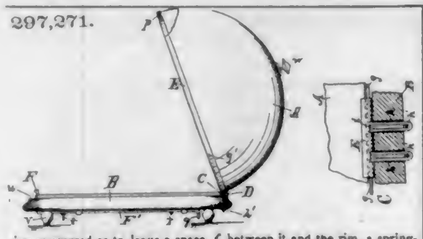
6. The combination of the cap forming one side of the joint, the sleeve turning therein, forming the other side, and the shell *f*, covering said sleeve, substantially as set forth.

7. In a swinging bracket containing continuous flexible electrical conductors extending through the bracket from end to end, the tubes of the bracket extending from the ends of the joints, substantially as set forth.

297,270. KEY-TAG. FRANK A. KNOX, Woodland, Cal. Filed Aug. 27, 1883. (No model.)

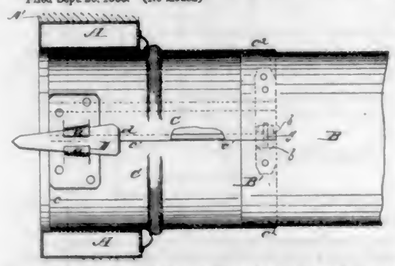
Claim.—1. In a tag, the plate A, having an open center and guides *a* on its side edges, adapted to receive a card, the inscription of which may be exhibited through its open center on its outer side, in combination with the plate E, adapted to fit within the guides *a* of plate A, and to hold a second card between itself and said guides, whose inscription is exhibited on the opposite side of the tag, substantially as herein described.

2. In a tag, the plate A, having an open center and guides *a* on its side edges, adapted to receive a card, in combination with the plate E, having the top guides, *c*, said plate being adapted to fit within the guides *a* of plate A, and to receive a card on its outer side, under its guides *c*, and hold it between itself and said guides, substantially as herein described.



3. In a tag, the plate A, having an open center and guides *a* on its side edges, adapted to receive a card, in combination with the plate E, having top guides, *c*, and a tongue, F, adapted to fit through a hole, *b*, in the head of plate A, whereby said plate is secured, said plate being fitted within the guides *a*, and adapted to receive a card on its outer side, under its guides *c*, and hold it between itself and said guides, substantially as herein described.

297,271. SHOW-CASE. DANIEL E. LADD and ELIJAH J. E. WHITAKER, Baltimore, Md. Filed June 23, 1882. Renewed Mar. 19, 1884. (No model.)

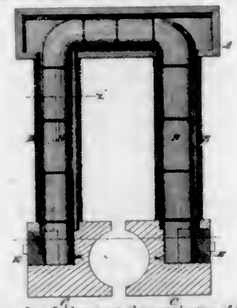


Claim.—1. In a show-case, the combination of a base, B, a half-spherical glass shade provided around its rim with a metal binding, a hinge attached to the said binding and base, a spring which tends normally to raise the shade, and a catch-hook which holds the shade when down, and which is provided on the under side of the base with means for its release, as set forth.

2. In a show-case, the combination of the glass shade provided around its rim with a metal binding having openings *i*, the binding being so secured as to leave a space, *f*, between it and the rim, a spring-wire having loops *h*, the ends of the wire occupying the space, and the loops projecting through the aforesaid openings, and a base having holes *k*, through which pass the said loops, which are rigidly secured, as and for the purpose set forth.

297,271.

297,272. STOVE-PIPE CONNECTION. GODFRIED LAUBE, Huron, Dak. Filed Sept. 26, 1883. (No model.)

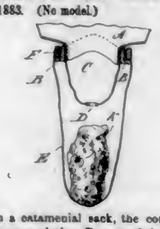


Claim.—1. An expansible stove-pipe connection provided at opposite ends with mechanism for contracting and expanding said ends, respectively, substantially as set forth.

2. An expansible stove-pipe connection provided with mechanism on the inside thereof at one end for expanding said connection, and with mechanism on the other end outside of said connection for contracting it, substantially as set forth.

3. The stove-pipe connection C, having its edges overlapped, as at *c c'*, and provided on its inside, near one end, with brackets *a*, and wedge D, for expanding that end of said connection, and with a device at its opposite end, outside of the connection, for contracting that end of said connection.

4. The connection C, constructed substantially as described, with the loose joint *c'*, the ears *a a*, and lugs *b b*, and adapted to receive the wedge D, and the bolt *g* and nut *g'*, and to be attached to the thimble A or to the chimney-aperture, and to receive and be attached to the stove-pipe B, as set forth.

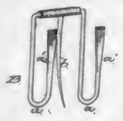


297,273. FIELD-MAGNET FOR DYNAMO-ELECTRIC MACHINES. JOHN W. LAWSON, Harrison, N. J. Filed Nov. 16, 1883. (No model.)

Claim.—1. In a field-magnet, the combination of the hollow yoke A, tubular cores B, pole-pieces C, and wire bundle D, and clamps for binding the said wire bundle to the pole-pieces C, as specified.

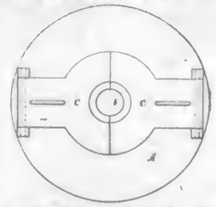
2. In a field-magnet, the combination, with the wire bundle D and pole-pieces C, of a clamp for binding the said wire bundle to the pole-pieces.

297,274. CATAMENIAL SACK. CHARLES H. LEVY, New York, N. Y. Filed Sept. 26, 1883. (No model.)



Claim.—1. In a catamenial sack, the combination, with an apertured piece, A, and grooved piece B, secured thereto, of the spring-frame F, carrying the sack E, and removably secured to the grooved frame B, substantially as shown and described, whereby said sack can readily be removed, cleansed, and replaced without removing the other parts of the device from the wearer, as set forth.

2. In a catamenial sack, the combination, with the apertured piece A, of the frame B, secured to the same, the pouch or sack E, and the spring-frame F, secured to the pouch E, and provided at one end with a notched head, H, and at the other end with a prong or projection, G, substantially as herein shown and described.



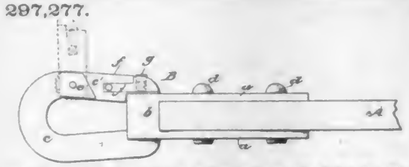
297,275. NECKTIE-FASTENER. WILLIAM L. LINDER, Burlington, Iowa. Filed Dec. 31, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 289,670, dated December 4, 1883.

Claim.—An improved neck-tie fastener, consisting of the two upright or vertical hooks *a a*, adapted to be hooked over the collar, and the rearwardly-projecting hinged pin *b*, for attachment to the cravat, all substantially as hereih set forth.

297,276. GLASS LAMP-FOUNTAIN. GEORGE HENRY LOMAX, Somerville, Mass. Filed Jan. 16, 1884. (No model.)

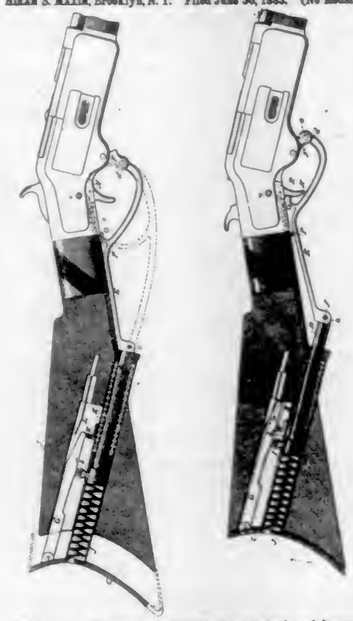
Claim.—1. A lamp-fountain consisting of a ring and a body united by casting or forming the body in a mold against the said ring previously laid therein, all being substantially as set forth, the said ring being to constitute a lip extending around and projecting above the top of the body, as explained.



2. The process substantially as described of making a glass lamp-fountain with a lip or drip-flange, such consisting in first making a ring of glass and inserting it within the upper part or mouth of a mold having a cover or covers recessed peripherally, as described, to receive such ring, and next placing the said cover or covers within the ring, so as to cover its upper edge, and blowing within the mold and against the lower edge of the glass ring in a sufficiently-heated state the glass to constitute the body of the fountain, such ring being thereby united to the body, as specified.

297,277. HAME-CLIP. CHARLES W. MASSENHEIMER, Allentown, Pa. Filed Feb. 25, 1884. (No model.)

Claim.—1. The hame-clip herein shown and described, formed of the plates *a*, bridge *b*, and hook *c*, made in one piece, and the hinged closing-tongue *f*, arranged for closing the entrance to the hook *c*, substantially as described.

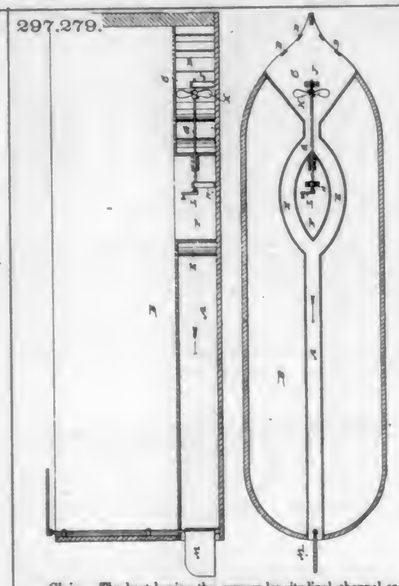


2. In a hame-clip, the closing-section *f*, hinged to the end of the hook *c*, and provided with the catch-hook and spring *j i*, in combina-

297,277.

tion with notched pin or stud *g*, formed upon one side of the clip, substantially as and for the purposes set forth.

297,278. MECHANISM FOR OPERATING GUN-LOCKS BY RECOIL. HIRAM S. MAXIM, Brooklyn, N. Y. Filed June 30, 1883. (No model.)



Claim.—1. The combination, with the gun-stock and hammer-operating lever F, of the bolt D, arranged in a passage in the stock, the rod E, connecting said bolt with said hammer-operating lever, the shoulder-plate C, supported by a suitable guide, the spring J, having one end bearing against said plate and the other against the end of bolt D, a spring arranged to force said bolt in opposition to said spring J, a latch for holding plate C compressed to the butt of the stock, and a device operated by the kick or rebound of the gun for releasing said latch, substantially as described.

2. The combination, with the hammer-operating lever F, trigger N, and pin P, connected with the trigger-stop, of the shoulder-plate C, the latch G, connected thereto, the stationary catch H, the bolt D, carrying a trip for releasing said latch, the spring J, arranged between the bolt and shoulder-piece, spring K, arranged to drive the bolt rearwardly, and the combined guard and connecting-rod E, pivoted at its front end to the trigger-operating lever and at its rear end to the bolt, and provided intermediately with the projection O, arranged to strike the rear side of the trigger when the rod is thrown forward and to press inward the trigger stop-pin when it is drawn rearward, the whole arranged, as shown, in connection with the stock of a gun of the kind described.

3. The combination, with the movable shoulder-plate C, connected with the hammer-cocking lever of a gun, as described, of a latch arranged to hold said shoulder-plate to the position for cocking the hammer, and a device operated by the rebound of the gun for unlatching said plate, substantially as described.

297,279. CANAL-BOAT. ANGUS MCDONALD, Ausable, Mich. Filed Feb. 6, 1884. (No model.)

297,279.

Claim.—The boat having the narrow longitudinal channel or tunnel in its lower surface, with a widened front end protected by a screen or bars, the said channel or tunnel curved laterally on each side of a central chamber and extending throughout the length of the boat, in combination with the propeller and its shaft, with its forward end supported in the widened portion of said tunnel, and its other end provided with means for its operation and supported in the aforesaid central chamber, as shown and described, and for the purpose set forth.

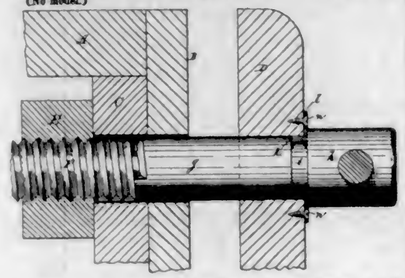
297,280. METHOD OF FORMING FELT BOOTS, SHOES, &c. DANL. F. MERRER, Baltimore, Md., assignor to the Marine Shoe Company, Kenne bunk, Me. Filed Feb. 4, 1884. (No model.)

Claim.—1. As an improvement in the art of forming felt boots, shoes, &c., the cylindrical woolen bat, as set forth.

2. As an improvement in the art of forming felt boots, shoes, &c., the cylindrical woolen bat in which the staple is crossed upon itself, as set forth.

3. As an improvement in the art of forming felt boots, shoes, &c., the method which consists in, first, forming the sliver into a cylindrical bat; second, cutting such bat on the line *x x*; third, cutting said bat on the line *u u*; fourth, hardening the blank thus formed, bringing the edges *b b* together, and then felting, &c., all as described.

4. As an improvement in the art of forming felt boots, shoes, &c., the method which consists in, first, forming the sliver into a cylindrical bat in which the sliver crosses itself; second, cutting such bat on the line *x x*; third, cutting such bat on the line *u u*; fourth, hardening the blank thus formed, bringing the edges *b b* together, and then felting, &c., all as described.

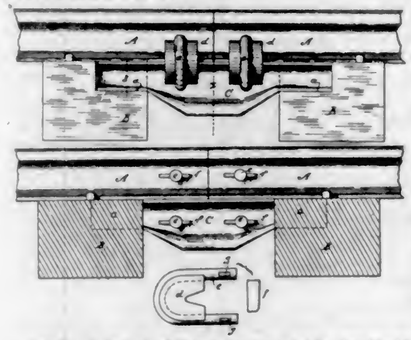


297,281. UMBRELLA AND PARASOL RIB. ABNER T. MEYER, New York, N. Y. Filed Sept. 11, 1883. (Model.)

Claim.—1. As an improved article of manufacture, a hollow umbrella-rib re-enforced at its outer end by a bar, as specified, and provided on its said outer end with a bead, C, and flattened portion D, having an eye passing through both the rib and bar, as set forth.

2. The herein-described improvement in the method of finishing the ends of hollow umbrella or parasol ribs, consisting in placing a wire in the end of the rib, pressing the outer end of the rib together, flattening and upsetting the wire and the rib, and then perforating the flattened rib and wire, substantially as herein shown and described.

297,282. CARPENTER'S VISE. JOHN F. MILLER, Pittsburg, Pa., assignor of one-half to Walter E. Hague, same place. Filed Sept. 10, 1883. (No model.)



Claim.—1. In a carpenter's vise, the combination, with the jaw D, of the screw F, having shank *g*, groove *i*, and head A, and the two-part metallic sleeve *k*, having flange *l* secured to said jaw, substantially as described.

2. The combination of the nut E, screw F, having head A, and groove *i* next to said head, and metallic sleeve *k*, having flange *l*, said sleeve fitting in groove *i*, and said flange being constructed, substantially as described, for attachment to a vise-jaw, as set forth.

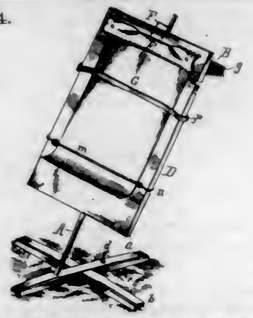
297,283. RAILWAY-RAIL JOINT. RICHARD PEERE MORGAN, Jr., Dwight, Ill., assignor to the Morgan Rail-Joint Company, same place. Filed Dec. 1, 1883. (No model.)

Brief.—The sub-rail having reduced or flattened ends is secured to the main rails by ⊓-staples and jaw-pieces, and suitable securing devices to hold the latter to the former.

Claim.—1. The sub-rail C, having its bearing ends reduced or flattened, substantially as described.

2. The jaw-piece *d* and separate ⊓-staple *e*, encompassing the same, the ends of said staple being provided with suitable fastening means, whereby in co-operation the track and sub rails may be securely clamped together, substantially as set forth.

3. The combination, with the track-rails and cross-ties, of the sub-rail having reduced ends, the jaw-piece to receive the webs of said track and sub rails, the separate staple, and the fastening devices, (wedge-keys,) substantially as set forth.

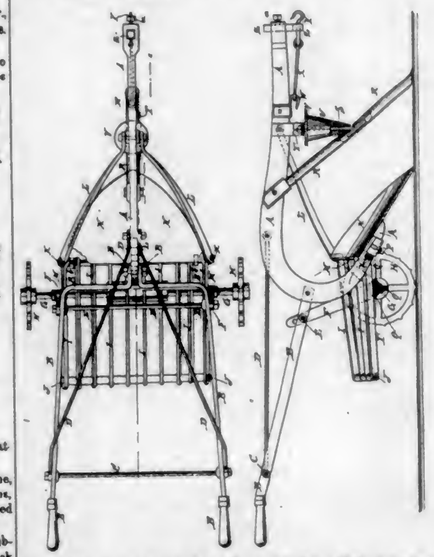


4. The combination, with the track-rails and cross-ties, of the sub-rail having reduced or flattened bearing ends, and the clamping devices for securely holding said rails together, substantially as set forth.

297,284. PAPER-HOLDER. ISAIAH S. MUDGETT, Princeton, Minn. Filed Jan. 31, 1884. (No model.)

Claim.—1. The combination, in a paper-supporting device, of a rod having a clamp and rear cross-bars perforated for the passage of a rod, the lower end of which is adapted to engage either an inclined or vertical recess in the base, and a base having said inclined and vertical recess, substantially as set forth.

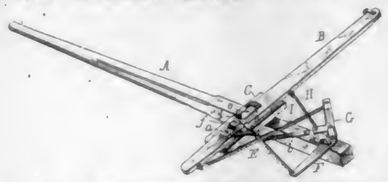
2. The combination, in a paper-supporting device, of a pad having



297,284.

the upper and lower cross-bar secured to its rear face perforated for the passage of a rod mounted in a base, the said upper cross-bar being recessed at its ends to form a projection to retain one end of a spring which is attached to the center of a curved cross-bar on the upper front face of the pad and provided with a lug, substantially as set forth.

3. The combination, in a paper-supporting device, of a pad arranged and constructed as described, and having the rear cross-bars perforated for the passage of a rod mounted in the base, and a spring secured at the rear of the pad and bearing frictionally against the said rod, substantially as set forth.

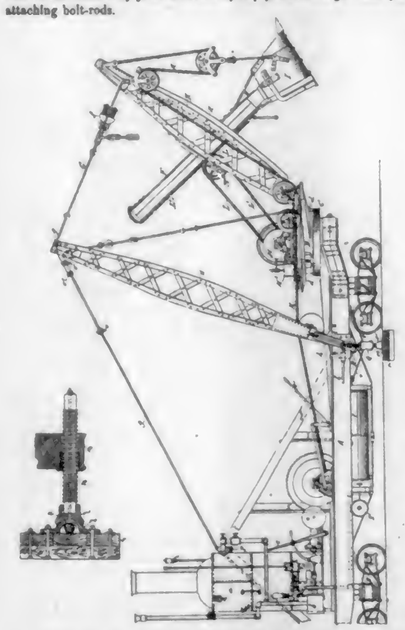


297,285. POTATO-DIGGER. HANS NELSON, Waupaca, Wis. Filed Jan. 4, 1884. (No model.)

Claim.—1. In a potato-digger, the combination, with the beam and the scoop connected to its rear downwardly and inwardly curved end, of the clearer, with its forward curved bar supported in the lower end of the beam and in lugs on the rear bottom portion of the scoop, and connected to the divergent ends of bars fastened at their convergent ends to the beam, and the clearer-vibrating cams or wings on the axle of supporting-wheels, substantially as and for the purpose set forth.

2. In a potato-digger, the combination of the beam, the scoop, the curved clearer supported at its forward end in the lower end of the beam and in lugs on the rear bottom edge of the scoop, and connected to the divergent ends of bars fastened to the beam, the handles, with their right-angled portions connected to the beam, and the axle having the clearer-vibrating cams and the axle-supporting bars connected to the forward bar of the clearer and to the handles, substantially as and for the purpose set forth.

297,286. DRAFT-EQUALIZER. CHRISTIAN OLSON, Granite Falls, Minn. Filed Jan. 31, 1884. (No model.)



Claim.—1. The combination, in a draft-equalizer, of a bar suitably pivoted and designed to receive the whiffletrees, and intermediate devices, adjustable as described, substantially as and for the purpose set forth.

2. The combination, in a draft-equalizer, of a bar suitably pivoted and designed to receive the whiffletrees, intermediate devices, adjustable as described, and containing the flexible rods E I, substantially as set forth.

297,287. EXCAVATOR AND DREDGE. RALPH R. OSGOOD, Albany, N. Y., assignor, by mesne assignments, to the Osgood Dredge Company, same place. Filed Feb. 14, 1883. (No model.)

Brief.—The dipper-handle is thrust and returned by chains run around sheaves to a drum mounted with its engine on the turn-table. The lift-chain runs to a drum with its engine on the main frame. The boom is supported from a hinged A-frame bearing, through bracing-rods, on lateral arms on the truck, which carry jack-screws with broad foundation-blocks universally jointed thereto by cap-plates, through which pass attaching bolt-rods.

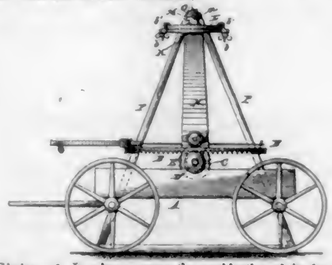
Claim.—1. In a dredging or excavating machine, the combination of a main engine with its adjuncts, a hoisting-drum with operative connecting mechanism, a turn-table having mounted thereon an independent engine and a drum for a dipper-thrusting chain, a boom supporting a dipper-handle carrying a dipper, a hoisting-cable, and an A-frame with connecting means leading to the boom, substantially as described.

2. In a machine of the class described, the combination, with a turn-table having mounted thereon a driving-engine and a drum operated directly by said engine, of the boom provided with the intermediate sheaves, M M', and dipper-handle, with the chains L L' passing over and around the said sheaves and drum, the combination and mode of operation being substantially as described.

3. In a machine of the character herein set forth, having an A-frame for sustaining the boom, the combination, with the platform, of the side arms for receiving the jack-screws, and the inclined braces connecting the A-frame and the side arms, substantially as and for the purposes set forth.

4. The combination, as before set forth, of the platform, the A-frame mounted thereon, the side arms connected with the platform at or near the bases of the A-frame, the inclined braces connecting the A-frame and side arms, and the jack-screws passing through the outer ends of said arms, substantially as and for the purposes explained.

5. The combination of the jack-screw mounted in the side arm, the broad foundation therefor, provided with a suitable cap, and the connecting-rod passing through the body of the screw and secured at top and bottom, substantially as shown and described.



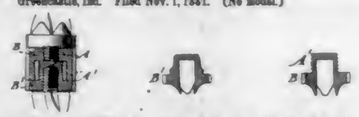
6. In a machine of the class described, the combination, with the body of the machine, having side arms through which are passed jack-screws, of the A-frame, having bracing-rods connected to the jack-stay arms, substantially as described.

297,288. CORN-SHELLER. HARVEY PACKER, Rock Falls, assignor to Thomas A. Galt and George S. Tracy, both of Sterling, Ill. Filed Jan. 2, 1884. (No model.)

Claim.—In a corn-sheller, the combination of the stationary partitions C and the intermediate separating and carrying chains, B, said chains consisting of open links and projecting spurs, the apices of the partitions being above the plane of the links of the chains and below the points of the spurs, substantially as and for the purpose set forth.

297,289. PORTABLE HORSE-POWER. HARVEY PACKER, Rock Falls, Ill. Filed Mar. 14, 1884. (No model.)

Claim.—1. In a horse-power, the combination of the frame A, a post or posts, H, disk K, and plate L, the plate L being adjustable in a horizontal plane, substantially as shown, and for the purpose described.

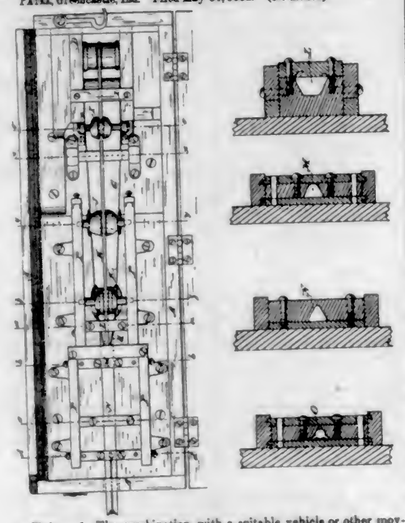


2. In a horse-power, the combination of the frame A, a post or posts, H, and the vertical shaft G, the latter being suitably journaled to and supported by such post, substantially as shown, and for the purpose specified.

3. In a horse-power, the combination of the frame A, post or posts H, disk K, plate L, bolts *b*, and shaft M, substantially as shown, and for the purpose named.

4. In a horse-power, the combination of the wheel B, pinions C, independent shafts D, bevel-wheels E, pinion F, and shaft G, substantially as shown, and for the purpose described.

5. In a horse-power, the combination of the support P, shaft M, provided with the collars *d*, and the plate L, substantially as shown, and for the purpose mentioned.



297,290. COUPLING FOR LIGHTNING-RODS. THEODORUS H. PATEK, Greencastle, Ind. Filed Nov. 1, 1881. (No model.)

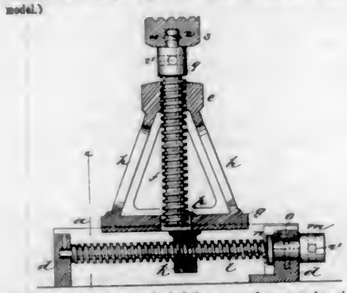
Claim.—1. The lightning-rod joint consisting of the dovetailed tenons on the ends of the rod-sections, in combination with the coupling-pieces B B', provided with screw-threads, and with projecting portions for clasping the ends of the rod, as shown and described.

2. The lightning-rod joint consisting of threaded tenons as shown, in combination with the internally-threaded coupling-pieces of larger diameter than said tenons, whereby the coupling-pieces are adapted to fit loosely on said tenons and to be secured, as described.

297,291. PORTABLE LIGHTNING-ROD MACHINE. THEODORUS H. PATEK, Greencastle, Ind. Filed May 31, 1882. (No model.)

Claim.—1. The combination, with a suitable vehicle or other movable support, of the frame or box A, lightning-rod-forming mechanism, and the wire-core-straightening mechanism, substantially as described.

2. The combination of the dies for forming the sheet-metal covering with the rolls or guides for straightening and directing the wire core rigidly secured to a frame or box in compact form, as hereinbefore set forth.



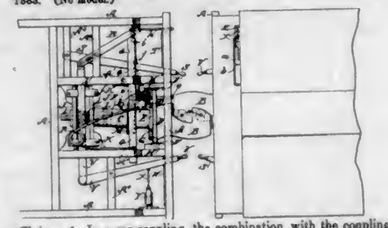
3. The wire straightening and guiding rolls, in combination with the formers arranged in rear thereof, whereby the guide-rolls perform the double function of guiding and straightening the core-wire, and partially forming the copper covering, substantially as described.

4. The peculiar form of the die shown at Fig. 7, substantially as and for the purpose set forth.

5. The peculiar form of the die shown at Fig. 8, substantially as and for the purpose set forth.

6. The peculiar form of the die shown at Fig. 9, with the three radial slots for forming the wings of the rod, and a central orifice for the passage of the core, substantially as set forth.

297,292. LIFTING-JACK. ERICK J. QVARNSTROM, Norway, assignor to himself and John E. Hagey, Vulcan, Mich. Filed Mar. 3, 1884. (No model.)



Claim.—1. The nut *e* for the hoisting-screw *f*, supported on the base-plate *g*, having rabbet-grooves *i* in the bottom, fitted to the sides *a* of the bed-frame, and having the nut *k*, in combination with the screw *l*, fitted in said nut and in bearings of the end pieces, *d*, of the bed-frame, substantially as described.

2. The nut *e*, legs *h*, and the base-plate *g*, constructed in one integral piece, and combined with the hoisting-screw *f*, adjusting-screw *l*, and the bed-frame *a d*, substantially as described.

3. The nut-supporting bed-plate *g*, fitted to the sides *a* of the bed-frame by rabbet-grooves *i*, in combination with end pieces, *d*, of said bed-frame, fitted to allow the bed-plate to slide over them, said bed-plate being connected with the adjusting-screw *l*, substantially as described.

297,293. CAR-COUPLING. EDWARD L. RAYNSFORD, Susquehanna, assignor to himself and John R. Raynsford, Montrose, Pa. Filed Sept. 27, 1883. (No model.)

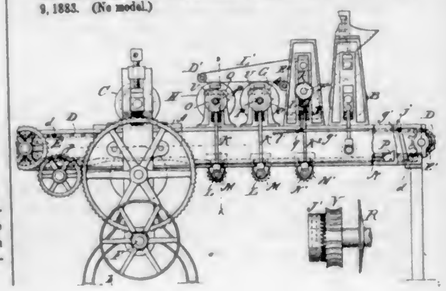
Claim.—1. In a car-coupling, the combination, with the coupling-hook B, the draw-bar C, and the sills A', of the collar E, the bearing-plate D, having cross-heads D', and the slide-bearings H, substantially as herein shown and described, whereby the coupling-hook and draw-bar are suspended and allowed to turn and slide freely, as set forth.

2. In a car-coupling, the combination, with the collar E and the sliding bearing-plate D, of the stops F G, substantially as herein shown and described, whereby the rotation of the draw-bar and coupling-hook is limited, as set forth.

3. In a car-coupling, the combination, with the draw-bar C and the frame A, of the pulley M, the chain N, the sliding bar O, and an operating mechanism, substantially as herein shown and described, whereby the said draw-bar and the coupling-hook can be turned to couple and uncouple the cars, as set forth.

4. In a car-coupling, the combination, with the sliding bar O, having notch *d*, of the spring-catch *c*, substantially as herein shown and described, whereby the coupling-hook B is locked in an uncoupled position, as set forth.

5. In a car-coupling, the combination, with the sliding bar O and the frame A, of the levers R S, substantially as herein shown and described, whereby the cars can be uncoupled from one side of the track, as set forth.



6. In a car-coupling, the combination, with the frame A and the levers R S, of the sliding bar U and the lever V, substantially as herein shown and described, whereby the cars can be uncoupled from either side of the track, as set forth.

7. In a car-coupling, the combination, with the lever V and the car-body, of the chain X, the pulleys Y Z, and the lever *a*, substantially as herein shown and described, whereby the cars can be uncoupled from the top of the car, as set forth.

8. In a car-coupling, the combination, with the frame A, the sliding bar O, and the spring-catch *c*, of the spring P and the spring-held trip-rod *e*, substantially as herein shown and described, whereby the cars, when run together, will be coupled automatically, as set forth.

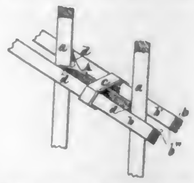
9. In a car-coupling, the combination, with the frame A and the spring-held trip-rod *e*, of the sliding bar *j*, having beveled end, the connecting-bar *i*, and the crank-rod *h*, substantially as herein shown and described, whereby the said trip-rod will be held from operating, as set forth.

297,294. WIPING AND POLISHING APPARATUS FOR PLATE-PRINTING MACHINES. ALEXANDER REID, Brooklyn, N. Y. Filed Jan. 9, 1883. (No model.)

Claim.—1. In a plate-printing press, the combination, with the reciprocating bed A, of the roller H, having slots *c*, the webs *b*, the paying-off spools Q Q', the receiving-spools R R', and means, substantially as herein shown and described, for rotating the spools R R' and vertically reciprocating the roller, as set forth.

2. The combination, with the roller G or H, having receiving and paying-off spools, of the worm-shafts W and worm-wheels V V', the shafts being formed or provided with the gears *f*, meshing with the gear *h*, substantially as and for the purposes set forth.

3. The combination, with the worm-wheels V V' and worm-shafts W, formed with the beveled gears at their inner ends, of the shaft X, formed with the beveled gear *h*, and running in the hollow journal Y, substantially as described.



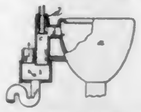
4. The combination, with the wiping and polishing rollers and the web L', passing over the rollers D' and E' and under the wiper J, and attached to the roller F', of the ratchet-and-lever mechanism for revolving the roller F', substantially as and for the purposes set forth.

5. The reciprocating rack N, in combination with the pinions M M, eccentric shafts L L, and connecting-rods K K, attached to the rollers, whereby the rollers are reciprocated vertically, as and for the purposes set forth.

6. The combination, with the reciprocating rack N, of the pinion M', eccentric shaft N', and connecting-rod K', attached to the wiper J, whereby the wiper is reciprocated vertically, as and for the purposes set forth.

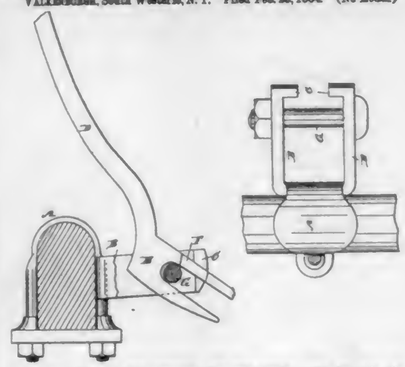
7. The chain D, attached at its ends to the bed A, and provided with the studs or pins *d d*, in combination with the rack N, formed or provided with the toes *p p*, as and for the purposes set forth.

297,295. IRON FENCE. TIMOTHY ROGERS, Springfield, Ohio, assignor to the Rogers Fence Company, same place. Filed Mar. 31, 1883. (No model.)



Claim.—1. In an iron fence having two rails in the same plane, forming a double rail, and having pickets supported between said rails, the combination of a spacer-bar extending in line with said rails, and in the same plane therewith between the pickets, having an end fork straddling the picket and a lateral fork on either side, formed by a prong of the end fork, in connection with a lateral spur which straddles the rails, and an intermediate band adapted to inclose the rails and spacer-bar, as set forth.

2. In a double-rail fence having square rails and pickets of like form between them, the combination, with said rails and pickets, of a spacer-bar having end forks engaging with the picket-rods, side forks or notches contiguous thereto engaging with the inner angles of said rails, and an intermediate band inclosing the whole midway between the pickets.



3. The combination, with rails *b*, having the inner angles, *b''*, and the picket-rods *a*, inserted between said rails, with their transverse angles in contact therewith, and their opposite angles in the central longitudinal line between them, of the spacer A, having the prongs *d* and *e*, and the clip-band *c*, substantially as set forth.

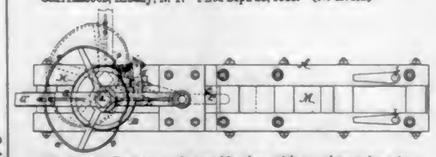
297,296. APPARATUS FOR VENTILATING WATER-CLOSETS, URINALS, DRAINS, SEWERS, AND THE LIKE. THOMAS ROWAN, London, England. Filed Nov. 3, 1883. (No model.) Patented in England Jan. 19, 1883, No. 276, and in Canada Jan. 24, 1883, No. 16,193.

Claim.—The combination, with the structure to be ventilated, of the receiver B, supplied with a purifying material through which the foul air or gas passes, the water-nozzle *d*, having its mouth located as described with reference to the inlet of the tube through which the air or gas is driven and washed, chamber *e*, and pipes *g* and *f*, all as and for the purposes described.

297,297. THILL-COUPLING. LORENZO D. RUNDELL and PERRY VAN VALKENBURGH, South Westerlo, N. Y. Filed Feb. 25, 1884. (No model.)

Claim.—1. In a thill-coupling, the combination, with the axle-clip A, having jaws B, provided with inside flanges, C, at the outer ends, of the bar D, secured to the thill, and having a fork, E, provided with notches F in the side edges of the front prong, substantially as herein shown and described.

2. In a thill-coupling, the combination, with the axle-clip A, having jaws B, provided with inwardly-projecting flanges C, tapered toward the lower ends of the bar D, secured to the thill, having a fork, E, formed on its end, in the side edges of the front prong of which notches F are formed, and of the bolt G, substantially as herein shown and described.



297,298. STOPPERING BOTTLES FOR AERATED OR GASEOUS LIQUIDS. RICHARD J. SANKEY, London, England. Filed June 11, 1883. (No model.) Patented in England Apr. 30, 1883, No. 2,176; in Germany May 26, 1883, No. 24,740; in Victoria Aug. 7, 1883, No. 3,516; in South Australia Aug. 13, 1883, No. 330, and in New South Wales Oct. 11, 1883, No. 83 12,341.

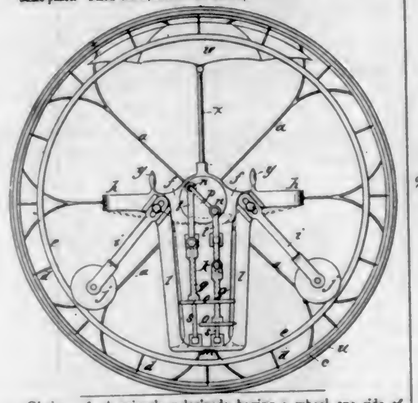
Claim.—1. The method herein described of fixing an elastic seating in the narrowing or conical neck of a bottle, consisting in first reducing in diameter a ring of hard india-rubber, usually called "vulcanite" or "ebonite," next passing it into the bottle-neck, placing it against an elastic seating in such neck, and then subjecting it to heat until the said ring expands and becomes tightly fitted in the interior of the bottle and against the elastic seating, substantially as and for the purpose set forth.

2. A bottle for internal stoppers, having a conical or narrowing opening in its neck, and having an interior rubber seating resting upon a step and held to place therein by an expanded hard-rubber ring, substantially in the manner herein shown and described.

3. A bottle for internal stoppers, having a narrowing neck, and having a seating fixed in such neck resting upon a step consisting of an expanded vulcanite ring, and held to place thereon by another expanded vulcanite ring, substantially in the manner herein shown and described.

297,299. BALING-PRESS. HENRY V. SCATTERGOOD and CHARLES F. SCATTERGOOD, Albany, N. Y. Filed Sept. 25, 1883. (No model.)

Claim.—1. In a press, the combination, with a reciprocating plunger, of a plunger-operating mechanism consisting of a crank-motion whose shafts have their bearings in the swinging ends of vibratile links, the opposite ends of said links being pivoted at a fixed point on the press-frame, substantially as specified.



2. In a press, the combination, with a plunger and its operating mechanism, of an automatic brake mechanism adapted to prevent the rebound of the plunger, substantially as herein specified.

3. In a press, the combination, with a reciprocating plunger and its operating mechanism, of an extensible sweep or lever which has its maximum length when the plunger meets with the greatest resistance, and its minimum length when the plunger meets with the least resistance, as herein specified.

4. The resistance-bars K, having in one or both edges longitudinal grooves *k*, as and for the purpose herein specified.

5. In a press, the combination, with the resistance-bars K, of the shafts L, arranged as herein described, and for the purpose specified.

297,300. VELOCIPEDE. CHARLES M. SCHAFFER, Louisville, Ky., assignor to himself, James T. Ritchig, C. C. Allen, and G. W. Allen, all of same place. Filed Oct. 8, 1883. (No model.)

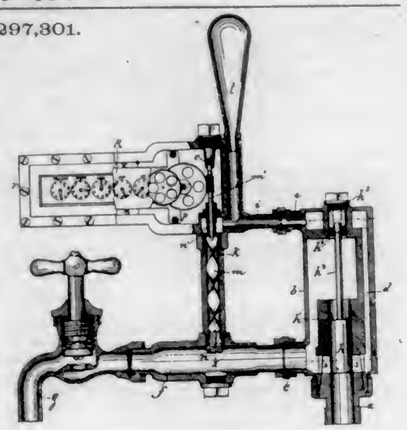
Claim.—1. A unicycle velocipede having a wheel, one side of which consists of a rim, *e*, of nearly the size of the felly-rim, and short spokes *d*, connecting said rim *e* with the felly-rim, substantially as described.

2. A unicycle velocipede having a wheel, one side of which consists of a rim, *e*, of nearly the size of the felly-rim, and spokes *d*, connecting said rim *e* with the felly-rim, and also having a frame for the operator, one side of which is supported on the wheel-hub, and the other side is supported on the rim *e* by one or more grooved rollers, *j*, substantially as described.

3. In a unicycle velocipede, the combination, with the frame-bar *f*, supported on the hub of the wheel, and having U-shaped arms A, of the arms *i*, having the grooved rollers *j* traveling on the rim *e* of the wheel, substantially as and for the purpose set forth.

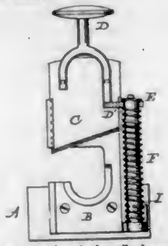
4. In a unicycle velocipede, the combination, with the frame-bar *f*, supported on the hub of the wheel, and having U-shaped arms A, of the arms *i*, having the grooved rollers *j* traveling on the rim *e* of the wheel, and adjustably connected to the said arms, substantially as and for the purpose set forth.

5. The combination, with a unicycle velocipede having an open-sided wheel, of the frame-bar *f*, supported on the hub of the wheel, and having U-shaped arms A, supported by one or more rollers, *j*, on the rim *e* of the open side of the wheel, substantially as described.



6. The rim of a unicycle-wheel, consisting of two felly-rims, *e*, connected by short bolts *c*, with a clear space between said felly-rims, forming an outlook directly ahead of the operator, substantially as described.

7. A unicycle velocipede having a wheel open at one side, and having a car or frame for the operator, sustained internally of the wheel from the hub and by adjustable rollers, substantially as described.



297,301. WATER-METER. NICHOLAS SIEBERT, Maplewood, assignor of three-eighths to Oliver E. Simmons, Boston, and Edward W. Simmons, Jamaica Plain, Mass. Filed July 11, 1883. (No model.)

Claim.—The combination of the chamber *b* and its inlet-passage, having two ports in the sides thereof at the same level, and a valve-guide, forming a continuation of the said inlet-passage, with the valve-plug *h*, longitudinally movable in the said passage, and controlling both ports simultaneously, the outlet-passages *f* and *i*, communicating with the said ports independently, and the connecting-passage *k* and measuring-screw *m* therein, substantially as described.

297,301.

297,302. CIGAR-CUTTER. GEORGE E. SIEBLER, Dayton, Ohio. Filed Aug. 20, 1883. (No model.)

Claim.—The cigar-cutter herein described, consisting of the grooved block A, frame B, provided with guides for the cutter, a lug, and a semi-circular notch, the stationary rod I, supported by the lug, spiral spring F, surrounding said rod, cutter C, provided with head D, having branches, with said cutter riveted thereto, and a forked arm embracing the rod, and washer E, said parts being combined and arranged substantially as described.

297,303. CORD-CLAMP. CARL J. A. SJOBERG, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed Mar. 21, 1884. (No model.)

Claim.—1. In a clamp for cord, rope, &c., the clamping-dogs adapted to rock within the shells from a point of contact within the same, substantially as set forth.

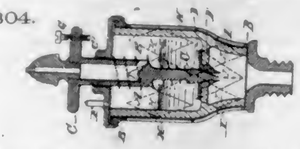
2. The shells provided with openings, as described, and having arranged therein rocking dogs provided with lugs projecting outwardly through said shells, substantially as described.

3. The dogs C, serrated at their forward portions, and with their rear extremities terminating in angular portions E, adapted to fit within one corner of the shells and rock therein, and having lugs F projecting outwardly through said shells, substantially as set forth.

297,304. OIL-CUP. PERRY SMALL, Guyamas, Mexico. Filed Dec. 29, 1883. (No model.)

Claim.—The combination of the glass oil-cup A, having a partition-plate, D', integral therewith, and provided with a seat, said partition dividing the cup into an oil and drip chamber, with the frame B surrounding said cup, and provided with openings H above the partition-

297,304.



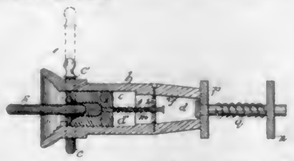


plate and openings I below the partition, and also provided at its upper end with a suitable cap, C', supporting the drop C, substantially as set forth.

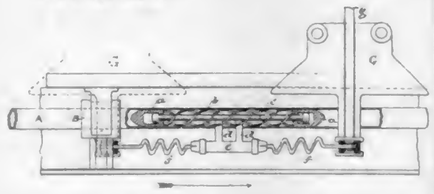
297,305. CAR-COUPLING. GEORGE W. SKELLIE, Newark, N. J. Filed Sept. 17, 1883. (No model.)



Claim.—1. The combination, with the funnel-shaped buffer *b*, having the chamber *d* therein and pin-perforation therethrough, of the spring-actuated plunger working in said chamber, adapted to automatically cover the said pin-perforation when the said pin is withdrawn, and with the beam having the longitudinal-slot-sliding blocks and levers, whereby the pins are withdrawn, substantially as herein set forth.

2. The repressible bumper *b*, having the funnel-shaped head, and having the chamber *d* and pin-perforation therein, and having the spring-actuated plunger *e*, provided with the link-opening and the pin *c*, and levers working in sliding fulcrum-blocks, all said parts being arranged and operating substantially as set forth.

3. A car-coupling of the character described, provided with the slotted beam *a*, the sliding fulcrumed blocks *s s*, and the levers *r r*, arranged and operating in the manner substantially set forth.

4. The combination, in a car-coupling, of a spring-actuated plunger (having a concave outer end) adapted to hold the coupling-pin up when the cars are uncoupled, and a draw-head having a mouth flaring at all sides, and a central aperture adapted to allow the link, when the pin is inserted, the requisite lateral and vertical swing, and at the same time to hold it in a position to automatically engage and couple with an opposite draw-head when the cars are brought together, as set forth.

297,306. APPARATUS TO BE USED IN ELECTRIC RAIL OR TRAM WAY SYSTEMS. MICHAEL HOLROYD SMITH, Halifax, County of York, England. Filed Dec. 11, 1883. (No model.) Patented in England Oct. 24, 1883, No. 5,065.

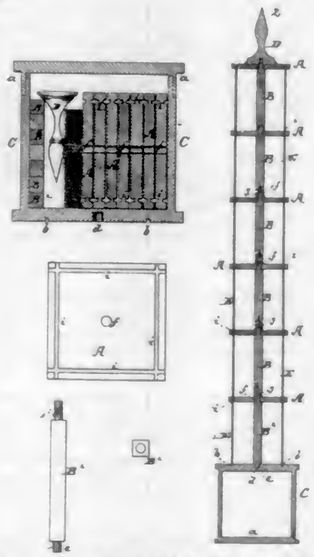
Claim.—1. In an electric rail or tram way, the combination, with a tubular conductor, of a shuttle composed of the expansible spring-collector *b* and heads *a*, located and adapted to travel in said tubular conductors, to collect and transmit the current through suitable connections with said shuttle to the motor, substantially as and for the purpose described.

2. In an electric tramway, substantially as shown and described, the combination of the shuttle composed of the heads *a* and an expansible spring between said heads, with a connecting-bolt to limit the movement of the heads toward and from each other, and thereby the expansion and contraction of the spring-collector, substantially as described.

3. In an electric tramway, the conductor A and the shuttle located therein, combined with the coiled spring *f*, connected with said shuttle and with the car, substantially in the manner and for the purpose described.

4. In electric rail or tram ways, the combination of the tubular conductor A and insulating-support B with supports C, D, and F, wedge E, and cover H, all substantially as and for the purposes set forth.

5. In an electric rail or tram way, the walls of the channel, a removable cover, H, having attached thereto the wedge-holding projection F, the supporting-pieces C, and slide-piece A, combined with the lugs *i* on the wall of the channel, to receive the piece A, and the movable piece D, held by the wedge, all substantially as described.



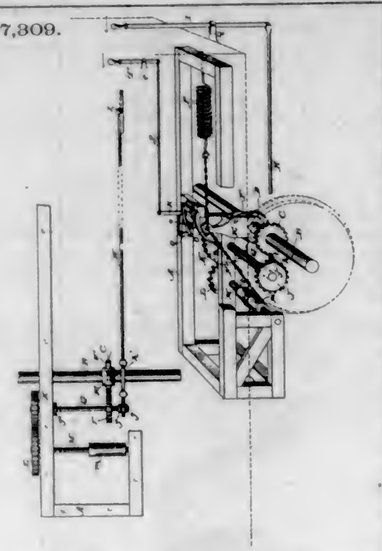
297,307. FLYING TARGET. CHARLES F. STOCK, Peoria, Ill. Filed Feb. 1, 1884. (No model.)

Claim.—1. The combination of the fragile ring B, formed on its lower inner edge with a flange, *a*, with the infrangible carrier-ring constructed to be inserted within the fragile ring and be held therein by the said flange, substantially as set forth.

2. The combination of the fragile ring B, formed with a flange, *a*, on its lower inner edge, with the infrangible carrier-ring A, closed on its top and constructed to be inserted within the fragile ring and be held therein by the said flange, substantially as set forth.

297,308. BUILDING-BLOCK. WALTER STRANDBERG, New York, assignor to Edward I. Horsman, Brooklyn, N. Y. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination of the box C, having one or more sockets, *d*, with the post B^3, having tenons *e* and *g*, and with the posts B B, having sockets *h* and tenons *g*, and with the perforated and grooved boards A A, substantially as herein shown and described.



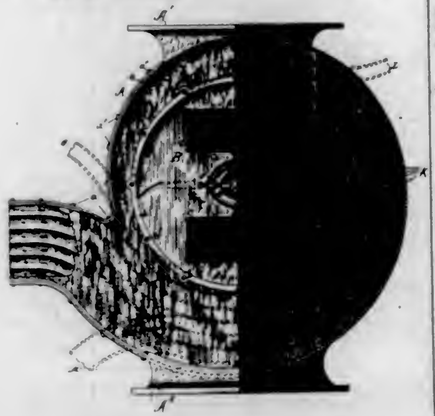
2. The box C, combined with the posts B^3 and B, the boards A A, and the upright strips or sheets E E, the boards A and the face of the box C being grooved to receive said upright strips or sheets, substantially as herein shown and described.

297,309. CAR STARTER AND BRAKE. JACOB W. STRICKLE and GEORGE R. STRICKLE, Louisville, Ky. Filed Mar. 7, 1884. (No model.)

Claim.—1. The combination, with the axle of a car, of a ratchet-wheel secured thereto, a lever or pawl carrier mounted loosely on said axle and provided with a pawl, a spring connected with said pawl-carrier, a gear-wheel mounted on said axle, a second gear-wheel adapted to be moved toward or from the first gear-wheel, mechanism arranged to be operated by the driver of the car for bringing said gear-wheels into engagement with each other when the car is to be stopped, and mechanism operated by said gear-wheels and connected with said pawl-carrier for extending said spring, all substantially as set forth.

2. The combination, with the axle of a car, of a ratchet-wheel secured thereto, a pawl-carrier having a pawl, a spring connected with said pawl-carrier, mechanism adapted to be thrown into operation by the driver and connected with said axle for extending said spring, means for automatically disconnecting the extending mechanism from the car-axle, and means for keeping said spring extended when the extending mechanism has been thus disconnected, all substantially as set forth.

297,309.



3. The combination of the axle B, ratchet-wheel D, pawl-carrier E, pawl F, gear-wheels C and J, shaft G, gear-wheels K and L, shaft M, chain N, spring P, sliding bar H, having an extension, A, serving as a support for the shaft G, and hand-lever I, substantially as set forth.

4. The combination, with the chain N, having a catch or stop, *n*, of the pawl O, link Q, angular lever R, link S, and hand-lever T, substantially as set forth.

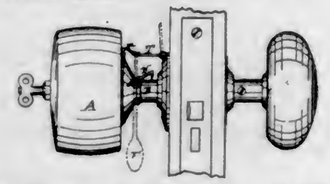
5. The combination of the frame A, axle B, ratchet-wheel D, pawl-carrier E, pawl F, gear-wheels C and J, the latter having the blank or double cog *j*, shaft G, gear-wheels K and L, shaft M, having drum *m*, chain N, having stop or catch *n*, pawl O, links Q and S, levers R and T, spring P, sliding bar H, having extension A, and hand-lever I, substantially as set forth.

297,310. FAN-BLOWER. JAMES E. STUDLEY, Oshkosh, Wis. Filed May 5, 1883. (No model.)

Claim.—1. A fan-blower provided with a series of partitions within the shell, arranged, respectively, in volute form, the beginning of said partitions being at equal distances from each other and from the axis of the fan, respectively, and corresponding in number to the blades of the fan, substantially as and for the purposes set forth.

2. A fan-blower provided with a series of partitions within the shell, arranged in a volute form and terminating in the eduction-pipe in parallel lines, substantially as described.

3. A fan-blower provided with a series of partitions within the shell, arranged, respectively, in volute form, the beginning of said partitions being at equal distances from each other and from the axis of the fan, respectively, and corresponding in number or bearing a fixed proportion to the blades of the fan, whereby the latter may be balanced while in labor, substantially as described.

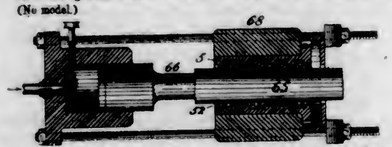


4. A fan-blower in which the air is received from side induction-pipes provided with a cylinder surrounding the axis of the fan, and to which cylinder the blades of said fan are secured, substantially as and for the purposes set forth.

5. A fan-blower provided with a seat upon the bottom and top, respectively, whereby the position of said blower may be reversed and the same adapted for use as an exhaust or pressure blower, substantially as described.

6. A fan-blower provided with a series of partitions within the shell between the fan and peripheral chamber, the beginning of said partitions being at equal distances from each other and concentric with the axis of the fan, and corresponding in number or bearing a fixed proportion to the blades of the fan, whereby said fan may be balanced while in labor, said partitions being carried outward, so that the end of one may pass the beginning of the next, substantially as and for the purposes set forth.

7. A fan-blower in which the air is received from opposite sides, provided with a series of partitions within the shell, arranged in volute form, and terminating in parallel lines in the eduction-pipe, in combination with the fan G, having the central annular disk, H, substantially as and for the purposes set forth.

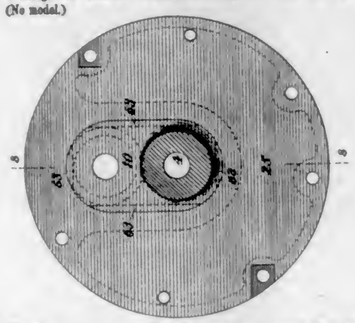


297,311. BURGLAR-ALARM. HENRY E. TABER, Watkins, N. Y. Filed Dec. 18, 1883. (Model.)

Claim.—1. In combination with the hollow resonant door-knob and spring-actuated clock-work inclosed therein, the bell-hammer connected to the verge-shaft *i*, the external detent, *m*, connected to the protruding end of said shaft, and the hinged stop T, adapted to be thrown in and out of position for engaging the detent when the knob is in its normal position, substantially as described and shown.

2. In combination with the detachable hollow knob, inclosed alarm mechanism, and detent protruding through the knob, as shown, a stop hinged on the knob and adapted to engage the detent while the knob is detached from the door, substantially as described and shown.

297,312. SHAFT-BEARING. HARRIS TABOR, Allegheny, assignor to the Westinghouse Machine Company, Pittsburg, Pa. Filed Feb. 28, 1884. (No model.)



Claim.—1. The method of forming and finishing soft-metal linings for bearings, which consists in first casting a lining around a core-mandrel of less diameter than the journal which the lining is to receive, and thereafter expanding said lining into its bearing or box, and coincidently truing and finishing its bore by the internal pressure of a finishing-mandrel of larger diameter than the core-mandrel, substantially as set forth.

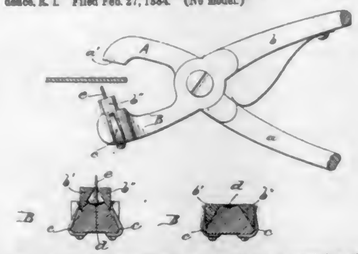
2. As a new article of manufacture, a shaft-bearing having a soft-metal lining which is expanded into position in the bearing and coincidently trued and finished by the application of internal pressure, substantially as set forth.

4.

3. The combination of a shaft-bearing and a lining of soft metal, having the wearing-surface of its bore trued and finished by compression exerted upon the natural skin or surface of the metal, substantially as set forth.

297,313. CRANK-DISK. HARRIS TABOR, Allegheny, assignor to the Westinghouse Machine Company, Pittsburg, Pa. Filed Feb. 28, 1884. (No model.)

Claim.—1. As a new article of manufacture, a crank-disk which is united to an arm or crank of a crank-shaft by being cast upon and around the same, substantially as set forth.



2. The combination of a crank-arm and a crank-disk cast upon and around the crank-arm, and engaging the same by a tongue-and-groove connection, substantially as set forth.

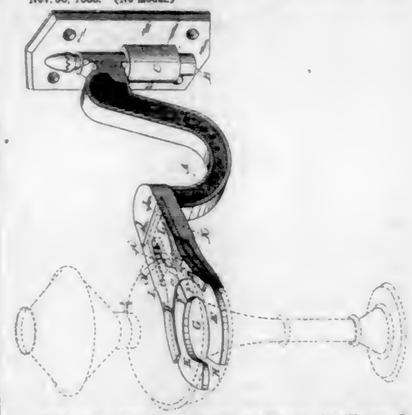
297,314. BUTTON-FASTENER. JAMES F. THAYER, Providence, R. I. Filed Feb. 25, 1884. (No model.)

Claim.—The herein-described one-piece cut-sheet-metal button-fastener A, consisting of the base *a*, projecting prong *b*, terminating in curved end *d*, substantially as shown and described.

297,315. BUTTON-SETTING IMPLEMENT. JAMES F. THAYER, Providence, R. I. Filed Feb. 27, 1884. (No model.)

Claim.—1. An instrument for setting buttons, consisting of two jaws or members, one of which is provided with supplemental movable jaws, the meeting faces of which are beveled, and which are adapted to hold the fastener and to slide out of the way while it is being secured, substantially as described.

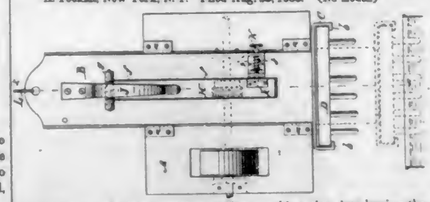
2. In an instrument for setting buttons, the combination, with the members thereof, of the movable jaws *b'* and *b''* and springs *c*, arranged and adapted for use substantially as described.



3. The herein-described instrument for attaching buttons, consisting of the member B, provided with seat *d*, movable jaws *b'* and *b''*, and spring *c*, in combination with the member A, provided with die *a'*, the whole combined, arranged, and adapted for use substantially as described and shown.

297,316. BRACE FOR SLEIGH-KNEES. ORLANDO A. THAYER, Paris, Me. Filed Nov. 23, 1883. (No model.)

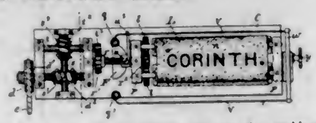
Claim.—The brace for sleds or sleighs herein described, consisting of a casting made in a single piece, and provided with an under and an inner socket adapted to respectively receive and firmly retain the extremities of the standard and cross-bar, a depending extension formed integral with said brace and adapted to act as a re-enforce for the standard, a perforation in the body of said brace for the passage and retention of the side rail of the sleigh, substantially as and for the purpose set forth.



297,317. LAMP-BRACKET. ALFRED THURSER, Concord, Cal. Filed Nov. 30, 1883. (No model.)

Claim.—In a lamp-bracket having the elevated sides K, arms D, the pivoted jaws E, forming a circular central opening adapted to receive the shank of a lamp, and provided with a flaring or beveled mouth, in combination with the backwardly-extending arms or lugs J, connected by a curved spring, whereby the jaws are closed automatically, all substantially as shown, and for the purposes described.

297,318. MACHINE FOR MOLDING GELATINE CAPSULES. WM. A. TUCKER, New York, N. Y. Filed Aug. 23, 1883. (No model.)

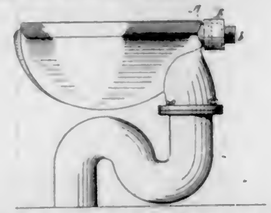


Claim.—1. In a capsule-molding machine, the plate having the openings *c* and *c*, and on which is journaled the shaft E, provided with the pulley F and pinion G, the plate B, fitted to slide in ways on plate A, and having the opening *f*, the plate H, hinged to the plate B, and provided with the rack I and spring J, and the head C, secured to said plate B, all as and for the purposes described.

2. In a capsule-molding machine, the plate A, on which is journaled the shaft E, provided with the pinion G and hub *d*, the plate B, which is provided with the spring-bolt K, and to which is hinged the plate H, that is provided with the rack I, lug *h*, and ear *k*, and the spring J, secured to the plate B, all as and for the purpose described.

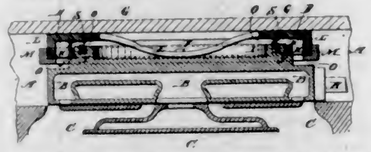
297,319. BLEACHING RAW COTTON. JOHN C. VANLOHE, Baltimore, Md. Filed Mar. 25, 1884. (No specimens.)

Claim.—The process herein described of bleaching raw cotton, which consists in first subjecting the cotton in a compressed state, as in a bale, to the action of bleaching-liquids, then rinsing the compressed and bleached cotton, then tearing the bleached and compressed cotton apart or loosening it, and then drying it, substantially as specified.



297,320. STATION-INDICATOR. MARTIN V. WALKER, Wesson, Miss. Filed Jan. 3, 1884. (No model.)

Claim.—1. In a station-indicator for cars, the combination of a station-name roll, L, mounted on rollers, a bell, F, a shaft, *r*, having a pinion, r^2, to move the rollers of the name-roll, a projecting finger, w^2, and two bell-hammers, each having a spring-arm, *w*, and adapted to be shifted so that only one of the spring-arms is within reach of the said projecting finger, as set forth.

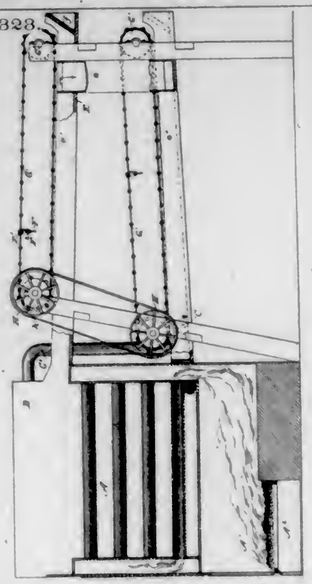


2. In a station-indicator for cars, the combination of a station-name roll, L, two rollers, *k k'*, a bell, F, two bell-hammers to be used alternately on the one bell, both being attached to a slotted bar, *w*, a set-screw, *y*, for holding the bar in either position to which it may be shifted, and a shaft, *r*, to operate the roll and hammers, as set forth.

297,321. WATER-CLOSET CONNECTION. HENRY C. WEEDEN, Boston, Mass. Filed Jan. 12, 1884. (No model.)

Claim.—The combination, with the flushing-pipe of an earthenware water-closet bowl, A, having the projections *a*, of a metallic surrounding and re-enforcing connection, B, having the reduced screw-threaded part *b* and the inwardly-projecting parts *c*, the whole being cemented and held together by a suitable cement or bind, all substantially as herein specified and described.

297,322. BALANCED SLIDE VALVE. ASHBEL WELCH, Lambertville, N. J. Filed Dec. 22, 1883. (No model.)



Claim.—1. A balanced slide-valve constructed with a balance-ring working against the inner face of the valve-chest cover, and connected to the body of the valve by a flexible diaphragm-packing and a cross-bar, and centrally secured to the valve, substantially as shown and described.

2. A balanced slide-valve constructed with a balance-ring working against the inner face of the valve-chest cover, and connected to the body of the valve by a flexible diaphragm-packing, and a cross-bar centrally secured to the valve, and having suitable springs interposed between the body of the valve and the balance-ring, substantially as shown and described.

3. The combination, in a balanced slide-valve, of the valve-body B, rabbeted at J, the balance-ring D, and the flexible diaphragm-packing H, held to the valve-body and the balance-ring at its inner and outer edges, respectively, by the ring-collars K M, substantially as shown and described.

297,323. APPARATUS FOR THE MANUFACTURE OF SALT. SCHUYLER C. WELLS, Le Roy, N. Y. Filed Feb. 1, 1884. (Model.)

297,323.

Claim.—1. The combination of the fire-box, the heating-flues directly over and at the side of the same, the dividing-wall, and the double grainers—one over the other—substantially as described.

2. The combination of the fire-box underneath the heater, the heating-tubes, the dividing fire-wall, the upright feed-flue, the force-pump, and the double grainers, arranged and operating substantially as described.

3. The combination of the solid rake-bar, the rake-driving mechanism, and the grainers—one above the other—substantially as described.

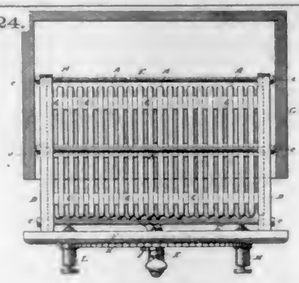
4. The combination of the rake-bar connecting the two rake-driving chains, the grainer, and the inclined drainer at the rear end of the grainer, all arranged and operating substantially as described.

5. The combination of the brine-heater and the double grainer—one arranged over the other—substantially as described.

6. The combination of the brine-heater, the double grainer, the centrifugal pump, the pump exit-pipe reaching underneath the brine in the heater, and the open space upon the upper grainer, all arranged and operating substantially as described.

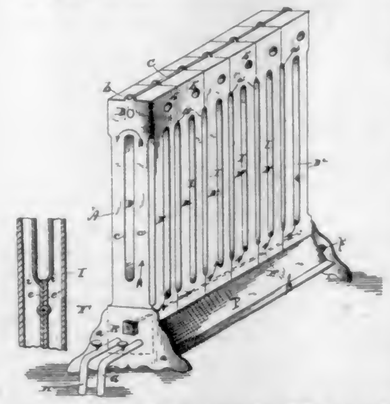
7. In a brine-heating device having return heating-flues, the combination of the upright feed-flue, the centrifugal pump, the steam-injecting pipe, connected therewith, and the pump exit-pipe, all arranged and operating substantially as described.

8. The combination of the upper grainer, the lower grainer, the connecting-conduit, and the force-pump, arranged and operating substantially as described.



9. The combination of two open-linked endless chains, running upon the same vertical level, the toothed chain-operating wheels, two of which are secured to a shaft in such manner that the two chains are kept in the same relative position, the flexibly-hinged rake, the central rake-locking devices, and the rake-retaining ribs, all arranged and operating substantially as described.

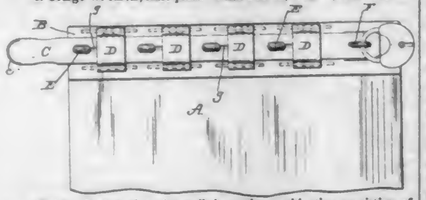
297,324. RHEOSTAT. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 19, 1883. (No model.)



Claim.—1. The combination, with a number of slabs or plates of insulating material bound together in a bundle, with interposed strips of insulating material, and wound with uninsulated resistance-coils, of a box or casing for containing the bundle, a removable cover to which the bundle is secured, a series of contact-plates on the exterior of said cover and connected with the coils, and a key or shifting-contact for including more or less of the coils in an electric circuit, as set forth.

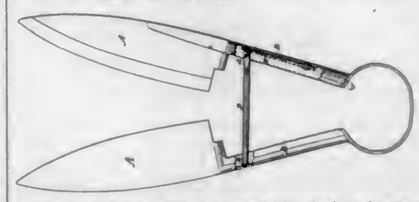
2. The combination of a number of plates or slabs, as A, wound with coils, the interposed strips or blocks, C, for keeping them apart and affording spaces for the circulation of air, the end plates D and rods E, or other suitable devices for binding the plates A together, the cover or support F, and the series of contact-plates arranged thereon and connected with the coils in substantially the manner described.

297,324.



297,325. STEAM-RADIATOR. CORYDON WHEAT, Geneva, N. Y. Filed Mar. 8, 1883. (No model.)

Claim.—1. In a radiator, the combination, with the end sections divided into vertical compartments, having a partition in the lower part thereof, and the intermediate sections having each vertical compartments and dividing-partitions in the lower parts thereof, of the inclined foot and heel rests, the said end and intermediate sections and rests being secured together, substantially as described.



2. In a radiator, the combination, with the end sections divided into vertical compartments, having vertical partitions in the lower parts thereof, an outlet and a drip pipe, of the intermediate sections having vertical compartments, and vertical partitions in the lower parts thereof, the said sections being secured together by bolts passing through lips at the top, and through a passage formed between and near the bottom of the partitions, and provided with the inclined and horizontal foot and heel rests at each side thereof, substantially as shown and described.

297,326. MAIL-BAG. FRANK WHEATON, New York, N. Y., assignor to George W. Carter, same place. Filed Feb. 12, 1884. (No model.)

Claim.—In fastenings for mail-bags, the combination consisting of the herein-described button, attached by its base to the front and exterior of the bag, near the mouth thereof, a flap extending from the rear over the mouth and front of the bag, and provided with apertures adapted to pass over the head of the herein-described button, a strap sliding upon the front of the herein-described flap, and having corresponding apertures prolonged horizontally into slots adapted to receive the shank of said button, clamps crossed over the herein-described strap to hold the same against the flap, an ordinary staple at one end of the herein-mentioned flap, upon which the sliding strap may be padlocked, with the aid of a slot cut in said strap, when the bag is closed, all as hereinbefore described, and for the purposes set forth.

297,327. ANIMAL-SHEARS. WM. F. WICKENDEN, San Luis Obispo, Cal. Filed Dec. 7, 1883. (No model.)

Claim.—1. In a pair of shears having blades, shanks, and spring, substantially as herein shown, the brace bar or rod D, pivoted by one end in one shank, and adapted, when extended transversely, to fit and secure its other end against the opposite shank, and the spring E, bearing against the pivoted end of said brace to keep it in position when closed, substantially as and for the purpose herein described.

2. In spring-shears the spring of which prevents the blade from remaining open beyond a certain width, a brace rod or bar pivoted at one end to the shank of one blade, in combination with the shank of the opposite blade, provided with a recess or socket, into which the loose end of the bar fits, substantially as and for the purpose set forth.

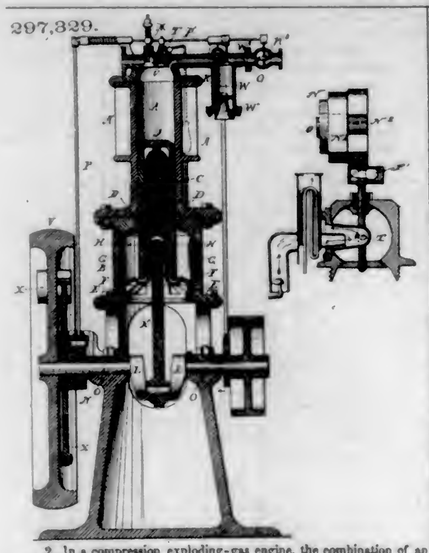
297,328. CAR-COUPLING. S. LLOYD WIEGAND, Philadelphia, Pa. Filed Sept. 3, 1883. (Model.)

Claim.—1. A car-coupling consisting of two interlocking hooks, A, of such form as to embrace the front and rear sides of the pin F, and subject the said pin to a compressing strain only in the direction of the line of draft or motion of the train, and each provided with a flaring jaw, E, adapted by its form to laterally guide the end of the opposing hook into the bottom of the converging hook and jaw, and there rigidly hold the same in proper alignment, in combination with the pin or key F, so constructed and arranged as to rigidly retain the end of each hook in the convergence of the opposite hook and jaw when the pin F is placed between the hooks A, substantially as shown, and for the purpose set forth.

2. A car-coupling consisting of two similar hooks, A, each having a flaring jaw, E, adapted to align each other, and provided with a tapering guide for supporting and guiding a central pin to a position for locking said hooks together, substantially as set forth.

3. A car-coupling consisting of two similar hooks, A, each having a flaring jaw, E, adapted to guide, by a lateral movement, the opposing hook into proper alignment in such manner as to permit the recurved or overlapping ends of the hooks A to pass each other in the act of coupling and uncoupling, with a bolt or pin, F, adapted to separate the overlapping ends of the hooks A in the direction of the line of traction of the coupling, substantially as and for the purpose set forth.

4. In a car-coupling, the combination of two similar hooks having flaring jaws, and adapted to be flexibly connected to the ordinary drawheads of railway-cars, and by their form align themselves, when forced together, with a pin or key adapted to secure them together, substantially as shown and described.



5. The combination of two similar hooks having flaring jaws, and adapted by their form to align themselves, when forced together, and susceptible of unrestricted vertical motion in each other, with a pin or other interposed body for securing the same together, substantially as set forth.

6. The combination of two similar hooks, A, having flaring jaws E, adapted to engage and align themselves, when pressed together, and be locked by an interposed pin, F, with a spring, G, arranged to disengage the same, when retracted, and present the hooks in position for re-engagement, substantially as set forth.

297,329. GAS-ENGINE. S. LLOYD WIEGAND, Philadelphia, Pa. Filed Sept. 13, 1883. (No model.)

Claim.—1. In an explosive-gas engine, a vertical exploding-cylinder provided with a heat non-conducting jacket at the upper part and a packing fitting a piston or plunger at the lower portion, substantially as and for the purpose set forth.

297,329.

2. In a compression exploding-gas engine, the combination of an exploding-cylinder with an air-pump of greater displacement than the exploding-cylinder discharging air directly into said cylinder, and a compression gas-pump delivering gas directly into said cylinder, and arranged during the same stroke to first purge the exploding-cylinder and afterward compress therein a charge of air and inflammable gas or vapor, substantially as and for the purpose set forth.

3. In a compression explosive-gas engine, in combination with a vertically-reciprocating piston or plunger working in a heated compression exploding cylinder or chamber, a packing located below the heated portion of said cylinder, fitting between the exploding-cylinder and air-pump and around the piston or plunger, substantially as and for the purpose set forth.

4. In a compression explosive-gas engine, the combination of an exploding-cylinder provided with an exhaust-valve operated by a cam controlled by a speed-regulator, so as to automatically vary the time of closing said valve in the compression or return stroke, with a pump arranged to force gas or mixtures of air and inflammable vapor into the said exploding-cylinder, and having a valve arranged to admit gas or air and inflammable vapor to the said pump during the outward stroke thereof, and to be held open by a cam controlled by a speed-regulator to varying points during the returning stroke, and thereby permit varying portions of the charge to return through the said admission-valve to the supply-pipe, and automatically regulate the speed of the engine by changing the volume of inflammable charge introduced into the exploding-cylinder, substantially as and for the purpose set forth.

5. In an explosive compression gas-engine, the combination of an igniting-chamber containing a body heated by an external flame, with a valve opening and closing communication between said chamber and the exploding-cylinder, said valve being operated by a cam varied and controlled in position by a speed regulator, so as to change the time of closing communication between the igniting-chamber and the exploding-chamber, substantially as and for the purpose set forth.

6. In a compression explosive-gas engine, the combination of a gas-pump, arranged to deliver gas into the exploding-cylinder, with a valve admitting gas into said pump, operated by a cam to close at varying positions of the pump, said cam being adjusted automatically, and controlled by a connected speed-regulator, substantially as and for the purpose set forth.

7. In an explosive compression gas-engine, the combination of a vertical air-pump piston, E, with a vertically-moving propelling trunk or piston, C, having a less displacement than the piston E, and reciprocating in an exploding-cylinder, A, of less capacity than the said air-pump cylinder B, and having ducts H, for admitting air into the exploding-cylinder A from the air-pump cylinder B, substantially as shown and described, and for the purpose set forth.

8. The combination of the piston C, provided with air-channels H, valve J, and piston E, having valves F, arranged to work in the cylinder G, substantially as and for the purpose set forth.

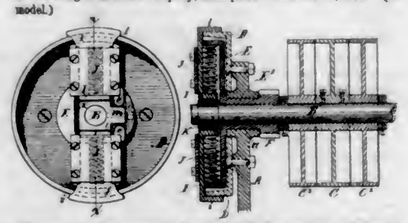
9. In an explosive compression gas-engine, the combination of a pump arranged to compress inflammable gas or inflammable mixtures of air and vapor and deliver the same directly into the pressure or exploding cylinder, with an inlet-valve arranged to admit gas or inflammable mixtures of air and vapor to the said pump throughout the outward stroke, and controlled by a cam operated by a connected speed-regulator, so as to close said valve at varying points in the returning stroke of the pump, for the purpose of varying the quantity of gas or equivalent inflammable charge introduced into the exploding-cylinder at each stroke by permitting variable portions thereof to return through the inlet-valve to the supply-pipe or reservoir, substantially as set forth.

10. In a compression gas-engine, the combination of a speed-regulator with a cam arranged and connected with the exhaust-valve of the exploding-cylinder, so as to control and regulate the volume of air shut up and compressed in the exploding-cylinder proportionately to any variations in the velocity of the engine, for the purpose of compensating and correcting such variations, substantially as shown and described.

11. The combination, in an explosive compression gas-engine, of a speed-regulator with the cam connected with and arranged to operate the exhaust-valve of the pressure-cylinder and the inlet-valve of the gas-pump, so as to open and close said valves at varying points in the piston-stroke of the engine, and thereby varying the volumes of air and inflammable gas or vapor to the pressure-cylinder for the purpose of compensating for variations in speed and maintaining uniform velocity of the engine.

12. In a compression explosive gas-engine, the combination of an air-pump forming a guide for the piston of the pressure-cylinder, and directly forcing air through the pressure-cylinder, for first purging the same of the products of the preceding combustion, and afterward for compressing charges of air in definitely-measured proportions to charges of gas forced into said cylinder, substantially as and for the purpose set forth.

13. In a compression explosive gas-engine, the combination of an igniting-chamber with a valve communicating with and shutting off communication with the exploding-chamber, and adapted, when open, to direct a current of air through the igniting-chamber, substantially as and for the purpose set forth.



14. In a compression explosive gas-engine, the combination of an igniting-chamber containing an incandescent body with an exploding or pressure cylinder, and having a valve controlling communication between them connected with an operating mechanism, to close the igniting-chamber from the pressure-cylinder at low pressure in both vessels, and to open and admit a portion of the explosive charge from the cylinder to the igniting-chamber when under higher pressure, for the purpose of igniting the same.

15. In a compression explosive gas-engine, an igniting-chamber containing an incandescent body heated by a flame-jet applied internally to said incandescent body, substantially as set forth.

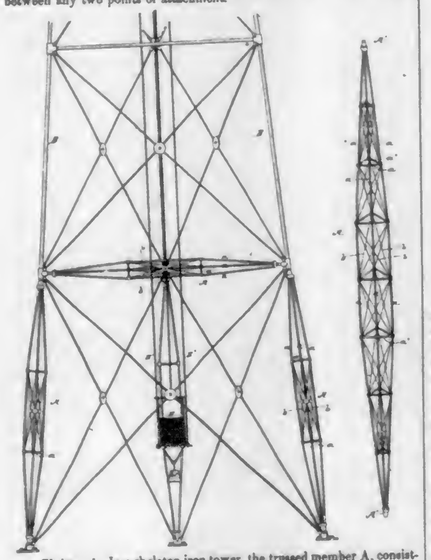
16. In a compression explosive gas-engine, an igniting-chamber containing an incandescent body heated by a jet of flame external to the said chamber, supplied with air heated by the escaping products of combustion of said flame, substantially as set forth.

17. In a compression exploding gas-engine, the combination of an air-pump forming a guide for the power-receiving piston, and arranged to directly purge the exploding-cylinder, and during the same stroke compress air therein, a gas measuring and compressing pump, a speed-regulator connected with and operating the inlet-valve of the gas-pump and the exhaust-valve of the pressure-cylinder, and an igniting-chamber connected by a valve with the exploding-cylinder, and operated by a cam rotated with a fly-wheel and shaft, receiving motion through a crank and pitman, operated by the piston or trunk propelled by the explosion of air and combustible gas in the exploding-cylinder, substantially as and for the purpose set forth.

297,330. MECHANISM FOR CHECKING OR STOPPING THE ACTION OF MACHINERY. JACOB D. WRIGHT, Worcester, Mass., assignor to the Wright Machine Company, same place. Filed Dec. 5, 1883. (No model.)

Claim.—1. The revoluble head or disk E, provided with lugs *c*, and carrying radially-moving friction-pad slides I, with recoil-springs J, in combination with a stationary concentric friction-flange, D, and a centrally-located operating-hub, K, having a projection, *m*, for engaging said disk, and provided with angles *l*, for moving said slides when the hub is turned to the position of engagement with said disk, substantially as set forth.

2. The combination, substantially as hereinbefore described, of the shaft B, having the hub K fixed thereon, the head or disk E, mounted loose on said shaft, and carrying the driving-pinion F, the radially-moving slides I, carrying friction-pads *i*, the springs J, the stationary friction-rim D, and means for effecting engagement between said hub and disk, and for moving said slides by action of the hub, as set forth.



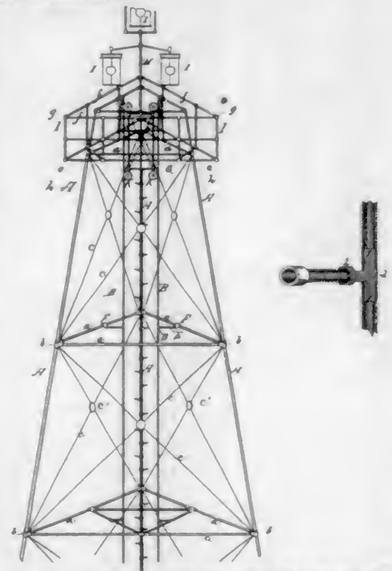
3. The combination of the following elements, viz: a central shaft, stud, or axis, a frictional surface concentric therewith, frictional pads for engaging said surface mounted on guiding-slides, in connection with a support plate or disk concentric with or centered upon said axis, and provided with springs for forcing the pads against said frictional surface, and a central hub or device adapted for counteracting said springs and relieving the frictional contact when the motive force is applied for starting and operating the machinery.

4. A head or disk carrying slides or friction-pads operated by springs, and a friction flange or plate, either of which may be stationary and the other revoluble, in combination with a suitable device for operating the friction-pads against the action of the springs when the motive power is brought into action, substantially as set forth.

5. The friction-slides, with their pads and springs, and the friction-flange, in combination with means for automatically relieving the friction and permitting the operation of the mechanism when power is applied to the revoluble shaft by the action of the propelling force exerted through said shaft.

297,331. SKELETON TOWER. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed Sept. 7, 1881. Renewed Jan. 3, 1883. Again renewed Mar. 17, 1884. (No model.)

Brief.—A trussed skeleton frame or member composed of three or more sub-members which are spread centrally and converge at their ends, where they are joined in a connecting-piece, and being straight between any two points of attachment.



Claim.—1. In a skeleton iron tower, the trussed member A, consisting of three or more sub-members, *a*, centrally spread and converging, and connected at their ends, and joined by cross-ties intermediate to their ends, said sub-members being straight between adjacent points of attachment, whereby longitudinal compressive strain upon the entire member A gives direct longitudinal compressive strain upon all parts of each sub-member, substantially as described.

2. In a skeleton iron tower, the combination, with the base piece or step, of the trussed member A, consisting of three or more sub-members spread centrally, converging at their extremities, straight between their connections, and joined by end connecting-pieces, A', and intermediate ties, as set forth, the lower of said end pieces being provided with an eye, and connected with the base-piece, substantially as and for the purposes set forth.

3. A trussed skeleton member open at its center, triangular in cross-section, its members arranged to resist crushing, tensile, and transverse strains, constructed in sections with cylindrical, longitudinal, and transverse sub-members screw-threaded at their ends, connected by screw-threaded couplings, and trussed by diagonal adjustable tension brace-rods, the end sections of the longitudinal sub-members being connected to and diverging from unitary couplings at each end of the member, substantially as described and shown.

297,332. ELECTRIC-LIGHT TOWER. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed July 16, 1881. Renewed Mar. 17, 1884. (No model.)

Brief.—The lamp-carriage moves up and down on the way in the interior of the tower, and its mast, to which the lamps are hung, projects above the top of the tower when it is elevated. The coupling connecting the tubes of the uprights is made with a tenon to enter and fit into each adjoining tube-section, and is provided with a socket to receive the ends of the connecting-tubes.

Claim.—1. The combination, with a tower and a way, of a lamp-carriage mounted in said way and projecting above the top of the tower, substantially as described.

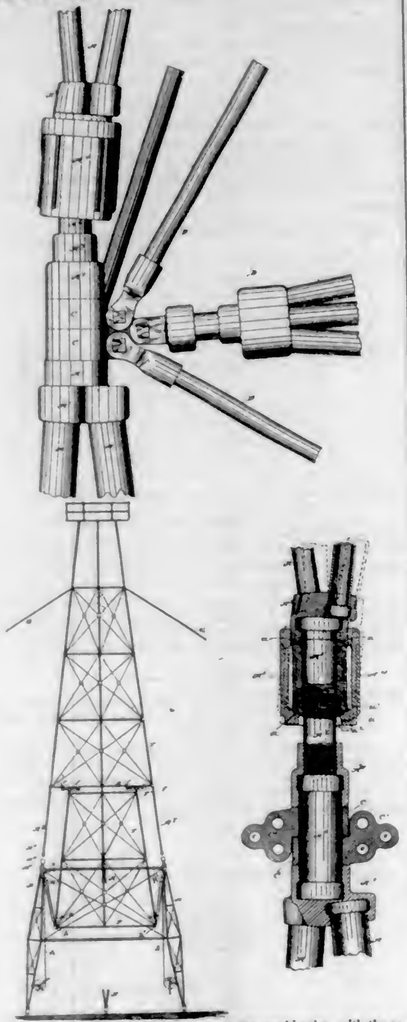
2. The combination, with a tower, of a lamp-carriage and a way for the same, said carriage being provided with a mast for supporting a lamp above the top of the carriage, substantially as described.

3. The combination, with a tower and an interior way, of a lamp-carriage mounted in said way, and one or more electric lamps supported on said carriage, substantially as described.

4. The combination, with a cross-sectionally-angular tower and a movable lamp-carriage, of lamps mounted upon the carriage and moving up and down in the angles of the tower, substantially as described.

5. The combination, with a tower and an interior way, of a lamp-carriage mounted in said way and projecting above the tower, substantially as described.

6. The combination, with a tower and a centrally interiorly arranged way, of a lamp-carriage mounted in said way, substantially as described.



7. The combination, with a tower and a centrally interiorly arranged way, of a lamp-carriage mounted in said way, and means for raising and lowering said carriage, substantially as described.

8. The combination, with a skeleton tower and an interior way, of a lamp-carriage supported in said way, and one or more electric lamps mounted on said carriage, substantially as described.

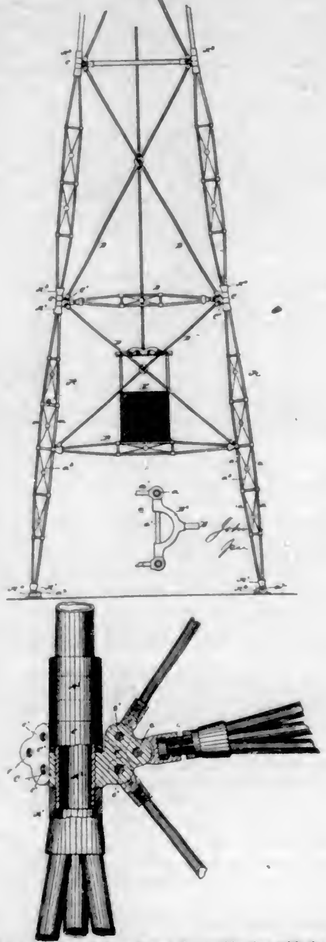
9. The combination, with the sectional tubular way, the girts, and the connecting-tubes, of a coupling provided with tenons entering each opposing tube-section of the way, and with a socket receiving the ends of the connecting-tubes, substantially as described.

297,333. SKELETON IRON TOWER AND MODE OF ERECTING THE SAME. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed Dec. 8, 1882. Renewed Mar. 17, 1884. (No model.)

Brief.—The uprights of the adjacent sections of a skeleton tower are united by universal-joint couplings consisting of a steel nipple threaded into a sleeve having rounded ends, the sleeve inclosed in a shell rounded in its lower end and connected by a screw-thread to a nut fitting the upper rounded end of the sleeve. The upper part of the tower is erected within the permanent lower section of the tower, and is raised by a hoisting-tackle and a false work of a greater height than the uprights to be inserted.

Claim.—1. In a skeleton iron tower, the combination, with the uprights, of universal-joint couplings uniting adjacent sections, substantially as described.

2. In a skeleton iron tower, the combination, with the adjacent tower-sections, of the sleeve A^2, having its ends rounded in the surface of a sphere, the correspondingly-socketed coupling-nut A^3, and the shell A^4, constructed to engage the lower end of the sleeve, and threaded to the nut A^3, substantially as described.



3. In combination with adjacent tubular tower-sections, the steel nipple A^2, sleeve A^2, shell A^4, and nut A^3, substantially as described, and for the purposes set forth.

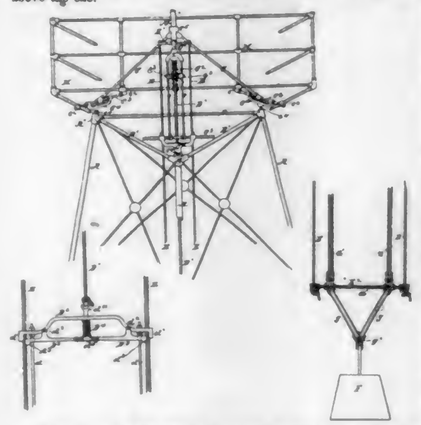
4. The method, substantially as described, of constructing skeleton towers, which consists in building both upper and lower parts on the ground, the latter permanently in place, the former within the latter, and finally raising the upper part and connecting it to the lower part, substantially as described.

5. In combination with the permanently-set lower section of the tower, with an upper part of the tower erected within the same, and with suitable hoisting-tackle, a false work, F, of greater height than the length of the tower section or uprights to be inserted, substantially as described.

297,334. SKELETON TOWER. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed June 13, 1882. Renewed July 30, 1883. Again renewed Mar. 17, 1884. (No model.)

Brief.—The girts are connected to the lower sections of the uprights between their ends by a branched coupling fitting on the cross-ties of the sections. The couplings by which the girts and diagonal braces are joined to the uprights, at the ends thereof, are formed with eyes, which are slipped over the tubes at the joint, and offset apertured lugs, to which the girts and braces are pivotally secured.

Claim.—1. In a skeleton tower, the combination, with the girt B, connected to the lower sections of the tower-uprights between their ends, of the said uprights having the trussed construction described, and the diagonal braces terminating at their lower ends at or near their girt extremities, substantially as described, and for the purposes set forth.



2. In a skeleton tower, the combination, with uprights A and horizontal girts, of the couplings formed of the two eyes C, having apertured lugs C', and suitable means for retaining the eyes in place upon the uprights, substantially as described, and for the purposes set forth.

3. As a special fitting for use in the construction of skeleton towers, as described, the casting composed of the eye C and the lug C', the latter being offset, as shown, and provided with the apertures *c c'*, arranged substantially as shown, and for the purposes stated.

4. In combination with the trussed sections of the tower-uprights and with the girt B, the fitting B'', centrally connected with the girt and embracing the tie *a'* at or near its ends, substantially as described.

297,335. SKELETON TOWER. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed Oct. 12, 1881. Renewed Mar. 17, 1884. (No model.)

Brief.—The inclined standards, which are supported by the uprights, are joined by a coupling at their upper ends and support the mast for holding the light, and also the guide and hoist ropes of the elevator-cab, which is placed in the interior of the tower. The hoist-rope runs over a pulley which is adjustable on its supporting-rods. The fittings on the lower ends of the inclined standards, which also support the landing, are screw-threaded into the couplings which connect them to the uprights. A weight secured to the lower ends of the guide-ropes holds them taut, while permitting expansion and contraction. A platform-landing is secured to the lower ends of the guide-ropes. Clamping-bars arranged to grip the guide-ropes, if the hoisting-rope breaks, are arranged above the cab.

Claim.—1. The combination of a tower, an electric lamp supported thereby, and an elevator mechanism placed in the interior of the tower, by which an attendant may reach the lamp, substantially as described.

2. In combination with the tower-uprights and the inclined standards C, the duplex standard C' and the pulley C^2, mounted upon the legs *c c* of the latter, substantially as and for the purposes stated.

3. In combination, the duplex leg C', pulley C^2, and bearings c^3, adjustably secured to the legs *c c*, substantially as described, and for the purposes set forth.

4. In combination with the three or more converging standards forming the apex of the tower, as described, the mast A^2 and a suitable connecting-piece, C^4, which joins the standards and supports the mast, substantially as and for the purposes set forth.

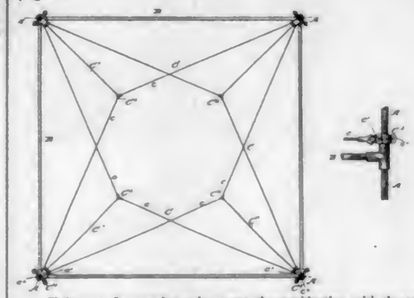
5. In combination with the uprights A and the inclined standards supported thereby, adjustable connections joining the standards with the uprights, substantially as described, and for the purposes set forth.

6. In combination with the uprights A and the inclined standards, the branched fittings C^4, and horizontal rods C^3, extended to give support to a landing, substantially as described.

7. In combination with the hollow tower, guides E for a cab, suspended from the top of the tower, means for securing the guides E at their lower ends, and means for holding them at a suitable and equal distance apart at both their ends, substantially as and for the purposes set forth.

8. In combination with a tower and an elevator cab or carriage, the suspended flexible guides E and means for holding said guides in practically uniform tension materially greater than is due to their weight, which means automatically yield with the expansion and contraction of the said guides, substantially as described.

9. In a tower, the combination, with suspended elevator-guides E, subject to expansion and contraction, of a weight suspended thereby clear of the ground, whereby a practically uniform tension is maintained upon said guides materially greater than that due to their own weight, while permitting them to expand and contract, substantially as described.



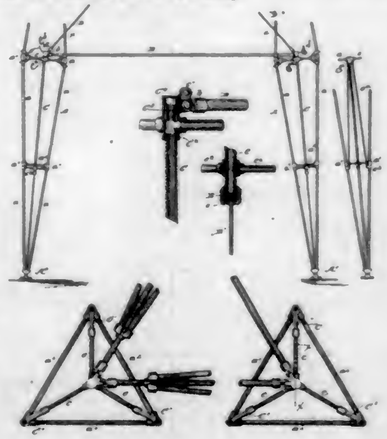
10. In combination with a skeleton tower, provided with an interior elevator, the platform G, forming a lower landing from which access may be had to the elevator cab or carriage, and located at a suitable elevation to allow passage beneath the same, substantially as described.

11. In combination with the suspended cab-guides E, the platform G, suitably supported at its outer end, and supported at its inner end from the guides E, substantially as described.

12. In combination with the flexible cab-guides E, the cab provided with clamping-bars D^2, arranged and actuated to bear upon the guides when the lifting-rope breaks, and fixed opposing bearings *d'*, whereby the ropes are first more or less deflected and then grasped, substantially as described.

297,336. SKELETON IRON TOWER. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed May 31, 1883. Renewed Mar. 17, 1884. (No model.)

Brief.—Combines with the uprights of a quadrangular tower diagonal ties centrally deflected by means of ties secured to the intermediate uprights.



Claim.—1. In a quadrangular tower, the combination, with the uprights, of the diagonal ties C and the ties C', the former of said ties being centrally deflected, and the latter operating to hold the former under proper tension in such deflected position, substantially as described.

2. In the quadrangular tower, the combination, with the uprights, of the four diagonal ties C C, connected in pairs to the diagonally-opposite uprights, and the ties C' C', connected severally with the ties C and with the intermediate uprights, whereby the said ties C are held centrally deflected at opposite sides of the tower-axis, substantially as described.

297,337. SKELETON TOWER. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed May 31, 1883. Renewed Mar. 17, 1884. (No model.)

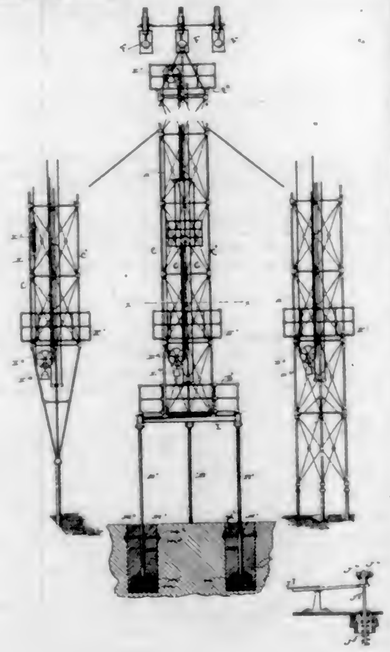
Brief.—The top of a center-post connected to the base-casting of a compound member is united to converging sub-members by a coupling. At the top of the center-post is a cap, to which a girt and diagonal brace are attached. The lower end of the center-post rests in a cap having a headed bolt threaded into the base-casting.

Claim.—1. In a skeleton iron tower, the combination, with the compound member A, of a part located and duly supported in the axis of said member, and between the ends thereof, and adapted for the attachment of a girt or brace, substantially as described.

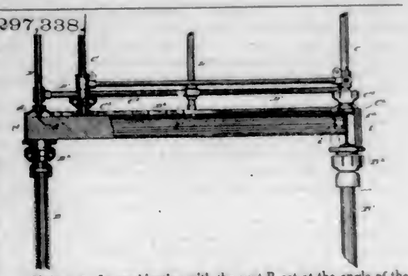
2. In a skeleton iron tower, the combination, with the sub-members *a* of the compound member A, of radial sub-members *c*, and a coupling supported thereby, for the attachment of a girt or brace, substantially as described.

3. In combination with the compound upright A and diagonal brace D, the converging sub-members *c*, means for connecting said members with the diagonal brace, and means for resisting the upward strain of said diagonal brace upon the sub-members *c*, substantially as described.

4. In combination with the upright A and diagonal brace D, the converging sub-members *c* and a center-post, C, connected with the base-casting A', substantially as described.



5. In combination with the compound upright A, the converging sub-members *c*, center-post, C, couplings C^2, and cap C^4, the latter constructed to afford attachment for the girt and diagonal, substantially as described.



6. In combination with the sub-members *a* and coupling *a'*, Fig. 6, the central coupling, C^2, the threaded brace *c*, and nuts c^4, substantially as and for the purpose set forth.

7. In a compound member, A, the combination, with the centrally-supported coupling for a brace or girt, of a cap, E, and a headed bolt, E', threaded into the base-casting, substantially as described.

297,338. SKELETON TOWER. JOHN S. ADAMS, Elgin, Ill., assignor to the Detroit Iron Tower Company, Detroit, Mich. Filed May 31, 1883. Renewed Mar. 17, 1884. (No model.)

Brief.—The tower-uprights are supported by a post set at the angle of a sidewalk, and by posts set at the opposite sides of the cross-walk from the post at the angle, the posts being joined by beams. The posts are surmounted by recessed castings, in which rest the ends of the beams, the castings being connected with the posts by adjustable union-joints. A rail-post is threaded at its lower end through the upper part of each recessed casting, and has a point set in its lower end and entering the beam. The elevator-cab has an endless counterweighted hoisting-rope, connected therein and in reach of the occupant, and a foot-piece to release blocks clutching flexible guide-ropes, by means of followers pressed outward by spring-actuated toggle-arms. The base-posts rest in masonry, with collars and cross-rods embedded therein, the rods having nuts external to the masonry.

Claim.—1. In combination with the post B, set at the angle of the walk, and the posts B' B', set at the opposite side of the cross-walks from the post B, the beam I, joining the posts B', and the tower-uprights C, C', and C', deriving their support from said posts and beams, substantially as described.

2. In combination with the tower-uprights C, C', and C', the base structure described for the intersection of street-walks, consisting, essentially, of the posts B, B', and B', set in the relative position shown, and the beams I and I', joining said posts, and forming the immediate supports for the tower-uprights, substantially as described.

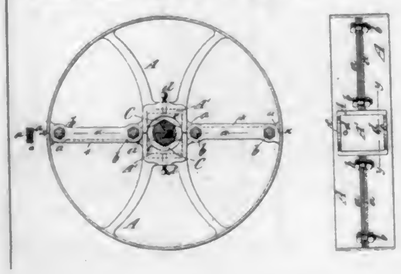
3. In combination with the posts B and B', and with the connected beams I and I', arranged as shown, the recessed castings I^3, surmounting the posts, and means for securing the ends of the beams to the said castings, substantially as described.

4. In combination with the posts B and B', and with the beams I and I', the castings I^3, forming seats for the ends of the beams, and adjustable union-joints B^3, connecting said castings with the posts, substantially as described.

5. In the base tower structure described, the combination, with the beams I and I' and recessed castings I^3, of the points *d*, inserted through the castings I^3, and entering the beams, substantially as described.

6. In combination with the recessed casting I^3 and beam I or I', the rail-post D, threaded through the upper surface of said casting I^3, and the point *d*, set in the lower end of the post D, substantially as described, and for the purposes set forth.

7. In a tower, the combination, with the elevator-cab and its guides, of an endless hoisting-rope, having the cab connected therein, and a counter-weight connected in said rope, said rope being arranged in convenient reach of the occupant of the cab, substantially as described, and for the purposes set forth.



8. In combination with the elevator-cab, the hoisting-rope arranged in convenient reach of the occupant, a counter-weight connected with the rope, and means for holding the cab stationary in the absence of the occupant, substantially as described.

9. In combination with the cab-hoisting rope, counter-balance, and means whereby the occupant may raise and lower the cab, means for normally holding the cab locked to the guides, and means whereby the occupant may release the cab, substantially as described.

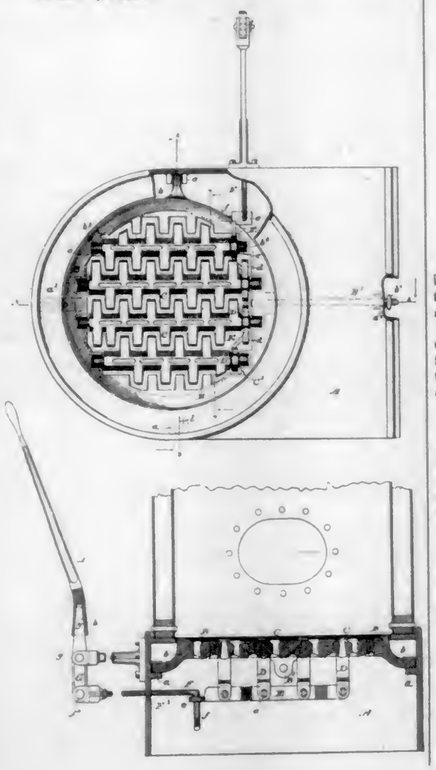
10. In combination with the cab, and with the flexible guide-ropes G therefor, the boxes J^3, suitable clutch-blocks contained therein, followers J^3, toggle-arms J^4, means for normally depressing the toggle, and means whereby the occupant may release the toggle, substantially as described.

11. In combination with the base posts or post of a tower, and with the masonry forming the foundations of the same, the collar M' and rods M^3, provided with suitable nuts external to the masonry, substantially as and for the purpose set forth.

297,339. SPLIT PULLEY. JOHN N. BALDWIN and THOMAS O. STILES, Bloomfield, N. J. Filed Feb. 25, 1884. (No model.)

Claim.—1. The combination, with a split pulley the sections of which may be separated to enable them to be placed on a shaft, of two clamps, with which the sections of the pulley are connected, and which have concave faces, and means whereby said clamps may be adjusted to and tightened upon the opposite sides of a shaft, to hold the shaft between their concave faces, substantially as herein described.

2. The combination, with a split pulley the sections of which may be separated to enable it to be placed on a shaft, of two clamps having angular or V-shaped faces, and with which the sections of the pulley are connected, and means whereby the clamps may be adjusted to and secured upon a shaft, substantially as herein described.



3. The combination, with a split pulley, of two clamps, with which the sections of the pulley are connected, and bolts passing through the two clamps on opposite sides and independent of the pulley, whereby the clamps may be tightened upon a shaft, substantially as herein described.

4. The combination, with the halves of a split pulley, of arms which are formed with the halves or sections, and which lap on or over each other in planes transverse to the axis of the pulley, and bolts inserted through said lapping arms in a direction parallel with the axis of the pulley, substantially as herein described.

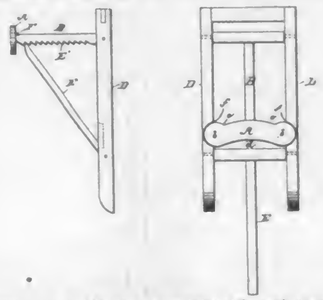
5. The combination, with the halves or sections of a split pulley, of two clamps connected with the pulley, and having faces which are recessed or cut away between their ends, so as to obtain a bearing near each end, and means independent of the pulley for securing said clamps upon a shaft, substantially as herein described.

6. The combination, with the halves or sections of a split pulley, A A, each having a cavity or box, A′, in which are openings or slots *e*, of the clamps C, provided with lugs or ears *e′*, extending through said openings or slots *e*, bolts *g*, passing through said lugs or ears, and serving as a means of tightening the clamps upon a shaft, and bolts for securing the halves or sections of the pulley to said clamps, substantially as herein described.

297,340. GRATE. LEMUEL BANNISTER, Philadelphia, Pa. Filed Apr. 28, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the casing, the grate-frame pivoted therein, the grate-bars pivoted in the grate-frame, their pendants, the coupling-bar, the link-rod connected with the bar by a swivel-connection, and the curved guide on the link-rod to enable the coupling-bar to conform without strain to the tilting movements of the grate.

2. The combination, substantially as hereinbefore set forth, of the tilting grate-frame, the grate-bars rocking therein, the pendants, the coupling-bar, the link-rod, the swivel-connection between the bar and link, and the guide-slot in the casing.



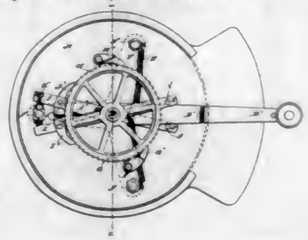
3. The combination, substantially as hereinbefore set forth, of the casing, its open bearings, the grate-frame, its trunnions resting in said bearings, the open bearings of the grate-frame, and the grate-bars resting therein, whereby both the grate-frame and grate-bars readily may be assembled or separated from each other and from the casing.

4. The combination, substantially as set forth, of the grate-frame, the grate-bars, the pendants for rocking the grate-bars interposed between the studs and trunnions of the grate-bars inside the grate-frame, and the wings *d* of the pendants, which constitute grate-bar teeth which serve to agitate the fuel.

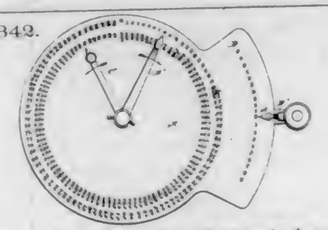
5. The combination, substantially as hereinbefore set forth, of the casing, the tilting grate-frame, the grate-bars rocking therein, the tilting-handle of the grate-frame, the pendants, their enlarged heads, the coupling-bar, the link-rod, the loose or swivel-joint connection between the bar and link, the rocking lever, and the guide-slot in the casing.

6. The combination of the casing, the pivoted grate-frame, the trunnions on the sides of the grate-frame on which the frame rocks, the handle rigidly secured to the front of the grate-frame, and means for suspending the handle so as to hold the grate in a horizontal position, substantially as set forth.

297,341. CLOTHES-HANGER. LOUIS BARXANT, Baltimore, Md. Filed Jan. 3, 1884. (No model.)



Claim.—1. A clothes-hanger consisting of the notched arm B, having a cross-bar, A, hinged at its free end, and a prop, E, for supporting the arm, the arm and prop being pivoted to the support D, substantially as shown and described.

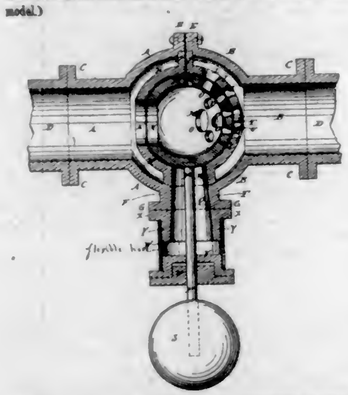


2. A clothes-hanger consisting of the notched arm B, having the cross-bar A at its free end, and formed with enlargements *b b* at its ends for holding a garment thereon, and a prop, E, for supporting the arm, the arm and prop being pivoted to the support D, substantially as shown and described.

297,342. ADDING-MACHINE. WILLIAM HENRY BEATLEY, Hurdsville, Ma. Filed Aug. 14, 1883. (No model.)

Brief.—Movement of the lever to one side of the central "0" actuates the units index; to the other side, the tens index. Each index, with its actuating devices, is independent of the other.

297,342.



Claim.—1. The combination, with the dial A, bearing the two concentric circular series of numerals B and C, reading in opposite directions, and also bearing a row of numerals, D, proceeding both ways from a central zero, of indicator-hands B′ C′, supported centrally of the series B and C, a lever movable in the direction of the row of numerals D, and mechanism connecting the lever with the indicator-hands, constructed to move said hands independently in opposite directions, whereby movements of the lever D to points opposite given numerals in the row D′ will carry the indicator-hands a corresponding number of places along the series B and C, substantially as and for the purposes set forth.

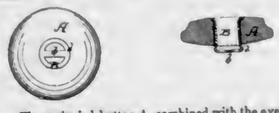
2. The combination, with the dial-plate bearing circular series of numerals B and C, of a central arbor, E, oppositely-toothed fast and loose ratchets G and H, indicator-hands B′ and C′, a hand-lever, D′, and movable pawls arranged to engage the ratchets, and constructed to be thrown, one in one direction and the other in the other direction, alternately by vibration of the hand-lever, substantially as described.

3. In an adding-machine, the combination, with the arbor E and ratchet-wheels G and H, mounted thereon, of a freely-pivoted lever, D′, pawl-levers I and J, separately movable by vibration of the hand-lever, a stop or stops for said pawl-levers, means for returning the pawl and hand-levers to their normal positions, and means for preventing the rotation of the ratchets during the return of the pawl-levers, substantially as described.

4. In an adding-machine, the combination, with the arbor E and fast and loose oppositely-toothed ratchets G and H thereon, of the lever D′, pawl-levers I and J, provided with pins *i* and *j*, springs O and P, and detent-pawls G′ and H′, substantially as and for the purposes set forth.

297,343. MARINE-ENGINE GOVERNOR. ALEXANDER HAMILTON BELL and ASPINWALL FULLER, New York, N. Y. Filed Dec. 17, 1883. (No model.)

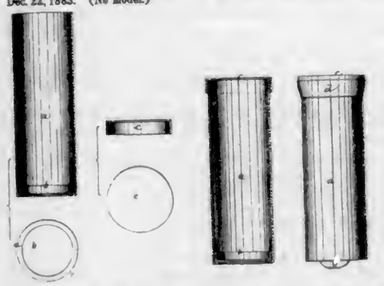
Claim.—1. A marine-engine governor constructed substantially as herein shown and described, and consisting of the shell A B, the two-part spherical valve-seat H I, having flanges J and perforations K L R, the spherical valve M, having perforations N O, and provided with a weighted valve-stem, P, and the stuffing-box V and flexible connecting-hose W, as set forth.



2. In a marine-engine governor, the combination, with the shell A B, of the two-part spherical valve-seat H I, having flanges J and perforations K L R, and the spherical valve M, having perforations N O, and weighted stem P S, substantially as herein shown and described, whereby the admission of steam will be regulated and stopped by the rocking and pitching of the vessel, as set forth.

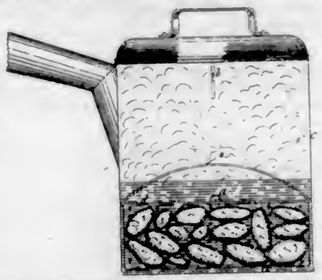
3. In a marine-engine governor, the valve constructed substantially as herein shown and described, and consisting of the two-part spherical seat H I, having flanges J and perforations K L R, and the spherical valve M, having perforations N O, and weighted stem P, whereby the rocking and pitching of the vessel will move the said valve to partly or fully shut off steam, as set forth.

4. In a marine-engine governor, the combination, with the valve-seat H I, having vertical slot U, and the valve M, of the pin T, substantially as herein shown and described, whereby the said valve is kept from turning about the axis of its stem, and taking its perforations out of register with the perforations of the valve-seat, as set forth.



5. In a marine-engine governor, the combination, with the collar F of the shell A B, and the valve-stem P, of the stuffing-box V, and the flexible hose W, substantially as herein shown and described, whereby the escape of steam around the oscillating valve-stem will be prevented, as set forth.

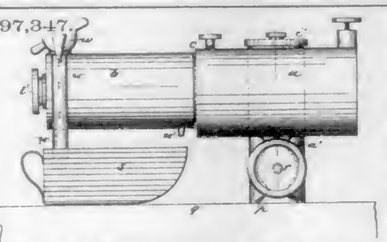
297,344. BUTTON. JOHN BIRD, Union City, Conn. Filed Feb. 8, 1884. (No model.)



Claim.—The swiveled button A, combined with the eyelet B, which has lower enlargement, *d*, that projects beyond the back of the button, and integral cross-bar *b*, substantially as herein shown and described.

297,345. CARTRIDGE-SHELL. PAUL BOCA, Paris, France. Filed Dec. 22, 1883. (No model.)

Claim.—As an improved article of manufacture, a cartridge-shell constructed of a tube, *a*, with an inturned flange, a bottom, *b*, with a flange, and a flanged cap, *c*, the said three parts being made from celluloid or its specified equivalent, and cemented together, substantially as set forth.



297,346. POTATO-STEAMER. CHRISTOPHER FABIAN BOWER, 43 College Street, Liverpool Road, County of Middlesex, England. Filed Aug. 24, 1883. (No model.) Patented in England Feb. 13, 1883, No. 780.

Claim.—The saucepan *c*, having a stud, *b*, secured thereto at or near its upper end, in combination with the vessel *d* fitting therein, and having the loop *a*, secured thereto at or near its upper end, and provided with the handle *e*, substantially as described.

297,347. LUBRICATOR. HENRY R. A. BOYS, Barrie, Ontario, Canada. Filed Jan. 17, 1884. (No model.)

297,347.

Claim.—1. A lubricator constructed with an oil-cylinder and forcing-piston and a liquid-gage cylinder and forcing-piston so arranged with relation to each other that the outward pressure of the lubricant by the piston of one cylinder shall cause a corresponding outflow of the liquid from the other cylinder to measure the rate of feed of the lubricant, substantially as shown and described.

2. A lubricator constructed with an oil-cylinder, *a*, and a gage-cylinder, *b*, provided with connecting-pistons *d e*, and having a transparent passage, *u*, for the gaging-liquid, to indicate the rate of feed of the lubricant, substantially as shown and described.

3. A lubricator constructed with oil-cylinder *a* and gage-cylinder *b*, connected in the line by a plug, *c*, and provided with pistons *d e*, to be moved one by the other, substantially as shown and described.

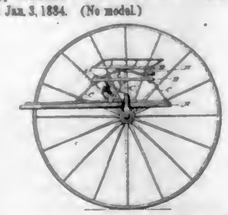
4. The combination, with the oil-cylinder *a*, of its piston *d*, passages *m*, *l*, and *o* in and along the side wall of the said cylinder, and the valve *n*, substantially as shown and described.

5. The combination, with the gage-cylinder *b*, of its piston *e*, pipe and valve *t t'*, and the valve *w*, substantially as shown and described.

6. The combination, with the oil-cylinder *a*, having piston *d*, and rod *f*, passages *m l o*, and valve *n*, of the gage-cylinder *b*, having piston *e*, pipe and valve *t t'*, valve *w*, and sight-glass *u*, substantially as shown and described.

7. The combination, with the gage-cylinder *b* and its piston *e*, pipe *t*, valve *t'*, and drop-valve *w*, of the vessel *s*, substantially as shown and described.

8. The combination, with the gage-cylinder *b* and vessel *s*, of the drip-nozzle *u'*, substantially as shown and described.

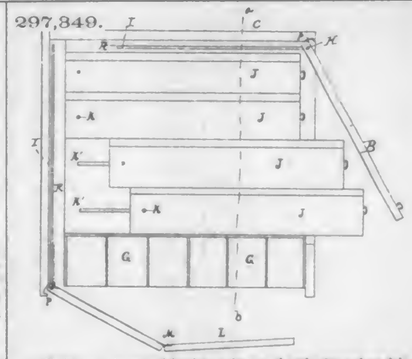


9. A lubricator constructed with oil and gage cylinders *a b*, having pistons *d* and *e* acted on one by the other, and arranged to feed the oil and measure the feed, and with an oil-reservoir having a downwardly-opening valve, *c'*, to be closed by steam-pressure while the piston of cylinder *a* is forced forward by the steam-pressure to feed the oil from said cylinder, and said reservoir being arranged to feed oil by an opening of its valve *c'* when the steam-pressure is cut off and the feed from the oil-cylinder *a* ceases, substantially as shown and described.

10. The reservoir *a'*, constructed with a case, *j'*, apertured to receive the oil-vessel *d'*, constructed with an opening, *e'*, and a valve therefor, and the valve *c'*, and said case connecting by a passage, *b'*, with the steam-chest *q*, substantially as shown and described.

11. The combination, with the case *j'*, of the reservoir *a'*, having the oil-vessel *d'*, apertured at *s'*, and valve *c'* of the cut-off valve *k'*, substantially as shown and described.

12. The reservoir *a'*, constructed with an apertured case, *j'*, having a valve, *c'*, controlling a passage, *b'*, to the steam-chest, and an oil-vessel, *d'*, apertured at *s'*, and having the adjustable plug-valve *f''*, substantially as shown and described.

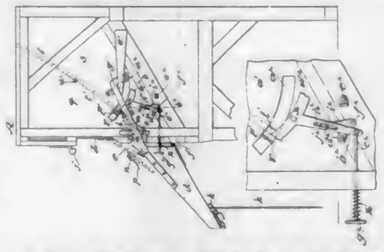


297,348. SKELETON SPEED-VEHICLE. THOS. H. BROWN, Chicago, Ill. Filed Jan. 3, 1884. (No model.)

Claim.—The combination, with the skeleton body and inclined seat-braces, of a fixed frame, B, secured to said braces, a vertically-movable seat, and springs supporting the seat and connecting it with the frame B, substantially as and for the purpose set forth.

297,349. TICKET-CASE. WILLIAM E. CHATTERTON, Troy, N. Y. Filed May 4, 1883. (No model.)

297,349.



Claim.—1. As an article of manufacture, the wire frame for a ticket-case, consisting of the border-wire, a plurality of vertical wires, and a plurality of horizontal wires with hooks, as shown, said parts being united together as described.

2. A ticket-case or the like formed with a recess or chamber, R, for receiving the sliding door when the case is opened, and the end of the outer wall provided with a notch, P, for receiving the inner end of the door when the case is closed, substantially as described.

3. The organized ticket-case consisting of the case formed with recesses R R, provided with the upper and lower guiding-grooves, I, the parallel sliding supports J, having the wire frames for suspending the tickets, and doors provided with upper and lower guide-pins, substantially as and for the purposes set forth.

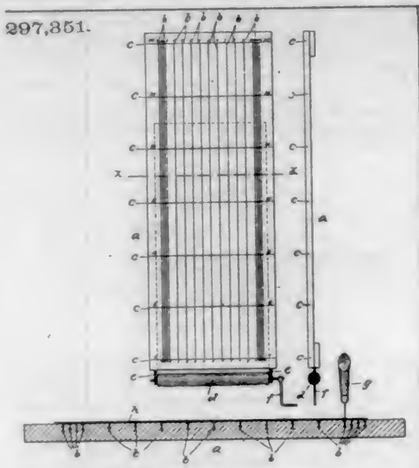
297,350. COAL-CHUTE. JOSEPH K. CLIFTON, Geneseo, Ill. Filed Feb. 11, 1884. (No model.)

Claim.—1. The combination of a self-closing latch-bolt, *h*, with the balanced apron *d* and the coal box or pocket *a*, said latch-bolt having the chain, rope, or rod *k* attached to it in such manner that the pull of the chain, rope, or rod to swing the balanced apron down will unlatch the balanced apron, substantially as described.

2. The combination of the pawl-brace *l* with the door *e* of the box or pocket *a* and the balance-arms *g* of the balanced apron *d*, said balance-arms having the notches *m* for said pawl-brace, substantially as described.

3. The buffers *p*, attached to the door *e*, in combination with the latch-bar *n*, catches *o*, and the balanced apron *d*, substantially as described.

4. The partition *t*, having the door *t'* and latches *v*, in combination with the coal box or pocket *a*, having door *e* and balanced apron *d*, and also having catches w^2, substantially as described.



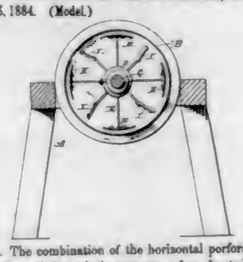
5. The partition *t*, having the door *t'*, with latches *v*, in combination with the box or pocket *a*, having the curved slots a^2, catches w^2, levers b^2, stops d^3 and e^2, rod c^3, handle g^2, and spring *z*, said levers b^2 being connected to the cranked rod f^2, i^2, and j^2, substantially as described.

6. The supporting-posts *c'*, set under the boxes or pockets *a*, and having spliced pieces *d* for the side frames of the boxes or pockets *a*, attached to said posts above the point where the weights *c'* of the balance-arms *g* of the balanced apron *d* drop when the balanced apron is in a closed position, in combination with the balance-arms *g*, attached to the overlapping sides *k'* of the balanced apron *d*, substantially as described.

297,351. CUTTING-BOARD. GEORGE W. CODY, Hartford, Conn. Filed Aug. 14, 1883. (No model.)

Claim.—A cutting-board, *a*, having the longitudinal grooves *b* and the transverse grooves *c*, arranged substantially as shown and described, in combination with a roller, *d*, supported in suitable brackets or bearings, all substantially as described.

297,351.



297,352. SNAP-HOOK. JAMES C. COVERT, West Troy, N. Y. Filed Jan. 7, 1884. (No model.)

Claim.—An improved snap-hook having an end hook and an end loop, and an integral body cast therewith, said body being chambered longitudinally, and having an open uniform slot extending from the forward end of same where base of hook is situated to the loop at rear end, and being provided with a spring and sliding bolt, all substantially as shown and described, for the objects herein set forth.

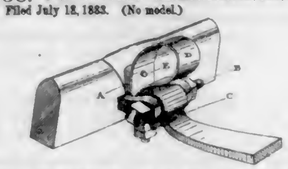
297,353. GRAIN-SCOURER. GEORGE A. DAWSON, Cardington, Ohio. Filed Jan. 16, 1884. (Model.)

Claim.—1. The combination of the horizontal perforated cylinder, a shaft passing through it, and the two sets of perforated scouring devices, which are arranged at right angles to each other, substantially as described.

2. The combination of the horizontal perforated cylinder B, the shaft G, which passes through it, a set of curved perforated scouring devices, and a set of perforated radial scouring devices, which extend at right angles to the devices H, substantially as described.

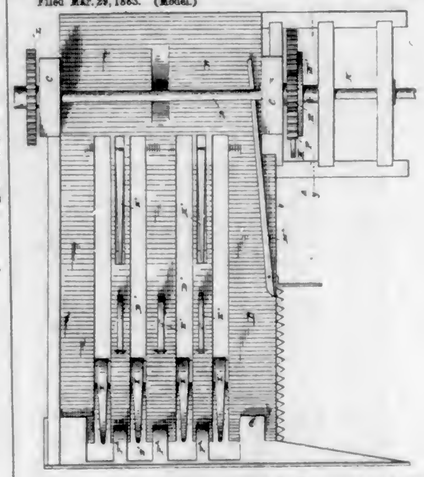
3. The combination of the horizontal perforated cylinder B, the shaft G, which passes through it, a set of curved perforated scouring devices, and a set of perforated radial scouring devices, which extend at right angles to the devices H, and a means for adjusting the said sets of scouring devices with respect to each other, substantially as set forth.

297,354. COMPOSITION FOR DESTROYING THE GRAPE OIDIUM. HENRI DE CHASSELOUP-LAUBAT, Périgueux, France. Filed Jan. 22, 1884. (No specimens.) Patented in France May 22, 1883, No. 155,595.



Claim.—The herein-described composition of matter to be used for destroying the oidium on the grapes, consisting of water, pentasulphuret of potassium, and marine salt, in the proportions specified.

297,355. THIMBLE. MARIE DEMME, Mühlhausen, Germany. Filed Oct. 12, 1883. (No model.) Patented in Germany Apr. 21, 1883, No. 25,669; in Belgium Sept. 29, 1883, No. 62,742; in England Sept. 29, 1883, No. 4,639, and in Italy Sept. 30, 1883, XXXI, 440, XVII, 15,951.



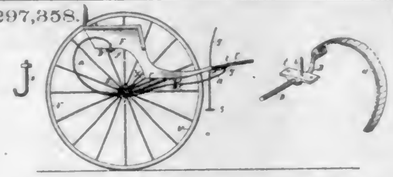
Claim.—A thimble lined with an elastic material, such as rubber, as described, for the purpose specified.

297,356. THILL-COUPLING. JEROME C. DIETRICH, Galt, Ontario, Canada. Filed July 12, 1883. (No model.)

Claim.—The combination, with the jack A, having pin E and bolt B, of the thill C and the spring D, having a large loop extending over the thill, as shown, whereby the thill is pressed downward upon the bolt and is made capable of easy removal, substantially as described.

297,357. HARVESTER. WALLACE DINGMAN, Battle Creek, Mich. Filed Mar. 29, 1883. (Model.)

Claim.—1. The combination, with the grain-platform and rake-head, of the grain-holding fingers, the spring-levers, and the ropes connecting said fingers and spring-levers and passing over the rake-head, the whole arranged to operate substantially as and for the purposes herein set forth.



2. The combination of the double platform, the rake-head, mechanism for reciprocating the rake-head, and the reversely-arranged springs secured to the bottom portion of the platform, as and for the purposes herein set forth.

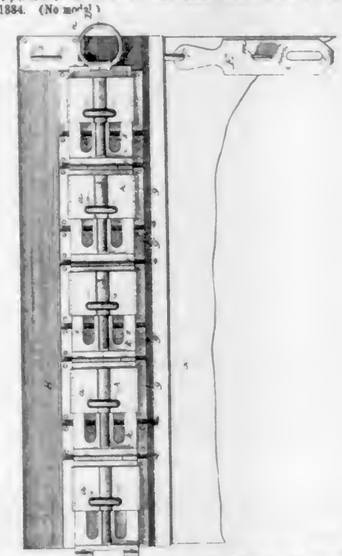
3. The combination of the platform, the rake-head, the mechanism for reciprocating the rake-head, and a shoe hinged to the rake-head, and adapted to fall in recesses in the bottom portion of the platform and to slide upon said bottom, as and for the purposes herein set forth.

4. The combination, in a harvester, of a double platform, the lower platform provided with recesses and openings, as described, the reciprocating rope and spring-levers, grain-holding fingers, and reversely-pointing springs, all carried by said lower platform, as and for the purposes herein set forth.

297,358. TWO-WHEELED VEHICLE. LEVI DONLEY, Kalamazoo, Mich., assignor of one-half to Hobert B. Sorter, same place. Filed Feb. 8, 1884. (No model.)

297,358.

Claim.—1. In a two-wheel vehicle, the combination, with the body, the thills, and the rocking bar having the end cranks, of the side and bolster springs, arranged substantially as set forth.



2. The combination, with the body and suitable supporting-springs, of the thills adjustably connecting with the axle by means of the confining-clips provided with the wedge-shape washers, substantially as described.

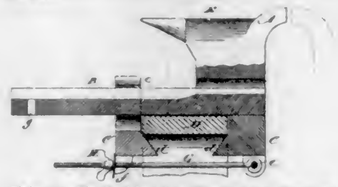
3. The combination, with the body and the side and bolster springs, of the rocking bar provided with the end cranks, and means for adjustably connecting the ends of the bolster-spring with the side springs, substantially as specified.

4. In a two-wheel vehicle, the combination, with the body provided with a rocking bar having a crank at each end, of the side springs, the C ends thereof pivotally connected with said cranks, and a bolster-spring, all substantially as set forth.

5. The combination, with the body and thill, of the side and bolster springs, and the double-jointed confining-clips provided with a thumb-nut and the rounded nut, substantially as set forth.

297,359. MAIL-BAG. JOHN EBERT, Frederick, Md. Filed Mar. 24 1884. (No model.)

Claim.—1. In combination with a mail or like bag having a series of holes near its mouth, a flap having a series of staples adapted to pass through the holes in the bag, and a series of locking-bolts, the staples and bolts being secured to the flap, all substantially as described.



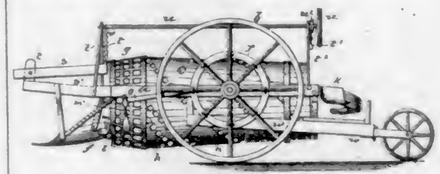
2. In combination, the bag having a series of holes near its mouth, the flap attached to the bag below the series of holes, the staples, the plates *g*, and straps A, and the locking-plates having bolts adapted to engage with the staples and straps, all secured to the flap, all substantially as described.

3. The plates *g*, having straps A, the plates being attached to the flap, with spaces between equaling the length of movement of the locking-plates, and the hinged locking-plates, the hinges being placed in the spaces between said plates, all these parts being combined with the staples and bag, substantially as described.

4. In combination with the series of connected locking-plates, and the straps A, and plates *g*, and with the staples, all secured to the flap, the locking-hasp and its staple, all substantially as described.

5. In combination with a mail or like bag having a series of holes near its mouth, a flap attached to the bag below the series of holes, a line of staples attached to the flap, and a flexibly-connected series of locking-plates, also attached to the flap, said locking-plates being adapted to slide longitudinally in engaging with the staples, all substantially as described.

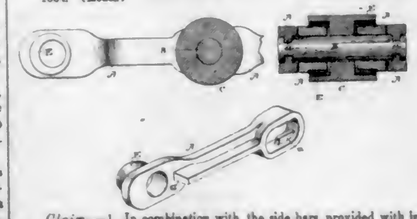
297,360. VISE ATTACHMENT. CHARLES H. EDDY, Auburn, N. Y. assignor to himself and Gustave S. Baker, same place. Filed Mar. 4, 1884. (No model.)



Claim.—1. The fixed jaw C on the under side of the vise, in combination with the adjustable jaw C′, arranged to slide on or along the bed of the vise, and the pivoted bolt G, with its nut H, for adjustment of the one jaw relatively to the other, substantially as and for the purpose herein set forth.

2. In combination with the vise, the fixed jaw C on the under side thereof, constructed with a beveled inner face or projection, *d*, and adjustable sliding jaw C′, having a reversely-beveled inner face or projection, *d*, in combination with means for adjusting the movable jaw, and whereby the vise is drawn down and firmly locked to its place, essentially as described.

3. The reversely-beveled fixed jaw C and adjustable jaw C′ of the vise-holding attachment, constructed for operation as described, in combination with the pivoted adjusting screw-bolt G and its thumb-screw H, applied to said jaws, substantially as and for the purposes specified.

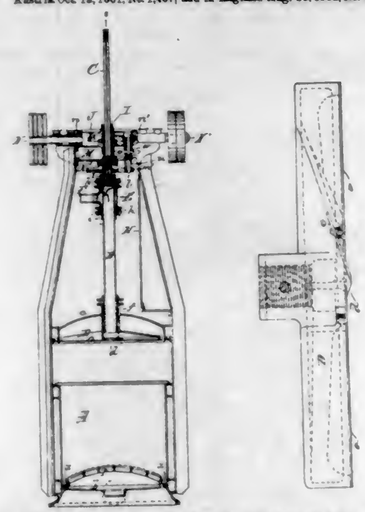


297,361. POTATO-DIGGER. JOB ESTES, Sterling, Mich. Filed Oct. 20, 1883. (No model.)

Claim.—1. In a potato-digger, the revolving drum mounted in bearings in the end timbers of the main frame, having the tapering open-work portion *g* at the forward end, the spirally-arranged opening in the remaining portion, and the internal spiral flange, *i*, extending throughout its length, and mechanism for revolving said drum, substantially as specified.

2. In a potato-digger, the combination, with the main frame, of the platform pivoted thereto in rear of the revolving open-work drum, and mounted upon a caster-wheel, and the seats arranged above the platform, substantially as and for the purposes specified.

297,362. DRIVE-CHAIN. WILLIAM DANA EWART, Chicago, Ill., assignor to the Ewart Manufacturing Company, same place. Filed Feb. 29, 1884. (Model.)

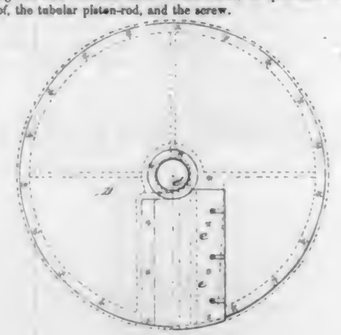


Claim.—1. In combination with the side bars provided with inwardly-projecting bosses (to get a large wearing-surface on the pintle) and the pintle-like end bars, anti-friction rollers which bear and run upon the pintle-like devices or end bars, and which have overhanging peripheries covering the boss-like devices, all substantially as and for the purposes set forth.

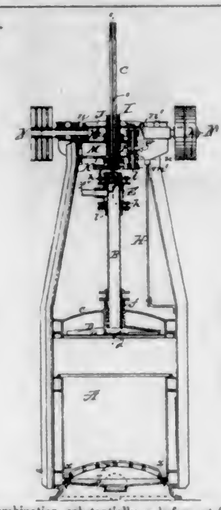
2. A drive-chain the side bars of which have inwardly-projecting

bosses adapted to work on a pintle-like end bar, said bosses having apertures or holes for the pintle formed eccentrically to the cylindrical contour of the bosses, substantially as and for the purposes set forth.

3. In combination with the side bars of a link, a pintle-like removable end bar having notches or recesses *e*, the oblong openings in two ends of said side bars provided with centrally-arranged feathers or ribs, *a*, adapted to engage with the recesses of the pintle of an adjacent link in such manner as to afford a bearing for the pulling strain on the unmutilated portion of the said pintle-like end bar, substantially as set forth.



297,363. FILTERING APPARATUS. JOHN F. C. FARQUHAR and WALTER OLDHAM, London, England; said Oldham assignor to said Farquhar. Filed Nov. 4, 1882. (No model.) Patented in France Sept. 13, 1879, No. 132,711; in Belgium Sept. 15, 1879, No. 49,316; in Germany Sept. 30, 1879, No. 9,557; in Spain Mar. 30, 1881, No. 1,379; in Italy May 19, 1881, No. 12,933; in Portugal June 1, 1881, No. 678; in Sweden July 22, 1881, No. 210; in Norway Aug. 2, 1881; in Denmark Oct. 12, 1881; in Austria Oct. 13, 1881, No. 1,407, and in England Aug. 25, 1882, No. 4,072.



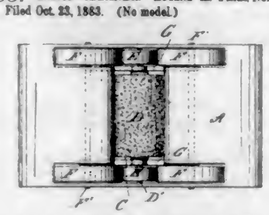
Claim.—The combination, substantially as before set forth, of the filtering-chamber, with the cutter-head, the screw, and the differential gear, for causing said cutter-head to revolve and to move progressively through the filtering-chamber.

297,364. APPARATUS FOR FILTERING LIQUIDS. JOHN F. C. FARQUHAR and WALTER OLDHAM, London, England. Filed July 7, 1883. (No model.) Patented in France Dec. 19, 1881, No. 146,417; in England Aug. 25, 1882, No. 4,072; in Belgium Sept. 19, 1882, No. 59,054; in Germany Oct. 27, 1882, No. 21,976; in Italy Nov. 10, 1882, No. 14,752; in Canada May 5, 1883, No. 16,820, and in Brazil July 21, 1883, No. 74.

Claim.—1. The combination, substantially as before set forth, of the filtering-chamber with the hollow cutter-head, the perforated bottom thereof, the tubular piston-rod, and the screw.

297,364.

2. The combination, substantially as before set forth, of the filtering-chamber with the cutter-head, the screw, the tubular piston-rod, and the feed-chest connected with said piston-rod between the screw and the cutter-head.



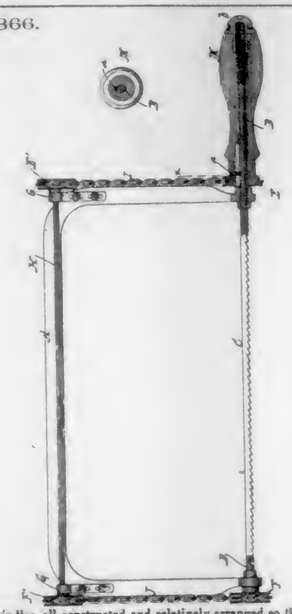
3. The combination, substantially as before set forth, of the filtering-chamber with the cutter-head, the tubular piston-rod, the feed-chest, and the slide and guide for said chest.

4. The combination, substantially as before set forth, of the cutter-head, the filtering-chamber, and the convex grid at the bottom of the said chamber, constructed of less diameter than said chamber, so that a peripheral pocket is formed for filtering material around said grid.

5. The combination, substantially as before set forth, of the cutter-head, the filtering-chamber, and the convex grid at the bottom of the filtering-chamber.

6. The combination, substantially as before set forth, of the filtering-chamber, the revolving cutter-head, the screw, the screw-nut, the cross-head which supports said screw-nut, and the inclined uprights which combine said cross-head with the filtering-chamber.

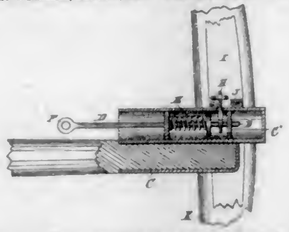
297,365. HORSE-CLEANER. EUGENE M. FARR, North Muskegon, Mich. Filed Oct. 23, 1883. (No model.)



Claim.—In a horse-cleaner, the combination, with a box, A, having a slot, C, of the brush D, the links or bars G, and the friction-wheels E and F, substantially as herein shown and described.

297,366. HANDSAW. CHAS. A. FENNER, Mystic River, Conn. Filed Feb. 14, 1884. (No model.)

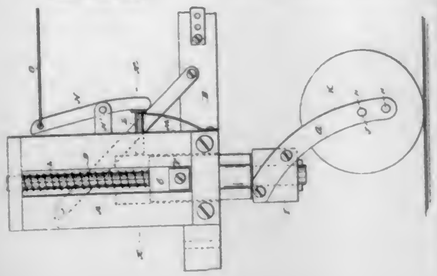
Claim.—1. A handsaw consisting, essentially, of a frame or arched holder, two spindles having their bearings in said frame, the saw-blade secured to said spindles, a handle fitted on one of the spindles, and mechanism, substantially as described, for connecting said handle with the other spindle, whereby both spindles are operated or turned simultaneously for setting the saw carried thereby into different positions relatively to the frame or holder, substantially as described.



2. The combination of the spindles B and D, having chain-wheels E F, the handle M, fitted on the spindle B, the chains I, and the longitudinal shaft H, having chain-wheels E′ F′, with the frame or holder A, having bearings for the spindles and shaft, and the saw-blade C, secured

297,366.

to the spindles, all constructed and relatively arranged so that the turning of the handle will enable both spindles to be rotated simultaneously for setting the saw into different positions, substantially as described.



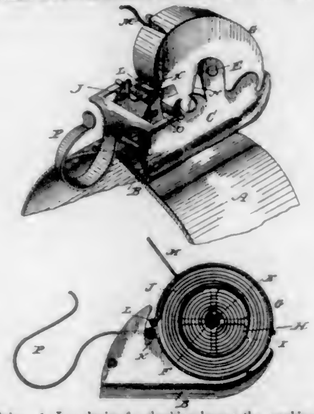
297,367. DEVICE FOR ATTACHING AND DETACHING HORSES. CICERO C. FERRELL, Shubuta, Miss. Filed Feb. 4, 1884. (No model.)

Claim.—1. The ferrule C, having tubular attachment C', provided with transverse opening G and spring-actuated pin D, substantially as shown and described.

2. The combination of the thills having the ferrules C and spring-actuated pins D, connected therewith, and the hames having the loops H and guards J, substantially as shown and described.

297,368. TONGUE-REST. JOHN FISHER, Riley, Ind. Filed Feb. 26, 1884. (No model.)

Claim.—1. In a tongue-rest, the combination, with the tongue, of the upright frame A, the slide C, the rod D, projecting upward from the same, and the spiral spring E, surrounding the said rod, substantially as herein shown and described.

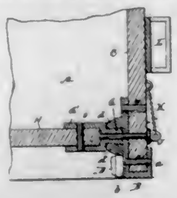


2. The combination, with the tongue B, of the upright frame A, the slide C, the upright rod D, the spring E, the swivel I, the arms G, and the wheel K, substantially as herein shown and described.

3. The combination, with the tongue B, of the upright frame A, the slide C, the spring E, the wheel K, held on the lower end of the slide, and the block F on the slide, substantially as herein shown and described.

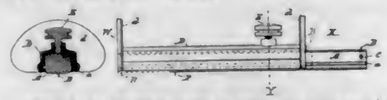
4. The combination, with the tongue B, of the slide C, the spring E, the wheel K, held on the lower end of the slide, the sliding bolt L, the spring M, and means for pressing the bolt L inward, substantially as herein shown and described.

5. The combination, with the tongue B, of the slide C, the spring E, the wheel K, held on the lower end of the slide, the sliding bolt L, the spring M, the pivoted lever N, and the cord O, substantially as herein shown and described.



297,369. CHECKING DEVICE FOR HARNESS. THEODORE B. FLOYD and HENRY L. BARTON, Pine Hill, N. Y. Filed Feb. 4, 1884. (No model.)

Claim.—1. In a device for checking horses, the combination of a plate adapted to be attached to the saddle of the harness, having upright parallel lips shaped into hooks or catches at their forward ends and united by a transverse axle or pin at their rear ends, a drum rolling upon said axle and provided with a central sleeve, a barrel containing a spring, the inner end of which is secured to the sleeve of the drum, a ribbon secured to the spring-barrel, and having a hook upon its outer end formed with an open frame adapted to catch over the hooks upon the upright lips, and means, substantially as described, for tilting the outer drum forward or backward, as and for the purpose shown and set forth.

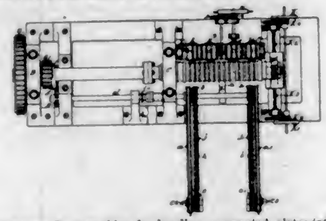


2. The combination, in a horse-checking device, of a plate adapted to be secured to the harness-saddle, having upright parallel lips shaped into hooks or catches at their forward ends, and united by a transverse axle or pin at their rear ends, a drum rocking upon said axle and provided with a central sleeve, a spring secured to the base-plate and to the drum, tilting it forward, a barrel containing a spring the inner end of which is secured to the sleeve of the drum, a ribbon secured to the spring-barrel, and having a hook upon its outer end formed with an open frame adapted to catch over the hooks upon the upright lips, and a bifurcated plate secured to the upper side of the drum, as and for the purpose shown and set forth.

297,370. WAGON-BODY. CHARLES F. FOLSOM, Atoka, Ind. Ter., assignor of one-half to John A. Dillon, same place. Filed Dec. 15, 1883. (No model.)

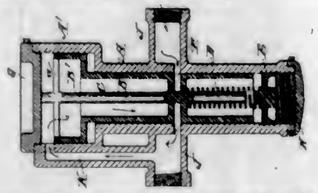
Claim.—The combination, with the bottom board A, corner-standards B, having vertical grooves for the ends of the side boards, dovetailed projections *d*, and bars D, secured to the standards, and having lower screw-threaded ends passed through the bottom board, and provided with nuts on their ends, of the U-shaped castings G', for the reception of the end-boards, and having the dovetailed tongues G, bolts *e p*, and locking-pin J, substantially as shown and described.

297,371. DOUBLE-HEADED GAGE. GEORGE S. FORREST, Concord, N. H. Filed Feb. 25, 1884. (No model.)



Claim.—1. In a carpenter's gage, the combination of the gage-bar A, having at either end the marking-points B, projecting from opposite sides thereof, with the double-headed slide D, provided with the thumb-screw E, operating substantially as and for the purpose set forth.

2. In a carpenter's gage constructed substantially as shown, the combination of the gage-bar A, having tongues *a*, and the marking-points B, projecting from opposite sides thereof, with the double-headed slide D, having grooves *d'*, and the screw E, constructed and operating substantially as described, and for the purpose specified.

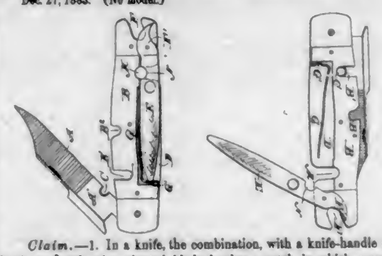


3. In a carpenter's gage-bar, A, the combination, with one or more marking-points, B, of the set-screws C, acting against said points B, for the purpose of holding them in position, substantially as and in the manner specified.

297,372. APPARATUS FOR CORRUGATING TUBES. SAMSON FOX, Harrogate, County of York, England. Filed Sept. 25, 1883. (No model.) Patented in England Nov. 15, 1881, No. 5,006; in Belgium May 26, 1882, No. 58,030, and in Germany June 2, 1882, No. 21,533.

Claim.—In a machine for bending corrugated plates into corrugated tubes, suitable guides adapted, as shown, to engage with a groove or grooves of a plate and guide it into the bite of the main rolls, in combination with the endless chains or their equivalents, provided with projections for taking or bearing against the rear edge of the plate, the pulleys for carrying the endless chains, one pair of which pulleys is driven at greater power to press the plate into the bite of the main rolls and to overcome the resisting action of the bending-roll in forming the tube, and means for arresting the movement of the endless chains when the rear edge of the plate has approached the bite of the main rolls, substantially in the manner as herein described.

297,373. PRESSURE-REGULATOR. FRANCIS JOSEPH FLEESS, Manchester, N. H. Filed Aug. 21, 1883. (No model.)



Claim.—In a pressure-regulator for steam, gases, or liquids, the combination of the cylindrical casing A, enlarged at A', provided with opposite internally-threaded necks J J, and having caps G H, the hollow sliding plunger B, enlarged at B' to fit into enlargement A', the rod C, having arms *a*, and a top extension-check extending through the plunger, and provided with a spiral spring at the lower end, and the nut E, screwing into the lower end of case, as shown and described.

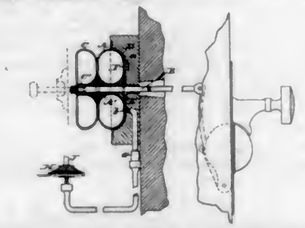
297,374. ROOFING COMPOUND. JAMES T. FRETWELL, Atlanta, Ga. Filed Nov. 13, 1883. (No specimens.)

Claim.—A roofing compound composed of Roman cement, sand, white lead, litharge, and linseed-oil, all mixed together in about the proportions and in the manner specified.

297,375. POCKET-KNIFE. GEORGE FREUND, Durango, Colo. Filed Dec. 27, 1883. (No model.)

Claim.—1. In a knife, the combination, with a knife-handle case having a hoteh, of a pivoted blade having a notch in which a screw-thread is cut, substantially as herein shown and described.

2. In a knife, the combination, with the handle-case B, having notches B² B', of a pivoted blade having a notch, O, in which a screw-thread is cut, substantially as herein shown and described.



3. In a knife, the combination, with the handle-case B, having a forked end, of a knife pivoted to the case, and having a projection beyond the pivot, thereby forming pliers to cut a fuse, substantially as herein shown and described.

4. In a knife, the combination, with the knife-case B, having a recess, D, of the pivoted blade E, adapted to swing into the recess, and of the spring G, for throwing the blade E outward, substantially as herein shown and described.

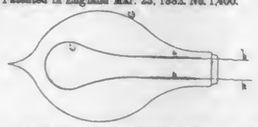
5. In a knife, the combination, with the knife-case B, having a recess, D, of the pivoted blade E, and the L-shaped spring G, having a notch, G', in its short shank, substantially as herein shown and described.

6. The combination, with a knife-handle case, provided with a notch, M, of a blade having one side recessed to form a spoon-blade for digging out giant-powder candles, and a screw-threaded notch, N, in its edge, substantially as herein shown and described.

297,376. PUMP. ROBERT P. GARSED, Norristown, Pa. Filed Sept. 26, 1883. (No model.)

Claim.—1. A hollow flexible body with central walled opening, and having a hole for the passage of air, communicating with the interior of said body, in combination with a plunger with central opening, whereby the flexible fold in said body finds room for its distention upon the collapsion of said body, substantially as and for the purposes set forth.

2. A hollow body of flexible material with hole for the passage of air, and a walled opening passing through said body, in combination with a plunger of dishing form with upwardly-extending hollow boss adapted to overhang the walled opening in said body, whereby by the pressure of the plunger the fold around the inner periphery of said body (which forms during its collapsion) finds storage within the boss on the plunger.

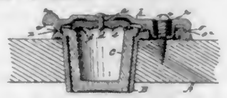


3. A hollow flexible body with walled opening having a hole for the passage of air, communicating with the interior of said body, in combination with an operative plunger adapted to collapse said body and force air therefrom, substantially as and for the purposes set forth.

4. A hollow body rounded upon its surface, with central circular walled opening, and having a hole for the passage of air, communicating with the interior of said body, in combination with an operative plunger and an air-conveying pipe, substantially as and for the purpose set forth.

5. A hollow body rounded upon its surface, with central circular walled opening, and having a hole for the passage of air, communicating with the interior of said body, in combination with an operative plunger, an air-conveying pipe, and an inflatable bellows, substantially as and for the purpose set forth.

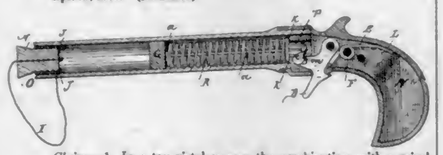
6. A pump having a body of the form of an annulus, with inner and outer walls, a plunger adapted to bear against said body, and a plunger-stem passed through the opening formed by the inner wall of said body, substantially as and for the purpose set forth.



297,377. INCANDESCENT ELECTRIC LAMP, TOM ERNEST GATEHOUSE, Camberwell, County of Surrey, England. Filed Nov. 9, 1882. (No model.) Patented in England Mar. 23, 1883. No. 1,400.

Claim.—1. In an incandescent electric lamp, the combination, in continuous circuit, of two directly-connected conductors—such as platinum and carbon—proportioned as to resistance, substantially as specified, whereby the electrical resistance of the conductors will vary in opposite directions with similar changes of temperature, substantially as described.

2. An incandescent electric lamp having its burner formed of a carbon filament and its leading-in wires of platinum, said leading-in wires being directly connected to the carbon filament and having resistances proportioned substantially as described, whereby the electrical resistance of the conductors will vary in opposite directions with similar changes of temperature, as set forth.

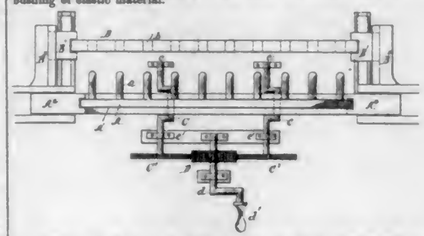


297,378. INK-WELL. JOHN H. GIFFORD, Springfield, Mass. Filed Sept. 17, 1883. (No model.)

Claim.—1. In an ink-well, an ink-receptacle, a case to receive the same, said case having a side extension, a cover pivoted to said extension and having a bearing, as *o*, as described, which engages a bearing, as o^2, to lift the rear part of the cover when closed, and a spring held to bear upon the cover by means of its pivot, all in combination substantially as described.

2. An ink-receptacle, a case to receive the same, having a side projection, a cover pivoted to said projection and pressed down by a spring surrounding the pivot, projections on the cover and the case near the pivot, which tend to lift the cover at its rear end when closed, and a notch and projection at the side of the case and cover opposite the pivot, forming a catch to the cover when closed, all in combination substantially as set forth.

297,379. TOY PISTOL. AMBROSE GILMAN, Shelburne, Mass. Filed Apr. 30, 1883. (No model.)



Claim.—1. In a toy pistol or gun, the combination, with a spiral spring having a rod or stem in continuation of and formed of the same wire as the coils of said spring, extending from the front toward the rear of said spring, and provided with a knob or shoulder, B, of a barrel shouldered at each end, and a trigger suitably located and arranged to engage and release the knob B of said spring, substantially as described.

2. In a toy pistol or gun, the combination, with a shouldered barrel, of a spiral spring, R, having an internal wire or stem in continuation of and formed of the same wire as the coils of said spring, extending from the front toward the rear of said spring, and provided with the knob or shoulder B, the cork or substance G, located in said barrel at the forward end of said spring, and the trigger suitably hung, and having a notch, *c*, and spring E, all arranged for operation substantially as described.

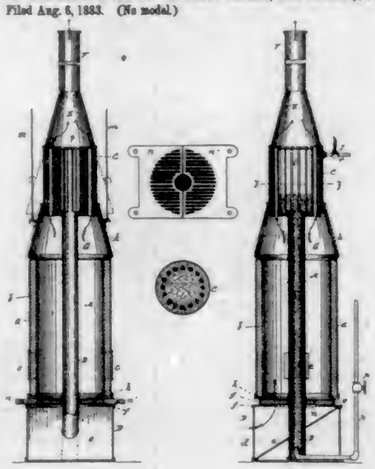
3. In a toy pistol or gun, the combination, with a shouldered barrel, of a spiral spring, R, having an internal wire or stem in continuation of and formed of the same wire as the coils of said spring, extending from the front toward the rear of said spring, and provided with the knob or shoulder B, the cork or substance G, located in said barrel at the forward end of said spring, and the trigger, suitably hung, and having a notch, *c*, and spring E, all arranged for operation substantially as described.

297,380. CAPSULE-MACHINE. JAMES H. GLOVER, Detroit, Mich. Filed May 19, 1883. (No model.)

Brief.—Ring-cutters cut upon their inner peripheries and have a bushing of elastic material.

Claim.—1. In a capsule-cutting machine, a plate provided with an orifice having an annular cutting-edge, in combination with a frame constructed to receive a mold-plate provided with a capsule-mold pin which is adapted to enter the cutting-orifice of the plate, and mechanism acting on the frame to impart a circular motion to the mold-pin within said orifice, substantially as described.

2. In a capsule-cutting machine, a cutter-plate constructed with an orifice surrounded by an annular beveled cutting-edge projecting inwardly toward the center of the orifice, substantially as described.



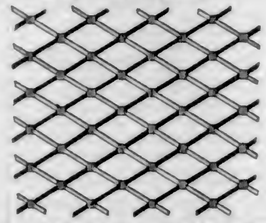
3. In a capsule-cutting machine, a plate having an annular cutting-edge, in combination with a frame constructed to receive a mold-plate having a mold-pin adapted to enter the cutting-orifice of the plate, a crank connected with the said frame, and mechanism for rotating the crank to impart motion to the mold-pin in the cutting-orifice for severing the capsule, substantially as described.

4. In a capsule-cutting machine, a plate provided with an orifice having a yielding cutting-edge, in combination with a mold-plate having a mold-pin adapted to enter said cutting-orifice, and means for imparting motion to the mold-pin in the orifice, substantially as described.

5. In a capsule-cutting machine, a plate provided with one or more orifices, annular cutters arranged around said orifice or orifices, and a bushing of elastic material around the periphery of the cutters, and means for rotating the plate, substantially as described.

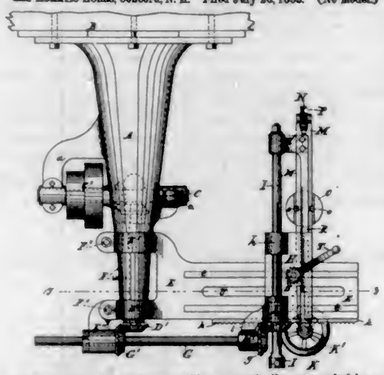
6. The combination, in a capsule-cutting machine, of ring-cutters cutting upon their inner peripheries, and a bushing of elastic material, substantially as described.

297,381. APPARATUS FOR UTILIZING WASTE HEAT OF KILNS IN GENERATING STEAM. CORNELIUS GODFREY, East Williston, N. Y. Filed Aug. 6, 1883. (No model.)



Claim.—1. In an apparatus for utilizing the waste heat of cement-kilns and similar structures to generate steam, the combination of the tubular boiler or steam-generator C, the upright pipe B, passing through the center of the kiln, and connecting with said generator C, and appliances, as described, for taking steam from said generator and for supplying water to said pipe B, as and for the purposes set forth.

2. The combination, with a cement-kiln or similar structure, A, of the steam-generator B C, consisting of the central tube, B, and tubular receptacle C, the water-supply pipe H, and the steam-discharge pipe I, and arranged in relation to said kiln, substantially as shown and described.

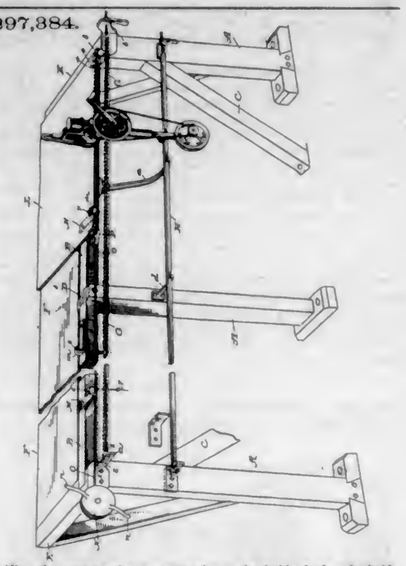


3. The grate *n n'*, made in two separate sections, and provided with the ears *o o*, as described, in combination with the body A, plate *f*, provided with flanges *g g*, and plate A, as and for the purposes set forth.

297,382. SLASHED METALLIC SCREENING. JOHN F. GOLDING, Chicago, Ill. Filed Sept. 24, 1883. (No model.)

Claim.—As an article of manufacture, metallic screening formed of slashed and stretched metal, substantially as hereinbefore set forth.

297,383. SUSPENDED DRILLING-MACHINE. EDWARD F. GORDON and HORATIO HOBBS, Concord, N. H. Filed July 26, 1883. (No model.)



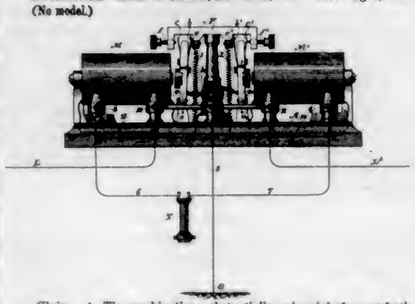
Claim.—1. In a drilling-machine, a vertically-suspended hanger adapted to support the drilling apparatus from the beams above it, and provided with a cylindrical portion around which said apparatus may be revolved, in combination with an arm or frame adapted to swing entirely around said hanger, a sliding head mounted for radial movement on said frame, a tool-stock having a vertical movement on said head, and a connected system of shafts and gearing, for the purposes set forth.

2. The depending hanger A, with its vertical cylindrical portion A', and supporting nut or sleeve F, and the vertical shaft D, adapted to revolve therein, in combination with a radial frame swinging in a horizontal plane around the hanger, a tool-carrying head arranged to move lengthwise of the frame, a horizontal shaft having bearings in said frame and head, and a tool-stock having a fixed and a sliding bearing carried on such head, said shafts being connected by bevel-gears, substantially as and for the purpose set forth.

297,384. CARPET-SEWING MACHINE. GEORGE GOWING, Boston, Mass. Filed Dec. 21, 1883. (No model.)

Claim.—1. In combination, a bar, B, and the carpet-supporting frame in the same horizontal plane with the upper surface of the bar, a cogged rail, G, parallel with the bar, with suitable lower rail, the two rails carrying the sewing-machine, devices at the ends of the track for

297,384.



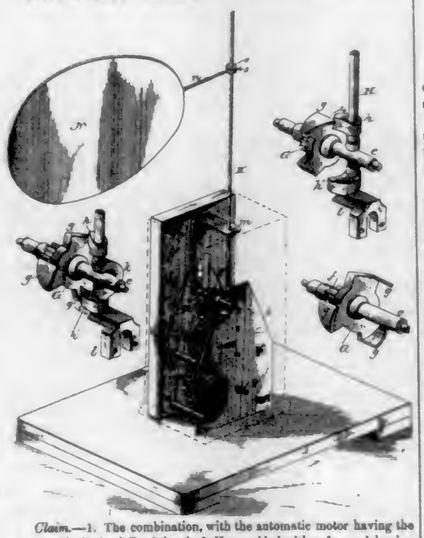
holding the carpet under proper tension, and suitable devices for holding the edges of the carpet to the sewing-machine, all substantially as described.

2. In combination, the sectional bar B, supported on suitable standards, cross-pieces E extending from the bar B, and supported by braces from the standards, the table-sections F, a track for the sewing-machine parallel with the bar B, and the arms M, pivoted on the bar and adapted to be swung aside as the machine advances, substantially as described.

3. In combination with a table for supporting the carpet, and a track for the machine parallel with the table, arms M, pivoted on the table and having the peforated bent ends, said arms being adapted to hold the edge of the carpet by means of a pin, and to swing out of the way of the machine, substantially as described.

4. In combination, a table for supporting the carpet, a track parallel to the table-edge for the machine, devices at one end of the track for holding the two ends of the carpet, swinging arms M, for supporting evenly the edges of the carpet, a pulley at the other end of the track, and a cord and a gripper adapted to hold the two parts of the carpet under unequal strain, whereby the figuring may be made to match as the carpet is sewed, all substantially as described.

297,385. PROTECTOR FOR TELEGRAPH AND TELEPHONE INSTRUMENTS. ELIAS M. GREENE, New York, N. Y. Filed Aug. 4, 1883. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, with a main line and a telephone or telegraph instrument, of two electro-magnets included in said main line, their armatures and armature-levers, two insulated rear contact-stops through which the circuit-connections with said telephone are normally completed, two front contact-stops in electrical connection with each other and with the earth, and means, substantially such as described, whereby the circuit through said telephone will be interrupted at two independent points upon opposite

sides of the same and the circuit of said main line completed independently thereof, when said main line is traversed by currents of abnormal strength.

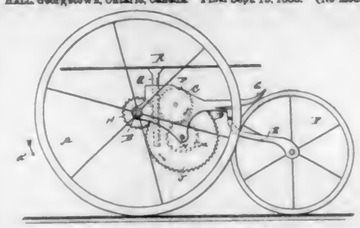
2. The combination, substantially as hereinbefore set forth, with a telephone or other electrical instrument, a main line in the circuit of which it is normally included, and means, substantially such as described, for interrupting the connections of said telephone upon each side thereof whenever a current of abnormal intensity traverses the main line, and substituting therefor electrical connections with the earth, of a lightning-guard consisting of two adjustable milled surfaces extending from points in the conductor upon opposite sides of said telephone into close proximity with the conductor united with the earth.

3. The combination, substantially as hereinbefore set forth, of two electro-magnets, their armatures and armature-levers, two contact-springs carried upon each of said levers, two insulated back contact-stops, against which one of the contact-springs upon each of said levers normally rests, a telephone or telegraphic instrument included in a conductor uniting these two contact-stops, and two front contact-stops against which the remaining springs upon said levers are caused to impinge when said electro-magnets are traversed by currents of abnormal strength, which front contact-stops are in electrical connection with the earth.

297,386. AUTOMATIC FAN. WILL B. GREENE, Washington, D. C. Filed Feb. 18, 1884. (No model.)

Claim.—1. The combination, with the automatic motor having the rotary toothed wheel G, of the shaft H, provided with a fan, and having the pallets A A' projecting at different angles, and arranged to be struck alternately by teeth of said wheel for the purpose of giving the shaft and fan an oscillating motion, substantially as described.

2. The combination, with the toothed wheel G, provided with teeth *g*, and arranged to receive rotary motion from suitable automatic mechanism, of the fan-shaft H, having the bend *k*, curved on one side of the shaft of said wheel, so as to bring the shaft H in the plane of the diameter of said wheel, the pallets A A', projecting at different angles from said fan-shaft, so as to be struck alternately by the teeth *g*, and the fan N, secured to said shaft, substantially as described.



297,387. CHECK-REIN HOOK. GEORGE W. HALL, Bridgeport, Conn., assignor of one-half to Edward J. Morgan, same place. Filed Mar. 1, 1884. (No model.)

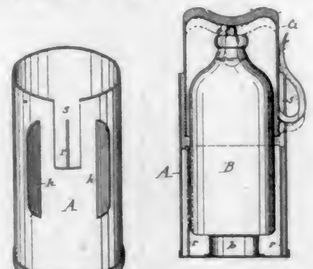
Claim.—1. In a check-rein hook, arm H, pivoted within a recess in the housing, and having a curved projection which fits the inner wall of said housing and acts as a stop, and a stump which projects downward to the bottom of the recess, in combination with a coil-spring resting in a socket in the housing and bearing against said stump, whereby said spring is fully protected against the entrance of dirt or water.

2. In a check-rein hook, the rigid curved hook, the housing, the base, and a shank cast in a single piece, in combination with a spring, an arm pivoted within the housing, and provided with a stop to limit its motion, and an abutment against which the spring bears, said pivot, stop, abutment, and spring being all located within the housing, as described, and for the purpose set forth.

297,388. ROLLER-SKATE. TOMAS P. HALL, Toronto, and JAMES B. HALL, Georgetown, Ontario, Canada. Filed Sept. 15, 1883. (No model.)

Claim.—1. A foot-power vehicle or wheel-skate having a foot-rest downwardly movable by the gravity of the operator and upwardly by a spring, for the purpose specified.

2. The combination, in a gravimotor having two front wheels, with a rear wheel, F, of a spring-supported brake-plate and a vertically-reciprocating foot-rest, whereby the brake may be applied by throwing the weight on the heel, as described.



3. A gravimotor having the front wheels A A, the bearing-frame C, a single rear wheel F, and a bearing frame or fork, E, jointed to said frame C, as shown and described.

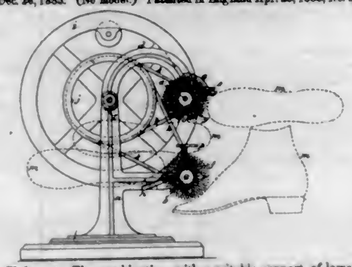
4. The combination, with a platform, C, of the vertically-reciprocating platform R, the shaft B, the driving-wheels A, the pinion H, the cog-wheels P, M, and J, the clutch L, the spring O, and the rack Q, substantially as herein shown and described.

5. The combination, with the frame C, provided with the spring-arm D, of the fork E, pivoted to the arm D, the wheel F, and means for revolving the driving-wheels, substantially as herein shown and described.

6. The combination, with the frame C, provided with a spring-arm, D, and a tongue, G, of the fork E, pivoted to the spring-arm D, the wheel F, and means for revolving the driving-wheels, substantially as herein shown and described.

297,389. BOTTLE-OPENER. WILLIAM H. HANNAN, Palermo, N. Y. Filed Mar. 1, 1884. (No model.)

Claim.—1. The within-described bottle-opener, consisting of a liquid-receptacle adapted to contain the body of the bottle, and provided around the bottle with a space for receiving the overflow from the bottle, as set forth.



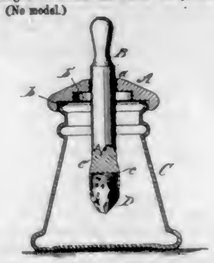
2. The bottle-holder A, provided with ribs *r r* and raised base *b*, as shown and described.

3. The bottle-holder A, provided with ribs *r r*, raised base *b*, and slot *s*, substantially as described and shown, for the purpose set forth.

4. The bottle-holder A, provided with ribs *r*, raised base *b*, slot *s*, and handles *h h* at opposite sides of the slot, substantially as described and shown.

5. The combination of the bottle-holder A, provided with ribs *r*, raised base *b*, slot *s*, and spring *c*, substantially as and for the purpose shown and set forth.

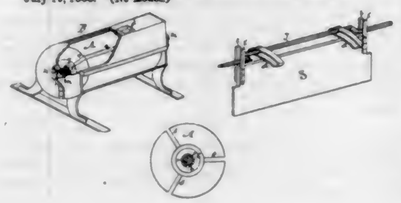
297,390. MACHINE FOR CLEANING AND BLACKING BOOTS OR SHOES. JAS. HARGRAVE, Burley Leeds, County of York, England. Filed Dec. 26, 1883. (No model.) Patented in England Apr. 23, 1883, No. 2,054.



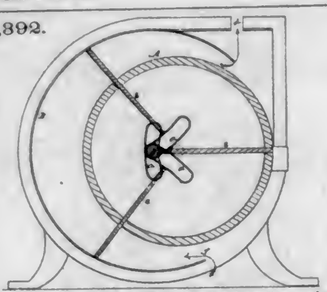
Claim.—1. The combination, with a suitable support, of lower and upper rotating brush-carrying spindles, the former in a fixed or constant position in the machine, the other moving radially about a center, a stud or center, *c*, the hand-wheel *i*, the pulley, and the driving-bands, arranged as described, so that one brush approaches or recedes from the other while both are rotated from the common driving source, substantially as set forth.

2. The combination, with a suitable support, of the spindles *b c*, threaded, as shown, to admit of radially mounting and changing the brushes, and the said brushes adapted to be mounted on said spindles, substantially in the manner as herein described.

3. In a machine for cleaning, blacking, and polishing boots and shoes and for other analogous purposes, the combination of standard *a*, spindle *b*, stud *c*, movable arm *d*, rotating spindle *e*, brushes *f g*, driving-pulley *j*, and driving-bands *k*, whereby said spindles *b* and *e*, together with brushes *f* and *g*, can be caused to rotate, as and for the purposes described and set forth.



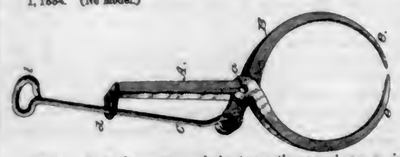
297,391. MUCILAGE CUP OR HOLDER. STEPHEN S. HARMAN, New York, N. Y., assignor to himself and Morris T. Lynch, same place. Filed Feb. 2, 1884. (No model.)



Claim.—1. The cover A, formed with the recesses *b b'*, whereby the cover is adapted to be applied to cups of different sizes, in combination with the handle or stick B, having the sponge D attached to its lower or inner end, substantially as and for the purposes set forth.

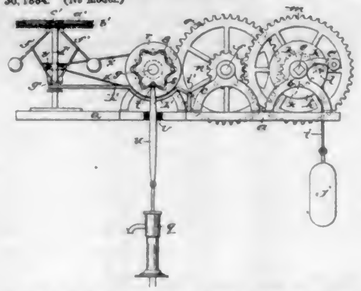
2. The stick B, fitted in the cover A, enlarged and recessed or cupped at its lower end to receive and hold the sponge D, substantially as described.

297,392. ROTARY BLOWER. RALPH E. HARRIS, Macomb, Ill. Filed July 19, 1883. (No model.)



297,392.

Claim.—1. The cylinder A, having hollow journals *c c* and slots *e e e* in its outer circumference, and placed at one side of the inner circumference of the casing B, in combination with the shaft J and wings *s s s*, having yokes *a a a* and guides *i i i* attached, substantially as shown and described, for the purpose set forth.

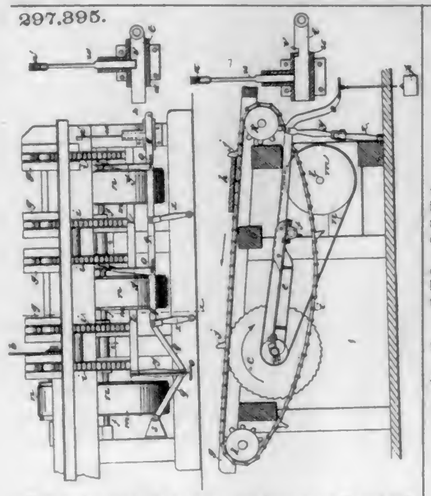


2. The wings *s s s*, having yokes *a a a* and guides *i i i i* attached, in combination with the crank-shaft J, as shown and described.

297,393. ICE-TONGS. MARION HATFIELD, Marshall, Mo. Filed Mar. 1, 1884. (No model.)

Claim.—As an improvement in ice-tongs, the curved arm or jaw A, having a straight extension terminated by the loop *d*, in combination with the short curved arm B, pivoted to the arm A, and provided with an eye to which is attached the bar C, passing through the loop *d*, and terminating in a hand-hold or loop, *b*, all the parts being constructed and arranged for joint operation in the manner shown and described.

297,394. MOTOR. JACOB HECKENLIVELY, Eureka, Kans. Filed Jan. 30, 1884. (No model.)

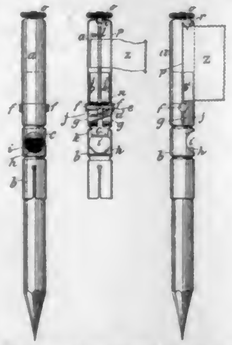


Claim.—1. A motor constructed with a drum and a weight suspended therefrom, said drum connecting by a ratchet-and-pawl device with a gear-train, which drives a shaft carrying a wheel having a zigzag or star-shaped cam-groove, for driving the pitman of a pump or other machine, and the said driving-shaft connecting by a ball-governor with a pivoted brake-lever acting on the periphery of the cam-wheel to control the speed, substantially as shown and described.

2. The combination, with the sleeve *g'* of the ball-governor *f'* and the cam-wheel *r*, of the pivoted brake-lever A', connected to be lifted by the sleeve against the cam-wheel when the speed is excessive, substantially as shown and described.

297,395. LUMBER-TRIMMING MACHINE. EDWARD HEYDE, East Saginaw, Mich. Filed Jan. 21, 1884. (No model.)

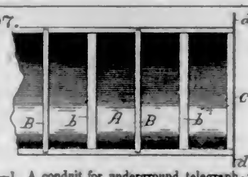
Claim.—1. The combination, with a series of trimming-saws mounted on swinging frames for use of one only at a time in the working position, of the chain *q*, the joints of which are connected alternately



297,395.

with the levers of said swinging frames, and joint-supports for said chain, said joint-supports consisting of the vibrating struts *x* between the levers, permanent support *s* at one end and the slide-bar *t* at the other end of said chain, and said slide-bar having a notch, *v*, and a latch-bolt, *w*, to set said slide-support either for maintaining one of the saws in the working position or all of them out of said working position, substantially as described.

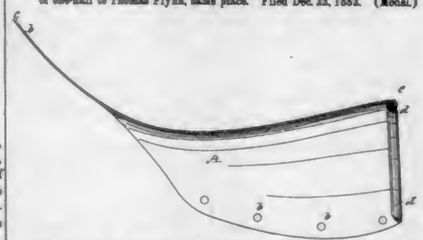
2. The combination of a series of counterbalanced pivoted saw-frames, having trimming-saws at their inner ends and foot-levers *o* at their outer ends, with the chain-links *q*, connected to said foot-levers by rods *y*, pivoted thereto, and to struts *x*, pivoted to the frame below said rods, the said chain-links being connected to the frame at one end by a fixed support, *s*, and provided at the opposite end with a notched slide, *t*, working in the casing *u*, a stop-latch, *w*, also working in said casing at right angles to the slide *t*, for engaging said slide, and a lever, *a'*, connected to said stop-latch for operating the same, substantially as set forth.



297,396. COMBINED APPARATUS FOR ATTACHMENT TO PENCILS. JAMES HICKISSON and WILLIAM LEE, London, County of Middlesex, England; said Lee assignor to said Hickisson. Filed Oct. 12, 1883. (No model.)

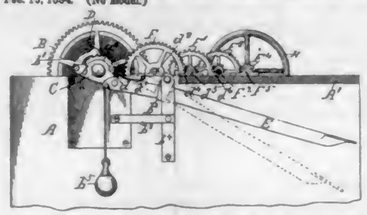
Claim.—The improved attachment for pencils, composed of the tubular slotted holder *a*, spindle and head, the cigar-cutter, and mechanism for operating the same, the tubular case containing said cutter, with an opening at one side, and slotted at one end, and adapted to receive a lead-pencil, as and for the purposes set forth.

297,397. CONDUIT FOR UNDERGROUND TELEGRAPH-WIRES. EMIL C. HILDEBRAND, Chicago, Ill. Filed Dec. 6, 1883. (No model.)



297,397.

Claim.—1. A conduit for underground telegraph-wires, provided with a removable cover, and having the rounded bottom part, *a'*, forming a chamber or passage under the wires, in combination with the removable perforated diaphragms B and the cross-bars *b b'*, substantially as and for the purpose described.



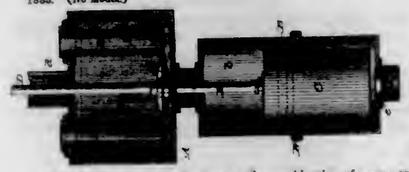
2. In a conduit for underground wires, the combination, with the conduit A, of the metallic plate C, provided with the arms *d d'*, and having numerous perforations for the passage of the electric wires, substantially as and for the purpose set forth.

297,398. SADDLE-SEAT. PETER B. HIRSCH, Denver, Colo., assignor of one-half to Thomas Flynn, same place. Filed Dec. 22, 1883. (Model.)

Claim.—A sheet-metal saddle-seat shaped to the form of a rider's buttocks, and turned at the front over a stiffening-wire to retain the plate in shape, as described.

297,399. SPRING-MOTOR. HENRY HOFMANN, Austin, Ill. Filed Feb. 19, 1884. (No model.)

Claim.—1. In a spring-motor, the combination, with a master gear-wheel, of a main shaft, on which said gear-wheel is loosely mounted, and a coiled spring having one end rigidly secured to said gear-wheel, and the opposite end rigidly secured to said shaft, whereby the spring is adapted to be wound up no matter whether the said gear-wheel is moving or stationary, substantially as and for the purpose set forth.



2. In a spring-motor, the combination, with a main shaft, of a gear-wheel loosely mounted on said shaft, whereby the same are adapted to have an independent rotation relative to each other, a coiled spring encircling said shaft and having one end rigidly secured thereto, while the opposite end is rigidly connected to the said gear-wheel, a ratchet-wheel rigidly mounted on one end of said shaft, a rocking plate loosely mounted on said shaft, a winding-pawl having one end pivoted to said rocking plate, the opposite end engaging with said ratchet-wheel, and a locking-pawl adapted to engage with and lock said ratchet-wheel against a back movement, substantially as and for the purpose set forth.

3. The combination, with a main shaft, of a gear-wheel loosely mounted on said shaft, a motor-spring encircling said shaft, a ratchet-wheel rigidly mounted on said shaft, a rocking plate having a pivotal movement on said shaft, and a treadle-bar connected to said rocking plate, whereby said spring is adapted to be wound up and a continuous motion maintained by an intermittent pressure on the treadle-bar, substantially as described.

4. In a spring-motor, the combination, with a rocking plate loosely mounted on a main or spring shaft, of a treadle-bar connected to said rocking plate, and means for returning these parts to a normal position when the pressure is relaxed on said treadle-bar, substantially as and for the purpose set forth.

5. In a spring-motor, the combination, with a multiplying train of gearing, of a motor-spring having connection with said train, a main shaft, a ratchet-wheel, a rocking plate, and a treadle-bar, all combined, arranged, and operating substantially as described.

297,400. DOUBLE-ACTING PUMP. WILLIAM H. HOLCOMBE and CLIFFORD A. HOLCOMBE, Beloit, Wis., assignors to the Holcombe Brothers and Stone Manufacturing Corporation, (Limited,) same place. Filed Jan. 22, 1883. (No model.)

Claim.—1. In a double-acting pump, the combination of a case or body consisting of two communicating chambers, one above the other, the upper chamber having a central outlet-pipe, and provided with a piston working through the top of the chamber, and the lower chamber containing an elongated piston, and provided with an upwardly-opening valve about midway of its height, encircling the piston, and with an inlet-valve at its lower end, the respective pistons being connected to and operated by a rod common to all, and passing through the central outlet, substantially as shown and described.

2. The herein-described pump, consisting of case A, containing chambers *a b*, the former provided with outlet *d* and the latter provided with valves B and *c*, piston E, working in and passing through the top of chamber *a*, piston C, working in chamber *b*, and the piston-rod D, common to both the pistons, passing through the outlet *d*, substantially as shown and described.

3. In a pump, the combination of two separate pistons carried by independent rods, said rods adapted to be connected or disconnected at will, substantially as and for the purpose specified.

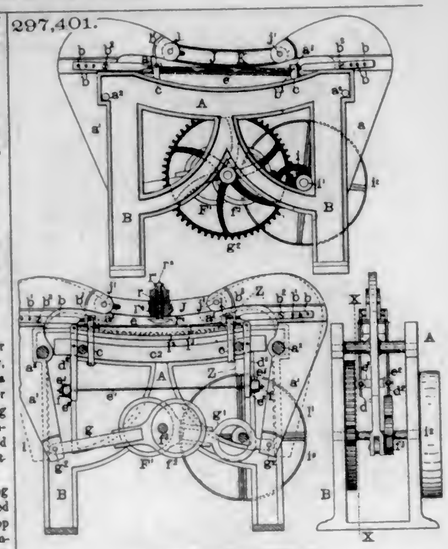
4. In combination with cylinder A, having upper and lower chambers, *a* and *b*, piston C, arranged to act in the lower chamber, piston E, arranged to act in the upper chamber, and independent rods connected, respectively, with pistons C and E, and adapted to be connected with or disconnected from each other, substantially as described.

5. The herein-described pump, consisting of case or body A, having chambers *a b*, the latter containing a valve at its bottom and another about midway of its height, piston C, carried by rod D, pistons E, carried by rod D', and set-screw F, adapted to connect or disconnect the two rods, as required.

6. In a double-acting pump, the combination of an upper chamber having a central outlet, and pistons passing through the wall or top of the chamber on opposite sides of said outlet, a lower chamber containing a valve at its lower end, a piston, and a valve about midway of the height of the chamber, between the piston and the walls of the chamber, the lower piston being carried by a rod extending upward to the lever or operating device, and the pistons E being carried by a tubular rod encircling the first, and adapted to be connected therewith or disconnected therefrom, substantially as explained.

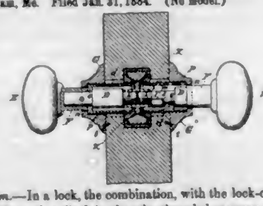
297,401. STAVE-BENDING MACHINE. EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N.Y. Filed MAY 30, 1883. (No model.)

Claim.—1. The within-described mode of bending staves, consisting in applying the pressure at the ends of the stave in the direction of its length and partly downward in the direction of the bend while the back or outside of the stave is supported on a yielding bed, substantially as described.



2. In a machine for bending staves, the arms or levers for giving the end-pressure, and their operating mechanisms, substantially as described, and the pushing-blocks a^2, secured by pivots to the arms *b*, and made adjustable by bolts b^2, in combination with the arms *c*, having their lower ends pivoted to a cross-bar, substantially as and for the purposes specified.

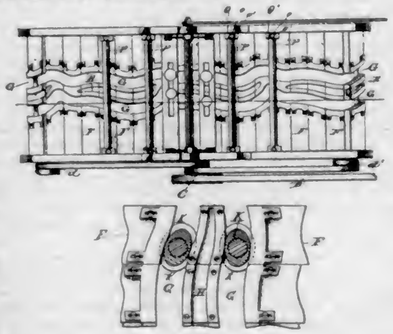
3. The end-pressing arms provided with pushing-blocks, and their operating mechanism, substantially as described, and a yielding bed secured to the pivoted arms d^2, in combination with the rod *d'* and springs d^3, for the purposes specified.



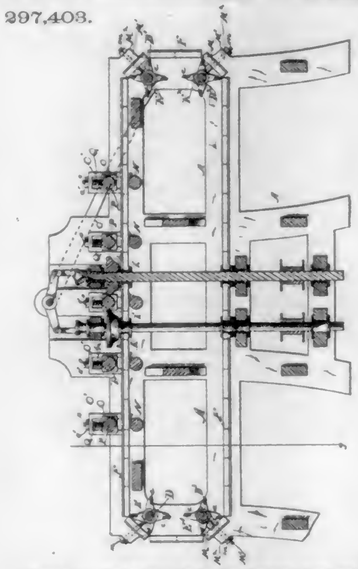
4. The end-pressing arms or levers, the adjustable pushing-blocks secured to the pivoted arms *b*, as specified, a yielding spring-bed secured to the pivoted arms d^2, and the rod *d'* and springs d^3, in combination with the eccentric F' f^3, arms *g g'*, and their operating mechanism, substantially as described.

5. The combination of the spring or yielding bed, the arms d^2, pivoted to the bed c^2, rod *d'*, springs d^3, and screw-nuts *f*, for the purpose of regulating the tension of the yielding spring-bed, substantially as described.

297,401.



297,402. LATCH KNOB ATTACHMENT. GEORGE LEWIS HOWLAND, Topeka, Mo. Filed Jan. 31, 1884. (No model.)



Claim.—In a lock, the combination, with the lock-case, constructed substantially as described, having the threaded recesses *x* to engage the inner ends of the externally-threaded thimbles D, of the thimbles D, having interior flanges, *e*, the knob-shanks having the lugs *l*, and the knob-roses, substantially as specified.

297,403. MOLDING-MACHINE. JOHN W. HUDSON, Wellington, Ill. Filed Feb. 29, 1884. (No model.)

Brief.—An endless table formed of sections hinged together is provided with slots in its surface, which guide the revolving cutters and hold them in contact with the material to be acted upon, said material being clamped upon the table between the slots which guide the cutters. This table passes over bearing-rollers beneath spring-actuated presser-rolls, and is actuated by pulleys and shafts at each end of the machine, each of said shafts being adjustable by means of set-screws.

297,403.

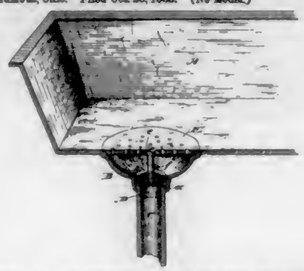
Claim.—1. In a machine for finishing irregular forms, and in combination with revolving cutters, an endless traveling table, constructed as herein described, having hinged sections extending from side to side of the machine, and provided with cam-slots that determine the position of the cutters, as and for the purpose set forth.

2. In combination with an endless table, as described, and with cutters directed by cam-slots in such table, boxes in which the cutter-spindles are journaled, having flanges, as *k k'*, and oval shanks which traverse the said slots, as set forth.

3. In a machine for finishing irregular forms, the combination of the endless traveling table composed of hinged sections which extend from side to side of the machine, and are provided with slots, as described, with fan-wheels E E' E² E³, and means, substantially as described, whereby said table is operated and the tension thereof adjusted at will, as and for the purpose set forth.

4. In a machine for finishing irregular forms, the combination of the fan-wheels mounted in adjustable boxes, as described, with the endless traveling table composed of hinged sections extending from side to side of the machine, and provided with slots that direct the position of the cutters, and means, substantially as described, for operating the fan-wheels and table, as and for the purpose set forth.

5. In a machine for finishing irregular forms, the fan-wheels, constructed substantially as described, journaled in adjustable boxes and adapted to be rotated in the same direction and at equal speed, in combination with the endless traveling table having hinged sections extending from side to side of the machine, and provided with two slots having irregular sides, to direct the position of the revolving cutters, and means for operating said fan-wheels, the endless table, and revolving cutters, as and for the purpose set forth.

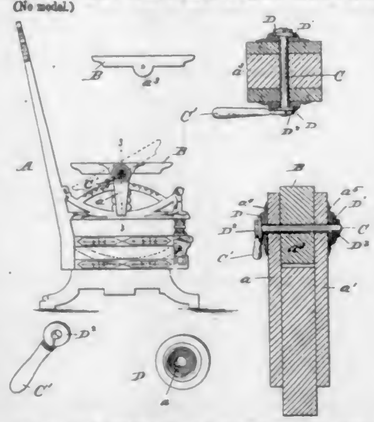


6. In a machine for finishing irregular forms, the combination of an endless traveling table having hinged sections extending from side to side of the machine, and provided with slots for determining the position of the revolving cutters, and provided with grooves wherein the articles to be finished are placed and held, in combination with the revolving cutters, adjustable fan-wheels, and means, substantially as described, whereby motion is imparted to said endless table, revolving cutters, and adjustable fan-wheels, as set forth.

7. In a machine for finishing irregular forms, the combination of an endless traveling table composed of hinged sections extending from side to side of the machine, and provided with slots and a groove, for the purpose described, with a series of rolls placed below and supporting said table, and means, substantially as described, for operating said table, as and for the purpose set forth.

8. In a machine for finishing irregular forms, an endless table composed of hinged sections extending from side to side of the machine, and provided with slots and a groove, as described, in combination with a bearing-roll placed below the table, and spring-pressure rolls placed above such table, substantially as described, and for the purpose set forth.

9. A machine for finishing irregular forms, consisting of the following elements, to wit: an endless traveling table composed of hinged sections F, extending from side to side of a frame, A, provided with irregular slots G, for determining the position of the cutter-spindles, and grooves H, for the reception of the blanks, said table operated by fan-wheels E E' E² E³, journaled in boxes M, which are adjusted by rods M' and nuts *m*, and rotated by pulleys *d d'* *d²* *d³* upon their shafts, carrying rolls N, located below the table, adjustable spring-pressure rolls located above the table, and the driving-pulley, all combined and operating substantially as herein described.

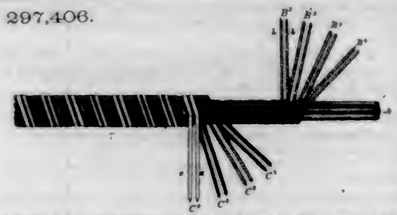


297,404. SINK OR ANALOGOUS ARTICLE. HENRY L. JACOBS, Columbus, Ohio. Filed Oct. 20, 1883. (No model.)

Claim.—1. The combination of the sink-neck, the expanding plug or ferrule, and the pipe expanded and clamped against the interior walls of the neck by the ferrule, and calked down around and upon the upper portion of the latter, as and for the purposes hereinbefore set forth.

2. The combination, with the body and neck of the sink, of the pipe inserted in the neck, the tubular plug or ferrule inserted in the pipe so as to clamp the latter in place in the neck, the strainer, and the binding-screw passing down through the said strainer into a screw-threaded hole or socket provided for it in the ferrule or plug, substantially as and for the purposes hereinbefore set forth.

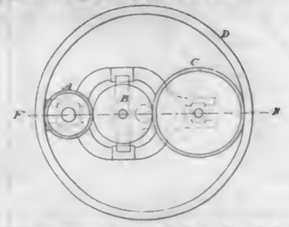
297,405. CHAIR. NIELS JACOBSON, Chicago, Ill. Filed Feb. 20, 1883. (No model.)



Claim.—The combination, with the seat-supporting frame of a chair, of the standard attached to said frame, and the arm-rest attached to the upper end of said standard by the horizontal pivoting-bolt transverse to the arm, and means, substantially as described, for clamping said rest in any desired position, as set forth.

297,406. CONDUCTOR FOR TELEPHONE AND TELEGRAPH PURPOSES. WILLIAM JAMIESON, New York, N. Y. Filed Feb. 15, 1884. (No model.)

Claim.—1. A telephone or telegraph cable in which the conducting-wires are helically wound and grouped in pairs for the formation of metallic circuits, the two wires forming each circuit being separated from each other by one or more intervening wires, substantially as described.



2. A telephone or telegraph cable consisting in the combination,

297,406.

substantially as hereinbefore set forth, of conducting-wires helically wound and grouped in pairs for the formation of metallic circuits, the two wires forming each circuit being separated from each other by one or more intervening wires, and a conducting-core consisting of one or more parallel insulated wires.

297,407. DRIVING-GEAR. FLEEMING JENKIN, Edinburgh, Scotland. Filed July 12, 1883. (No model.) Patented in England Apr. 14, 1883, No. 1,913; in France May 21, 1883, No. 155,568; in Austria Aug. 16, 1883, No. 30,212, and in Belgium Dec. 10, 1883, No. 63,486.

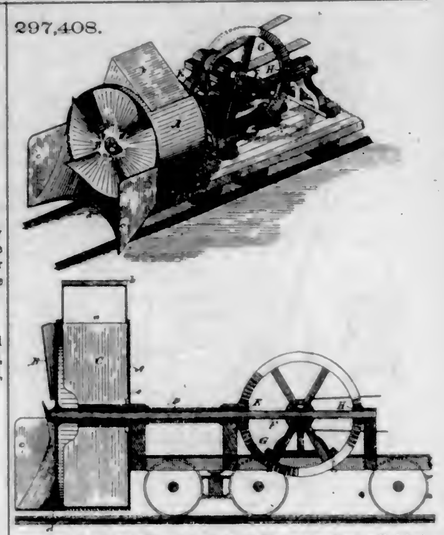
Claim.—1. The improved system of frictional gearing wherein the reduplication and arrangement of parts cause the required pressure to produce adhesion by friction without causing pressure on the bearings, substantially as shown and described.

2. The combination of the series of rollers arranged in a nest, as described, and means by which to adjust frictional contact or surface pressure between the rollers without causing pressure on their bearings, substantially as hereinbefore set forth.

3. The combination of the series of rollers arranged in a nest, as described, the rack, and means by which to adjust frictional contact or surface pressure between the rollers and between the rack and contiguous rollers without causing pressure on the roller-bearings, substantially as and for the purpose hereinbefore set forth.

4. The combination of the series of rollers arranged in a nest, as described, and the spring (or springs) by which to adjust frictional contact or surface pressure between the rollers without causing pressure on their bearings, substantially as and for the purpose hereinbefore set forth.

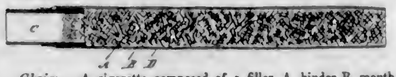
5. The combination, with an endless band, of one or more nests of gearing, the reduplication and arrangement of parts constituting such nest or nests being such, substantially as described and shown, as to produce adhesion by friction without causing pressure on the bearings, as set forth.



297,408. SNOW-PLOW. ORANGE JULL, Orangeville, Ontario, Canada, assignor to Edward Ledlie, same place. Filed Jan. 15, 1884. (No model.) Patented in Canada Jan. 22, 1884, No. 18,506.

Brief.—A pinion on the hollow shaft which carries the fan-blade and on the solid shaft which carries the cutting-blade mesh with the driving gear-wheel. An opening in the case over the fan-blade is provided with a hood to direct the snow from the track.

Claim.—1. In an improved snow-plow in which a cutting-blade is caused to revolve in front of and in the opposite direction to a revolving fan-blade, a hollow shaft arranged to support and revolve with the fan-blade, in combination with a shaft journaled within the hollow shaft and arranged to propel the cutting-blade, each of said shafts being provided with a pinion meshing with the gear-wheel G, substantially as and for the purpose specified.



2. The fan-blades C, fixed to and propelled by the hollow shaft D, and the cutting-blades B, fixed to and propelled by the shaft F, which is journaled within the shaft D, in combination with a cylindrical case, A, having an opening, *a*, in its circumference, and flaring side flanges, *c*, with a bottom flange, *d*, curved from the side flanges, *c*, inwardly to a point near the revolving blades B, substantially as and for the purpose specified.

297,408.

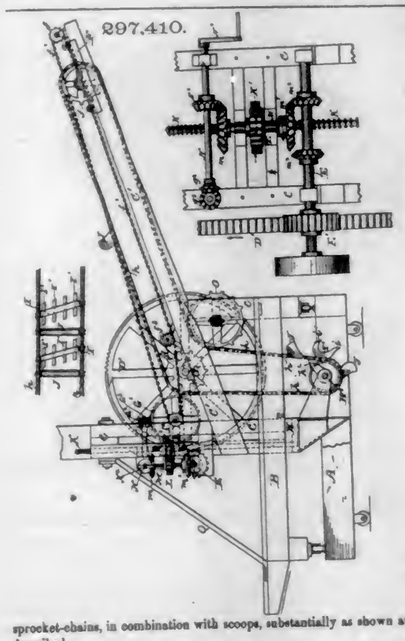
3. A series of fan-blades revolving within an open-front cylindrical case having an opening, *a*, in its circumference, and an opening, *c*, in its back, and a hood, *b*, over said opening *a*, in combination with a revolving disk formed by a series of cutting-blades, B, and located at the open front of the cylindrical case, substantially as and for the purpose specified.

297,409. CIGARETTE. BARNARD A. KAUFMANN, Detroit, Mich., assignor to the Globe Tobacco Company, same place. Filed Dec. 19, 1883. (No model.)

Claim.—A cigarette composed of a filler, A, binder B, mouth-piece C, secured between the ends of said binder and filler, and secured to the former upon its inner wall, and a wrapper, D, inclosing the whole and gummed to the binder where it incloses the mouth-piece, substantially as herein shown and described.

297,410. EXCAVATING-ELEVATOR. GEO. H. KANNACHER, Columbus, Ohio. Filed July 12, 1883. (No model.)

Brief.—A vertical slide carrying in brackets the lower shaft of an excavating-chain is raised or lowered through a screw-shaft, and a nut driven at will in reverse directions through the interchangeable engagement with a horizontal gear-wheel communicating with the nut of bevel-gears to the right and left of such wheel, respectively. The driving-shaft carrying said bevel-gears gears with the driving sprocket-shaft of the excavating-chain to drive it continuously. The upper chain-shaft is on a car raised or lowered simultaneously with the slide by an endless chain secured to the car driven by worm and gearing from the slide-driving shaft. Duplex pointed cutters, with the rear point the longer, are secured to cross-bars diagonally arranged on the chains alternate with scoops.



Claim.—1. In an excavator, the combination of the main shaft provided with sprockets, a counter-shaft, G, provided with sprockets, endless chains carrying, separately secured thereto, excavating and elevating devices, a car adapted to ride the boom, and means for rotating the main shaft continuously in one direction and the counter-shaft in either direction, at will, substantially as and for the purpose set forth.

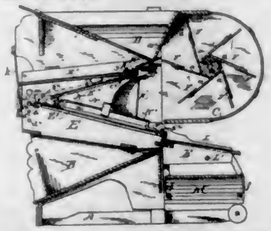
2. The combination of a vertical slide, a screw and gears for elevating and depressing the same, and the endless chain *f*, secured to the car F and operated through gearing and worm-wheel from the driving-shaft, for automatically and proportionately varying the position of the car carrying excavating chain-sprockets, substantially as specified.

3. In an excavating-machine, the combination of an endless chain and a pick having two operative points, the rear one of which is projected farther from its base than the forward one, substantially as specified.

4. In an excavator, a series of picks, arranged diagonally upon the

297,410.

sprocket-chains, in combination with scoops, substantially as shown and described.



5. The combination of the shaft D, provided with sprockets *d*, car F, provided with sprockets *f*, idler O, vertical slide H, shaft H', carried by brackets upon the slide, shaft G, worm-gear G', sprockets f^3, chains *f'* and A, and means for rotating said shafts, substantially as shown and described.

6. The combination of the slide H, screw K, nut K', gear L, and shaft E, provided with interchangeable gears m^2 m^3, with gears E' D', and an endless chain having picks and scoops, substantially as shown and described.

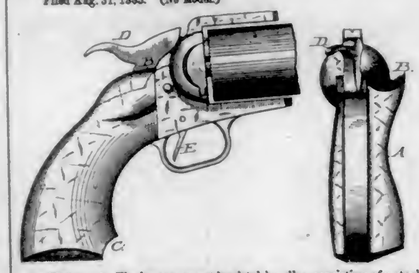
7. The combination of horizontal shaft E, gears m^2 m^3, vertical shaft M, gears *m m'*, shaft N, gears N^2 g^2 thereon, gears g^3, and worm G^3, and car carrying endless chain, substantially as shown and described.

8. The combination of the chains A A, diagonal cross-bar I, picks I', and scoops or shovels J, substantially as shown and described.

297,411. FANNING-MILL. WILLIAM H. KELLY, Lexington, Va. Filed Oct. 26, 1883. (No model.)

Claim.—1. The combination, with the fan-shaft a^2, the shoe E, and the hangers *k k'*, of the actuating devices, all arranged on one side of the machine, and consisting of the band-wheel G, the recessed pulley G^2, the central pulley, H', the bands G' H, and the rod *b*, eccentrically attached to the central pulley and connected to the middle portion of the side of the shoe, substantially as and for the purposes described.

2. The combination, with the riddle E' and the screen E^2, of the sieve E^3, having its lower end provided with feet e^4, supported upon the inclined screen, and the fixed pins e^3, for supporting its upper end, the sieve being thus adjustable at any required inclination, substantially as and for the purposes set forth.



3. The combination, with the riddle E' and the cant-board K', of the board K, removably attached to the inner end of the riddle, and extended under the cant-board, substantially as and for the purposes described.

4. The combination, with the shoe E and the riddle E', of the holders c^2 c^3, and the bolts *c c*, having the locking ends *c' c'*, substantially as and for the purposes set forth.

5. The combination, with the shoe E, of the chute M, removably attached to the lower end of the shoe, the notched pendants *f f*, the key A', and the screws *f' f'*, inserted through the slots *h h*, substantially as and for the purposes set forth.

6. The combination, with a vibrating shoe, E, and a screen, E^2, provided with the cleats *n n*, of the knocker N, the rod N', attached to the screen between the cleats, said knocker adapted to be oscillated and caused, by the vibratory motion of the shoe, to strike the cleats and produce both lateral and vertical jarring motions upon the screen, substantially as and for the purposes described.

297,412. PISTOL-HANDLE. JOHN C. KELTON, San Francisco, Cal. Filed Aug. 31, 1883. (No model.)

Claim.—1. The improvement in pistol-handles, consisting of a stock attached to the back-strap, and formed with a curve upon one side to fit the hand, and made thicker at its curved side than at its opposite side, substantially as and for the purposes set forth.

2. In a pistol-handle, the stock enlarged upon one side and curved to fit the hand, and provided with the groove B, formed in its upper part at one side of the back-strap, and having the recess C in its lower end to receive the little finger of the operator's hand, substantially as and for the purposes herein set forth.

3. In a pistol-handle, the stock having the enlarged side portion, A, curved to fit the hand, and provided with the groove B in its upper end to receive the thumb of the operator's hand, and also with the recess C in its lower end to receive the operator's little finger, in combination with the broad flat trigger E, inclined backward at right angles to the line of applied force, substantially as described, and for the purpose specified.

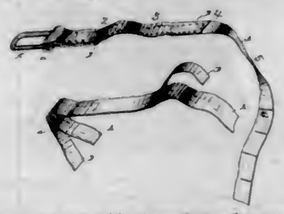
4. In a pistol, the handle having the enlarged side portion, thumb-groove B, and finger-recess C, as shown, in combination with a hammer having the comb depressed, bent to the left, broadened, and canted to the right, substantially as herein shown and described.

297,413. MANUFACTURE OF ETHYL-BLUE COLORING-MATTER. ALFRED KERN, Basle, Switzerland, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Jan. 10, 1884. (No specimens.)

Claim.—The blue coloring-matter produced by the condensation of alpha-phenyl-naphthylamine with tetra-ethyl-diamido-benzophenone, and having the characteristics above described.

297,414. METHYL-BLUE COLORING-MATTER. ALFRED KERN, Basle, Switzerland, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Jan. 10, 1884. (No specimens.)

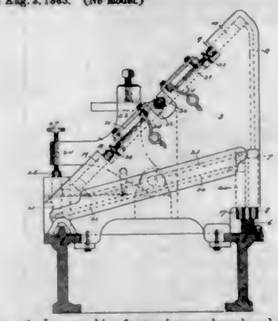
Claim.—As a new product, the blue dye-stuff or coloring-matter hereinbefore described, and having the characteristics above set forth.



297,415. METHYL-BLUE COLORING-MATTER. ALFRED KERN, Basle, Switzerland, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Jan. 10, 1884. (No specimens.)

Claim.—As a new product, the purple dye-stuff or coloring-matter hereinbefore described, and having the characteristics above set forth.

297,416. ETHYL-BLUE COLORING-MATTER. ALFRED KERN, Basle, Switzerland, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Mar. 4, 1884. (Specimens.)



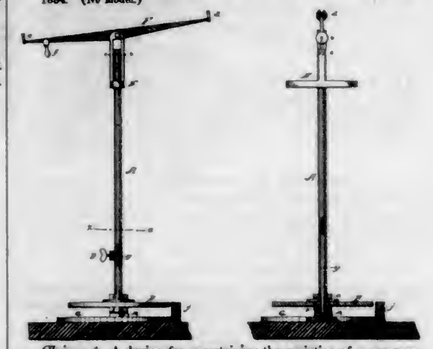
Claim.—The blue coloring-matter produced by the condensation of tetra-ethyl-diamido-benzophenone with dibenzyl-aniline, and having the characteristics above described.

297,417. TAPE-MEASURE. WILLIAM KNUPPEL, Hoboken, N. J. Filed Feb. 5, 1883. (No model.)

Claim.—As a new article of manufacture, the measuring-tape herein described, consisting of the tape A, the loop A', and the strengthening and marking piece B, the latter extending down the tape and ending at the two-inch and four-inch marks, or other designated points on opposite sides, thereby making such points conspicuous, as and for the purposes set forth.

297,418. MACHINE FOR TURNING GUN-BARRELS AND OTHER ARTICLES OF IRREGULAR FORM. CHARLES A. KING, Meriden, Conn. Filed Aug. 3, 1883. (No model.)

Claim.—1. In a machine for turning gun-barrels and other articles, a stationary former or guide secured to the bed of the machine, in combination with a carriage movable along said bed, a movable tool-holder secured on said carriage, a piston movable within a cavity in said carriage, and against which said tool-holder has a bearing, a piston movable within a cavity in said carriage and bearing against said former or guide, and a duct or chamber connecting said cavities and adapted to be filled with liquid, whereby the movement of the piston along said former or guide will actuate the tool-holder through the medium of the liquid, substantially as described.



2. In a machine for turning gun-barrels and other articles, a stationary former or guide secured to the bed of the machine, in combination with a carriage movable along said bed, a movable rest secured on said carriage, a piston movable within a cavity in said carriage against which said movable rest has a bearing, a piston movable within a cavity in said carriage and having a bearing against said former or guide, and a duct or chamber connecting said cavities and adapted to be filled with liquid, whereby the movement of the piston against said former or guide will actuate said movable rest through the medium of the liquid, substantially as described.

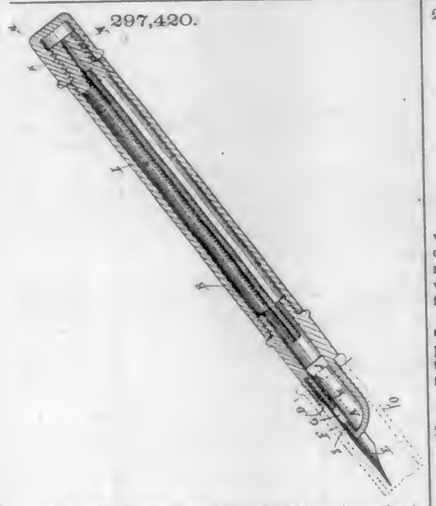
3. In a machine for turning gun-barrels and other articles, a single stationary former or guide secured to the bed of the machine, a carriage movable along said bed, a movable tool-holder secured on the carriage, a piston movable within a cavity in said carriage against which the tool-holder has a bearing, a piston movable within a cavity in said carriage and having a bearing against said former or guide, and a duct or chamber connecting said cavities and adapted to be filled with liquid, in combination with a movable rest secured on said carriage, a piston movable within a cavity in said carriage, and against which said rest has a bearing to support a barrel or other article while being turned, a piston movable within a cavity in the carriage and having a bearing against said former or guide, and a duct or chamber connecting said cavities and adapted to be filled with liquid, whereby said tool-holder and said rest to support the barrel are operated in unison through the medium of the liquid in said ducts or chambers by their respective pistons moving against the same former or guide, substantially as described.

4. In a machine for turning gun-barrels and other articles, a stationary former or guide secured to the bed of the machine, a carriage movable along the bed of said machine, two rests movable on said carriage and located to support a gun-barrel or other article on opposite sides while being turned, a piston for each rest to bear against and movable within a cavity behind each rest, a piston to actuate each rest and movable within a cavity in the carriage and bearing against said former or guide, and a duct or chamber connecting each two cavities containing the pistons for each rest and adapted to be filled with liquid, whereby both said rests will be operated in unison by the movement of their respective pistons along the former or guide, through the medium of the liquid contained in their respective ducts or chambers, substantially as described.

5. In a machine for turning gun-barrels and other articles, a carriage movable along the bed of the machine, a movable rest secured on said carriage, and a piston movable within a cavity in said carriage, in combination with an adjusting-screw adapted to operate between said rest and said piston, for adjusting the pressure of the piston against the movable rest, substantially as described.

297,419. DEVICE FOR ASCERTAINING THE VARIATION OF COMPASSES. CHARLES E. KIRTLAND, Milwaukee, Wis. Filed Jan. 25, 1884. (No model.)

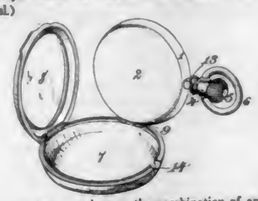
Claim.—1. A device for ascertaining the variation of a compass, substantially as herein shown and described, consisting of a fore sight and rear sight rigidly affixed at the respective ends of a vertically-oscillating sight-bar centrally pivoted in the top of a gravity-acting guide-frame vibrating freely at right angles to the line of motion of the sight-bar and pivoted near its top, at the top of a standard on and by which it is supported, and against which it is guided, which standard, near its lower end, has a rigid flange or plate on which is the usual compass-chart notation, and at the end of which standard, below said flange, is a bearing-collar, said bearing-collar and plate being centrally perforated, admitting a supporting-pintle adjustably inserted through said collar and plate up a distance into the tubular standard, said pintle having a rigid collar near its lower end, on and against which the above-described standard-collar bears and is supported, said pintle and pintle-collar being rigidly affixed to a plate, which plate is adapted to be rigidly affixed to the deck of a vessel or other suitable place, and which plate has also a guide-standard, with a fore-and-aft notch in its top surface, substantially as and for the purpose specified.



2. In a device for ascertaining the variation of a compass, the vertically-oscillating sight-bar F, provided at its extremities with rigidly-affixed sights *d* and *e*, the gravity-guide frame E, in the top of which guide-frame the sight-bar F is centrally pivoted, the tubular standard A, to which, near the top, the gravity-guide frame E is pivoted, said standard being provided with the rigidly-attached flange or plate B, in combination with the plate G, provided with rigidly-affixed pintle *g*, and guide-standard *j*, substantially as and for the purpose specified.

3. In a device for ascertaining the variation of a compass, the sights *d* and *e*, sight-bar F, centrally pivoted in top of gravity-guide frame E, which guide-frame is pivoted in top of tubular standard A, having chart-bearing flange B and bearing-collar nut *b*, in combination with pintle *g*, bearing-collar nut *h*, plate G, and notched guide-standard *j*, all substantially as and for the purpose specified.

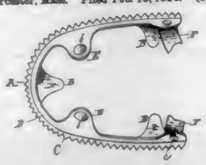
297,420. FOUNTAIN-PEN. ALBERT J. KLETZKER, New York, N. Y., and CHARLES H. COURT, Jersey City, N. J.; said Court assignor of one-half his right to said Kletzker. Filed Feb. 17, 1882. (No model.)



Claim.—1. In a fountain-pen, the combination, with the apertured point-section A, of a spring-pressed block or plug projecting into the aperture and provided with a tongue, substantially as herein shown and described, whereby the block or plug is adapted to be vibrated by the pen to cause the flow of ink, and the ink conducted to the point of the pen, as set forth.

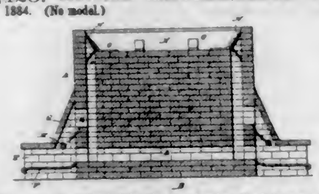
297,420.

2. In a fountain-pen, the combination, with the point-section A, provided with pen-recess D and the aperture F, of the transverse piece J, the spring H, secured to the said piece, and the block or plug G, provided with the tongue S, and adapted to be vibrated by the pen, substantially as and for the purpose set forth.



297,421. WATCH-CASE. JAMES LAMONT, Sag Harbor, N. Y., assignor to the Fahys Watch Case Company, same place. Filed Mar. 22, 1884. (No model.)

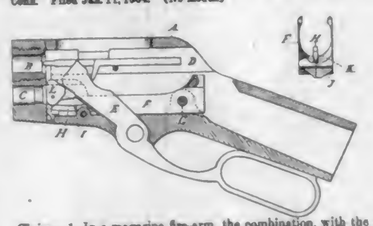
Claim.—1. In a watch-case, the combination of an outer case, a suitable pendant or stem attached to an inner case, an inner case hinged to the outer case upon an axis or pintle parallel with the pendant or stem, and adapted to be opened on said hinge, substantially as described.



2. In a watch-case, the combination of an inner case for carrying the movement, a suitable pendant or stem attached to the inner case, and an outer case composed of two parts secured together, the outer and inner cases having a hinged connection upon an axis or pintle parallel with the stem or pendant, whereby the inner case may be turned outwardly from the outer case at a right angle to the stem or pendant, substantially as described.

297,422. COASTING-GUARD FOR BOOTS OR SHOES. WILLIAM LAWRENCE, Worcester, Mass. Filed Feb. 15, 1884. (No model.)

Claim.—As an improved article of manufacture, a coasting-guard for boots or shoes, of substantially the form shown in the drawings, having three or more lips or projections, B, or their equivalent, upon its under surface, for the foot to rest upon, with a row of teeth or corrugations, C, on the outer and lower edge, for the purpose stated, and two or more parts, E, projecting out from the part D, substantially as shown and described.



297,423. BRICK-KILN. JAMES S. LESTER, Atlanta, Ga. Filed Mar. 17 1884. (No model.)

Claim.—1. In a brick-kiln, the herein-described furnace, provided with a grate having an upward turn at its inner end, and an extension or hood having in it a damper, both the furnace and the extension communicating with the inside of the kiln through suitable openings in the wall of same, and being arranged to operate as and for the purpose set forth.

2. In a brick-kiln provided with furnaces of the construction described, the automatically-adjustable plates or strips beveled and supported by braces, as described, and operating to close the space between the kiln-wall and brick-pile, thus preventing the escape of heat from the furnace through the said opening, substantially as described.

297,424. MAGAZINE FIRE-ARM. JOHN M. MARLIN, New Haven, Conn. Filed Jan. 11, 1884. (No model.)

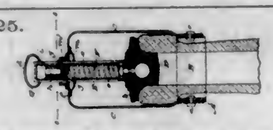
Claim.—1. In a magazine fire-arm, the combination, with the carrier and breech-piece, of a stop located in the forward end of the carrier, and normally standing above the bed thereof, and arranged to be engaged and depressed by the breech-piece, substantially as set forth.

2. In a magazine fire-arm, the combination, with the carrier and breech-piece, of a stop located in the forward end of the carrier, and normally standing above the bed thereof, and arranged to be engaged and depressed by the breech-piece, and means for elevating the said stop after depression, substantially as set forth.

3. In a magazine fire-arm, the combination, with the carrier and breech-piece, of a stop mounted in a recess formed in the bed of the carrier, and normally standing above the level of the same, and arranged to be depressed by the breech-piece, substantially as set forth.

4. In a magazine fire-arm, the combination, with the carrier and breech-piece, of a stop mounted in the forward end of the carrier, and normally standing above the bed thereof, and having its rear end provided with an incline with which the breech-piece engages in its rearward movement and elevates the outer end of the stop, substantially as set forth.

5. In a magazine fire-arm, the combination, with a split carrier and the breech-piece, of a stop mounted in and normally standing above the bed of the carrier, and constructed and arranged to be depressed by the breech-piece, and to enter between and force the sides of the carrier apart when so depressed, substantially as set forth.



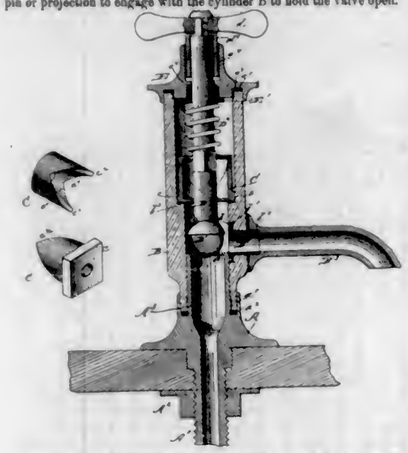
6. In a magazine fire-arm, the combination, with a split carrier and the breech-piece, of a stop mounted in and normally standing above the bed of the carrier, and constructed and arranged to be depressed by the breech-piece, and to enter between and force the sides of the carrier apart when so depressed, and to be elevated by the same in closing, substantially as set forth.

7. In a magazine fire-arm, the combination, with a split carrier and breech-piece, of a stop located in and normally standing above the bed thereof, having its forward end wedge-shaped, and arranged to be depressed by the breech-piece, and to enter between and force the sides of the carrier apart when so depressed, and to be elevated by the same in closing, substantially as set forth.

297,425. STOPPER-LOCK. JAS. D. MATTESON, New York, N. Y. Filed Feb. 8, 1884. (No model.)

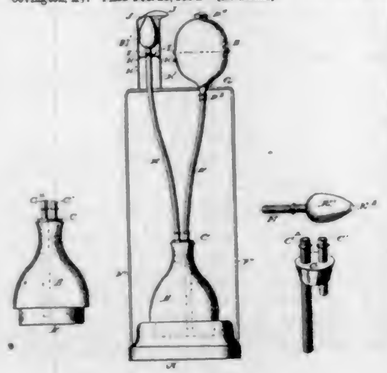
Claim.—1. In a stopper-lock for bottles and similar receptacles, the combination, with the bail provided with a nut, of the stopper, the screw provided with a key-socket, the slotted tube which incloses the

297,425.



screw, and the casing secured to said tube and provided with a key-hole substantially as set forth.

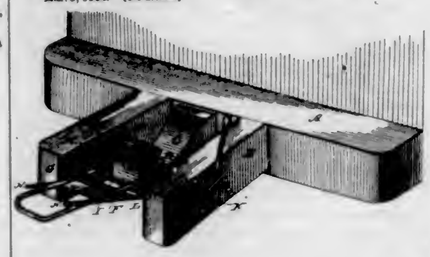
2. In a stopper-lock for bottles and similar receptacles, the combination, with the bail provided with a nut, of the stopper, the slotted tube E, the stem *c*, for attaching the stopper to the tube, the inclosed screw F, provided with a key-socket in its upper end, and the casing G, provided with a key-hole to receive the key, all arranged substantially as set forth.



297,426. FAUCET. JAMES MCGINLEY, Chicago, Ill. Filed May 8, 1883. (No model.)

Brief.—The upper part of the cam-box C may be provided with a pin or projection to engage with the cylinder B to hold the valve open.

Claim.—A self-closing faucet consisting of the base A, having valve-seat *a*, cylinder B, provided with nozzle B^2, and formed with the shoulder b^2, above which it is formed angular in cross-section, and the cap E, having a stuffing-box and a socket, e^2, in combination with the two-part cam-box C, one part of which is formed square or angular and held stationary within the cylinder, and the other is fast upon and moves with the valve-stem, the valve-stem D, and the spring D^2, adapted to hold the cam-box and valve properly seated and return the latter to place when released, all constructed and arranged to operate substantially as and for the purpose set forth.

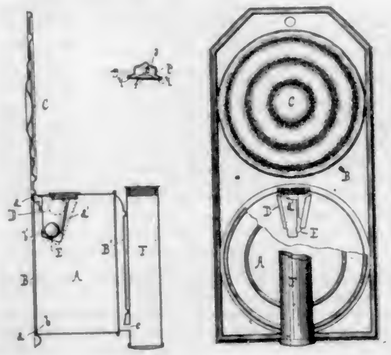


297,427. AIR MEDICATOR AND INJECTOR. BRADFORD MCGREGOR, Covington, Ky. Filed Feb. 23, 1884. (No model.)

Claim.—1. In a device for medicating and applying air, the combination, with the bottle having a reservoir in its lower end and the tubes D' E, connected with such bottle, substantially in the manner described, and provided with bulbs D E', of the base provided in its upper side with a socket fitted to receive said reservoir, and the frame or arch mounted on said base and provided with supports adapted to hold said bulbs, substantially as set forth.

2. The combination of the bottle, the base adapted to receive the same, the discharge-tube E, having a bulb-nozzle, E', provided with a suitable discharge-opening, and the supply-frame provided with means for holding the bulb-nozzle, and having a spring-cap arranged to bear on the bulb-nozzle and close the discharge-opening thereof, substantially as set forth.

297,428. CAR-COUPLING. THOMAS L. MCKEEN, Easton, Pa. Filed Mar. 3, 1884. (No model.)

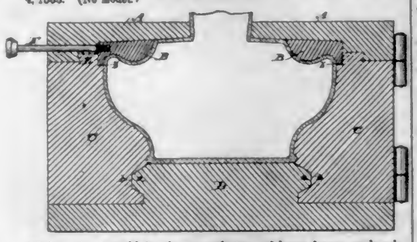


Claim.—1. The combination of a hook-shaped draw-head having a horizontal longitudinal slot near its outer end, a link having its inner end forming a transverse bar sliding in the slot, and two bumpers, one upon each side of the draw-head, and having longitudinally-slotted bearings upon their inner sides for the reception of the ends of the transverse bar, as and for the purpose shown and set forth.

2. The combination, in a car-coupling, of a link hinged at its inner end in a hook-shaped draw-head, with a transverse bar turning in transverse bearings in two bumpers upon the sides of the draw-head, having handles upon its ends, and having two projecting rods upon its middle provided with a plate secured between them at a short distance from their ends, the said arms and plate being adapted to clasp and support the link, as and for the purpose shown and set forth.

3. In a car-coupling of the described class, the combination of a hook-shaped draw-head, having a horizontal slot near its outer end, two bumpers secured at the sides of the draw-head, and having longitudinally-slotted boxes upon their inner sides, open at the rear ends, and forming transverse bearings, a link having a transverse bar at its inner end sliding in the horizontal slot in the draw-head, and sliding with its ends in the slotted boxes upon the bumpers, and a transverse bar turning in the bearings in the bumpers, having handles upon its ends, and having two projecting arms connected near their ends by a plate, and adapted to support and clasp the link, as and for the purpose shown and set forth.

297,429. LAMP. FRANKLIN W. MERRYMAN, Baltimore, Md. Filed Oct. 18, 1883. (No model.)



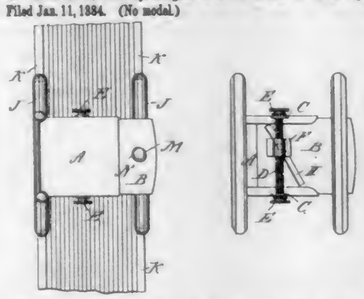
Claim.—1. The back B of the lamp, corrugated to form the reflector C, substantially as specified.

2. In a lamp, the cylindrical reservoir A, with one of its ends secured to the back B and the other provided with the head B', substantially as and for the purpose specified.

3. The open-sided float-chamber D, having as a part thereof a spring, *a'*, substantially as and for the purpose specified.

4. In combination with the lamp, the cap G, which consists of the threaded cylinder *d*, having the perforated conical bottom *e*, and plate *f*, combined with the curved circular disk *g*, substantially as specified.

297,430. MOLD FOR THE MANUFACTURE OF GLASS LAMPS AND LAMP-FOUNTS. JOHN F. MILLER, Martin's Ferry, Ohio. Filed Dec 4, 1883. (No model.)

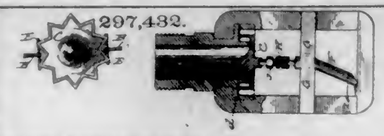


Claim.—1. A mold for the manufacture of lamp founts or bowls, provided with a solid removable ring located beneath the folding or hinged top of the mold, said ring being adapted to form an annular depression or groove in the top of the fount or bowl, as set forth.

2. A mold for the manufacture of lamp founts or bowls, provided with a recess in its top to receive a solid removable ring, and a hinged cap or cover adapted to hold said ring in position, as set forth.

3. In a glass mold, the base D and mold-sections C, provided with an annular offset, *b'*, in combination with a removable ring, B, and hinged cap or cover A, as set forth.

297,431. EXTENSIBLE CLASP FOR BOOKS. JACOB MÜNCH, Offenbach-on-the-Main, Germany, assignor to Edward Posen & Co., same place. Filed Jan. 11, 1884. (No model.)



Claim.—1. In a book-clasp, the combination, with two overlapping plates, of a transverse screw journaled in one plate and passing through a nut or block having a part engaging with a diagonal slot or guide in the other plate, all substantially as herein shown and described.

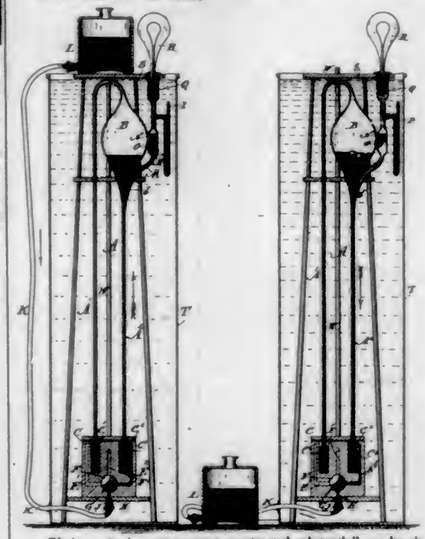
2. In a book-clasp, the combination, with the plate A and the plate B, held to slide under the plate A, of the screw D, journaled on the plate A, and the nut F, mounted on the spindle D, and having a projection engaging with a diagonal slot in the plate B, whereby one plate is adapted to slide beneath the other, substantially as herein shown and described.

3. In a book-clasp, the combination, with the plate A and the sliding plate B, having a diagonal slot, H, of the screw-spindle D, journaled on the plate A, and the nut F, mounted on the spindle D, and provided with a projection, G, extending into the slot H, substantially as herein shown and described.

297,432. AUTOMATIC FIRE-EXTINGUISHER. WM. MERACHER, Cleveland, Ohio. Filed Jan. 21, 1884. (No model.)

Claim.—1. In an automatic fire-sprinkler, a distributer having continuous vertical walls with salient projections, said distributer being located to receive the water from the pipe and to distribute it in various

297,432.



directions, substantially as described.

2. In an automatic fire-extinguisher, the distributer having a vertical continuous wall, said wall being provided with salients and with a central cone, substantially as described.

3. In an automatic fire-extinguisher, the body A, having frame B, and a distributer with supporting-posts and arms G, adapted by means of solder to hold the distributer to the body, substantially as described.

4. In a distributer, the body, a frame, a distributer adapted to close the body, a supporting-post having arms adapted to be connected to the frame by solder, and post H and extensible post J, the parts being constructed and arranged in their relation to each other substantially as described.

297,433. VACUUM-PUMP. CHARLES G. E. NEVEUX, New York, N. Y. Filed Oct. 6, 1883. (No model.)

Claim.—1. A vacuum-pump constructed substantially as herein shown and described, and consisting of two vertical tubes united at their upper ends, one of the tubes being provided at the upper end with a bulb and at the base of the bulb with a pipe leading to the receptacle from which the air is to be exhausted, as set forth.

2. A vacuum-pump constructed of two vertical tubes united at their upper ends, one of the tubes being provided at the upper end with a bulb communicating with both tubes, from the bottom of which bulb a tube projects upward, which is connected with a receptacle from which the air is to be exhausted, the lower ends of the said tubes being contained in cups forming mercury seals, to and from which cups channels lead for conducting mercury into and from the tubes, substantially as herein shown and described, and for the purpose set forth.

3. In a vacuum-pump, the combination, with two vertical tubes united at their upper ends, of channels leading to the lower ends of the tubes, and of a cock for bringing the lower end of either tube in communication with a channel through which the mercury can be conducted, substantially as herein shown and described, and for the purpose set forth.

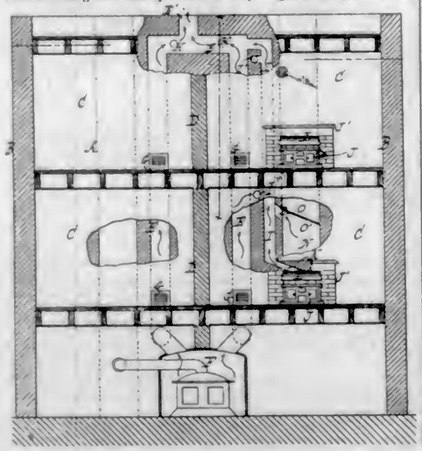
4. In a vacuum-pump, the combination, with two vertical tubes united at their upper ends, in one of which tubes a bulb is formed, of a tube projecting upward from the base of the bulb, an apertured disk in the said tube, and a valve for closing the aperture in the said disk, substantially as herein shown and described, and for the purpose set forth.

5. In a vacuum-pump, the combination, with two vertical tubes united at their upper ends, one of the tubes being provided with a bulb from the lower end of which a tube projects upward, which is connected with a vessel from which the air is to be exhausted, of two pockets, into

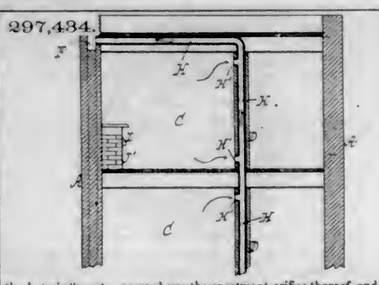
which the lower ends of the tubes pass, and in which they are sealed by mercury seals, channels connecting the said pockets with an opening containing a cock-plug, which cock-plug opening is connected by suitable tubing with a mercury-receptacle, substantially as herein shown and described, and for the purpose set forth.

6. In a vacuum-pump, the combination, with two vertical tubes united at their upper ends, a bulb being formed in one of the tubes, and a tube projecting from the base of the bulb, with which tube the receptacle from which the air is to be exhausted is connected, of a block provided with pockets, into which the lower ends of the tubes pass, a reservoir-opening formed in the said block, an opening containing a cock-plug, channels connecting the said openings with the upper ends of the pockets, a channel connecting the said opening with the reservoir recess or aperture, and a tube connecting the said opening with a mercury-receptacle, substantially as herein shown and described, and for the purpose set forth.

7. In a vacuum-pump, the combination, with a U-shaped tube, A, having a bulb, B, of the tube M, with which the vessel to be exhausted is connected, the blocks C, provided with pockets C' C², for receiving the ends of the shanks, and with an opening, C³, forming a mercury-reservoir, which block is provided with chambers E' E², extending from the pockets to an opening, F, containing a cock-plug, G, and with a channel, F', extending from the aperture C² to the opening F, the neck J, the tube K, the mercury-bottle L, the valve V in the bottom of the reservoir, and the air-pipe W, substantially as herein shown and described, and for the purpose set forth.



8. A vacuum-pump constructed with two pipes united at the upper ends, one of the pipes being provided with a bulb and with a branch pipe, to which the receptacle from which the air is to be exhausted is connected, which branch pipe is so located that when the mercury rises to enter the bulb from the bottom the mercury will seal the lower end of the said branch pipe before it rises in the bulb, substantially as herein shown and described, and for the purpose set forth.



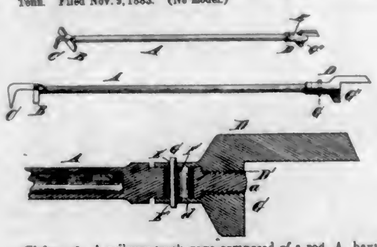
9. In a vacuum-pump, the combination, with two vertical pipes united at their upper ends, one of which pipes is provided with a bulb, of a cock by means of which the inlets at the lower ends of the pipes can be regulated in such a manner that mercury can be admitted in the bulb, either from the top or from the bottom, and also whereby the flow of mercury into the top of the bulb can be regulated as may be desired, substantially as herein shown and described, and for the purpose set forth.

297,434. HEATING AND VENTILATING APPARATUS. PATRICK W. NOLAN, New York, N. Y., assignor to himself, and Carlos Bardwell, Lakewood, N.J. Filed Mar. 17, 1883. (No model.)

Claim.—1. In a building, the combination, with a hot-air flue leading from a furnace, communicating with an apartment of the building, and opening at the upper end to the exterior of the building, of a ventilating-flue, also communicating with said apartment and opening into the hot-air flue at a point above the apartment-orifice thereof, whereby an artificial draft may be created in the ventilating-flue from the hot-air flue, without contaminating the air admitted to the apartment with the gases entering the hot-air flue from the ventilating-flue.

2. In a building, the combination of a hot-air flue leading from a furnace, communicating with an apartment of the building, and opening at the upper end to the exterior of the building, a ventilating-flue, also communicating with said apartment and opening at the upper end into

297,434.



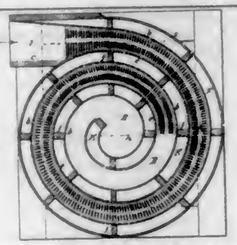
the hot-air flue at a point above the apartment-orifice thereof, and a second ventilating-flue leading from a kitchen-range or other heating medium and opening into the other or main ventilating-flue, whereby an artificial draft can be created in the main ventilating-flue, either from the hot-air flue or from the second ventilating-flue.

3. In a building, the combination of a hot-air flue, E, leading from a furnace, communicating with an apartment of the building and opening at the upper end to the exterior of the building, a ventilating-flue, H, also communicating with said apartment and opening into the hot-air flue at a point above the apartment-orifice thereof, a ventilating-flue, I, opening at its upper end into the hot-air and ventilating flues E and H, and a channel, K, connecting the flue I with a kitchen-range, J, or other heating medium, substantially as described.

4. In a building, the combination of a hot-air flue, E, leading from a furnace, communicating with an apartment of the building, and opening at the upper end to the exterior of the building, a ventilating-flue, H, also communicating with said apartment and opening into the hot-air flue at a point above the apartment-orifice thereof, a ventilating-flue, I, opening at its upper end into the hot-air and ventilating flues E and H, a channel, K, connecting the flue I with a kitchen-range or other heating medium, a chimney, N, receiving the products of combustion from the range, and having an orifice, O, connecting it with the ventilating-flue from the range, and a damper, O', serving to open and close said orifice, substantially as and for the purpose described.

5. In a building, the combination of a hot-air flue leading from a furnace, communicating with an apartment of the building, and opening at the upper end to the exterior of the building, a ventilating-flue, I, leading from a kitchen-range, connecting through an orifice with a chimney receiving the products of combustion from the range, and opening at its upper end into the hot-air flue, and a damper for opening and closing the orifice between the chimney and the flue, substantially as described.

297,435. RAILROAD-TRACK GAGE. PATRICK NOLAN, Hurricott, Tenn. Filed Nov. 9, 1883. (No model.)



Claim.—1. A railway-track gage composed of a rod, A, having a transverse bar, B, and clamp-hook C at one end, and an adjustable extension-bar, D, at its other end, substantially as herein set forth.

2. A railway-track gage composed of a rod, A, having a clamping bar and hook, B C, at one end, and an adjustable shouldered extension-bar D at its other end, the said extension D being locked in position for the desired width of track by a pin, G, passed through perforations E E' and slot F, substantially as herein set forth.

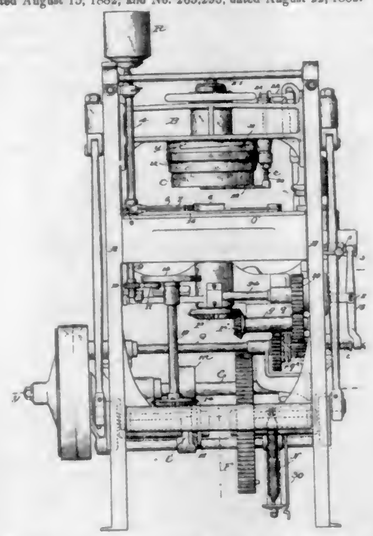
297,436. DUST-COLLECTOR. BARNEY F. OKTMAN and HORATIO R. TAYLOR, Buffalo, N. Y. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a dust-collector, the combination of a bent or curved air-passage constructed with a perforated wall, which deflects the dust-laden air out of its course, and a dead-air chamber, which receives the dust-particles, which are driven through the said perforated wall by their momentum, while the air passes off through said passage in another direction, substantially as described.

297,436.

2. In a dust-collector, the combination, with a spiral passage having an outer perforated wall, of a spiral dead-air chamber arranged on the outer side of said perforated wall, substantially as described.

3. In a dust-collector, the combination, with a bent or curved air-passage constructed with a perforated wall, which deflects the dust-laden air out of its course, of a dead-air chamber arranged on the outer side of said perforated wall, and partitions arranged in said dead-air chamber, whereby its continuity is broken, substantially as described.



4. In a dust-collector, the combination, with a bent or curved air-passage constructed with a perforated outer wall, which deflects the dust-laden air out of its course, and with a perforated bottom, of a dead-air chamber arranged on the outer side of said perforated wall and below said perforated bottom, substantially as described.

5. The combination, with the spiral air-passage B, having an outer perforated wall, *b*, inlet-spout A, and discharge-spout D, of the spiral dead-air chamber E, open at the bottom, and a receiver, K, arranged below the said chamber E, substantially as described.

6. The combination, with the spiral air-passage B, having an outer perforated wall, *b*, inlet-spout A, and discharge-spout D, of the spiral dead-air chamber E, provided with partitions *f*, and receiving-hopper K, substantially as described.

297,437. HEEL-MACHINE. EDWARD H. PARKS, Providence, R. I., assignor to the Mansell Heel Machine Company. Filed July 17, 1883. Renewed Mar. 19, 1884. (No model.)

Brief.—Improvement on Mansell's Letters Patent No. 262,902, dated August 15, 1882, and No. 263,293, dated August 22, 1882.

Claim.—1. A horizontal rotary table carrying cutter-dies, in combination with mechanism for holding the table in a fixed position, and mechanism for starting it at the will of the operator, and with a vertically-reciprocating block acting in conjunction with the dies, substantially as described.

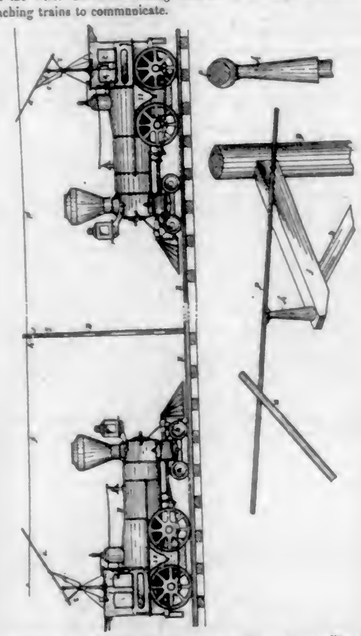
2. A horizontal rotary table having two cutting-dies or sets of dies, a vertically-reciprocating block acting in conjunction with the die, mechanism for rotating the table, automatic arresting mechanism, and starting mechanism, substantially as described.

3. A cutting-die, a vertically-reciprocating block acting in connection therewith, and a reciprocating pasting mechanism adapted to move under the block and deposit or apply paste after the cutting of each lift, substantially as described.

4. A revolving table carrying cutter-dies or sets of dies, automatic stopping mechanism, starting mechanism, a vertically-reciprocating block, reciprocating pasting mechanism, and discharging mechanism, substantially as described.

5. A revolving table carrying cutting-dies or sets of dies, automatic stopping mechanism, starting mechanism, reciprocating pasting device, blank-discharging devices, a press, and an arm adapted to move the blank from the position of the die to the said press, substantially as described.

6. The inner and outer dies, in combination with their respective die-holders, and annular flanges or rings having inclines reversed in position to inclines on the die-holders, substantially as described.



7. In combination with the reciprocating block and dies, the guard-arm and mechanism for moving the same in the described relation to said block, substantially as set forth.

8. The revolving table carrying dies in the described relation to a reciprocating block, and provided with holes to receive a locking-pin, in combination with said locking-pin, connected by lovers to a spring-clutch forming connection between the driving-power and the table, all substantially as set forth.

9. The press-piston, in combination with the clearing-plunger, the toggle-joint having projection 66, and the spring, all substantially as described.

297,438. TRAIN-SIGNAL. MARCUS F. PARRISH and SCHUYLER J. MUNN, Niles, Mich., assignors of one-third to Charles W. Millard, same place. Filed Oct. 30, 1883. (No model.)

Brief.—The contact-arm is spring-pressed and reversible from one side of engine to the other; also can be lifted wholly out of engagement with the wire. Short connecting-sections at crossings to enable approaching trains to communicate.

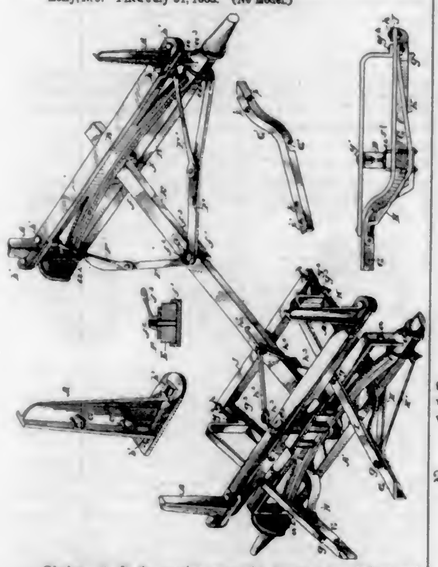
Claim.—1. The combination, with a metal track and a line of wire along said track, of railway-engines or other vehicles, each provided with an alarm, an electric generator, and an electric reversible conducting-arm adapted to engage said line of wire, whereby an alarm is sounded in the engines approaching each other, substantially as set forth.

2. The combination, with a metal track and a line of wire along said track, of separate engines or other vehicles adapted to traverse said track, each provided with an alarm, an electrical generator, conducting-wires, and a reversible conducting-arm adapted to engage said line of wire, substantially as described.

3. The combination, with a metal track and a line of wire along said track, of railway-engines or other vehicles, each provided with means for producing electricity, means for receiving and transmitting signals, alarms, or messages, a reversible conducting-arm adapted to engage said line of wire, and means for causing a yielding engagement of said parts, all substantially as set forth.

4. An engine or other vehicle provided with a tube-support, and a shaft adapted to rotate in said tube-support, in combination with a conducting-arm connected with the top of said shaft, and means for rotating the shaft, for the purpose of throwing the conducting-arm from one position to another, substantially as described and shown.

5. In a train-signaling device, the combination, with a tube-support, a thimble at the top of said tube-support, and adapted to rotate around the latter, of a pivotally-connected conducting-arm and spring-braces connecting said arm and thimble, substantially as specified.



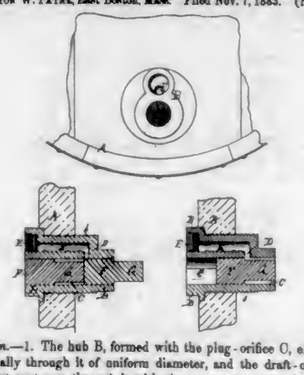
6. In a train-signaling device, the combination, with a metal track and a line of wire along said track, of an engine or other vehicle adapted to traverse said track, and provided with means for communicating signals or messages, means for producing electricity, a reversible conducting-arm, and conducting-wires connecting said means and conducting-arm with the axle, or equivalent metal portion of the vehicle, substantially as set forth.

7. An engine or other vehicle provided with an insulated tube-support, a shaft adapted to rotate in said support, a pivoted conducting-arm, an electrical generator, an alarm, and conducting-wires, in combination with a metal track and a line of wire along said track, substantially as described and shown.

8. In a train-signaling device, the combination, with a vehicle having a shaft adapted to rotate, an operating-lever at the lower end of said shaft, a conducting-arm connecting with the upper end thereof, an alarm, generator, and conducting-wires, of a metal track and a line of wire along the line of said track, substantially as described and shown.

9. The combination, with metal tracks crossing each other and vehicles adapted to traverse said tracks provided with conducting-arms, conducting-wires, generators, and means for receiving and transmitting signals or messages, of the main lines of wire thrown out of their regular line at the crossing of the tracks, and the short lines of wire connecting with each other where they cross, all substantially as set forth.

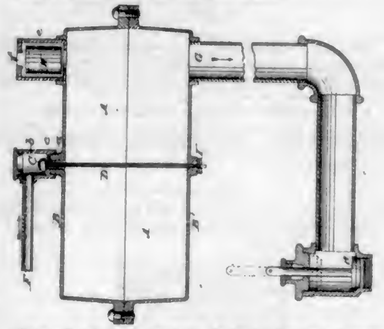
297,439. VEHICLE RUNNING-GEAR. ROBERT C. PARVIN, Mount Holly, N. J. Filed July 31, 1883. (No model.)



Claim.—1. In the running-gear of a wagon, a rear bolster and arched axle-bed formed in one piece, the axle-bed being constructed to bear at the extremities only, and being provided with central projections, *f*, in combination with the axle B', braces F and F', and T-bolt *f*', as described and shown.

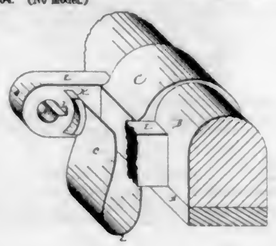
2. In the running-gear of a wagon, in combination with standards A, having the bases, as shown, the bolster C, having depressions or seats at the extremities for standards, and apertures d^3 to receive nuts d^2 for the securing-bolts, as herein shown and specified.

3. In combination with the front axle of a wagon, the arched axle-bed D, formed, substantially as shown, with enlargements e' e^3, perforated to receive king-bolt and securing-bolts, perforated vertical walls *a*, and hub-covers a^3, and the bolster C, formed with perforated enlargement *e* and bearing-plate e^4, substantially as shown and specified.



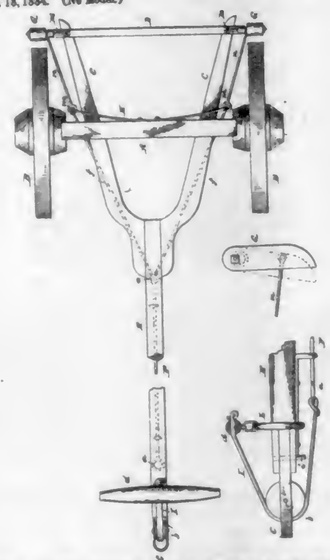
297,440. APPARATUS FOR PLUGGING AND TAPPING BARRELS. NEWTON W. PAYNE, East Boston, Mass. Filed Nov. 7, 1883. (No model.)

Claim.—1. The hub B, formed with the plug-orifice C, extending longitudinally through it of uniform diameter, and the draft-orifice E, running but part way through it with the transverse connecting-recess D, in combination with plugs adapted by driving in to alternately open and close the tap-hole of the barrel, for the purpose set forth.



2. A barrel provided with a hub permanently secured in its tap-hole, and having one internal and two external orifices connected transversely, as shown, in combination with the plug or plugs F G, having two distinct diameters, substantially as and for the purpose set forth.

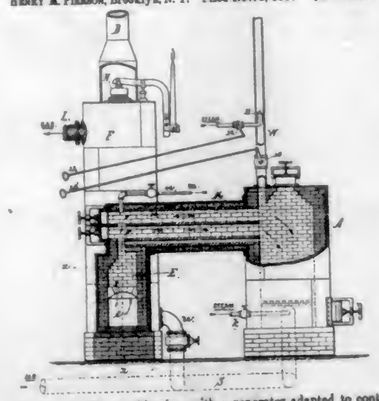
297,441. PRESSURE-REGULATING VALVE. GALEN W. PEARSONS, Kansas City, Mo. Filed Oct. 26, 1883. (No model.)



Claim.—In a device for regulating the flow of liquids, the combination of the chamber A, having flexible walls and valve-operating devices, substantially such as described, connected thereto, with the float-valve H, outlet-pipe G, and valve *d*, as and for the purpose set forth.

297,442. THILL-COUPLING. PALMER D. PECK, Colesburg, Iowa. Filed Feb. 12, 1884. (No model.)

Claim.—The combination, with the perforated and slotted ears, of a thill-iron bored and slotted, as described, and formed with an enlarged eccentric portion, a splined pin to secure the parts, a spring upon which the thill-iron bears, and stops to limit the movement of the spring, substantially as set forth.

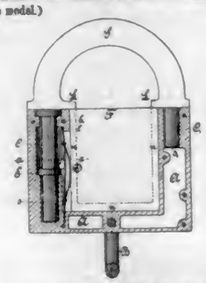


297,443. WAGON-BRAKE. LAWSON G. PEEL, Hazlehurst, Miss. Filed Feb. 18, 1884. (No model.)

Claim.—1. The brake-blocks G G, connected at their upper ends to the short axles M M upon the cross-bar D, and at their lower ends to the rods *n n*, in combination with the spring H, which connects with the rods *n n*, substantially as and for the purpose set forth.

2. The combination, for applying and relieving the brakes, of the following parts: neck-yoke *d*, pulley *b*, strap I, rods F, *f f*, and *n n*, connecting to the brake-blocks, and the spring H, substantially as and for the purpose specified.

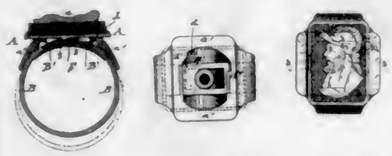
297,444. APPARATUS FOR THE MANUFACTURE OF GAS. HENRY M. PIERSON, Brooklyn, N. Y. Filed Nov. 5, 1883. (No model.)



Claim.—1. The combination, with a generator adapted to contain a bed of incandescent fuel, of a fixing-chamber, and cokers between the generator and fixing-chamber and forming the sole passages for the gases, the loosely-laid fire-brick or similar material in the fixing-chamber, pipes for supplying the air at the base of the fixing-chamber and at the base of the generator, and a pipe for supplying steam at the base of the generator, substantially as set forth.

2. The combination, in a gas-making apparatus, of a set of cokers adapted to the reception of soft coal or similar material, and forming also the passage for the gases, a generator connected with one end of such cokers for the reception of the coke from such cokers, a fixing-chamber, F, connected with the other end of such cokers, and the pipe for supplying steam beneath the incandescent bed of fuel in the generator, substantially as set forth.

3. The combination, with the generator adapted to contain a bed of incandescent fuel, of a pipe for supplying steam into such generator, one or more cokers connected with the opening into such generator and adapted to receive soft coal or similar fuel, a fixing-chamber and the flue connected from the said cokers to the said chamber, and means of supplying hydrocarbon into such flue, substantially as and for the purposes set forth.

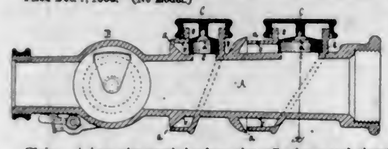


4. The combination, in a gas-making apparatus, of one or more cokers for receiving the soft coal or similar material, the movable cover or covers of such retorts, an escape-pipe connected with the back end of such retort, a jet-pipe for steam or other material under pressure to induce a current in such escape-pipe, and the cock for closing the said pipe substantially as and for the purposes set forth.

297,445. SEAL-LOCK. CHARLES M. PLUMB, Madison, Wis. Filed Feb. 20, 1884. (No model.)

Claim.—The combination of the staple S, having the extensions *s* and *s'*, and the collar E, working in the sockets C C, with the seal-plate F, the double spring D, and catch *c*, all arranged to operate as described, and for the purposes set forth.

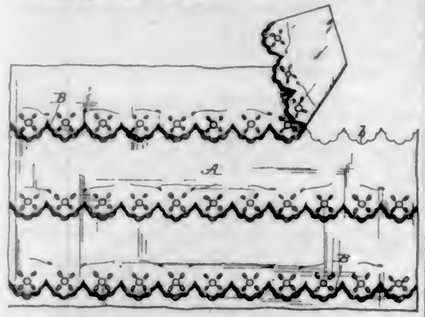
297,446. FINGER-RING. CHARLES PEARL, Cranford, N. J., assignor to Sterne Brothers & Co., New York, N. Y. Filed Mar. 7, 1884. (No model.)



Claim.—1. The combination, in a finger-ring, of a lower box portion, an axially-turning upper box portion, and a shank the ends of which are guided in the lower box portion, and adapted to be tightly clamped by the upper box portion, substantially as set forth.

2. The combination, in a finger-ring, of a lower box portion, a shank the ends of which are guided in the lower box portion, an axially-turning upper box portion adapted to clamp the ends of the shank, and means whereby the extent of axial motion of the upper box portion is limited, substantially as set forth.

3. In a finger-ring, the combination of the lower box portion, *a'*, having a screw-socket, *b*, an adjustable shank, B, having slotted and overlapping ends B', and an upper box portion, *a*, having a central screw-post, *b'*, fitting into the socket of the lower box portion, so that the shank ends are tightly clamped or released, substantially as set forth.



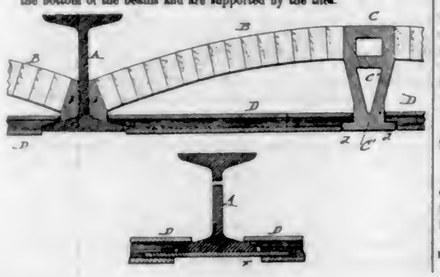
4. In a finger-ring, the combination of the lower box portion, *a'*, having a central screw-socket, *b*, an adjustable shank, B, having slotted and overlapping ends B', guided in said lower box portion, an axially-turning upper box portion having a central screw-post, *b'*, and a downward-projecting stop-pin, *d*, and abutments *d'* of the lower box portion, substantially as set forth.

297,447. HOSE-PIPE NOZZLE. JOHN E. PRUETT, Baltimore, Md. Filed Dec. 7, 1883. (No model.)

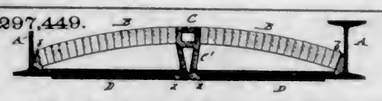
Claim.—A hose-pipe nozzle having a shut-off valve or cock therein, an annular space around said nozzle, with a lateral aperture for the escape of water, and an opening to form the means of communication between the said space and the interior of the nozzle, combined with a valve to control the said opening, substantially as specified.

297,448. EMBROIDERY. MORRIS H. PULASKI, Philadelphia, Pa. Filed Aug. 16, 1883. (No model.)

Claim.—1. As a new article of manufacture, a web of embroidery having the scalloped or curved edges of the embroidered part weakened, as described, as and for the purpose intended, substantially as described.



2. As a new article of manufacture, a web of embroidery having the edges of each embroidery-strip perforated, scored, indented, or cut contiguous to and around the curves and scallops constituting the lower edge of each embroidered strip of such web, as and for the purpose intended, substantially as described.

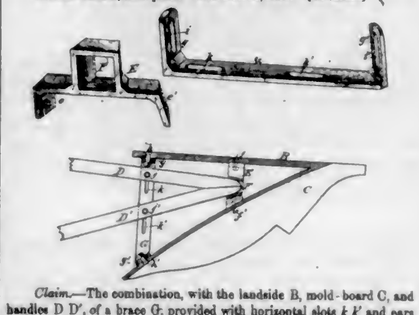


3. As a new article of manufacture, the within-described separable web of embroidery, indented, scored, or perforated contiguous to and around the curves or scallops of the edge of each strip of embroidery composing such web, whereby each of said strips is readily separable from the main fabric around said scallops of said edges, and when so detached each strip is practically cut out around the curves or scallops of the edge of the embroidery, substantially as described.

4. A separable web of embroidery consisting of strips of embroidery, the lower edge of each of said strips being a series of scallops, curves, or ellipses, and having surrounding such curves, ellipses, or scallops a weak frangible line, whereby each strip may be detached from the web in a finished condition, with its scallops, curves, or ellipses cut out ready for use, substantially as described.

297,449. FIRE-PROOF BUILDING. GUSTAVUS W. RADER, New York, N. Y. Filed Jan. 18, 1884. (No model.)

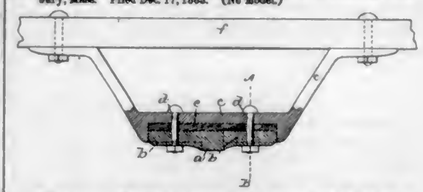
Brief.—A brick arch extending between and supported by I-beams has a keystone with a downward extension. Fire-proof tiles are supported by the extension and the I-beams. Fire-proof plates extend across the bottom of the beams and are supported by the tiles.



297,449. 

Claim.—1. The combination of the beams, a transverse brick arch extending between the beams, a keystone having a downward extension, and horizontal tiles or plates that are supported on the keystone-extension and the beams, substantially as set forth.

2. The combination of the beams A, a transverse brick arch, B, extending between the beams, a keystone, C, having a downward extension, C', provided with lateral shoulders *d d*, and hollow fire-proof tiles or plates D D, that rest by their recessed ends on the keystone-extension and the base of the beams, substantially as set forth.



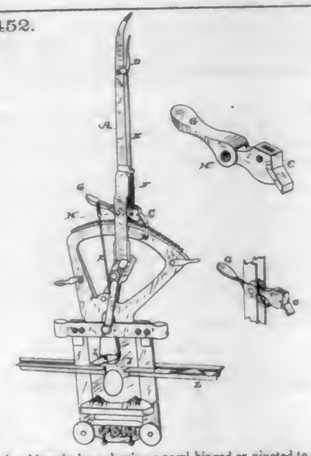
3. The combination of the beams A A, brick arch B, extending between the beams, keystone C, having a downward extension, C', fire-proof tiles or plates D D, supported by the beams A and extensions C', and fire-proof plates E, extending across the bottom of the beams and supported by the tiles, substantially as specified.

297,450. PLOW. JOHN RITZ, Gowanda, N. Y., assignor of one-half to William Danber, same place. Filed Dec. 10, 1883. (No model.)

Claim.—The combination, with the landside B, mold-board C, and handles D D', of a brace G, provided with horizontal slots *k k'* and ears *g g'*, having upright slots *i i'*, the ear *g'* being fitted directly against the inner side of the mold-board, and a brace, E, having a socket, F, formed upon the upper part of said brace and integral therewith, in which the lower ends of the handles D D' are secured, substantially as set forth.

297,451. TWO-WHEELED VEHICLE. JAMES D. ROBERTSON, Salisbury, Mass. Filed Dec. 17, 1883. (No model.)

Claim.—1. The saddle *c*, formed with a central longitudinal cavity to receive the axle-lugs and elastic buffer, and having a transverse seat in the side walls of said cavity for the axle, and with the elevated ends formed to be secured to shaft *f*, substantially as specified.

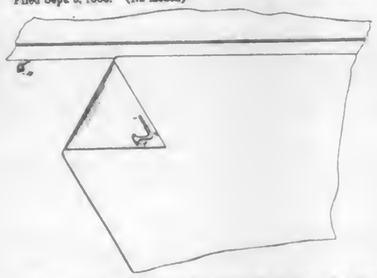


2. The combination, with saddle *c*, formed as specified, of axle *a*, formed or provided with securing-lugs adapted to enter the chamber in said saddle, a cushioning body interposed between said lugs and the roof of said chamber, and screw-bolts *d d*, extending through the upper wall of said chamber, the cushioning body, and lugs, whereby the angle of the shafts relatively to the upper plane of the axle may be changed at will by actuating the screw-nuts on said bolts, substantially as specified.

297,452. PAWL FOR CABLE-GRIP LEVERS. HENRY ROOT and FREDERICK A. TUCKER, San Francisco, Cal. Filed Feb. 18, 1884. (No model.)

Brief.—The pawl is extended to the rear of the lever to permit its operation by the foot, and said extension is connected to a lever pivoted to the grip-frame, which is actuated automatically by inclines upon the slot-irons.

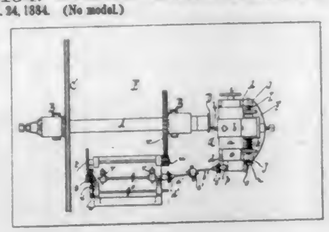
Claim.—1. A pawl for cable-grip levers, having an extension to the rear of the lever, substantially as herein described.



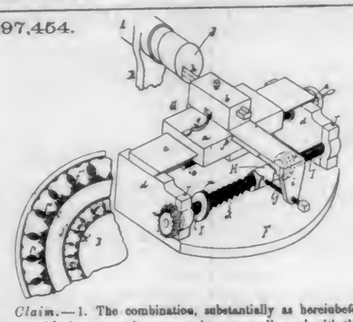
297,452.

2. A cable-grip lever having a pawl hinged or pivoted to it so as to engage a curved rack, in combination with an extension or foot-piece projecting upon the opposite side of the lever from the pawl, and forming a part or connected with it, substantially as herein described.

3. A pawl for cable-grip levers, having an extension to the rear of the lever, in combination with a short supplemental lever pivoted to the grip-frame, and connected with the pawl by a rod, and lugs fixed to the slot-iron so as to act upon the supplemental lever and disengage the pawl, substantially as herein described.



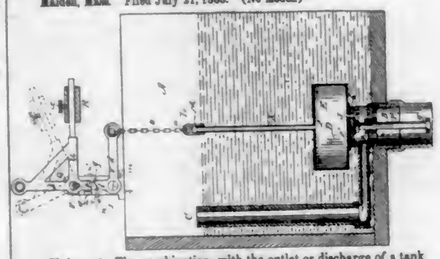
297,453. CARPET-FASTENER. HERMAN A. SCHWERS, Chicago, Ill. Filed Sept. 5, 1883. (No model.)



Claim.—1. A securing-hook for carpets, having its shank adapted for attachment to the carpet and formed with an arm at right angles, having a hinged spring-actuated extension adapted to be turned in or out at pleasure and locked in either position, substantially as shown and described.

2. The shank A, having a right-angle bend, *a*, pivoted extension *a'*, its inner end squared and shouldered, and the spring *a²*, all combined, constructed, and arranged to operate substantially as and for the purpose set forth.

297,454. ROSE-ENGINE. ANTON SCHWITTER, Brooklyn, N.Y. Filed Jan. 24, 1884. (No model.)



297,454.

Claim.—1. The combination, substantially as hereinbefore described, with the tracer, the graver, the pattern-die, and with the spindle which carries the work or the article to be acted upon by the graver, of a multiplying-gear for imparting to the pattern-die a revolving motion faster than that of the spindle which carries the work, and of means for moving the pattern-die in the direction of the length of its supporting-shaft.

2. The combination, substantially as hereinbefore described, of the spindle A, shaft *q*, multiplying-gear to transmit motion from the shaft A to the shaft *q*, shaft *p*, extension-rods *a' b'*, with universal joints *d' c'*, spindle I, geared with the shaft *p*, pattern-die H, feathered on the spindle I, spring *k*, nut *l*, and slide-rest G, carrying the tracer *j* and graver A.

297,455. VALVE FOR WATER-CLOSETS, &c. WILLIAM SCOTT, Malden, Mass. Filed July 21, 1883. (No model.)

Claim.—1. The combination, with the outlet or discharge of a tank for water or other liquid, of a chambered valve which has openings or passages for the ingress and egress of the liquid of the tank and of air, and is otherwise constructed and arranged that seated said discharge is closed and raised said discharge is opened, and from the then ingress of liquid said valve is again seated, emptying its contents, substantially as described, for the purpose specified.

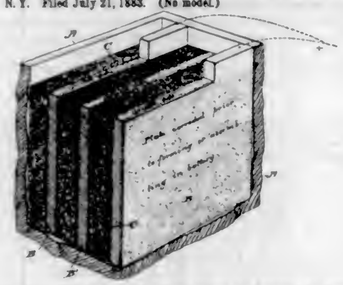
2. The combination, with the seat H of the outlet or discharge B of a tank for water or other liquid, of a chambered valve, D, which has openings or passages J K for the ingress and egress of the liquid of the tank and of air, and is provided with a stem, P, suitably guided, all so that when said valve is seated said discharge is closed and when raised said discharge is opened, and from the then ingress of liquid from the tank said valve is again seated, emptying its contents into said discharge, substantially as described, for the purpose specified.

3. The combination, with the outlet or discharge of a tank for water or other liquid, of a chambered valve which has openings or passages J and K, for the ingress and egress of the liquid of the tank and of air, and the port M of the air-passage made downwardly inclining, and all otherwise constructed and arranged that seated said discharge is closed and raised said discharge is opened, and from the then ingress of liquid said valve is again seated, emptying its contents into said discharge, substantially as described, for the purposes specified.

4. The combination, with a tank for liquid, an outlet-pipe for the liquid, and a valve to said outlet-pipe, of two pivoted levers for operating said valve, one of said levers being constructed to slide at its pivotal point and to act on the other lever to open the valve when moved in one direction and when moved in the other direction to be shifted at its pivotal point, substantially as described.

5. A crank-lever, N, having arm *d*, connected to a valve of a tank for water or other liquid, and arm *l*, rounded at its outer end, in combination with an operating crank-lever, Q, having arms *s*, *t*, and *u*, its arm *t* at its outer end rounded, and an elongated fulcrum-bearing, *w*, substantially as described, for the purpose specified.

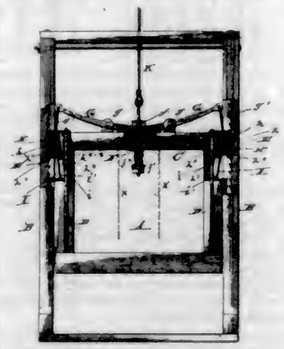
6. The pivoted lever N, having long arm *d*, and short arm *l*, rounded at its free end, in combination with a lever, Q, having its short arm *t* rounded at its free end, and formed with an elongated fulcrum-bearing, *w*, whereby said levers are adapted to operate substantially as described.



7. The combination, with a tank for liquid, an outlet-pipe for the liquid, a float-valve for closing said outlet-pipe, provided with an air-inlet pipe and a liquid-inlet, the liquid-inlet being located at such point that when the valve is unseated the liquid will pass from the tank into said valve, and when seated the liquid will pass therefrom into the outlet-pipe of the tank, substantially as described.

297,456. CHUCK FOR ROCK-DRILLS. HENRY C. SERGEANT, Denver, Colo. Filed Feb. 23, 1884. (No model.)

Claim.—The combination, with the drill-chuck having a socket for the reception of the drill or drill-rod, of clamping screw-bolts having their heads formed with concave bearing-surfaces *i' i'*, and inserted through the chuck from opposite sides thereof and on opposite sides of its socket, for clamping the drill or drill-rod by pressure applied in opposite directions on diametrically-opposite portions thereof, substantially as herein described.

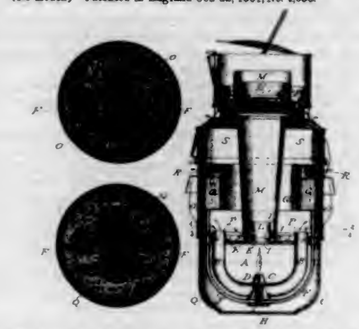


297,457. SECONDARY BATTERY. WILLIAM ANTHONY SHAW, Pittsburg, Pa., assignor to the Electrical Accumulator Company, New York, N.Y. Filed July 21, 1883. (No model.)

Claim.—The method of making plates or elements for secondary batteries by corroding with nitric, acetic, or hydrochloric acid or other chemical corroding agent, a plain, corrugated, or perforated lead plate, or other suitable body of lead, or a suitable body of other metal, and then removing them from the action of the corroding agent and assembling the same with other elements in the cell, with an exciting solution or electrolyte, substantially as described.

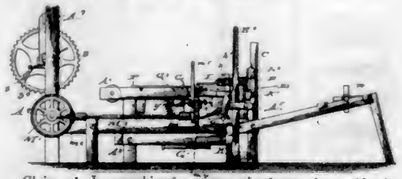
297,458. WITHDRAWN.

297,459. SAFETY-CLUTCH FOR ELEVATORS. JAMES WILLIAM SIMMONS, East Monroe, Ohio. Filed Feb. 19, 1884. (No model.)



Claim.—1. In a safety-clutch for elevators, the combination, with the vertical side racks, E E, king-bolt F, and clutch-blocks H H, provided with proper connecting and operating mechanism, of the beams D, having recesses I I, provided with inclined surfaces *i i*, all constructed and adapted to operate substantially as shown and described.

2. In a safety-clutch for elevators, the combination, with the vertical side racks, E E, king-bolt F, levers G G, and links *g' g'*, of the clutch-blocks H H and beams D, having recesses I I, all constructed and arranged to operate substantially as shown and described.



3. The combination, with an elevator-cage, of vertical side racks, E E, king-bolt F, provided with shoulders *f f*, a spring, *f'*, chain or cord K, levers G G, clutch-blocks H H, and links *g' g'*, all constructed and arranged to operate substantially as and for the purpose set forth.

297,460. VENTILATION OF LAMPS. FREDERICK HENRY SMITH, Winchmore Hill, County of Middlesex, England. Filed Feb. 19, 1883. (No model.) Patented in England Oct. 22, 1881, No. 4,638.

Claim.—In inclosed lamps or burners, the reflector E, having an opening, I, in the center thereof, not fitted directly with a chimney, the false cover J, having a central opening, K, therein, concentric with but smaller than the opening I in the reflector E, the short neck or chimney L, attached to the false cover J, and the chimney M, external to the short neck or chimney L, the whole constructed, arranged, combined, and operating so that the heated products of combustion emanating from the said lamp shall induce currents of air to be drawn in through the holes or openings R in the outer casing, and be caused to traverse the spaces between the reflector E and the false cover J, and between the short neck or chimney L and the longer chimney M, substantially as hereinbefore described, and illustrated in Figs. 1, 2, and 3 of the drawings, and for the purpose specified.

297,461. MACHINE FOR MAKING WIRE FENCES. HOMER SMITH, Kirksville, Mo. Filed July 10, 1883. (Model.)

Claim.—1. In a machine for making wire fences, the combination of uprights, cross-pieces vertically adjustable upon said uprights, and heads adjustable upon said cross-pieces, substantially as described.

2. In a machine for making wire fences, the combination of uprights having longitudinal slots, cross-pieces having longitudinal slots and attached to the uprights by bolts, and adjustable heads between the cross-pieces, and held in place by bolts passing through the longitudinal slots in said cross-pieces, substantially as described.

3. In a machine for making wire fences, a head having a pinion for revolving it, stationary jaws attached to the pinion, and pivoted jaws attached to the stationary jaws, substantially as described.

4. In a machine for making wire fences, a head having jaws pivoted at their rear ends, substantially as described.

5. In a machine for making wire fences, a head having curved pivoted jaws and a gradually-reduced opening, for the purpose set forth.

6. In a machine for making wire fences, a head having a pinion provided with openings for the wire, stationary jaws attached to the pinion and having guide-grooves for the wire, and pivoted jaws having an opening for the wire to pass through and be twisted, substantially as described.

7. In a machine for making wire fences, a head having stationary jaws, and pivoted jaws attached to the stationary jaws, and provided with springs, for the purpose set forth.

8. In a machine for making wire fences, the combination of wire-twisting heads, stops adapted to be raised or lowered in front of the heads, movable beater-frames between the stops and heads, and springs rigidly attached by one end to the frame C, and the other end projecting forward between the heads and resting upon the top of the machine for holding the picket in place, substantially as described.

9. In a machine for making wire fences, the combination of a roller suspended in a frame, a wheel also suspended in a frame and having a radial flange, *s*, a register operated by said flange, and a bell having a hammer which is tripped by said flange when the wheel is revolved, substantially as described.

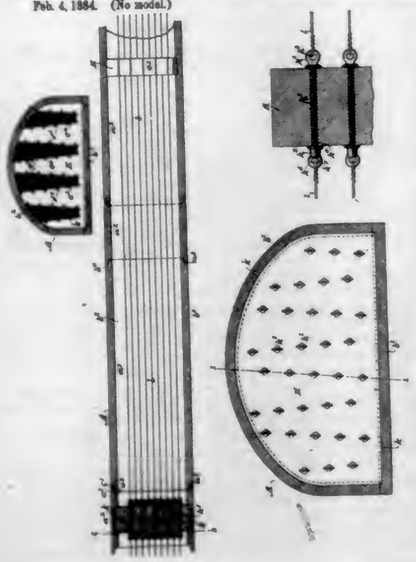
10. In a machine for making wire fences, the combination of a roller upon which the fence is wound, a wheel journaled in movable bearings and having a radial flange, and a registering apparatus operated by said flange, substantially as described.

11. In a machine for making wire fences, the combination of a frame having movable bearings, a wheel journaled in said bearings, and having an arm, and a registering apparatus operated by said arm when the wheel is revolved, substantially as described.

12. In a fence-making machine, the spring I, attached to the cross-head C, and having its free end projecting between the heads and resting upon the top of the machine.

13. In a fence-making machine, the combination of a roller, M, having miter-wheel M′, a shaft, M³, having one end journaled on the shaft of roller M, and having a miter-wheel, M³, gearing with said wheel M′, and means, substantially as described, for revolving the shaft.

14. In a fence-making machine, a reel-frame having shaft B³, reels B′, and keys *b*, substantially as and for the purpose set forth.



15. In a machine for making wire fences, the combination of a plate having clamps and a central aperture, and a revolving head having a disk held in place by said clamps, substantially as described.

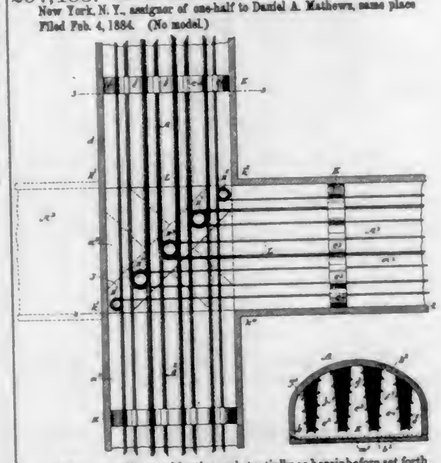
16. In a machine for making wire fences, the combination of a plate having adjustable clamps and a central opening, and a head having a disk held in place by said clamps, substantially as described.

17. In a machine for making wire fences, the combination of a frame having loops A⁴ and grooves A³, a beater, H, having arms *h*′ moving in said loops A⁴, cross-pieces A, held in grooves A³, and projections A², extending above the top of the frame, and toggle-levers *k* and *k*′, attached to arms *h*′ and to a shaft, and said shaft having a crank, substantially as described.

18. In a machine for making wire fences, the combination of a frame having revolving heads and stops adjustable to and from the heads, substantially as and for the purpose set forth.

297,462. UNDERGROUND WIRE-CONDUIT. THOMAS L. SMITH, New York, N. Y., assignor of one-half to Daniel A. Mathews, same place. Filed Feb. 4, 1884. (No model.)

Claim.—1. In a conduit for electric conductors, a series of bridges for supporting the conductors, and a series of solid supports extending across said conduits and separating the same into distinct compartments, and a series of conducting rods or bolts extending through said supports, for supporting the separate sections of conductors within said conduit and placing the adjacent sections in electrical connection with each other.



2. The combination, substantially as hereinbefore set forth, with a conduit for electric conductors, of a series of supports for the conductors, which supports divide the conduit into water-tight compartments, a series of screw-bolts extending through said supports, and means for attaching sections of conductors to the respective ends of said screw-bolts, and for causing said screw-bolts to exert tension upon the sections of conductors.

3. The combination, substantially as hereinbefore set forth, of a series of sections of a conduit for electric conductors, a series of non-conducting bridges placed within the same, non-conducting plates applied to said bridges, a series of shorter sections of conduit alternating with the first-named sections, a series of rigid non-conducting supports placed within certain of the shorter sections, and means, substantially such as described, for obtaining independent electrical connections through said supports.

4. The combination, substantially as hereinbefore set forth, in an underground conduit, of a series of bridges having notches for receiving electric conductors, and a series of solid supports interposed in said series of bridges, having means, substantially such as described, for receiving the terminals of the conductors supported in said bridges, and for securing connections through the supports without changing the relative positions of the conductors.

5. The combination, substantially as hereinbefore set forth, of a series of supporting-bridges for electric conductors, having a series of upwardly-projecting tapering fingers, in the sides of which are formed notches for receiving the conductors, non-conducting plates covering said notches, and rigid supports interposed in said series of bridges, and means for securing electrical connections for the conductors through said rigid supports without changing the relative position of the conductors.

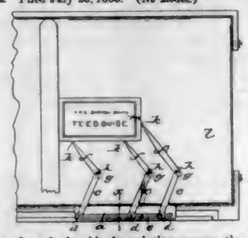
297,463. CONDUIT FOR UNDERGROUND LINES. THOMAS L. SMITH, New York, N. Y., assignor of one-half to Daniel A. Mathews, same place. Filed Feb. 4, 1884. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a series of supporting-bridges for electric conductors, having a series of upwardly-projecting fingers, in the sides of which are formed notches for receiving the conductors, non-conducting plates covering said notches, and a series of tapering pillars for receiving the conductors led from said fingers, and extending diagonally across the conduit containing said bridges.

2. In an underground conduit, the combination, substantially as hereinbefore set forth, of a bridge consisting of a series of upwardly-projecting fingers for supporting electric conductors, and a series of pillars corresponding in number to the number of said fingers.

3. The combination, substantially as hereinbefore set forth, in a conduit for electric conductors, of means, substantially such as described, for supporting conductors throughout the length of said conduit, and a series of conical pillars placed at the corners formed in said conduit, or by branch sections of said conduit.

4. The combination, substantially as hereinbefore set forth, with a series of electric conductors, and means, substantially such as described, for supporting the same in different vertical planes within an underground conduit, of a series of conical tapering pillars placed at the points where said conductors deviate from straight lines, for supporting said conductors in such a manner that they may be led in different directions, said pillars having spiral grooves, substantially as described.

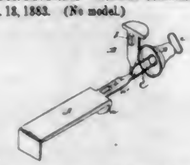


5. The combination, substantially as hereinbefore set forth, with a series of electric conductors, of means, substantially such as described, for supporting the same in different vertical and horizontal planes within an underground conduit, and a series of pillars placed at the points where said conductors deviate from straight lines, for supporting said conductors in such a manner that they may be led in different directions, said pillars having spiral corrugations or grooves, substantially as described.

6. In a conduit for underground lines, a series of tapering grooved pillars extending along the line of intersection of two or more sections of conduit, substantially as described.

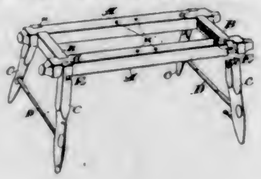
7. The combination, substantially as hereinbefore set forth, with the conduits A and A′ and the bridges E, of the pillars H, having the spiral grooves *h*.

8. The combination, substantially as hereinbefore set forth, in a conduit for underground lines, of a series of tapering grooved pillars arranged diagonally across said conduit, and supported at the top and bottom in the outer walls of said conduit, substantially as described.



297,464. FEED-GUIDE FOR PRINTING-PRESSES. WM. B. SMITH, Orlando, Fla. Filed July 23, 1883. (No model.)

Claim.—1. In a feed-guide for printing-presses, the combination, with the base-bar, of the series of fingers, each composed of articulated sections and pivoted to said bar, one of said series of fingers being longer than the others, to enable it to rest against a side edge of the sheet of paper, while the other fingers rest against or support the bottom edge thereof, substantially as and for the purpose set forth.

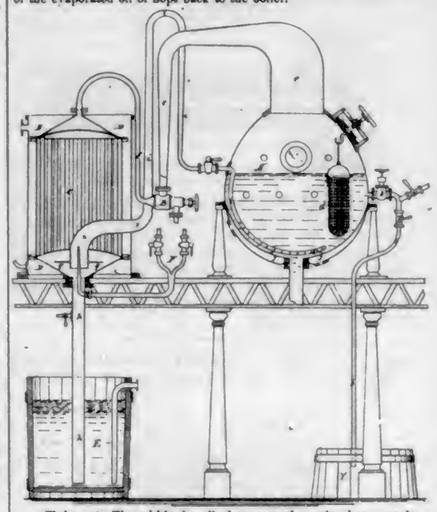


2. In a feed-guide for printing-presses, the combination, with the base-bar having a longitudinal slot, of the series of fingers, each composed of articulated sections and adjustably pivoted to said bar, one of the series of said fingers being longer than the others and resting against a side edge of the paper, while the shorter fingers rest against or support the bottom edge thereof, substantially as and for the purpose set forth.

297,465. DOOR-SECURER. WILLIAM STARRETT, North Manchester, Ind. Filed Dec. 13, 1883. (No model.)

Claim.—In a door-securer, the hook-shaped piece A, having a flange, *a*, screw-threaded shank *a*′, and socket *a*², in combination with the flanged part B, having projection *b*, nut D, and bent wire loop C, substantially as and for the purpose set forth.

297,466. KNOCKDOWN FRAME FOR GRINDSTONES. FRANK M. STEARNS, Berea, Ohio. Filed Feb. 26, 1884. (No model.)



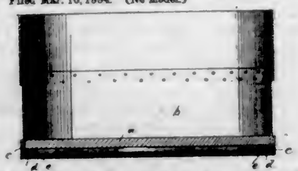
Claim.—1. In a knockdown grindstone-frame, the combination, with side pieces provided with the gains *a*, forming seats for the legs, as shown, of legs engaging the said gains, and provided with the shoulders *c*, and bolts for holding the legs in position, substantially as set forth.

2. In a knockdown grindstone frame, the combination, with side pieces of the frame, provided with the gains, forming seats for the legs, the inner walls of said gains sloping downward and outward, of legs coupled in pairs by flexible cross-bars, and provided with the shoulders *c*, and bolts for securing the parts together, substantially as set forth.

3. The combination, with the parts A and B, gained to form a frame, as shown, the former provided with the beveled gains *a* and the latter with the grooves *b*, of the legs C, provided with the shoulders *c*, and coupled in pairs by the flexible bar D, and secured by the bolt E, substantially as set forth.

297,467. PROCESS OF AND APPARATUS FOR THE TREATMENT OF HOPS IN THE MANUFACTURE OF MALT LIQUORS. ALEXANDER STEINER, New York, N. Y. Filed Sept. 29, 1883. (No model.)

Brief.—Boils the mash in vacuo. Conducts lighter portions only of the evaporated oil of hops back to the boiler.

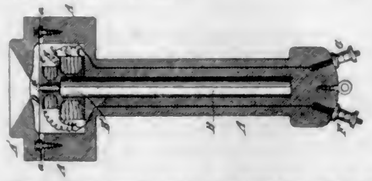


Claim.—1. The within-described process of treating hops, consisting in boiling the same in the presence of worts in a vacuum-pan, condensing from the vapors evolved therefrom the heavy oils, and returning the lighter aromatic vapors separated from the heavier oils to the vacuum-pan, substantially as described.

2. The combination, with a vacuum-pan, an ejector, and a condenser, of a pipe leading from the space beneath the condenser into the liquid in the pan, substantially as and for the purpose specified.

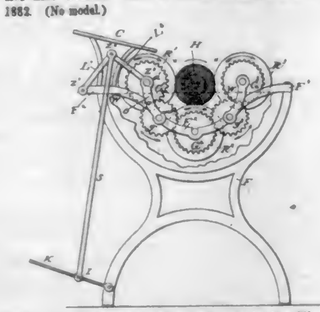
3. The combination, with a vacuum-pan, an ejector, and a condenser, of a pipe, *i*, leading from the space beneath the condenser into the liquid within the pan, and means for injecting steam or gas into the pipe *i*, substantially as and for the purpose specified.

297,468. TANK FOR WINDMILLS. HARRY R. STEVENS, Los Angeles, Cal. Filed Mar. 10, 1884. (No model.)



Claim.—The herein-described water-tank, consisting of the galvanized sheet-metal body, having the wooden bottom fitting tightly therein within a short distance of the lower edge of the body, in combination with the encircling-hoop directly opposite the edge of the wooden bottom, the wire ring below the under face of the bottom, and the lower projecting edge of the body bent inwardly over the wire ring and clinched into the under face of the bottom, substantially as specified.

297,469. SHOE. JOHN H. STICKNEY, Boston, Mass. Filed Feb. 28, 1884. (No model.)



Claim.—As an improved article of manufacture, a rubber overshoe provided with the permanent flexible shoe-horn and pants-supporter B, substantially as set forth.

297,470. TELEPHONE. HENRY R. T. STRANGWAYS, London, England. Filed Nov. 23, 1882. (No model.)

Claim.—In an electric telephone, the combination, with the diaphragm or vibrator D, fitted with a small magnet or piece of metal, *d*, capable of inductive action, and a main magnet, B', opposed to said small magnet, of the coils or helices C E, arranged concentric with such magnets, and wound, as described, so that a divided current will flow through each of the coils in one and the same direction, and act simultaneously and in precisely the same manner upon the two magnets, substantially as herein set forth.

297,471. METHOD OF AND MACHINE FOR SCALDING AND FELTING HAT-BODIES. JAMES S. TAYLOR, Danbury, Conn. Filed Jan. 19, 1882. (No model.)

Claim.—1. The method herein described of scalding and felting hat-bodies, which consists in gently rolling and manipulating the same in scalding water without superimposed pressure, substantially as set forth.

2. The combination, in a hat scalding and felting machine, of three rollers adjusted at suitable distances to felt a bundle of hats by rolling and pressing it in the cavity between them, the felts being inserted into and removed from the cavity without altering the distances of the rollers for that purpose, substantially as set forth.

3. In a hat scalding and felting machine, a series of parallel rollers combined and arranged to form an open and unobstructed chamber, within which the goods may be inserted and felted, and from which they may be conveniently removed, substantially as set forth.

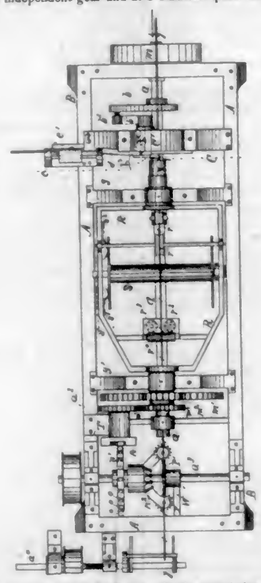
4. The method herein described of scalding and felting hat-bodies, which consists in the operations, while the goods are entirely or partly submerged in scalding water, of rolling and subjecting them to variable pressure between revolving surfaces, substantially as set forth.

5. The method herein described of scalding and felting hat-bodies, which consists in the operations, while the goods are exposed to the action of hot water, of continuously rolling the goods between revolving surfaces and alternately compressing and relieving them from pressure, whereby the water, by such variation of pressure, is successively taken up by the goods and in part ejected therefrom, substantially as set forth.

6. The combination, in a scalding and felting machine, of a vat or tub to hold scalding water, and inclosed within said tub, so as to be wholly or partially submerged in the water, a series of stationary rollers, and one or more rollers having a positive or variable pressure derived from connections controlled by the operator, substantially as set forth.

7. The combination, in a felting-machine, of a series of stationary rollers, and one or more rollers having a positive or variable pressure derived from connections controlled by the operator, substantially as set forth.

8. The toggle-joint L' L^2, as applied to the roller R', in combination with the lever K and connecting-rod S, operating in the manner and for the purpose substantially as described.



9. The combination of the toggle-joint L' L^2, arm O, and roller R', operating in manner and for the purpose substantially as described.

10. The plank C, arranged as shown, in combination with the roller R' and chamber or receptacle *z z*, substantially as set forth.

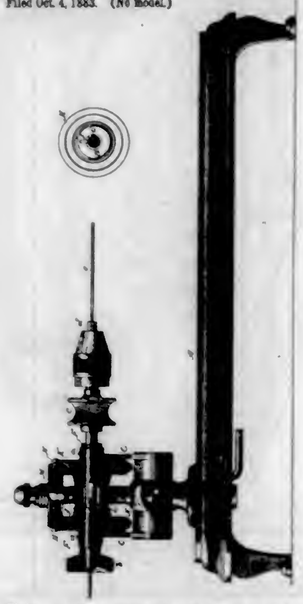
11. The rollers R^3 and R^4 in parallel bearings, as described, and the roller R', operated by means of the toggle-joint or its equivalent, in combination with the vessel for holding heated liquid for saturating the goods while undergoing the process of felting, all operating in manner and form substantially as described.

297,472. WIRE-BARBING MACHINE. PLEASANT A. TERRELL, Grinnell, assignor of one-half to James H. Coon, Des Moines, Iowa. Filed Aug. 27, 1883. (No model.)

Brief.—A sprocket-wheel effects the forward feed of the twisted and barbed wire and of one of its strands into and through the machine, and of the other strand from a spool in the twister-frame. The barb-wire is coiled and then cut. The wrapping-pinion is mounted on the end of the twister, and is fastened to and rotated by the twister, or is rotated by an independent gear and at a different speed from the twister.

Claim.—1. The barb-feeding mechanism consisting of the eccentric c^3, arm c^7, lever c^4, and sliding block c^5, and means for operating said device, substantially as described.

2. The combination of eccentric c^3, arm c^7, lever c^4, sliding block c^5, having the lug c^{10}, flange c^6, and adjusting-screw c^{11}, substantially as and for the purpose set forth.



3. The barb-cutting mechanism consisting of cam *b*, arm *b'*, oscillating shaft *a'*, made integral with head b^2, and cutting-dies *v'* and *v*, with means for operating said cam, substantially as described.

4. The rotating twister R and coiling-wheel *h*, mounted on the twister, in combination with the barb-feeding and barb-cutting devices, and means for rotating the twister, and means for actuating the barb-feeding and barb-cutting devices, substantially as described.

5. The rotating twister R, barb-coiling wheel *h*, mounted on the twister, and the barb-feeding and barb-cutting mechanisms, in combination with the drum n^2, and means for actuating all the said several devices, substantially as and for the purpose specified.

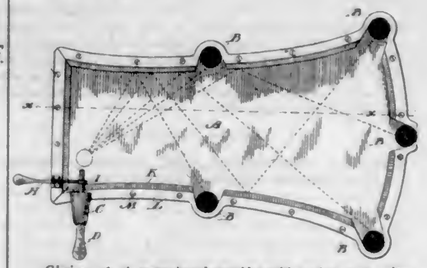
6. The rotating twister K and barb-coiling wheel A, mounted on the twister, with means for rotating each of said devices at different speeds, in combination with mechanism for feeding and cutting the barb-wire, substantially as described, and for the purpose set forth.

297,473. REVERSING-PULLEY. GEORGE A. TOBEY, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination, with two loose reversing-pulleys, an intermediate guide-pulley, and a belt, of a shaft or spindle capable of endwise movement, and means for bringing the same into engagement with either loose pulley, substantially as set forth.

2. The combination, with pulleys H K, having the lugs *f f*, guide-pulley M, and belt N, of the spindle D, provided with the lug G, and means for imparting to the shaft an endwise movement, whereby the same is caused to engage with either of the pulleys H K, as set forth.

297,474. HAME-TUG. IRA H. TUBBS, Chicago, Ill. Filed Dec. 26, 1883. (No model.)

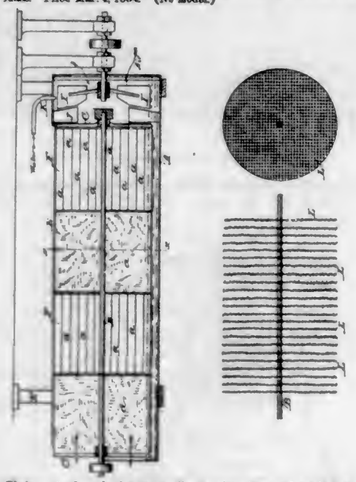


Claim.—1. The combination, with the hame-tug A, consisting of the two lower parts *a a'* and the upper shorter part, a^2, of the metallic clip B, having arms *b b'*, of unequal length, the longer arm being inserted between the parts *a a'* and attached to the chape or buckle-strap E, while the shorter arm is sheathed between the part *a'* and the shorter part a^2, substantially as described.

2. In a hame-tug, the connecting-plate D, provided at one end with the attaching-post a^2, and having the perforations a^4 b^4 in opposite ends of said plate, and the intermediate holding pins or posts, *d* d' d^2 d^3, substantially as and for the purpose set forth.

3. In a hame-tug, the combination, with the connecting-plate D, perforated at each end, and provided with attaching-posts, as described, of the shorter clip-arm *b'*, perforated at the extreme end to receive the post a^2, and the chape or trace-buckle strap E, whereby said clip-arm and chape are securely connected, substantially as herein set forth.

4. The combination, with the hame-tug A, of the clip-iron B, having arms of unequal length, formed integral by the attaching-eye E, the connecting-plate D, and the buckle-strap E, all secured together by means of the screw b^2, inserted from the under side and terminating in the plate D, and the screw a^2, inserted from the upper side and terminating in the end of the long arm of the clip B, substantially as set forth.



297,475. GAME-BOARD. LOUIS P. VALIQUET, Bridgeport, Conn., assignor of one-half to Louise W. Strong, New York, N. Y. Filed Oct. 10, 1883. (No model.)

Claim.—1. A game-board provided with pockets at the sides, a cue arranged within a stationary housing, and a cue-guide adapted to operate at right angles to the cue, substantially as set forth.

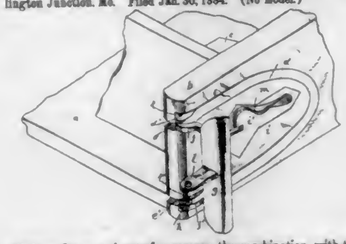
2. In a game-board provided with pockets, the cue-housing flared at the forward extremity and secured within the side of the board, and having interiorly arranged therein the spring-cue, in combination with the guide adapted to act on the cue at right angles, substantially as described.

297,476. AIR-COOLING DEVICE. WILLIAM V. WALLACE, Boston, Mass. Filed Mar. 4, 1884. (No model.)

Claim.—1. In a device for cooling, moistening, and purifying air, a cylinder adapted to be rotated, provided with a series of compartments, the walls of which are formed of fabric, perforated or water absorbing or conducting material, said compartments being adapted to have currents of air passed therethrough, as and for the purpose set forth.

2. An air cooling and moistening device composed of a cylinder having compartments or passages formed therein by means of fabric or other water-conducting material arranged as described, said cylinder being adapted to be slowly rotated in a trough or outer casing containing water, in combination with a fan-blower or other air-forcing device, as and for the purpose set forth.

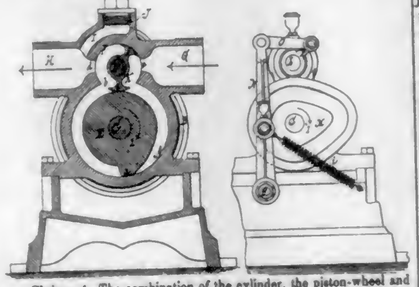
3. In an air-cooling device, a cylinder composed of a series of sections, said sections being provided with a series of air-compartments arranged vertically and horizontally, alternating at right angles to each other, the walls of said compartments being formed of canvas or other water conducting or absorbing material, as set forth.



4. In an air-cooling device, a cylinder covered with woven or reticulated material, and having internal compartments or ducts for the passage of air, said cylinder being adapted to be rotated and partially submerged in water, as set forth.

5. In an air-cooling device, a cylinder mounted in suitable bearings and provided on its periphery with a series of troughs or buckets adapted to receive and hold water poured therein, whereby said cylinder is caused to rotate with an intermittent motion, as set forth.

6. An air-cooling device consisting of a cylinder or compartment having air-passages therethrough formed of woven fabric, by winding or passing the same around bars or slats arranged near to and parallel with the axis and periphery of the cylinder, as set forth.

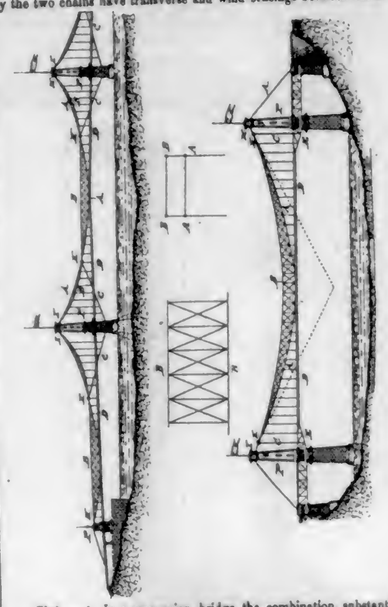


7. In an air-cooling device, a cylinder or compartment provided with a series of diaphragms of woven material adapted to be saturated with a cooling-liquid, in combination with a fan-blower adapted to rotate in a direction at right angles to the axis of the cylinder, and cut-offs or deflectors arranged near the fan-blower, whereby the air-currents are directed in straight lines into the cylinder and between the saturated surfaces of the fabric, as set forth.

297,477. CLEAT FOR END-GATES. JOHN HOWARD WARREN, Burlington Junction, Mo. Filed Jan. 30, 1884. (No model.)

Claim.—In an end-gate for wagons, the combination, with the side-board *b*, of the wagon-box having the wooden cleat *c*, the end recesses, *a a'*, and the metal-faced opening *i*, having the pivoted hook *m* on the outside of the face-plate of the metal frame *d* let into the outer face of the board *b*, and provided with the eyes *d' d'* at the ends of its arms, and the metal cleat *g*, having perforated arms *f f'*, hinged to the arms of the frame *d*, and working in the recesses *a a'*, and the staple-stud *l* on its front or inner face, said cleat *g* being adapted to be turned back out of the way of the end of the wagon-box when open, substantially as specified.

297,478. ROTARY PUMP. ALBIN WARTH, Stapleton, N. Y. Filed July 26, 1883. (No model.)



Claim.—1. The combination of the cylinder, the piston-wheel and piston fitted to revolve within the cylinder, the cylindrical valve-chamber communicating with the cylinder and with the supply and discharge pipes, the oscillating abutment-valve balanced within the valve-chamber, and the cam at the outside of the cylinder for oscillating the valve, substantially as described.

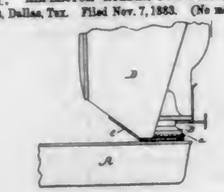
2. The combination of the cylinder, the piston-wheel and piston fitted to revolve within the cylinder, the cylindrical valve-chamber communicating with the cylinder and having the opposite supply and discharge ports, the oscillating abutment-valve arranged in the valve-chamber and composed of the oppositely-projecting wings, said valve being balanced in the valve-chamber by the pressure against one wing being balanced by the pressure against the other wing, and the cam outside of the cylinder, by which motion is imparted to the abutment-valve, substantially as described.

297,479. SUSPENSION-BRIDGE. GUSTAV WEHNER, Berlin, Germany, assignor of one-half to Eugene A. Radiger, Brooklyn, N. Y. Filed Aug. 25, 1882. (No model.)

Brief.—A suspension-bridge composed of a main and a secondary suspension-chain, and intermediate joints connecting the chains in the span, with stays extending from said joints to the piers. The ribs formed by the two chains have transverse and wind bracings between them.

Claim.—1. In a suspension-bridge, the combination, substantially as set forth, of a main suspension-chain, a secondary suspension-chain, intermediate joints connecting said chains between their pier-supports, and stays extending from said joints to the piers.

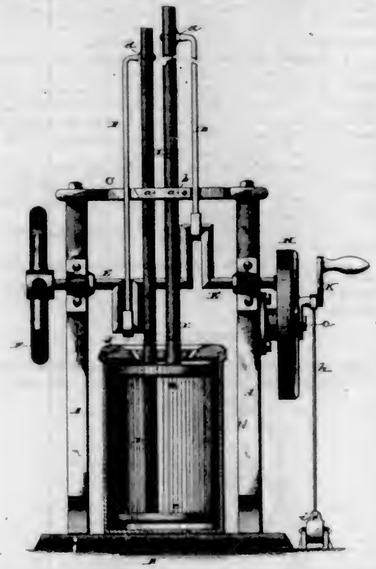
2. In a suspension-bridge, the combination, substantially as set forth, of a main suspension-chain, a secondary suspension-chain, intermediate joints connecting said chains between their pier-supports, braces connecting said chains between said intermediate joints, and stays extending from said joints to the piers.



3. In a suspension-bridge, the combination, substantially as set forth with ribs composed of a main suspension-chain, a secondary suspension-chain, intermediate joints connecting said chains between their pier-supports, and bracings between said chains, of transverse and wind bracings between such ribs.

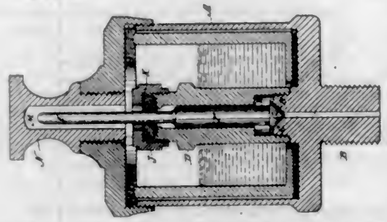
4. In a suspension-bridge, the combination, substantially as set forth, with ribs composed of a main suspension-chain, a secondary suspension-chain, intermediate joints connecting said chains between their pier-supports, and bracings between said chains, of transverse and wind bracings between the ribs and stays extending from said joints to the piers.

297,480. PROCESS OF SEPARATING METALS FROM FRANKLINITE ORES. ARTHUR F. WENDT, New York, N. Y. Filed Nov. 21, 1883. (Specimens.)



Claim.—The process herein described of reducing franklinite ores, which consists in selecting that portion of the ore containing practically only franklinite and willemite, separating these minerals according to their specific gravities, as described, smelting the willemite for spelter and reducing the franklinite by the Wetherill process for oxide of zinc, and finally smelting the residuum for spiegeleisen, substantially as set forth.

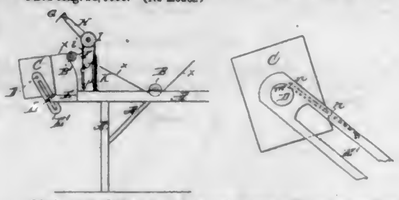
297,481. REFLECTOR-HOLDER FOR LAMPS. DANIEL RUGGLES WILLIAMS, Dallas, Tex. Filed Nov. 7, 1883. (No model.)



Claim.—The combination, with a lamp, A, and a lamp-collar, B, provided with a circumferential flange, *a*, of a reflector, D, provided with a keeper, *b'*, spring-clasp C'', springing around said collar under the flange *a* at its lower end, and having its free ends bent angularly at their upper ends and secured in said keeper by their tension, and slide *c*, substantially as shown and described.

297,482. CHURN. JONATHAN B. WILSON, Zanesville, Ohio. Filed Apr. 3, 1883. (No model.)

Claim.—In a reciprocating churn, the combination, with the upright standards, cross-bar C, provided with the grooves *a a*, the dasher-rods I, and the single latch *b*, for securing both dasher-rods in position, of the pitmen D, adjustably secured at their upper ends to the dasher-rods, the double-crank shaft provided at one end with a fly-wheel, and at its opposite end with a pinion, and journaled to the standards A, the intaglio gear-wheel H, journaled to one of the standards A, and provided with a combined crank and handle, the pitman *h*, secured to said crank, and the treadle *i*, all of the above parts combined as described.



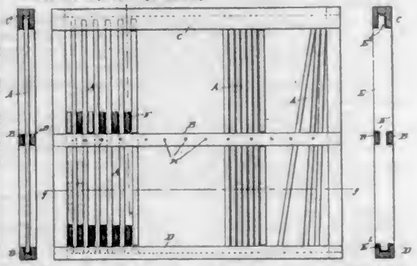
297,483. OIL-CUP FEEDER. JAS. E. WORSWICK, Montgomery, Ala., assignor of one-half to Arthur T. Hannon, same place. Filed Jan. 31, 1884. (No model.)

Claim.—1. The combination of the tube, the pin loosely arranged therein, and the removable collar secured to the upper end of the tube, and a removable perforated disk contained within the collar to form a bearing for the upper end of the pin, substantially as shown and described.

2. As a removable bearing for the feeding-pin of an oil-cup, a disk having a perforation adapted to form a bearing for the pin, and being made of a size adapted to be fitted in a holding-collar, substantially as shown and described.

297,484. PAPER-BOX MACHINE. PHILLIPS ABBOTT, Brooklyn, N. Y. Filed Aug. 21, 1883. (No model.)

Claim.—1. In box covering or trimming machines, the combination, with the box-form and the support from which the glue or paste coated strip passes to said form, of a single-bladed cutter arranged and operating to act against the unglued face of the strip at a point intermediate between said box-form and support, substantially as and for the purposes hereinbefore set forth.



2. The combination, substantially as hereinbefore set forth, of the revolving box-form, the detent therefor, the support from which the glue or paste coated strip passes to the said form, and the single-bladed cutter arranged and operating to act against the unglued face of the strip at a point intermediate between said support and box-form.

3. The combination of the box-form adjustable relatively to the cutter, substantially as described, the support from which the glue or paste coated strip passes to said form, and the single-bladed cutter arranged to act against the unglued face of the strip at a point intermediate between said support and adjustable box-form, substantially as hereinbefore described.

4. The combination of the revolving box-form adjustable relatively to the cutter, substantially as described, the detent therefor, the support from which the glue or paste coated strip passes to the box-form, and a single-bladed cutter arranged and operating to act against the unglued face of the strip at a point intermediate between the said box-form and support, substantially as and for the purposes hereinbefore set forth.

5. The combination of the knife G, the arm H, the wheel I, the lever J, the cord *i*, and the spring *k*, substantially as and for the purposes set forth.

297,485. LUMBER-RACK. JOSEPH AMB ATCOCK, Whitesburg, Ga. Filed Oct. 27, 1883. (No model.)

Claim.—1. A lumber-rack consisting of a frame and vertical sticks held movably between the bars of the said frame, substantially as herein shown and described.

2. The combination, with a frame and a series of sticks held movably between the bars of the said frame, of devices for drawing and pressing the lumber and sticks together, substantially as herein shown and described.

3. In a lumber-rack, the combination, with top, bottom, and end pieces, of a series of movable vertical sticks held between them, and of vertical studs held between the sticks, substantially as herein shown and described.

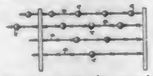
4. In a lumber-rack, the combination, with horizontal top, bottom, end, and intermediate bars, of a series of movable vertical sticks held between them, and of studs provided with tenons fitting in the grooves of the top and bottom pieces, (or bars,) and provided with notches for the intermediate pieces or bars, substantially as herein shown and described.

5. In a lumber-rack, the combination, with the top and bottom pieces, C D, of the frame, of the intermediate pieces, B, having apertures H, the movable vertical sticks A, held between the top and bottom pieces, C D, the pin G, and the wedge J, substantially as herein shown and described.

6. The combination, with the top pieces, C, and the bottom pieces, D, of the frame, each provided with a groove, of the intermediate pieces,

B, and the sticks A, held between the pieces B, and having their ends in the grooves formed in the top and bottom pieces, C D, respectively, substantially as herein shown and described.

297,486. HARNESS-PAD. HOLLAND C. BABCOCK, Hartford, Conn., assignor of one-half to P. Jewell & Sons, same place. Filed Nov. 17, 1883. (No model.)



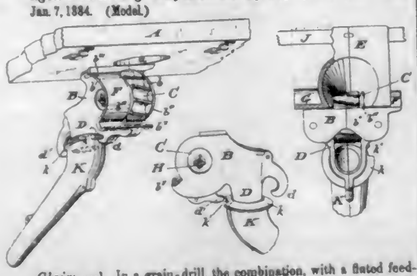
Claim.—1. As an improved article of manufacture, a harness-pad consisting of an outer foundation of enameled leather or other suitable material, an antiseptic filling, and a lining of pliable rawhide, substantially as set forth.

2. As an improved article of manufacture, a harness-pad or the like device consisting of a foundation of enameled leather or other suitable material, a filling, and a lining of pliable rawhide, all substantially as described.

3. The combination of a foundation, *a*, an antiseptic interlining, *b*, and a rawhide lining, *c*, all substantially as described.

4. As an improved article of manufacture, a harness-pad or analogous article having its bearing-surface covered with pliable rawhide, all substantially as described, and for the purpose set forth.

297,487. WARNING DEVICE FOR BARBED FENCES. CHARLES H. BACON, Springfield, Ohio. Filed Aug. 11, 1883. (No model.)



Claim.—1. The combination, with the strand of a fence having barbs thereon, of the combined signals and guards axially mounted on the strand and free to turn thereon, and having smooth or plain surfaces projecting outward beyond the barbs, to prevent the latter from tearing or lacerating an animal rubbing or moving sidewise against the fence, substantially as described.

2. The combination, with the strand of a fence, of signals and guards loosely and axially hung on the strand, said signals or guards constructed and located to have a free longitudinal or shifting movement imparted to them on their axial support, with means on the strand to limit the longitudinal or shifting motion of the said signals and guards, substantially as described.

3. The combination, with the strand of a fence having barbs thereon, of a combined signal and guard composed of two sections and means for connecting the sections, said signal and guard being hung on the strand and provided with smooth or plain surfaces projecting outward beyond the points of the barbs, substantially as described.

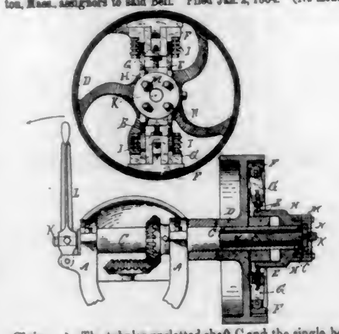
4. The combination, with the strand of a fence having barbs thereon, of spherical signals and guards axially hung on the strand, and having smooth or plane surfaces projecting outward beyond the points of the barbs, said spheres each comprising two halves, and means for uniting them, substantially as described.

297,488. GRAIN-DRILL. THEODORE BUKER, Lancaster, Ohio, assignor to the Hocking Valley Manufacturing Company, same place. Filed Jan. 7, 1884. (Model.)

Claim.—1. In a grain-drill, the combination, with a fluted feed-wheel, of a cup having two winged sections—to wit, one fixed section, B, in which said wheel is journaled, and having a delivery-spout, D, and one shiftable section, E, which constitutes the supply-funnel to said feed-wheel, and whose capacity and that of said delivery-nozzle remain unaffected by changes in capacity of the feed-wheel—the whole being constructed and operated substantially as set forth.

2. In a grain-drill, the combination, with a fluted feed-wheel, of a cup divided longitudinally of the feed-wheel on a line following the periphery of the feed-wheel on the receiving side thereof, to provide one fixed and one shiftable section to slide on the rear wall of the fixed section, each section having a guard-wing, constructed and operating substantially as set forth.

3. In a grain-drill, the described combination, with a fluted feed-wheel, of a grain-cup having a fixed section in two parts, and a shiftable section, a guard-wing on the fixed section, and a groove or recess in the rear of said section, and a guard-wing on the shiftable section, the latter being supported in the groove or recess, as set forth.



4. In a grain-drill, the described combination, with a fluted feed-wheel, C, of a grain-cup composed of two sections—to wit, a stationary section, B, which affords journal-bearing to said feed-wheel, and has a guard-wing, F, whose cylindrically-convex surface is flush with the feed-wheel's periphery, and a shiftable section, E, which has a cylindrically-concave wing, G, adapted to fit and slide upon said wing F—in the manner set forth, and for the purpose explained.

5. In a grain-drill, the described combination, with a fluted feed-wheel, of a cup composed of two sections—one fixed, the other slidable—a projection on the rear of the fixed section, and a projection or hook on the front thereof, for the purpose set forth.

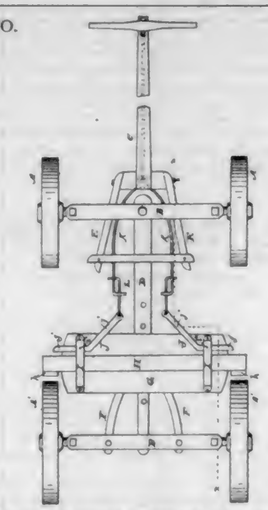
6. The delivery-spout having exterior flange formed with a gate or recess, for the purpose set forth.

7. In a grain-drill, the combination, with the delivery-nozzle D of the cup, of the hooks *d d'*, and separable and reversible delivery-spout having exterior flange, *k*, formed with gate or recess *k'*, substantially as set forth.

297,489. CLUTCH MECHANISM. WM. G. BELL and WM. P. GAY, Boston, Mass., assignors to said Bell. Filed Jan. 2, 1884. (No model.)

Claim.—1. The tubular unslotted shaft C and the single belt-pulley D, mounted loosely thereon, in combination with the clutch-operating rod K, extending entirely through said shaft, the lever L or other actuator at one end of said shaft, and clutch mechanism at the other end thereof, adapted by the reciprocation of said rod to be frictionally engaged with said pulley and disengaged therefrom, substantially as set forth.

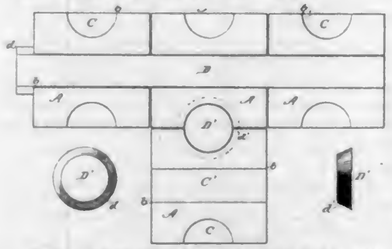
2. A belt-pulley of ordinary form loosely mounted on a plain tubular shaft, so as to revolve freely about the same without imparting motion thereto, in combination with a cross-bar secured to said hollow shaft, and a non-rotary rod reciprocating within it and engaging with a hub which carries toggles adapted to actuate two friction-segments at the extremities of said cross-bar, substantially as and for the purpose set forth.



3. The hollow shaft C, the rotary pulley D, and the sliding hub H, in combination with the pivoted lever L, the non-rotary reciprocating rod K, and the collar N, engaging internally with the hub, substantially as and for the purpose set forth.

297,490. VEHICLE-BRAKE. FRED. BIERY, Mastersville, Miss. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination, with the running-gear, of the platform or support secured to the running-gear in front of the rear wheels, the brake-bar H, mounted upon the platform, the bent levers J J, pivoted near the ends of the support or platform, the lever N, link M, and devices situated on each side of the reach, connecting said link with the levers J J, substantially as set forth.



2. The combination, with the running-gear, of the platform or support secured to the running-gear in front of the rear wheels, the brake-bar H, mounted upon the platform, and carrying at its ends the brake-shoes A, the straps or guides I, attached to the platform near its ends, and arranged to hold the cross-bar in place, the bent levers J J, pivoted at *j'* between the strap I and the platform, the arms *j* of which bear against bar H, and the arms *j'* of which extend inward and forward, whereby there is left a part of the platform near its center unobstructed by moving parts of the brake, the lever N at the front of the tongue, the link M, and connecting devices extending on each side of the reach, and connecting the link M with the levers J J, substantially as set forth.

297,490.

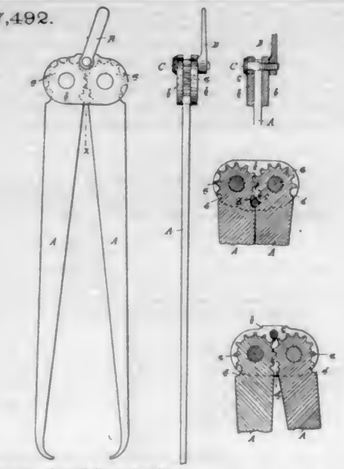
3. The combination, with the running-gear, of the platform or support secured to the running-gear in front of the rear wheels, the brake-bar H, mounted upon the platform, and carrying at its ends the brake-shoes *h*, the levers J J, pivoted to the platform, the lever N, the link M, the U-shaped bar K K, having the perforations *k* at its rear ends, and the arms or bars L L, which are secured to the levers J, and may be made to engage with any of the apertures *k*, to adjust the amount of pressure exerted upon the brake-bar, substantially as set forth.

297,491. CONSTRUCTING AND FASTENING TILES. WALTER BOOTH, Tarrytown, N. Y. Filed Mar. 7, 1884. (No model.)

Claim.—1. The method of binding tiles to each other by means of retaining undercut depressions and a back supporting tie or ties fitted therein, substantially as and for the purpose described.

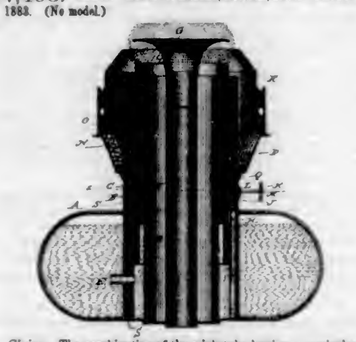
2. The manufacture of tiles provided with retaining undercut depressions in the backs thereof, for the purpose of receiving a supporting and conforming tie or ties, substantially as described.

3. In tiling, the art of supporting and uniting tiled surfaces by means of ties fitting in recesses in the backs thereof, substantially as described.



4. A tile brace or tie for uniting and supporting tiles by its insertion within the recessed backs thereof, substantially as described.

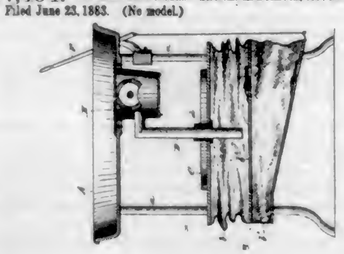
297,492. CALIPERS. CHARLEY BOVENSIEP, Detroit, Mich. Filed Feb. 23, 1884. (No model.)



Claim.—1. A calipers consisting of the legs A, each terminating in a toothed segment, and each leg being independently pivoted between the plates *b b*, through which passes the bolt C, provided with a lever locking-nut, substantially as described.

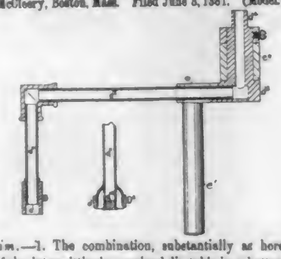
2. In a calipers having a locking-bolt, the legs A, having recesses *d*, adapted to inclose or embrace the locking-bolt when the legs are reversed to form inside calipers, substantially as specified.

297,492.



297,493. LAMP. LEWIS O. BREKKE, Decorah, Iowa. Filed Nov. 26, 1883. (No model.)

Claim.—The combination of the wick-tube having a vertical groove in its outer wall, with a recess near the middle, a wick-raising tube having triangular inwardly-raised tongues pointing together, and having a perforated flange formed by the ends of the strip composing the tube bent outward, soldered together, and punched at equal close distances, and the cog-wheel or pinion secured upon the inner end of a shaft turning with its inner end in the wick-tube, and turning in the recess formed in the outer wall of the wick-tube, as and for the purpose shown and set forth.



297,494. PORTABLE FORGE. THOMAS H. BULLOCK, Cleveland, Ohio. Filed June 23, 1883. (No model.)

Claim.—1. The combination, with a tray and bellows, of an intermediate connecting-pipe rigidly secured at one end to the tray or tuyere, and adapted to form a guide for the bellows, substantially as set forth.

2. The combination, with a tray provided with a tuyere and a bellows, the latter being provided with a weight, C, arranged concentrically with the bellows, of an intermediate connecting-pipe, the upper end of which is rigidly secured to the tuyere, while the lower portion thereof forms a guide for the bellows, substantially as set forth.

297,495. MACHINE FOR MAKING BUTTONS. DUNCAN H. CAMPBELL, Pawtucket, R. I., assignor to Henry B. Metcalf, same place, and William McCleery, Boston, Mass. Filed June 8, 1881. (Model.)

Claim.—1. The combination, substantially as hereinbefore described, of the intermittingly-revolved die-table in a button-making machine, one or more feeding-cupules, an air-pump, a vacuum-chamber, and valve mechanism for controlling communication between the cupules and vacuum-chamber and causing said cupules to engage with and release the parts of a button.

2. The combination, substantially as hereinbefore described, of the revolving die-table of a button-making machine, the series of dies in said table, the series of receptacles for parts of a button, a series of cupules or suckers provided with automatic valves, and mechanism for vibrating, lifting, and lowering said cupules.

3. The combination, in a button-making machine, with the revolving die-table, its series of dies, and the vertically-reciprocating plungers, of feeding-cupules moving vertically with said plungers, substantially as described.

4. The combination, in a button-making machine, of the intermittingly-revolved die-table, the intermittingly-reciprocating plunger, the feeding-cupules, and intermediate connecting mechanism, whereby said cupules are alternately moved vertically and swung laterally toward and from the dies on the table, substantially as described.

5. The combination, in a button-making machine, of the intermittingly-revolved die-table, the intermittingly-reciprocated plungers, the feeding-cupules, the receptacles or chutes for parts of a button, and the mechanism which operatively connects said die-table and plungers with said cupules, whereby said cupules are alternately moved vertically and swung laterally toward and away from said die-table and said receptacles or chutes, substantially as described.

6. The combination, substantially as hereinbefore described, of the intermittingly-rotated die-table, a series of laterally-vibrating automatic feeding devices concentrically arranged above the die-table, and the intermittingly-rotated cam for swinging said feeding devices.

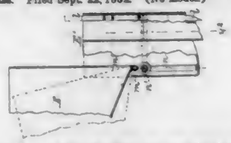
7. The combination, in a button-making machine, of a laterally-vibrating and vertically-reciprocated feeding-cupule, and an inclined conducting-chute which affords a yielding support for the lowest button part therein when pressed upon by the cupule, substantially as described.

8. The combination, substantially as hereinbefore described, of two or more feeding-cupules connected by two necks with a vacuum-chamber, of a pair of coupled sliding valves—one in each neck—the rotative valve-plate, and means, substantially as described, for reciprocating the valve-plate, and also for causing the engaging contact of the valves and plate for alternately opening and closing said valves.

9. The combination, with the vertically-reciprocated vacuum-chamber, two or more cupules, and a pair of coupled valves, of the valve-plate, the cam-wheel on the die-table, and the intermediate lever, and a spring for rotating the valve-plate, substantially as described.

10. The combination, with the cupules, their coupled valves, and rotated valve-plate, of the adjusting-screws at the base of each valve-plug, for varying the tenacious capacities of the cupules, substantially as described.

11. The combination, in a button-making machine, of the intermittingly-rotating die-table and its dies, a feeding-cupule, a bell-crank lever, and an intermittingly-rotated cam-wheel, substantially as described.



12. The combination, with the cupules, of the torsionally-elastic pipes connecting them to the local vacuum-chamber, and serving as springs for effecting one swinging movement of the cupules, substantially as described.

13. The cupule D^2, provided with an annular mouth and central pad or cushion, substantially as described.

14. The combination, substantially as hereinbefore described, of a die-table, a series of tubes open at each end, and mounted upon a movable table, laterally-vibrating feeding mechanism for transferring the contents of said tubes to the die-table, and means for forcing the contents of either tube to one end thereof, and thereby delivering said contents progressively to the feeding mechanism, as set forth.

15. The combination of a series of feed-tubes open at each end, and mounted upon a movable table, and a plunger, substantially as described, whereby either of said tubes may be readily placed in line with said plunger, which forces its contents to one end thereof, as set forth.

297,496. BUTTON-MACHINE. DUNCAN H. CAMPBELL, Pawtucket, R. I., assignor to Henry B. Metcalf, same place, and William McCleery, Boston, Mass. Filed Sept. 22, 1882. (No model.)

Claim.—1. In a button-machine, the combination, substantially as hereinbefore described, of the revolving die-table, its series of dies, automatic feeding mechanism, and the counterbalanced vertically-reciprocating plunger-frame, whereby shocks or jars liable to impair the operation of the feeding mechanism are obviated, as set forth.

2. The combination, in a button-machine, of the revolving die-table, the main shaft, its cams below said table, the plunger-frame, and the counterbalance-weight below said table, and its levers for lifting equally at opposite sides of said plunger-frame, substantially as described.

3. The combination, in a button-machine, of the vertical pipe, the mechanism for vertically reciprocating said pipe, the flanged sleeve and cupule telescoped on said pipe, and the spring on said pipe, which permits the cupule to yield to pressure during the descent of said vertical pipes and when the cupule is in contact with the button part which is to be lifted thereby, substantially as described.

4. The combination, in a button-machine, of a chute and a cupule, and a retaining-finger vibrated by the cupule as it descends into the lower end of the chute, substantially as described, whereby the lowest button part in said chute is relieved from contact with the next following part in the chute during the engagement of the cupule with said lowest part, as set forth.

5. In a button-machine, the combination, with transferring mechanism, of a feeding-chute provided with a separate or detached yielding foot, substantially as described.

6. A feeding-chute provided with a longitudinally-sliding top, which frictionally engages with the contents of the chute for forcing them to the foot of the chute for delivery therefrom, substantially as described.

7. The combination, with a feeding-chute, of a longitudinally-reciprocating sliding top and a latch-slide for lifting the lower end of said top away from the contents of the chute during its backward movement, substantially as described.

8. The combination of the stationary auxiliary hopper and the reciprocating pivoted main hopper, substantially as described.

9. The combination of a chute, a hopper vertically recessed at one end to form a three-sided vertical mouth for said chute, and a stirrer within the hopper, which sweeps in a vertical plane across the open side of said vertical mouth, substantially as described, whereby disk-shaped fillings massed in the hopper are separately caused to enter said mouth in a vertical position and left free to fall edgewise into the chute, as set forth.

10. The combination of a hopper, a chute having a vertical mouth at one end of the hopper, a vertically-reciprocating agitator, which serves as a movable side of said mouth within the hopper, and a stirrer which operates within the hopper, substantially as described.

11. The combination of a chute, a swinging triangular stirrer, and a hopper containing the stirrer, and having a rounded and inclined bottom, substantially as described.

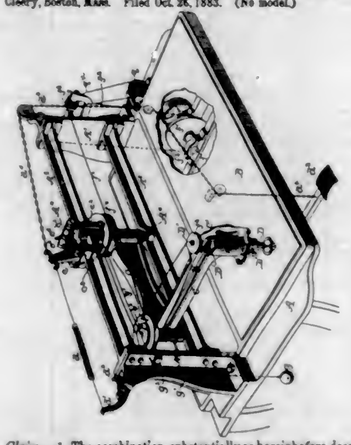
12. In a button-making machine, the combination, with a series of vertical detachable tubes having each a collar, and mounted upon a revolving table, of a stationary stop, which engages successively with the collar of each tube as the table revolves, and thereby secures each tube against vertical displacement while delivering its contents, substantially as described.

13. A cloth-feed tube for button-machines, contracted internally at both ends and having one of said ends readily removable, substantially as described.

14. The combination, substantially as hereinbefore described, of dies, a feed-tube, a device for transferring the contents of said tube piece by piece to the dies, a follower, and positively-operated mechanism, substantially as described, for lifting said follower within said tube at a speed proportioned to that at which the contents of the tube are removed.

15. The combination, in a button-machine, of a feed-tube, a follower provided with a screw-threaded stem, a rotative nut which embraces said stem, a ratchet-wheel connected to said nut, and a pawl-lever which engages with said ratchet-wheel, and is vibrated by mechanism connected with the main shaft of the machine, substantially as described, for positively lifting said follower within the feed-tube, as set forth.

16. The combination of the follower having a threaded stem, a rotative split nut, which embraces said stem and lifts the follower, a ratchet-wheel and vibrating pawl-lever for rotating said nut, a rigid arm projecting from the stem of the follower below the nut, and a wedge, which is forced into service by the rigid arm as it rises with the follower-stem for opening the split nut and permitting the follower to fall, substantially as described.



17. The combination, with the follower, its threaded stem, the split nut, and the ratchet-wheel and vibrating pawl-lever for rotating the nut, of a rigid arm on the stem of the follower and a wedge forced upward by a spring, substantially as described, for maintaining the split nut in its opened condition during the fall of the follower, substantially as described.

18. The combination, with the follower, its threaded stem, the split nut, and the ratchet-wheel and vibrating pawl-lever for rotating the nut, of the wedge, its spring, and a rigid arm on the follower-stem, which, when the follower rises, causes said wedge to open the nut and permit the follower to fall, and when said follower falls causes said wedge to retire from the nut and permits it to close again upon the stem, substantially as described.

19. The combination, with the split nut, the follower, its stem, and rigid arm, of the wedge, its spring, and the pendent latch, by which the wedge is kept free from the nut until released by said rigid arm upon the follower-stem, substantially as described.

20. The combination, with a series of feed-tubes, a tube-table provided with a weight, cord and pulley, and a ratchet-wheel, of a follower which is common to all of said tubes, and a spring-pawl which engages with the ratchet-wheel and is automatically released therefrom at intervals by the follower, substantially as described, whereby when one tube is discharged the table is rotated sufficiently to present another tube to the follower, as set forth.

297,497. CLOTH-CUTTING MACHINE. DUNCAN H. CAMPBELL, Pawtucket, R. I., assignor to Henry B. Metcalf, same place, and William McCleery, Boston, Mass. Filed Oct. 26, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the revolving tubular cloth-knife, the cloth-bed, and means, substantially as described, for enabling the knife to be located while revolving above any and all portions of the cloth-bed and a pile of fabric thereon, and to cut through said pile at any and all parts thereof, as and for the purposes specified.

2. The combination, substantially as hereinbefore described, of the tubular cloth-knife, its vertically-movable jointed arm, and the cloth-bed.

3. The combination, substantially as hereinbefore described, of the cloth-bed and its leveling mechanism, and a revolving tubular knife, which can be moved toward and away from the bed only in the axial line of the knife, as set forth.

4. The combination, substantially as hereinbefore described, of a revolving tubular cloth-cutting knife, the cloth-bed, a knife-pad supported by said bed, but movable laterally with the knife, and means, substantially as described, for enabling the knife while revolving to cut its way through a pile of fabric interposed between the pad and knife, as set forth.

5. The combination, substantially as hereinbefore described, of a revolving tubular cloth-cutting knife, and a knife axis or chuck which is skeletonized for the reception of a removable disk-holder for receiving the cloth disks which are cut by said knife, as set forth.

6. The skeletonized knife-chuck, in combination with the clamping-collar, substantially as described, whereby a tubular disk-holder is secured in position above and concentric with a tubular knife mounted on said chuck, as set forth.

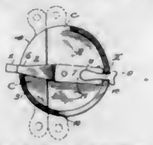
7. The combination of the chuck, the jointed arm, the belt-pulleys at the butt of the arm, its central joint, and on the chuck, their belts, and counteracting drags, which overcome the tendency of the arm to swing in the direction of the draft on the belts, substantially as described.

8. The combination, substantially as hereinbefore described, of a hollow revolving chuck, the jointed arm, its lifting-spring, the depressing-treadle, and the cloth-bed.

9. The combination, with a tubular knife and its chuck, and a jointed arm on which the knife-chuck is mounted, of a grinding-wheel located within the sweep of the arm, substantially as described, whereby the knife may be ground while revolving on its chuck.

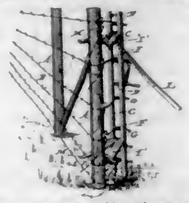
297,498. WATCH-CHAIN HOOK. CHARLES B. CARPENTER, North Attleborough, Mass., assignor to E. A. Bliss Company, same place. Filed Sept. 18, 1883. (No model.)

Claim.—1. The combination of a segmental piece, A, having a swivel-ring, *a*, a hook, B, pivoted to one end of the piece A, and provided with a recess, *b*, at the other end, a recessed and spring-cushioned catch, C, that is guided in the opposite end of the piece A, and provided with a stud, *d*, projecting through a slot, *d'*, of the piece A, substantially as set forth.



2. The combination of a hollow segmental piece, A, provided with a spring-catch, C, at one end, the spring-catch having a projecting stud, *d*, guided in a slot, *d'*, of the segment A, with a hook, B, pivoted to the other end of the piece A, the free end of which is recessed, so as to be locked by the spring-catch, substantially as set forth.

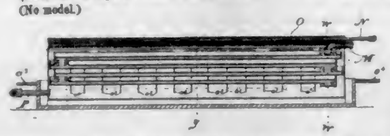
297,499. FASTENER FOR MEETING-RAILS OF SASHES. LOUIS J. CHURCH, Washington, D. C., assignor of one-half to William H. Wylie, same place. Filed Nov. 19, 1883. (No model.)



Claim.—The sash-lock described, consisting of the part *a*, having the locking-notches *g*, and extensions 1, for attachment to the sash, the latch *c*, pivoted on the part *a*, and slotted at its front end, and a gravity-latch pivoted within said slot by a pivot passing through the front thereof, said gravity-latch being larger at its lower inner end, and adapted to fall by gravity in the locking-notches when opposite thereto, in combination with the catch B on the outer sash, adapted to receive the end of the catch C, substantially as described.

297,600. FASTENER FOR MEETING-RAILS OF SASHES. LOUIS J. CHURCH, Washington, D. C., assignor of one-half to William H. Wylie, same place. Filed Nov. 19, 1883. (No model.)

Claim.—In a sash-lock, the case A in the arc of a circle, connected to the inner sash, and provided with the slot and locking-notches 10, the locking-catch B, the latch E, weighted at its inner end and inclosed within said case, and adapted thereto, combined with the part C, connected to the outer sash and forming with the part A a complete circle, and adapted to receive the end of the catch B, substantially as described.

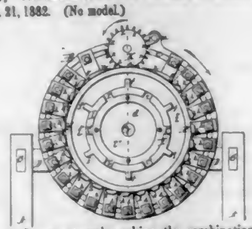


297,501. GANG-WIRE STRETCHER. JOHN H. COLE and EDWARD L. COLE, Muscatine, Iowa. Filed Sept. 26, 1883. (No model.)

Claim.—1. The machine for stretching wire, or gang-wire stretcher, herein shown and described, the same consisting of the upright frame C C, having brace-blocks, spools F, ratchets H, pawls I, and arms or projections I' M I', substantially as and for the purpose shown and set forth.

2. The combination, in a machine for stretching wire, of the frame C D, having spools F, a removable handle for turning the spools, a pawl-and-ratchet mechanism for holding the spools, the arms or extensions I I, having curved bearings M at their outer ends, brace L, stake-iron O, and stake N, all constructed and combined to operate substantially in the manner and for the purpose shown and set forth.

297,502. ABSORBER FOR AMMONIA ICE-MAKING APPARATUS. MAHLON S. CONLY, Indianapolis, Ind., assignor of two-thirds to Thomas H. Butler and Orange R. Weaver, both of same place. Filed Aug. 10, 1883. (No model.)



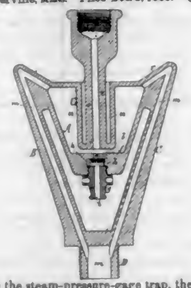
Claim.—1. An absorber for ammonia-gas, consisting of an outer shell and a series of hollow-bottomed troughs therein, the ammonia-gas being conducted through the several chambers formed by the hollow bottoms, and the weak aqua-ammonia or water being conducted through the troughs over the bottoms thereof, which also constitute the tops of said chambers, substantially as set forth.

2. In an absorber or device for charging water or weak aqua-ammonia with ammonia-gas, a series of hollow-bottomed troughs, the trough portions of which are adapted to contain the water or weak aqua-ammonia, and the hollow bottoms or chambers of which are adapted to contain the ammonia-gas, provided with a series of small pipes, which extend from said chambers to the bottoms of the troughs next below them, substantially as set forth.

3. The combination of the shell O, the series of hollow-bottomed troughs therein, the inlet-pipes M and N, and the outlet-pipe P, substantially as described, and for the purposes specified.

297,503. OATMEAL-MACHINE. GEORGE H. CORMACK, Rockford, Ill. Filed Apr. 21, 1882. (No model.)

Claim.—1. In an oatmeal-machine, the combination, with a rotary cylinder, substantially as herein described, having its rim perforated, of a pin-wheel mounted to revolve on the periphery of the perforated rim, having its pins to enter the perforations in the rim, substantially as and for the purpose hereinbefore set forth.



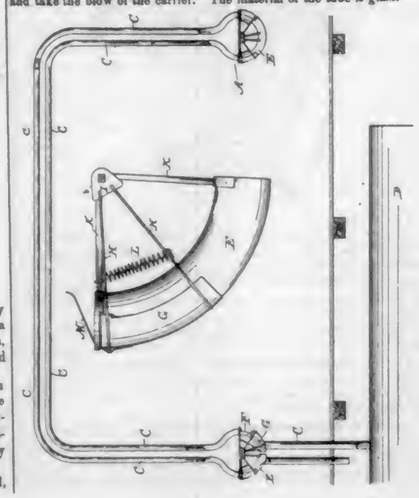
2. The combination, with a rotary cylinder, substantially as herein described, having its rim perforated, of a pin-wheel mounted to revolve on the periphery of the perforated rim, having its pins to enter the perforations in the rim, and a pivoted lever-support for said pin-wheel, adapting it to engage the perforated rim by the action of gravity, substantially as and for the purpose hereinbefore set forth.

3. The combination, with a rotary cylinder, having its rim perforated, and a pin-wheel mounted to engage its perforated periphery, of guards overlapping the periphery of the perforated rim on opposite sides of the pin-wheel, substantially as and for the purpose hereinbefore set forth.

4. The combination, with a rotary cylinder having its rim perforated, a pin-wheel mounted to engage the periphery of the perforated rim, and guards to overlap the perforated rim on opposite sides of the pin-wheel, of cutters placed to engage the oat-grains and divide them in sections, substantially as and for the purpose hereinbefore set forth.

5. The combination, with a rotary cylinder having its rim perforated, a pin-wheel mounted to engage the periphery of the perforated rim, and guards to overlap the perforated rim on opposite sides of the pin-wheel, of double-edged adjustable cutters capable of use, in connection with the perforated revolving rim, in either direction, and at velocities dependent upon its use as a centrifugal or gravity machine, substantially as and for the purpose hereinbefore set forth.

297,504. TRAP FOR STEAM-PRESSURE GAGES. GEORGE HANCHARD CROSBY, Somerville, Mass. Filed Dec. 3, 1883. (No model.)

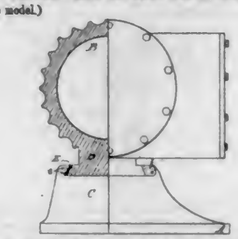


Claim.—1. In the steam-pressure-gage trap, the combination of an open insulating chamber or space, *a*, arranged between the eduction-pipe *c* and the vase or water-holder, with such pipe and said vase or holder, such space or chamber being for the purpose as set forth.

2. The improved gage-trap, substantially as described, consisting not only of the vase or water-holder A, the connection-screw D, and bent arms B and C, arranged and provided with a passage, *m*, leading through such screw and one or each of the said arms and into the upper part of the vase, but of the eduction-tube *c*, and the insulating-cup G, open at top, and arranged in the vase, all being substantially as set forth.

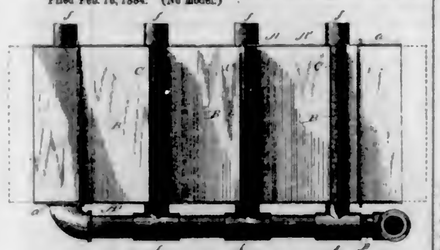
297,505. PNEUMATIC TUBE. WILBUR G. DAVIS, Syracuse, N. Y. Filed Jan. 3, 1884. (No model.)

Brief.—A pneumatic dispatch-tube the openings in which for the reception and delivery of the carriers are normally closed by sliding spring-actuated covers withdrawn by hand when a carrier is to be inserted, and pushed aside automatically for the delivery of a carrier by means of a spring-arm projecting from the cover into the tube, to stop and take the blow of the carrier. The material of the tube is glass.



Claim.—1. Pneumatic tubes for use in stores, &c., for conveying cash boxes or carriers or other packages, said tubes being made of glass or other transparent material, as set forth.

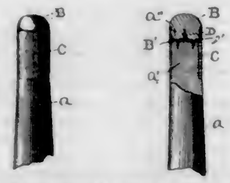
2. In devices for opening and closing the exit and entrance ports of pneumatic tubes, a sliding plate adapted to cover the opening in the tube, provided with an arm which projects into the tube, against which the carrier is forced to push the plate back and open the port, in combination with a spring adapted to operate on the plate in a reverse direction, to close the port after the carrier has been discharged from the tube, as set forth.



3. The sliding plate G, secured to the pivoted plate I by means of rods H, and provided with a spring-arm, M, in combination with the bars K, spring L, and tube C, provided with an aperture, F, as set forth.

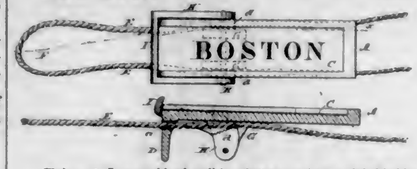
297,506. ENGINE. ISAAC DE GRAFF, Detroit, Mich. Filed Oct. 1, 1883. (No model.)

Claim.—The connection between an engine and its frame, as herein described, the foot D, engaging by a tenon in an undercut mortise in the post C, and provided with wedges and devices for holding the same, substantially as and for the purposes set forth.



297,507. STEAM-EMPTYING ASH-PAN. JOHN DESMOND, Jackson, Mich., assignor to James Carey and Charles Ratson, both of same place. Filed Feb. 16, 1884. (No model.)

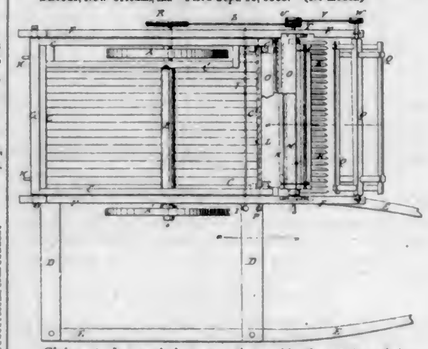
Claim.—1. In a locomotive ash-pan, the plates B, arranged with relation to the ejector-pipes C, having slots C' for ejecting the ashes from the bottom of the pan, substantially as shown, and for the purpose described.



2. In a locomotive ash-pan, the combination of the pan A, having outlet-gates *a a*, plates B, ejector-pipes C, and steam-supply pipe D, substantially as shown, and for the purpose described.

297,508. BILLIARD-CUE TIP. DAVID DESBAUER, Martinsville, Ind. Filed Sept. 8, 1883. (No model.)

Claim.—The combination of thimble C, having the sockets A' and A'', base-plate B', provided with the inverted screw D, screw-holes D', and inner screw-threaded portion, tip B, and cue A, all substantially as herein described and set forth.



297,509. MAIL-BAG FASTENER AND TAG-HOLDER. WILLARD D. DORENUS, Washington, D. C., assignor, by direct and mesne assignments, to Frank Hodges and Albert L. Pitney, both of same place. Filed Mar. 31, 1884. (No model.)

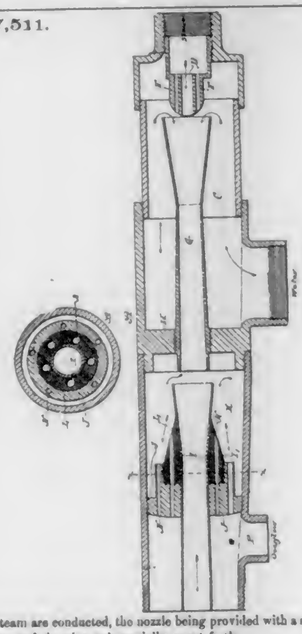
Claim.—1. In a combined mail-bag fastener and tag or label holder, a plate provided with a dovetailed recess to receive the tag or label, and two levers provided with eccentrics or cams pivoted thereto, and adapted to clamp the rope or cord, the outer ends of the levers being connected by a cross-bar, which, when the device is in use, closes the end of the tag-holding recess to hold the tag or label in its proper place, as set forth.

2. In a mail-bag fastener, a plate having a tag-holding recess, and perforated lugs for the passage therethrough of cords or ropes, and having pivoted thereto eccentric levers, over which the cord or rope passes, and adapted to hold said rope in contact with the plate, as set forth.

297,510. GRAIN HEADER AND HARVESTER. PETER EDWARD DROUET, New Orleans, La. Filed Sept. 19, 1883. (No model.)

Claim.—1. In a grain-harvester, the combination of the cart having a front board made in two or more parts adjustable with respect to each other, the side bars, F, pivoted at their rear ends on a bar, G, secured to the upper part of the rear end of the cart, the scraper-roller, comb, reel, and driving mechanism therefor carried on the forward portions of said side bars, and a rod, I, passing through the side bars and any one of a series of holes in the forward end of each side of the cart, for the purpose of adjusting the bars at different heights, substantially as set forth.

2. In a grain-harvester, the combination of the cart having a front board made in two or more parts adjustable with respect to each other, the pivoted adjustable side bar, F, the scraper-roller and reel journaled between the forward ends of the side bars, suitable driving mechanism therefor, the comb-plate under the scraper-roller formed with or having secured thereto the rearward-extending plate L, and a cover-plate O, also formed with a rearward-extending plate, the two said plates forming a chute adapted to project to or within the opening formed in the adjustable front board, substantially as set forth.

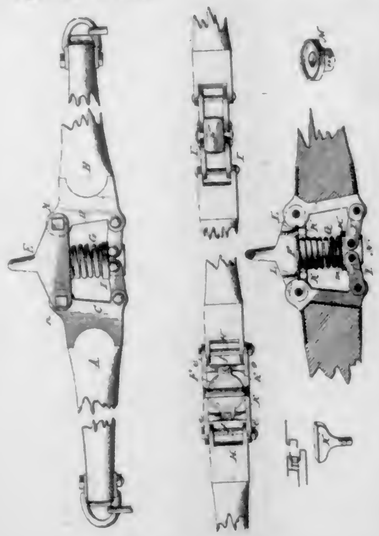


3. In a grain-harvester, the combination of the side bars, F, the scraper-roller and reel journaled between the forward ends of said bars, suitable driving mechanism therefor, the comb K, arranged below the scraper-roller, and a friction-roller, X, journaled in the side bars below the comb-plate, substantially as set forth.

4. In a grain-harvester, the combination, with the side-boards of the cart-body C, and the end-board made in two or more parts, of the rod P, substantially as herein shown and described, whereby the upper part or parts can be supported above the lower part to form an inlet-opening, as set forth.

297,511. INJECTOR. WILLIAM T. EWING, Chicago, Ill. Filed Aug. 27, 1883. (Model.)

Claim.—1. The combination, in an injector, of a condensing-chamber provided with a nozzle or nozzles and a pipe through which the water



297,511.

and steam are conducted, the nozzle being provided with a series of openings around the pipe, substantially as set forth.

2. In an injector, the combination of the suction-chamber, a steam jet or nozzle provided with a series of auxiliary jets, the pipe through which the water is forced, the condensing-chamber, the pipe through which the water is carried away, and the nozzles J, provided with a removable nozzle or cone, both of the cones being provided with apertures or openings through which the water is forced from the chamber, substantially as specified.

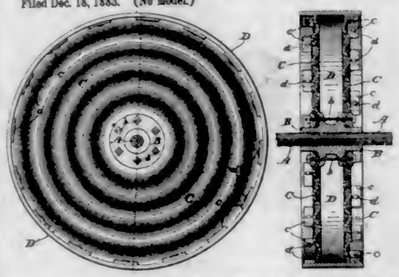
297,512. DOUBLE-TREE. SAMUEL M. FIREY, Clear Spring, Md. Filed Aug. 1, 1883. (No model.)

Claim.—1. The combination of the hinged arms A and B with the toggle-links and the central spring, substantially as and for the purposes set forth.

2. The arms A and B, provided with clips C and D, in combination with toggle-links I, clevis E, and spring G, all arranged to operate substantially as and for the purposes set forth.

3. The arms A and B, hinged to clevis E, provided with a seat for the spring G, in combination with toggle-links I, substantially as set forth.

4. The combination of the spring-cap M and adjusting-screw N, for regulating the tension of the spring, and thus giving the arms of the double-tree more or less stiffness, as set forth.



297,513. COMBINED SAW JOINTER AND GAGE. HENRY FLATER, Findlay, Ohio, assignor of one-half to William L. Carlin, same place. Filed Dec. 7, 1883. (No model.)

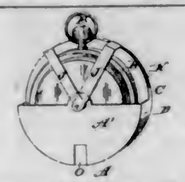
Claim.—1. The combination, with the jointer-head having the vertically and longitudinally slotted central depression and the depending end flanges, of the integral base and pivot-standard and the swivel-headed clamping-bolt, substantially as specified.

2. The combination, with the pivoted jointer-head having the vertically-slotted central depression and the depending end flanges, of the horizontal base portion having the short locking-arm, and the swivel-headed clamping-bolt in the opposite longer arm, substantially as specified.

297,514. WHEEL OR PULLEY. HARMON H. FULTON, Indianapolis, Ind., assignor to the Indianapolis Machine and Bolt Works, of Indiana. Filed Dec. 18, 1883. (No model.)

Claim.—1. A wheel or pulley composed of a hub consisting of three parts, a web consisting of two corrugated sheet-metal disks arranged substantially parallel with each other, and a rim, said several parts being constructed and secured together, substantially as shown and described, and for the purposes specified.

2. The combination of the three-part hub B, the double corrugated sheet-metal web C C, and rim D, forming a wheel or pulley, substantially as shown and specified.



297,515. LEATHER AND CLOTH VARNISH. WALTER C. GIFFORD, Brooks, Mich. Filed Oct. 11, 1883. (No specimens.)

Claim.—The herein-described composition of matter for coating leather, cloth, &c., to render it water-proof and provide it with a polish, consisting of alcohol, gum-shellac, white resin, oil of turpentine, kerosene-oil, oil of cinnamon, and lamp-black, in the proportions herein specified.

297,516. WATCH-PROTECTOR ATTACHMENT. JULIUS C. GRINNELL, Brooklyn, N. Y. Filed Sept. 10, 1883. (No model.)

Claim.—1. A watch-protector made substantially as herein shown and described, and consisting of a casing provided with swinging stirrups adapted to swing over the watch when the same is in the casing, as set forth.

297,516.

2. In a watch-protector, the combination, with a casing adapted to receive a watch, of swinging stirrups and a fork or hook hanging from the said stirrups, substantially as herein shown and described, and for the purpose set forth.

3. In a watch-protector, the combination, with a casing adapted to receive a watch, of pivoted stirrups, springs for swinging them apart, and a hook suspended from the said stirrups, substantially as herein shown and described, and for the purpose set forth.

4. In a watch-protector, the combination, with a casing adapted to receive a watch, of pivoted stirrups, springs for swinging them apart, a hook suspended from the said stirrups, and a catch for locking the stirrups when they are swung upward, substantially as herein shown and described, and for the purpose set forth.

5. In a watch-protector, the combination, with a casing and swinging stirrups, of springs for pressing them apart, and of a fork hanging from the ends of the stirrups, and provided with a projecting arm passing through a slot in the bottom of the casing, substantially as herein shown and described, and for the purpose set forth.

6. In a watch-protector, the combination, with a casing, of swinging stirrups having studs, a catch for locking the stirrups in place, a spring for swinging them from each other, and a fork suspended from the ends of the stirrups, and provided with an arm projecting through a slot in the bottom of the casing, substantially as herein shown and described, and for the purpose set forth.

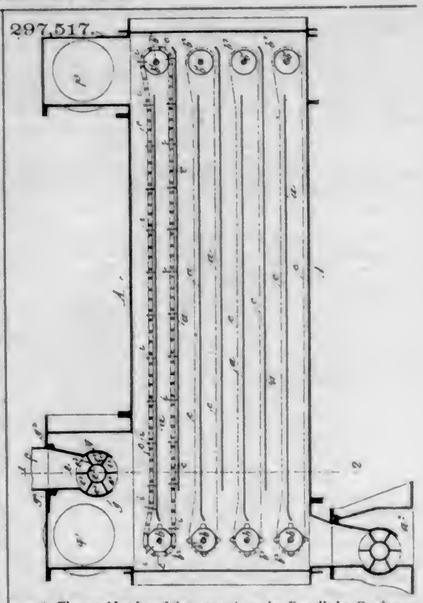
7. In a watch-protector, the combination, with the casing A, provided with the plates B C, united by a rim, D, having slots K, of pivoted stirrups J, one shank of each of which passes through a slot K into the space between the plates B C, substantially as herein shown and described, and for the purpose set forth.

8. In a watch-protector, the combination, with a casing, A, of the swinging stirrups J, having studs M, the anchor H, the pin G, the button F, the spring I, and the fork P, suspended from the inner shanks of the stirrups, substantially as herein shown and described, and for the purpose set forth.

9. In a watch-protector, the combination, with the casing A, of the swinging stirrups J, provided with studs M, the anchor H, the pin G, the button F, the spring I, the spring L, and the fork P, suspended from the inner shanks of the stirrups, substantially as herein shown and described, and for the purpose set forth.

10. In a watch-protector, the combination, with the casing A, having plates B C, and a neck, E, provided with a groove, *b*, of the stirrups J, having studs M, the anchor H, the pin G, the button F, the stud *a*, projecting from the pin G, the spring L, and the fork P, substantially as herein shown and described, and for the purpose set forth.

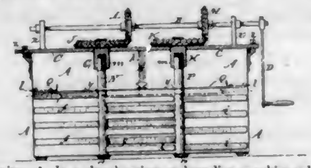
11. In a watch-protector, the combination, with a casing, of swinging stirrups, springs for separating them, and a device suspended from the stirrups and adapted to support the watch, and to be pressed downward by the same, thereby swinging the stirrups toward each other and over the watch, substantially as herein shown and described, and for the purpose set forth.



297,517. APPARATUS FOR THE DISTILLATION OF WOOD. ROBT. HALDANE, Glasgow, County of Lanark, Scotland. Filed Sept. 24, 1881. (No model.) Patented in England Apr. 5, 1880, No. 1,435.

Claim.—1. The combination, with the retort A, having shelf or shelves *a*, chain or chains *c*, scrapers *i*, feed-wheel *e*, operating mechanism for said chain and wheel, and outlets for conducting off the distilled gases, of the cooler B, communicating with the said retort through a passage, a^2, controlled by a feed-wheel, and formed or provided with chambers *n*, tubes n^2, ropes or chains *p*, scrapers p^2, driving-wheels q q^2, operating mechanism therefor, water-casing n^3, and controlled discharge-outlet b^2, as and for the purpose hereinbefore set forth.

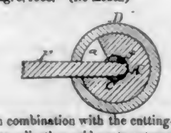
2. The cooler B, consisting of the combination of the chambers *n*, tubes n^2, ropes or chains *p*, scrapers p^2, driving-wheels q q^2, discharge-wheel *e*, and casing n^3, for the purpose described.



3. In apparatus for obtaining products from the destructive distillation of sawdust, shavings, and other small wood, the combination of the retort A, the cooler B, and the winnowing-machine E, constructed, arranged, and communicating with one another substantially as hereinbefore described, whereby the material fed into the retort is conducted successively through said retort, cooler, and winnowing-machine, from which latter it is finally discharged in the condition of charcoal, as and for the purposes hereinbefore specified.

297,517.

4. The combination of the retort A, cooler B, cylinder C, winnowing-machine E, and means, substantially as hereinbefore described, whereby the material fed into the retort is conveyed successively through said retort, cooler, cylinder, and winnowing-machine, as and for the purposes set forth.



297,518. DOUGH-MIXER. FRANCIS F. HUSSEY, Newton, Mass. Filed July 17, 1883. (No model.)

Claim.—1. In a dough-mixer or kneading-machine substantially such as described, the removable truss or bar C, having the standards *x x*, and carrying the crank-shaft B, provided with the gears L M, in combination with the gears J K, and vertical shafts G H, having the sockets *m*, for receiving the float-shafts N P, the gears L M being respectively arranged on corresponding sides of the gears J K, whereby the float-shafts are caused to revolve in the same direction and their intermeshing floats to move in opposite directions, and said bar may be readily removed from the body of the machine without removing the float-shafts, substantially as set forth.

2. In a dough-mixer or kneading-machine, the guard Q, in combination with the body A, float-shafts N P, means for securing said guard in said body, and operative mechanism for said shafts, substantially as and for the purpose specified.

297,519. COLLAPSIBLE SCREW-TAP. JAS. M. JOHNSON, Cleveland, Ohio. Filed Aug. 8, 1883. (No model.)

Claim.—1. In combination with the cutting-dies constructed in two parts, the strip A, for adjusting said parts outwardly, as and for the purpose set forth.

2. The tapering core C, having the grooves *c* in the forward end,

and the slot *f'*, substantially as described.

3. The sliding nut *f*, in combination with lever F and core C, as and for the purpose specified.

4. In combination with the tapering core C, having slot *f'*, the lever F, nut *f*, mandrel A, and the adjusting-screw *n* in the rear end of said hollow mandrel, for adjusting and securing the core in place, substantially as described.

297,520. AUTOMATIC WINDING-SIGNAL FOR SPRING-CLOCKS. EDWARD JUNGERMAN, Gettysburg, Pa. Filed Jan. 10, 1884. (No model.)

Claim.—1. The combination, with the spring of a clock and its working parts, of a yielding bar placed in range of contact with the mainspring when relaxed and expanded, and a signal adapted to be set by the yielding movement of said bar, as and for the purpose described.

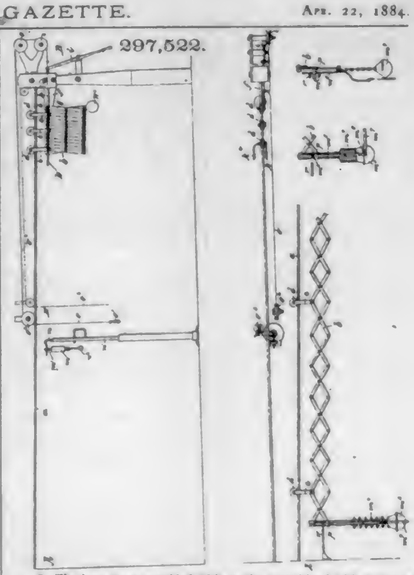
2. The combination, with the spring of a clock and its working parts, of a yielding bar placed in range of contact with the mainspring when relaxed and expanded, a stop for limiting the movement of said bar inward toward the clock-spring, a signal adapted to be set by the yielding of the bar, and a spring for drawing back the signal, as and for the purpose described.

3. The combination, with the spring of a clock, its slotted face, and its working parts, of the yielding bar C, adjusted in relation to the spring to be struck and moved by the expansion of the latter, arm D, oscillating sleeve E, arm G, signal-plate J, and spring I, substantially as and for the purpose described.

297,521. COMBINED KNIFE-SHARPENER AND FORK. WILLIAM KAUFMAN, New York, N. Y. Filed Sept. 17, 1883. (No model.)

Claim.—A fork provided with the transversely V-notched sharpening-block secured thereto, and the longitudinal converging slit made therethrough, and terminating in converging grooves running out at the surface of the metal, substantially as specified.

297,522. CASH SYSTEM. THOMAS M. KENNEY, Cambridge, Mass., assignor of one-half to FRANK E. MASON, same place. Filed Mar. 24, 1884. (No model.)



Claim.—1. In a carrying apparatus, the combination, with a track or guide, of a lazy-tongs supported and guided by the said track and actuating mechanism for contracting and expanding the said lazy-tongs, whereby the latter may convey articles between stations on the said track, substantially as described.

2. The combination, with the lazy-tongs and actuating mechanism for expanding and contracting the same, of a carrier connected with the said lazy-tongs and moved thereby, substantially as described.

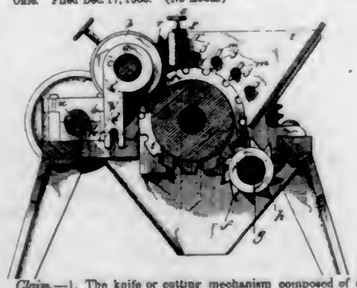
3. The lazy-tongs provided with a carrier, combined with a support for holding an article in position to be engaged by the said carrier in the movement of the lazy-tongs, substantially as described.

4. The lazy-tongs and carrier connected therewith, combined with a detacher adapted to engage an article supported on the said carrier and remove it therefrom, substantially as described.

297,522.

5. The lazy-tongs provided with carriers, combined with a support for holding an article in position to be engaged by one of the said carriers in the movement of the lazy-tongs in one direction, and a detacher in position to engage an article supported on one of the said carriers and remove it therefrom in the movement of the lazy-tongs in the other direction, substantially as described.

6. The lazy-tongs having at one end a joint connected with a fixed pivot and at its other end a carrier, combined with actuating mechanism for expanding the said lazy-tongs and an actuating-weight or equivalent for contracting the said lazy-tongs, substantially as described.



7. The lazy-tongs and actuating mechanism therefor, combined with a vertically-movable carrier connected with the said lazy-tongs, substantially as described.

8. The lazy-tongs provided with a carrier, combined with the flexible actuating device connected with the said lazy-tongs, whereby the latter may be actuated from different points or stations, substantially as described.

9. The main lazy-toogs and actuating mechanism therefor, combined with a carrier, receptacle, and vertically-movable lazy-tongs connecting the said receptacle with the main lazy-tongs, substantially as described.

10. The main lazy-tongs, combined with the vertically-movable lazy-tongs connected with one end thereof, and the actuating-bar for the vertically-movable lazy-tongs and hinged extension of the said bar, substantially as described.

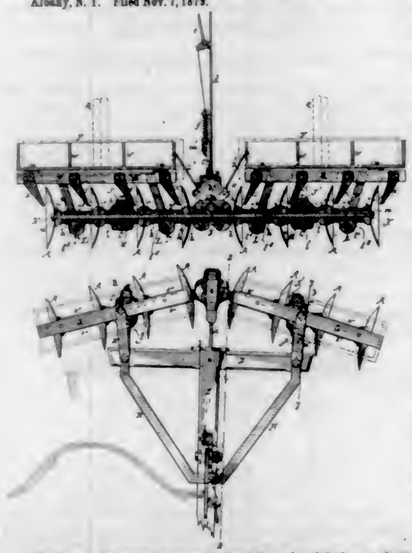
297,523. OATMEAL-CUTTER. FRANKLIN W. KREMER, Wadsworth, Ohio. Filed Dec. 17, 1883. (No model.)

Claim.—1. The knife or cutting mechanism composed of a shaft, circular cutters loosely secured thereon, to turn with the shaft, and interposed separating-washers having projecting arms intersecting the peripheries of the cutters, substantially as and for the purpose described.

2. The combination, in an oatmeal-machine, with the squared shaft and means to rotate the same, of circular knives arranged to turn with

the said shaft, and having lateral play thereon, the interposed non-rotating washers, and their projecting arms intersecting the acting edges of the knives, substantially as and for the purpose described.

3. In an oatmeal-machine, the combination, substantially as shown and described, of a longitudinally and circumferentially grooved feeding-cylinder, means to rotate the same at a given speed, a shaft, circular cutters loose on and turning with said shaft, stationary washers separating said cutters, arms projecting from said washers and intersecting the cutting-edges of the cutters, and means to rotate said shaft at a much-diminished speed relative to that of the feeding-cylinder, as and for the purpose set forth.



4. The combination, substantially as shown and described, of a feeding-cylinder having circumferential grooves, a cutting mechanism, a clearing device composed of a series of toothed circular plates, the teeth of which enter and clear said grooves, a shaft on which said plates are secured and properly spaced, a worm-wheel on said shaft, and worm-gearing connecting said shaft with the feeding-cylinder shaft, from which it and the cutting mechanism receive slow rotations, as set forth.

5. The combination, substantially as shown and described, of the hopper, a feeding cylinder therein grooved longitudinally, a cutting mechanism, a series of bars and pins therein, a head to which said bars are connected, a blade also attached to said head and arranged over and between the feeding-cylinder and cutting mechanism to operate upon grains standing on end in the grooves, and means to rotate said cylinder and feeding mechanism and reciprocate said bars and blade.

6. The combination, with the hopper and feeding-cylinder, of a blade arranged over the feeding-cylinder next its discharge side, means to reciprocate it, a pressure-board over the same, and temper-screws to hold the board down on the blade, substantially as shown and described.

7. The combination and arrangement, substantially as shown and described, of the framing, a driving-shaft on the same, a hopper, a longitudinally and circumferentially grooved feeding-cylinder, a shaft carrying circular cutters separated by non-rotating cutter-clearing washers, a shaft carrying a series of circular toothed plates, a grating or series of grain-distributing bars, and a blade arranged over the feeding-cylinder, a cam on the cylinder-shaft, gearing connecting said shaft and the driving-shaft, and the series of worms and worm-wheels connecting the shafts of the cutting and clearing shafts with the cylinder-shaft.

297,524. WHEEL CULTIVATOR OR HARROW. CHARLES LA DOW, Albany, N. Y. Filed Nov. 7, 1879.

Claim.—1. The combination, substantially as hereinbefore set forth, of a disk-gang shaft, a spool enveloping the shaft, a sleeve enveloping the spool, and provided with a spherical bearing, and a correspondingly-shaped socket in the boxing connected with the main frame.

2. The combination, substantially as hereinbefore set forth, of the disk-gang shaft, the sectional ball loosely mounted thereon, and its socket.

3. The combination, substantially as hereinbefore set forth, of the disk-gang shaft, the sleeve thereon, its hemispherical head, and the hemispherical section loose on the sleeve.

4. The combination, substantially as hereinbefore set forth, of the disk-gang shaft, the sectional ball thereon, the socket therefor, the recess therein, and the pin (on the section of the ball next the socket-opening) working in said recess to prevent said section from turning, while permitting the ball to rock.

5. The combination, substantially as hereinbefore set forth, of a disk-gang shaft, disks mounted thereon, spacing-thimbles interposed between the disks, a sleeve on the inner end of the disk-gang shaft having a hemispherical enlargement upon its end, a hemispherical collar loosely mounted on the sleeve, said hemispherical enlargement and collar forming a sectional ball, a socket for the said ball, a pin on the hemispherical collar working in a recess in the socket, and a clamp-nut upon the outer end of the axle.

6. The combination, substantially as hereinbefore set forth, of a disk-gang, a scraper-bar, scrapers mounted thereon, and supporting-bars pivoted on the spacing-thimbles and scraper-bar.

7. The combination, substantially as set forth, of a disk-gang, a scraper-bar, scrapers mounted thereon, supporting-bars pivoted on the spacing-thimbles and scraper-bar, a lever on the frame for actuating the scraper-bar, and a connection between the lever and the bar.

8. The combination, substantially as hereinbefore set forth, of the main frame, the disk-gangs, the scraper-bars, the pivoted supports between the spacing-thimbles and scraper-bars, the pivoted supports between the scraper-bars and main frame, scrapers, a rocking lever, and link-connections between the rocking lever and scraper-bars.

9. The combination, substantially as hereinbefore set forth, of a main frame, a disk-gang consisting of concave disks mounted on an axle, mechanism for adjusting the disk-gang relatively to the line of draft, and a weight-box mounted on the disk-gang and adjustable with it.

10. The combination, substantially as hereinbefore set forth, of a frame, disk-gangs composed of concavo-convex disks mounted on axles, weight-boxes mounted above the disk-gangs, and a lever whereby the angle of the gangs and weight-boxes relatively to the line of draft may be varied and a uniform depth of cut of the disks secured.

11. The combination, substantially as hereinbefore set forth, of a main frame, a disk-gang, a scraper-bar and weight-box mounted on pivoted supports above said disk-gang, so as to be free to vibrate laterally, a stop to limit said vibrations, and scrapers mounted upon the scraper-bar, whereby the scrapers are caused to approach and recede from the disks (to clear them of clogging matter) by the jostling of the machine.

12. The combination of the main frame, a disk-gang, mechanism for adjusting the gang relatively to the line of the draft, a weight support or beam mounted over and carried by the gang, draft-connections extending from the frame to the gang, which permit the adjustment of the gang, and a brace extending from the frame to the weight support or beam.

13. The combination of the main frame, a disk-gang, a weight support or beam mounted over and carried by the gang, and the bifurcated connection $H' H^2$, extending from said beam to the frame.

14. The combination, substantially as hereinbefore set forth, of a main frame, disk-gangs flexibly connected at their inner ends, and also connected to the main frame, a lever, a bar connecting the lever and the flexible connection, and a guide-plate in which said bar works endwise.

15. The combination of the main frame, the endwise-moving draw-bar *a*, the slotted guide-plate, and the disk-gangs, for the purpose set forth.

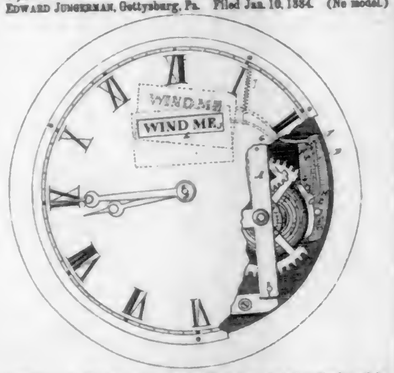
16. In a harrow, the combination of a pole, a cross-bar projecting laterally therefrom, disk-gangs hinged to the cross-bar, a lever on the pole, a bar connecting the lever to the disk-gangs, and a guide, between the prongs of which the bar is thrust back and forth by the action of the lever.

17. In a harrow, the combination of a pole, a draft-frame or cross-bar, disk-gangs connected to the frame, a lever on the pole in front of the cross-bar, a bar connecting the lever and the disk-gangs, and a guide located between the gangs and lever to regulate the motion of the bar.

18. The combination, substantially as hereinbefore set forth, of the main frame, disk-gangs connected to the frame by draft-connections, which leave the ends of the gangs free to vibrate vertically and horizontally, and stops or braces secured upon the main frame, applied at said draft-connections to prevent them from rising, and to relieve the draft-bars from vertical strain.

19. A seat-supporting standard composed of sheet metal of concavo-convex form in cross-section, and tapering from its base to its top, substantially as described.

297,525. FEEDING DEVICE FOR RULING-MACHINES. EMIL LARSON and OSCAR HAMMARLUND, Chicago, Ill., assignors of one-third to Nils F. Olson, same place. Filed Jan. 26, 1883. (No model.)



Claim.—1. In a pneumatic feeding device for paper-ruling machines, a vacuum-tube supported by telescopic arms adapted to be advanced or retracted, as described, in combination with spring-actuated pivoted arms provided with angular projections, whereby when these arms are thrown up the tube is forced suddenly back and freed from the paper, substantially as shown and described.

and the slot *f'*, substantially as described.

3. The sliding nut *f*, in combination with lever F and core C, as and for the purpose specified.

4. In combination with the tapering core C, having slot *f'*, the lever F, nut *f*, mandrel A, and the adjusting-screw *n* in the rear end of said hollow mandrel, for adjusting and securing the core in place, substantially as described.

297,520. AUTOMATIC WINDING-SIGNAL FOR SPRING-CLOCKS. EDWARD JUNGERMAN, Gettysburg, Pa. Filed Jan. 10, 1884. (No model.)

Claim.—1. The combination, with the spring of a clock and its working parts, of a yielding bar placed in range of contact with the mainspring when relaxed and expanded, and a signal adapted to be set by the yielding movement of said bar, as and for the purpose described.

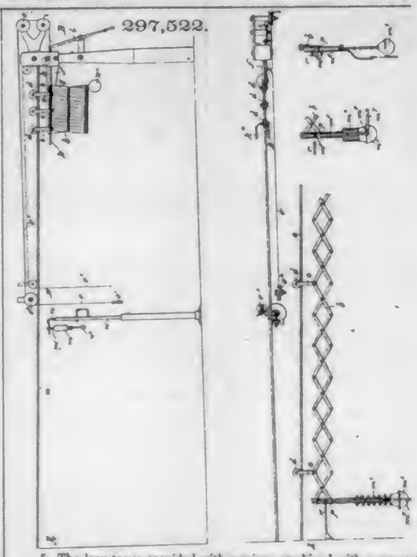
2. The combination, with the spring of a clock and its working parts, of a yielding bar placed in range of contact with the mainspring when relaxed and expanded, a stop for limiting the movement of said bar inward toward the clock-spring, a signal adapted to be set by the yielding of the bar, and a spring for drawing back the signal, as and for the purpose described.

3. The combination, with the spring of a clock, its slotted face, and its working parts, of the yielding bar C, adjusted in relation to the spring to be struck and moved by the expansion of the latter, arm D, oscillating sleeve E, arm G, signal-plate J, and spring I, substantially as and for the purpose described.

297,521. COMBINED KNIFE-SHARPENER AND FORK. WILLIAM KAUFMAN, New York, N. Y. Filed Sept. 17, 1883. (No model.)

Claim.—A fork provided with the transversely V-notched sharpening-block secured thereto, and the longitudinal converging slit made therethrough, and terminating in converging grooves running out at the surface of the metal, substantially as specified.

297,522. CASH SYSTEM. THOMAS M. KENNEY, Cambridge, Mass., assignor of one-half to Frank E. Mason, same place. Filed Mar. 24, 1884. (No model.)



Claim.—1. In a carrying apparatus, the combination, with a track or guide, of a lazy-tongs supported and guided by the said track and actuating mechanism for contracting and expanding the said lazy-tongs, whereby the latter may convey articles between stations on the said track, substantially as described.

2. The combination, with the lazy-tongs and actuating mechanism for expanding and contracting the same, of a carrier connected with the said lazy-tongs and moved thereby, substantially as described.

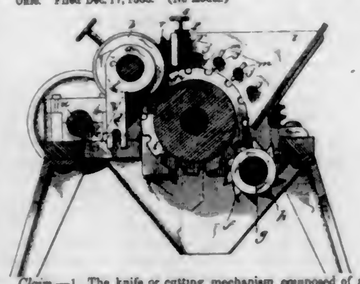
3. The lazy-tongs provided with a carrier, combined with a support for holding an article in position to be engaged by the said carrier in the movement of the lazy-tongs, substantially as described.

4. The lazy-tongs and carrier connected therewith, combined with a detacher adapted to engage an article supported on the said carrier and remove it therefrom, substantially as described.

297,522.

5. The lazy-tongs provided with carriers, combined with a support for holding an article in position to be engaged by one of the said carriers in the movement of the lazy-tongs in one direction, and a detacher in position to engage an article supported on one of the said carriers and remove it therefrom in the movement of the lazy-tongs in the other direction, substantially as described.

6. The lazy-tongs having at one end a joint connected with a fixed pivot and at its other end a carrier, combined with actuating mechanism for expanding the said lazy-tongs and an actuating-weight or equivalent for contracting the said lazy-tongs, substantially as described.



7. The lazy-tongs and actuating mechanism therefor, combined with a vertically-movable carrier connected with the said lazy-tongs, substantially as described.

8. The lazy-tongs provided with a carrier, combined with the flexible actuating device connected with the said lazy-tongs, whereby the latter may be actuated from different points or stations, substantially as described.

9. The main lazy-tongs and actuating mechanism therefor, combined with a carrier, receptacle, and vertically-movable lazy-tongs connecting the said receptacle with the main lazy-tongs, substantially as described.

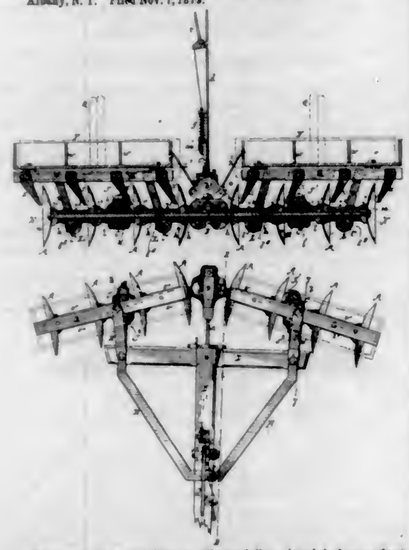
10. The main lazy-tongs, combined with the vertically-movable lazy-tongs connected with one end thereof, and the actuating-bar for the vertically-movable lazy-tongs and hinged extension of the said bar, substantially as described.

297,523. OATMEAL-CUTTER. FRANKLIN W. KREMER, Wadsworth, Ohio. Filed Dec. 17, 1883. (No model.)

Claim.—1. The knife or cutting mechanism composed of a shaft, circular cutters loosely secured thereon, to turn with the shaft, and interposed separating-washers having projecting arms intersecting the peripheries of the cutters, substantially as and for the purpose described.

2. The combination, in an oatmeal-machine, with the squared shaft and means to rotate the same, of circular knives arranged to turn with the said shaft, and having lateral play thereon, the interposed non-rotating washers, and their projecting arms intersecting the acting edges of the knives, substantially as and for the purpose described.

3. In an oatmeal-machine, the combination, substantially as shown and described, of a longitudinally and circumferentially grooved feeding-cylinder, means to rotate the same at a given speed, a shaft, circular cutters loose on and turning with said shaft, stationary washers separating said cutters, arms projecting from said washers and intersecting the cutting-edges of the cutters, and means to rotate said shaft at a much-diminished speed relative to that of the feeding-cylinder, as and for the purpose set forth.



4. The combination, substantially as shown and described, of a feeding-cylinder having circumferential grooves, a cutting mechanism, a clearing device composed of a series of toothed circular plates, the teeth of which enter and clear said grooves, a shaft on which said plates are secured and properly spaced, a worm-wheel on said shaft, and worm-gearing connecting said shaft with the feeding-cylinder shaft, from which it and the cutting mechanism receive slow rotations, as set forth.

5. The combination, substantially as shown and described, of the hopper, a feeding cylinder therein grooved longitudinally, a cutting mechanism, a series of bars and pins therein, a head to which said bars are connected, a blade also attached to said head and arranged over and between the feeding-cylinder and cutting mechanism to operate upon grains standing on end in the grooves, and means to rotate said cylinder and feeding mechanism and reciprocate said bars and blade.

6. The combination, with the hopper and feeding-cylinder, of a blade arranged over the feeding-cylinder next its discharge side, means to reciprocate it, a pressure-board over the same, and temper-screws to hold the board down on the blade, substantially as shown and described.

7. The combination and arrangement, substantially as shown and described, of the framing, a driving-shaft on the same, a hopper, a longitudinally and circumferentially grooved feeding-cylinder, a shaft carrying circular cutters separated by non-rotating cutter-clearing washers, a shaft carrying a series of circular toothed plates, a grating or series of grain-distributing bars, and a blade arranged over the feeding-cylinder, a cam on the cylinder-shaft, gearing connecting said shaft and the driving-shaft, and the series of worms and worm-wheels connecting the shafts of the cutting and clearing shafts with the cylinder-shaft.

297,524. WHEEL CULTIVATOR OR HARROW. CHARLES LA DOW, Albany, N. Y. Filed Nov. 7, 1879.

Claim.—1. The combination, substantially as hereinbefore set forth, of a disk-gang shaft, a spool enveloping the shaft, a sleeve enveloping the spool, and provided with a spherical bearing, and a correspondingly-shaped socket in the boxing connected with the main frame.

2. The combination, substantially as hereinbefore set forth, of the disk-gang shaft, the sectional ball loosely mounted thereon, and its socket.

3. The combination, substantially as hereinbefore set forth, of the disk-gang shaft, the sleeve thereon, its hemispherical head, and the hemispherical section loose on the sleeve.

4. The combination, substantially as hereinbefore set forth, of the disk-gang shaft, the sectional ball thereon, the socket therefor, the recess therein, and the pin (on the section of the ball next the socket-opening) working in said recess to prevent said section from turning, while permitting the ball to rock.

5. The combination, substantially as hereinbefore set forth, of a disk-gang shaft, disks mounted thereon, spacing-thimbles interposed between the disks, a sleeve on the inner end of the disk-gang shaft having a hemispherical enlargement upon its end, a hemispherical collar loosely mounted on the sleeve, said hemispherical enlargement and collar forming a sectional ball, a socket for the said ball, a pin on the hemispherical collar working in a recess in the socket, and a clamp-nut upon the outer end of the axle.

6. The combination, substantially as hereinbefore set forth, of a disk-gang, a scraper-bar, scrapers mounted thereon, and supporting-bars pivoted on the spacing-thimbles and scraper-bar.

7. The combination, substantially as set forth, of a disk-gang, a scraper-bar, scrapers mounted thereon, supporting-bars pivoted on the spacing-thimbles and scraper-bar, a lever on the frame for actuating the scraper-bar, and a connection between the lever and the bar.

8. The combination, substantially as hereinbefore set forth, of the main frame, the disk-gangs, the scraper-bars, the pivoted supports between the spacing-thimbles and scraper-bars, the pivoted supports between the scraper-bars and main frame, scrapers, a rocking lever, and link-connections between the rocking lever and scraper-bars.

9. The combination, substantially as hereinbefore set forth, of a main frame, a disk-gang consisting of concave disks mounted on an axle, mechanism for adjusting the disk-gang relatively to the line of draft, and a weight-box mounted on the disk-gang and adjustable with it.

10. The combination, substantially as hereinbefore set forth, of a frame, disk-gangs composed of concavo-convex disks mounted on axles, weight-boxes mounted above the disk-gangs, and a lever whereby the angle of the gangs and weight-boxes relatively to the line of draft may be varied and a uniform depth of cut of the disks secured.

11. The combination, substantially as hereinbefore set forth, of a main frame, a disk-gang, a scraper-bar and weight-box mounted on pivoted supports above said disk-gang, so as to be free to vibrate laterally, a stop to limit said vibrations, and scrapers mounted upon the scraper-bar, whereby the scrapers are caused to approach and recede from the disks (to clear them of clogging matter) by the jostling of the machine.

12. The combination of the main frame, a disk-gang, mechanism for adjusting the gang relatively to the line of the draft, a weight support or beam mounted over and carried by the gang, draft-connections extending from the frame to the gang, which permit the adjustment of the gang, and a brace extending from the frame to the weight support or beam.

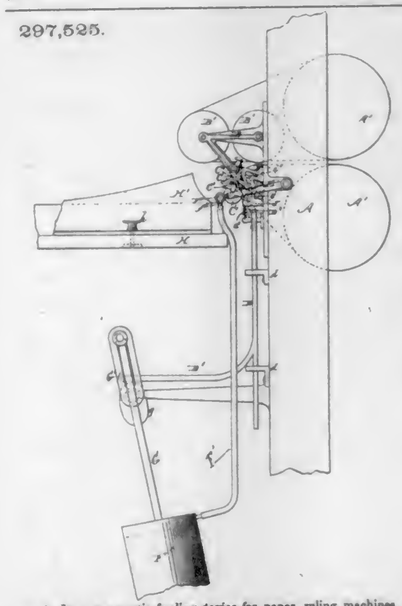
13. The combination of the main frame, a disk-gang, a weight support or beam mounted over and carried by the gang, and the bifurcated connection $H' H^2$, extending from said beam to the frame.

14. The combination, substantially as hereinbefore set forth, of a main frame, disk-gangs flexibly connected at their inner ends, and also connected to the main frame, a lever, a bar connecting the lever and the flexible connection, and a guide-plate in which said bar works endwise.

15. The combination of the main frame, the endwise-moving draw-bar *a*, the slotted guide-plate, and the disk-gangs, for the purpose set forth.

16. In a harrow, the combination of a pole, a cross-bar projecting laterally therefrom, disk-gangs hinged to the cross-bar, a lever on the pole, a bar connecting the lever to the disk-gangs, and a guide, between the prongs of which the bar is thrust back and forth by the action of the lever.

17. In a harrow, the combination of a pole, a draft-frame or cross-bar, disk-gangs connected to the frame, a lever on the pole in front of the cross-bar, a bar connecting the lever and the disk-gangs, and a guide located between the gangs and lever to regulate the motion of the bar.



18. The combination, substantially as hereinbefore set forth, of the main frame, disk-gangs connected to the frame by draft-connections, which leave the ends of the gangs free to vibrate vertically and horizontally, and stops or braces secured upon the main frame, applied at said draft-connections to prevent them from rising, and to relieve the draft-bars from vertical strain.

19. A seat-supporting standard composed of sheet metal of concavo-convex form in cross-section, and tapering from its base to its top, substantially as described.

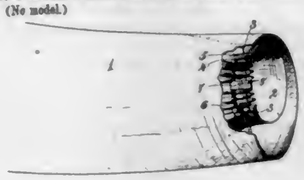
297,525. FEEDING DEVICE FOR RULING-MACHINES. EMIL LARSON and OSCAR HAMMARLUND, Chicago, Ill., assignors of one-third to Nils F. Olson, same place. Filed Jan. 26, 1883. (No model.)

Claim.—1. In a pneumatic feeding device for paper-ruling machines, a vacuum-tube supported by telescopic arms adapted to be advanced or retracted, as described, in combination with spring-actuated pivoted arms provided with angular projections, whereby when these arms are thrown up the tube is forced suddenly back and freed from the paper, substantially as shown and described.

297,525.

2. In a pneumatic feeding device for paper-ruling machines, the combination of a vacuum-tube adapted to detach and lift a sheet of paper from the pile with a spring-actuated roller provided with angular projections, adapted at the proper times to be thrown upward, releasing the tube from the sheet and carrying it up to the feeding-rollers, substantially as described and shown.

3. In a pneumatic feeding device for paper-ruling machines, the vacuum-tube F, supported in the ends of the pivoted telescopic arms E E', provided with projecting spring *e*, slot e^2, and pin e', in combination with a plate, I, secured to the frame and formed with the angular guide-slot i i', substantially as and for the purpose set forth.



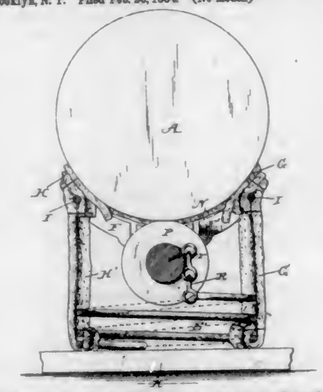
4. In a pneumatic feeding device for paper-ruling machines, a series of continually-revolving feed-rollers, B' B^2, journaled in a frame or casting secured to the main frame of the ruling-machine, in combination with a vacuum-tube, F, and a spring-actuated roller, C', the first adapted to lift the sheet from the pile and the latter to press it against the feed-rollers, substantially as and for the purpose set forth.

5. In a pneumatic feeding device for paper-ruling machines, the combination of the roller C', journaled in spring-actuated pivoted arms C, provided with a pin, c^3, with a retaining-catch, C^2, and the rod D, adapted to slide vertically, and provided with a retracting-hook, D^4, substantially as and for the purpose set forth.

6. In a pneumatic feeding device for paper-ruling machines, the shaft G^2, provided with a cam, *g*, and slotted crank G', connected to the piston of the air-pump, and the vertically-sliding operating-rod D, in combination with the vacuum-tube F, and feeding-roller C', substantially as and for the purpose set forth.

7. A pneumatic feeding device for paper-ruling machines, consisting, essentially, of a vacuum-tube flexibly connected to an air-pump, and supported in pivoted telescopic arms thrown in and out by a projecting pin working in a guide-slot, a pivoted spring-actuated roller, a sliding operating-rod, and a cam upon a driving-shaft, provided with a crank connected to the pump, all combined, constructed, and arranged to operate substantially as and for the purpose set forth.

297,526. GARMENT-SLEEVE. SALOMON LOESCH, New York, N. Y., assignor of one-half to David Heineman, Gloucester, Mass. Filed Jan. 24, 1884. (No model.)



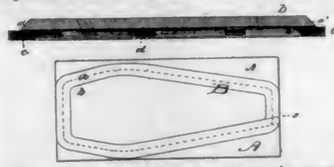
Claim.—1. A garment-sleeve having at or near its outer extremity two attached separated flaps provided with orifices, and a cord or tape passing through the said orifices for bringing the flaps toward each other and contracting the wrist-opening, substantially as described.

2. A garment-sleeve having at or near its outer extremity two separated flaps attached at one edge and free at the other, and connected by an adjustable cord or tape for bringing the flaps toward each other to shirr that part of the sleeve end between the flaps and leave the remaining portion smooth and plain, substantially as described.

3. A garment-sleeve provided at or near its outer extremity with two separated flaps, each provided with orifices, and a cord or tape passed through the said orifices and its ends brought together upon one of the flaps for drawing the flaps together to shirr that part of the sleeve end between the flaps, leaving the remaining portion of the sleeve end smooth and plain, substantially as described.

4. A garment-sleeve provided with two separated attached flaps, guide-loops intermediate the flaps, and a cord connecting the flaps and passing through the intermediate guide-loops for contracting the wrist-opening, substantially as described.

297,527. CAR-AXLE LUBRICATOR. WILLIAM GEORGE MITCHELL, Brooklyn, N. Y. Filed Feb. 20, 1884. (No model.)



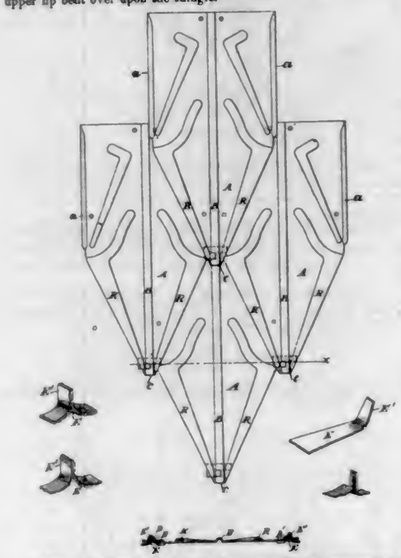
Claim.—1. In a journal-lubricator, a roller or spool provided with a chain or jointed beater, R, attached, to rotate with it as a beater.

2. In a journal-lubricator, a roller or spool provided with a metal chain, R, attached thereto at one point, as shown.

3. In a journal-lubricator, a roller or spool provided with a chain or jointed beater, R, combined with wipers G H, and with a spring-supporting frame.

297,528. COFFIN LID OR COVER AND PROCESS OF MAKING THE SAME. BENJAMIN MORRIS, Newark, N. J. Filed Feb. 16, 1884. (No model.)

Brief.—A center is cut out from a board, so that the inner edge of the band and the outer edge of the center are reciprocally beveled, said center being removed and secured upon the opposite side of said board, keeping the same faces of the parts uppermost.

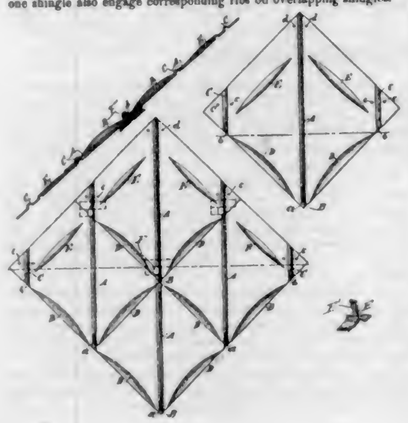


Claim.—1. The method of manufacturing wooden covers, to wit: cutting out a center from a board with an inclined saw, removing said center and securing it upon the opposite side of said board from that from which said center was withdrawn, keeping the same faces of said parts uppermost, substantially as set forth.

2. The method of manufacturing lids or covers for coffins, to wit: cutting the blank from the board, then cutting out a center from said blank with an inclined saw so that the inner edge of the band thus formed and the outer edge of said center will be reciprocally beveled, then removing said center from its band and securing it upon the opposite side of said band from that from which it was withdrawn, all substantially as herein set forth.

297,529. METALLIC ROOFING-SHINGLE. JOHN MOTT, New York, N. Y., assignor to the Anglo American Roofing Company, same place. Filed Sept. 22, 1883. (No model.)

Brief.—The point of the shingle is provided with a slot, through which projects an attaching-clasp having an underlying portion, and an upper lip bent over upon the shingle.



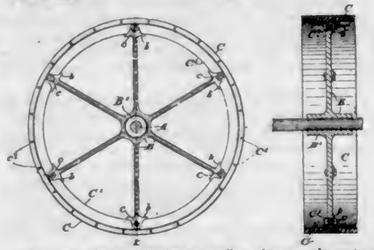
Claim.—1. A metallic shingle of substantially the construction described, having a longitudinal slit in its point adapted to pass over the upwardly-projecting lip of an attaching-clasp, as set forth.

2. The combination, with metallic shingles each having a longitudinal slit in its point, of attaching-clasps E, each having an upwardly-projecting lip, E', as and for the purpose described.

3. Metallic shingles of substantially the construction described, having a longitudinal slit in the points, in combination with clasps having a body adapted to fit under either one or both underlying shingles, and an upwardly-projecting lip adapted to pass through said longitudinal slit and be bent over on the shingle, whereby the point of the shingle is securely held in place, as set forth.

297,530. METALLIC SHINGLE. JOHN MOTT, New York, N. Y. Filed Oct. 24, 1883. (No model.)

Brief.—Shingles are connected by an attaching-clasp having an underlying portion and a lip passing up through a slot in the lower portion of a rib at the sides and center and bent over. Inclined ribs on one shingle also engage corresponding ribs on overlapping shingles.

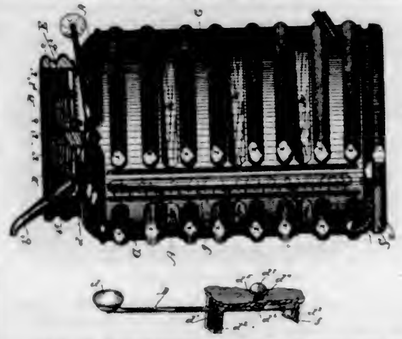


Claim.—1. A metallic roofing-shingle, substantially such as described, provided at its lower end, and just above the point, with a longitudinal slit, *a*, and at its parallel corners with longitudinal slots *b b*, as and for the purposes set forth.

2. Metallic shingles of substantially the construction described, having a longitudinal slit in the points and longitudinal slots in the opposite corners, in combination with an attaching-clasp having a body adapted to fit under the underlying shingles in the course next below, and an upwardly-projecting lip adapted to pass through said longitudinal slots and slit and be bent over onto the overlapping shingle, as and for the purposes set forth.

3. Metallic shingles each having a rib, A, provided with a longitudinal slit, *a*, ribs C C parallel to each other and to the rib A, and each provided with a longitudinal slot, *b*, at their lower ends, and ribs D E, whereby diamond-shaped shingles may be formed out of square pieces of sheet metal, and are adapted when combined with attaching-clasps to form a roofing, as set forth.

297,531. PULLEY. HORATIO C. NEWCOMER, Indianapolis, Ind., assignor of one-half to William E. Rockwood, same place. Filed Dec. 18, 1883. (No model.)



Claim.—1. The combination, in a pulley, of a paper rim and a cast-metal spider, the ends of the arms whereof are extended to form bearings by which the rim is supported, substantially as shown and specified.

2. The combination of a metal spider, the outer ends of the arms of which are enlarged, and a paper rim having an internal rib or flange against which the said enlarged ends fit, and to which they are secured, substantially as set forth.

3. The combination of the metal spider B, having enlarged ends or bearing-plates *b* on its arms, the paper rim C, having rib or flange C', and the bolts or rivets *c*, by which said rib and said arms are secured together, the whole forming a pulley, substantially as shown and described, and for the purposes specified.

297,532. VESSEL FOR CONTAINING AND TRANSPORTING LIQUIDS. DANIEL W. NORRIS, Elgin, Ill. Filed Feb. 15, 1884. (No model.)

Claim.—1. As a new article of manufacture, an incased vessel having a glass body and a top composed of a single piece of sheet metal shaped to form the cover for the mouth of the body, and also the internal and external annular flanges, between which the upper portion of the body is placed in attaching the top to the body, and provided with a filling-orifice and a pouring-spout, and secured to the body by a cemented screw-connection, substantially as described.

2. In combination with the glass body, the top composed of a single piece of sheet metal, forming a cover for the mouth of the body, the in-

ternal and external annular flanges having the groove between them, and provided with a filling-orifice and a pouring-spout, substantially as described.

3. The top composed of a single piece of sheet metal, forming the cover for the mouth of the body, and also the internal and external annular flanges, in combination with the supplemental internal annular flange and the glass body, substantially as described.

4. The top composed of a single piece of sheet metal, forming the cover for the mouth of the body and the external annular flange, in combination with the supplemental internal annular flange having its upper edge turned outward, and the glass body, substantially as described.

5. A sheet-metal top provided with an internal annular flange and an external annular screw-threaded flange, in combination with the body of a glass vessel having a screw-threaded upper portion, substantially as described.

6. The funnel-shaped sheet-metal top provided with a filling-orifice and a pouring-spout, substantially as described.

7. A can having a funnel-shaped sheet-metal top, which is provided with a filling-orifice at its lowest portion and a pouring-spout near its upper portion, substantially as described.

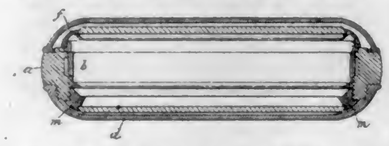
8. A can having a funnel-shaped sheet-metal top, which is provided with a filling-orifice and with a pouring-spout, substantially as described.

9. The combination, with a vessel having a pouring-orifice, of a spring-supported bar or lever carrying a pad or stopper at its outer end for closing the pouring-orifice, and means for first pressing the inner end of the lever to a fulcrum or bearing, and then causing it to turn on said bearing and release the pad from the pouring-orifice, substantially as described.

10. The combination, with a vessel having a pouring-orifice and a vent, of a spring-supported bar or lever carrying a pad or stopper at its outer end for closing the pouring-orifice, and a valved plunger adapted, when pressed, to open the vent, force the inner end of the lever to its fulcrum or bearing, and then cause the lever to turn on said bearing and release the pad from the pouring-orifice, substantially as described.

11. The combination, with a pouring-orifice, of the spring-supported lever having the pad or stopper at its outer end, of the loop constituting the fulcrum or bearing for the inner end of the lever, and of the plunger for operating the lever, substantially as described.

12. The combination, with the pouring-orifice, of the lever having the pad or stopper, the guide-loop and its spring, the inner loop or fulcrum, and the plunger, substantially as described.

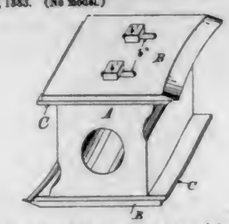


13. The combination, with the pouring-orifice and the vent, of the lever and its pad, the guide-loop and spring, the inner loop forming the fulcrum of the lever, and the valved plunger working in the vent-opening, substantially as described.

14. A sheet-metal can-top provided with a pouring-orifice and a vent, and having the spring-seated lever provided with the pad, the fulcrum for the inner end of the lever, and the valved plunger for operating the lever, substantially as described.

15. A glass vessel, in combination with a sheet-metal inclosing-case having one or more elongated longitudinal openings showing one or more of the principal units of measure, and one or more elongated vertical openings provided with a scale showing the minor units of measure, substantially as described.

16. A sheet-metal case having one or more elongated horizontal openings showing one or more of the principal units of measure, and one or more elongated vertical openings provided with a scale showing the minor units of measure, substantially as described.

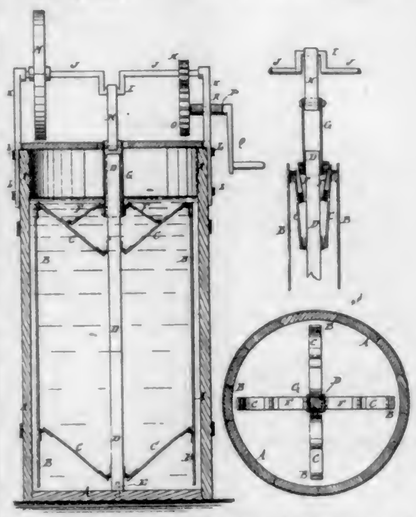


297,533. WATCH-CASE. DANIEL O'HARA, Waltham, assignor to Robbins & Appleton, Boston, Mass. Filed Dec. 1, 1883. (No model.)

Claim.—1. The combination, in a watch-case, of the case-center having an internally-threaded portion, and an external or outer back, *d*, the movement-holding ring screwed into said threaded portion, and the back cap or bezel *m*, screwed to the case-center, and serving as an additional protection for the back of the movement, the case-center or the ring being provided with a front bezel protecting the front of the movement, as set forth.

2. The combination, in a watch-case, of the case-center having an internally-threaded portion, 2, and an external or outer back, the movement-holding ring, and the back cap or bezel, both externally threaded and screwed into the threaded portion of the center, said portion being suitably widened to receive the ring and back cap, as set forth.

297,534. CUTTER-HEAD. MICHAEL S. O'NEIL, Rock Island, Ill. Filed Nov. 23, 1883. (No model.)

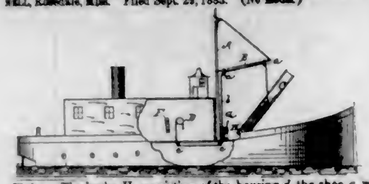


Claim.—1. A beveled or ovaled cap of steel, iron, or other suitable material applied between the knife and cutter-head of a rotating or revolving cutter, with the pointed portions of each together, as and for the purpose described.

2. The combination of the cutter-head, the cutter-knives with slots and bolts, and beveled or ovaled caps having slots corresponding to the slots in the knives, substantially as described, and for the purpose specified.

3. The combination of the cutter-head, the cutter-knives, and bolts by which they are secured with beveled or ovaled caps or plates, substantially as described, and for the purpose specified.

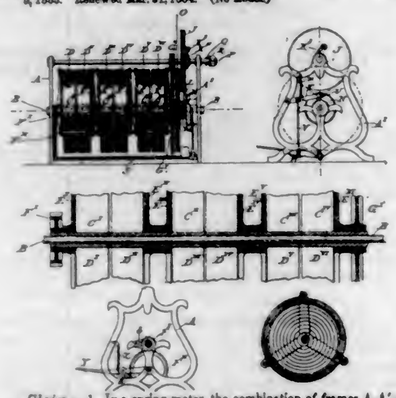
297,535. CHURN. ANSON MELVIN OTIS, York, Nebr. Filed Sept. 23, 1883. (No model.)



Claim.—1. A churn constructed substantially as herein shown and described, and consisting of a churn-body having a center screw at its bottom, and a stationary shaft provided with a radially expanding and contracting dasher connected by hinged bars, a sliding tube, a hinged connection attached to said tube and dasher, and a pitman with a driving mechanism, as set forth.

2. In a churn, the combination, with the churn-body A, having a screw, E, attached to its bottom, of the stationary shaft D and the hinged paddles B C, provided with connecting-bars F, a sliding tube, G, and a pitman for connecting the said dasher with a driving mechanism, substantially as herein shown and described, whereby the churning will be done by the successive expansion and contraction of the said dasher, as set forth.

3. In a churn, the combination, with the churn-body A, the radially expanding and contracting dasher B C D, and the bars, tube, and pitman F G H, of the crank-shaft J, the gear-wheels N O, and the crank Q, substantially as herein shown and described, whereby the said dasher can be readily and rapidly expanded and contracted, as set forth.



4. In a churn, the dasher constructed substantially as herein shown and described, and consisting of the stationary shaft D, the radial hinged paddles C, and the upright hinged paddles B, as set forth.

297,536. HOISTING DEVICE FOR VESSELS. RICHARD HOYT PURNELL, Rosedale, Miss. Filed Sept. 29, 1883. (No model.)

Claim.—The brake H, consisting of the housing *d*, the shoe *g*, with yoke *i*, sliding in grooves in the housing, and the lever *h*, fulcrumed in the housing, and having its lower end loosely inserted in the yoke of the shoe, in combination with the mast A, boom B, and rope *b*, swung from pulleys on said boom, as and for the purpose described.

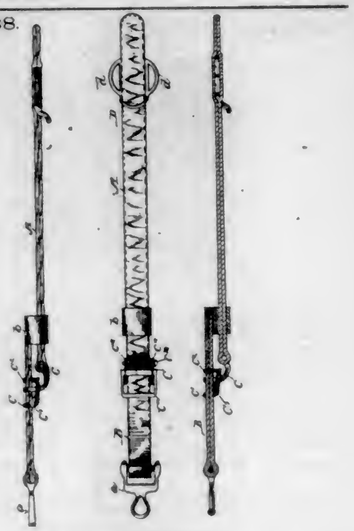
297,537. MOTOR. HERMANN ROSTER, Philadelphia, Pa. Filed June 5, 1883. Renewed Mar. 31, 1884. (No model.)

Claim.—1. In a spring-motor, the combination of frames A A', a longitudinal shaft, B B, a spur-wheel, F', a retaining-pawl, *b*, a series of hollow sleeve-shafts, C' C'' C''' C'', a number of shields and stays, E' E'' E''' E'' E'' E'', a spur-wheel, G, a spur-wheel, G'', a shaft, H, a pulley, J, a retaining-pawl, K', and ratchet-wheel K'', pulleys M' and M'', and a rope or band, L, substantially as described above.

2. In a spring-motor, the combination of a treadle, Y, retaining-pawl *a*, spur-wheels F'' F', retaining-pawl *b*, sleeve-shaft C' and longitudinal shaft B B, and the two frames A A', substantially as described above.

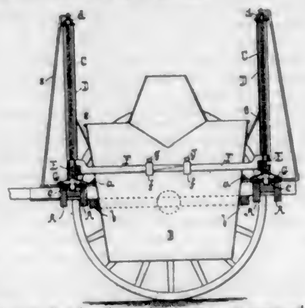
3. In a spring-motor, the combination of the two frames A A', a shaft, H, a pin, Q, a square piece, R, a washer, P, a pulley, J, a retaining-pawl, K', a ratchet-wheel, K'', spur-wheels G' and G'', a shaft, B B, a series of hollow sleeve-shafts, C'' C''' C'' C', a series of springs, D'' D' D'' D''' D'' D'', a number of shields and stays, E'' E'' E'' E''' E'' E', a spur-wheel, F', and a retaining-pawl, *b*.

4. In a spring-motor, the combination of a treadle, W, a link, V, a spring-lever, T, a sliding block, U, a spring, *d*, a spring, X, a circular disk, N, pulleys M', M'', and J, a rope or band, L, a shaft, H, spur-wheels G' G'', a shaft, B B, and a sleeve-shaft, C'', &c., substantially as set forth.



5. In a spring-motor, the combination of two frames, A A', the treadle Y, retaining-pawl *a*, spring Z, wheels F'' F', retaining-pawl *b*, shaft B B, sleeve-shafts C' C'' C''' C'', shields E' and E'' E''' E'' E' E'', springs D' D'' D''' D'' D' D'', spur-wheels G' G'', shaft H, pin Q, piece R, washer P, pulley J, retaining-pawl K', ratchet-wheel K'', pulleys M' M'', bands L and O, circular disk N, sliding block U, spring-lever T, spring X, link V, and treadle W, substantially as described.

297,538. HAME-TUG AND TRACE. GEO. RUFF, Monroe City, Mo. Filed Jan. 10, 1884. (No model.)



Claim.—1. The combination, with a trace and a tug arranged at the rear end of the trace, of the two-part or framed buckle, one having a portion of its surface at a right angle to the other portion, and connected to the rear or inner end of the trace, and the other part or frame interlocking with the former frame or part, and having a tongue projecting from its forward cross-bar, substantially as and for the purpose set forth.

2. The combination of the tug B, having loops *a* and *b*, trace A, having loop-frame D, and the buckle E, having interlocking parts or frames C and C', substantially as shown, and for the purpose described.

297,538. [illegible]

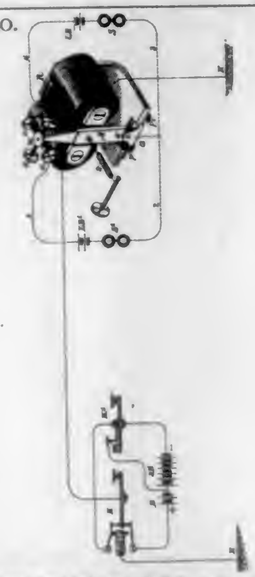
297,539. DUMPING COAL-CART. WILLIAM S. SHOEMAKER, Baltimore, Md. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a dumping coal-cart, a wheeled frame with an opening therein, a hopper located within and projecting through the said wheeled frame, combined with screws to elevate the said hopper, substantially as described.

2. In a dumping coal-cart, a wheeled frame having an opening therein, a hopper suspended within the said opening, a flange on the hopper to limit its depression within the said opening, and means to elevate the said hopper, all combined substantially as specified.

3. As means for elevating the hopper of a dumping coal-cart, a pair of vertical screws, nuts on the said screws, a bar which passes loosely through the hopper, with its ends resting on the said nuts, and means to revolve the said screws, all combined substantially as specified.

4. In combination with the screws C, nuts E, and the box F, the slotted tubes D, having bearings for the upper ends of the said screws, substantially as specified.



297,540. DIPLEX OR QUADRUPLEX TELEGRAPH. GERRITT SMITH, Astoria, N. Y. Filed July 7, 1883. (No model.)

Claim.—1. An electro-magnetic receiving-instrument having a single armature pivoted upon a universal joint, and capable of taking four contact positions, respectively, located in different radial planes with respect to the central position of the armature and against contact-points.

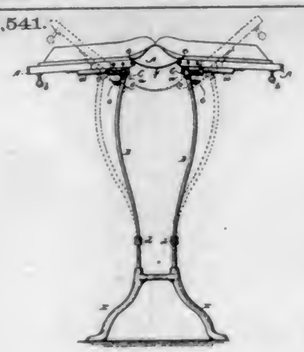
2. An electro-magnetic receiving-instrument responsive to variations in the polarity and in the strength of line-current, either or both, provided with one armature which is pivoted upon a universal joint, and in connection with two local circuits, and four fixed stops so located as to circumscribe the movements of said armature, substantially as described.

3. An electro-magnetic receiving-instrument responsive to varia-

297,540.

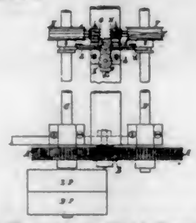
tions in the polarity and in the strength of line-current, either or both provided with one armature capable of taking four positions, and pivoted upon a universal joint, substantially as described.

4. An electro-magnetic receiving-instrument responsive to variations in the polarity and in the strength of line-current, either or both, having one armature upon a universal joint provided with three working-contacts and one resting-contact.



5. A receiving-instrument responsive to changes in the polarity and in the strength of main-line current, either or both, having one armature, and a rotating local-circuit contact-point, in combination with a main battery or batteries, and two keys or transmitters, one of which transmitters controls the polarity of the line-current and the other the strength of line-current.

6. A receiving-instrument responsive to changes in the polarity and in the strength of line-current, either or both, having one armature, and a rotating local-circuit contact-point, in combination with means for generating an electric current, and two keys or transmitters, one of which—say the first—when operated controls the strength of main-line current, the polarity of which is varied by the operation of the second key or transmitter.

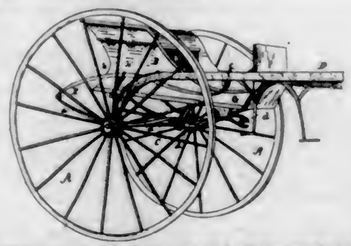


7. In a duplex-telegraph relay, the combination of an armature-bar, and a series of contact-stops surrounding said armature, two of which stops, respectively, form the poles of two local circuits, the whole being arranged, as shown, whereby the resultant of the movement of the armature upon the cessation of magnetism due to a current reversal and the movement of the armature due to the direct action of the reversed current shall be in direction toward the contact for making the desired signal, and away from the contact by which, if connection were made therewith, a false signal would be caused.

8. The receiving-instrument, R, having armature A, disk *w*, and stops *a b c d*, with their local-circuit connections, substantially as described.

297,541.

297,542. MACHINERY FOR STRETCHING AND SMOOTHING SEWING-THREAD. JOSEPH E. TYNAN, Paterson, N. J. Filed Mar. 19, 1883. (No model.)

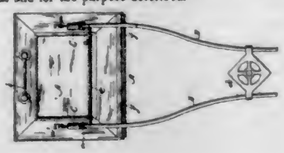


Claim.—1. The combination of the feeding wheel or roller F, drawing wheel or roller E, their shafts and operative gears, and the intermediate grooved guide-rollers, G and H, with the stop-motion arranged therewith, as set forth, and consisting of the clutches *a b a b*, furcated bar *d*, slider *e*, spring *h*, post *k*, roller K, standard *g*, and guide-roller I, all being arranged and adapted substantially as represented.

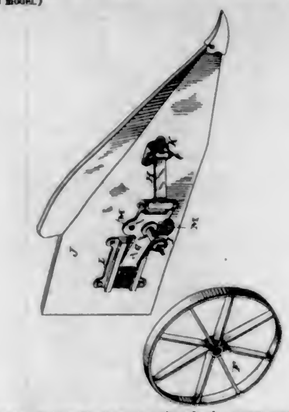
2. The stop-motion, substantially as described, consisting of the clutches *a b a b*, bar *d*, slider *e*, spring *h*, post *k*, roller K, standard *g*, and guide-roller I, arranged and combined essentially in manner to operate as and for the purpose set forth.

3. The combination of the stationary friction-abutments *s* with the feeding and drawing rollers or wheels, their shafts and operative gear and guide wheels, and stop-motion, as described, all being arranged, adapted, and to operate substantially as set forth.

297,543. TWO-WHEELED VEHICLE. WILLIS VANDERCOOK, Mason, Mich. Filed Aug. 8, 1883. (No model.)



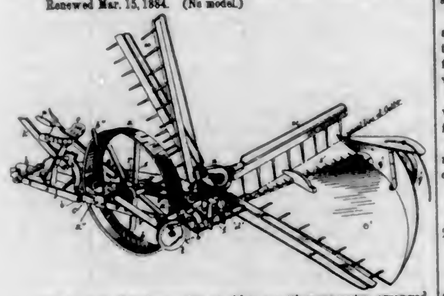
Claim.—1. A spring for two-wheeled vehicles, consisting of the side springs, E, having their top sections, *b*, connected to the shafts and their lower sections connected to the cross-spring F, and bar H, when constructed, arranged, and operating substantially as and for the purposes set forth.



2. In combination with the wheels A, axle C, body B, and shafts D, the springs E, having their top sections connected to the shafts and their lower sections connected to the cross-spring F, and cross-bar H, when constructed, arranged, and operating substantially as and for the purposes specified.

297,541. DICTIONARY-STAND. EDGAR D. SWAIN, Chicago, Ill. Filed Sept. 10, 1883. (No model.)

Claim.—The combination of the spring-rods B, and the sleeves C, pivoted to them and to the lids A, having the rods *a'* within said sleeves, substantially as and for the purpose described.

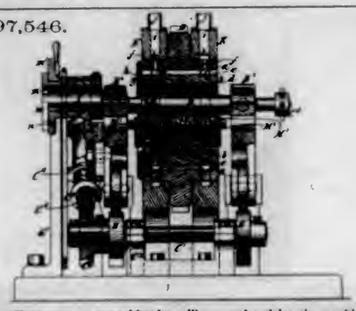


297,544. GRAIN-WHEEL FOR HARVESTERS. WILLIAM N. WHITELEY, Springfield, Ohio. Filed June 19, 1883. Renewed Mar. 15, 1884. (No model.)

Claim.—A knuckle-jointed grain-wheel support consisting of the jointed bars G H, the bar H being hinged to the divider, combined with the guide I, wherein the end of the bar G may slide, substantially as herein described, to permit the grain-wheel to automatically adjust itself into the plane of the tangent of the curve being described by the outer end of the machine.

297,545. HARVESTER. WILLIAM N. WHITELEY, Springfield, Ohio, assignor to Whiteley, Fraaler & Kelly, same place. Filed May 4, 1882. Renewed Mar. 15, 1884. (No model.)

Claim.—1. In a harvesting-machine, a cutting apparatus, arranged obliquely to the line of travel of the machine and actuated by one pair of bevel-gears, combined with a pivoted shaft and bearing, *u' v'*, box *y'*, track *s'*, having a cam-slot, *a''*, and a pivoted lever, *b''*, for the purpose specified.



2. In a harvesting-machine, a frame, *c*, bent and pivoted to the shoe *f* at *g*, in combination with an apertured suspension-piece, *b'*, connecting the parts *c* and *f*, so as to form a pivot upon which the platform may be tilted.

3. In a harvesting-machine, a frame, *c*, bent and pivoted to the shoe *f* at *g*, and an apertured suspension-piece, *b'*, connecting the parts *c f*, in combination with a drag-bar, *r*, substantially as described, and for the purpose of tilting the platform *c'*.

4. A main driving and supporting wheel provided with a bevel-gear ring located under its rim, with the teeth of the same facing outward, and a cutting apparatus set oblique to the line of advance, combined with an actuating crank-shaft at right angles with the cutting apparatus and in the plane of the main-wheel axis, and the pinion on its forward end in engagement with said gear-wheel, whereby said crank-shaft may pass the center of the wheel and its pinion engage with a gear-wheel sheltered beneath the rim of the main wheel.

297,546. MACHINE FOR ROLLING AXLES. SILAS H. WILSON, Brooklyn, N. Y., assignor, by direct and mesne assignments, to Robert H. Thompson and Elizabeth Wilson, same place, and Henry D. Norris, New York, N. Y. Filed Apr. 27, 1883. (No model.)

297,546.

Claim.—1. In a machine for rolling round articles, the combination of an annular or female roller, male rollers extending within the same, and means for rotating them so that their adjacent surfaces will move in the same direction, the operation of rolling being performed by the interior surface of the female roller acting in conjunction with the exterior surfaces of the male rollers, substantially as specified.

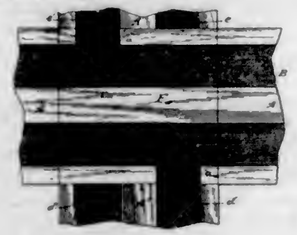
2. In a machine for rolling round articles, the combination of an annular or female roller, male rollers extending within the same, means for rotating the rollers, and mechanism for producing a movement of the male rollers toward the opposite portion of the female roller, substantially as specified.

3. In a machine for rolling round articles, the combination of an annular or female roller, male rollers extending within the same, a chuck for holding the metal to be rolled, means for rotating the rollers, and mechanism for moving the male rollers toward the opposite portion of the female roller and raising and lowering the chuck correspondingly, substantially as specified.

4. In a machine for rolling round articles, the combination of an annular or female roller, male rollers, a chuck for holding a bar of metal to be rolled, and means for rotating the said rollers and the said chuck, substantially as specified.

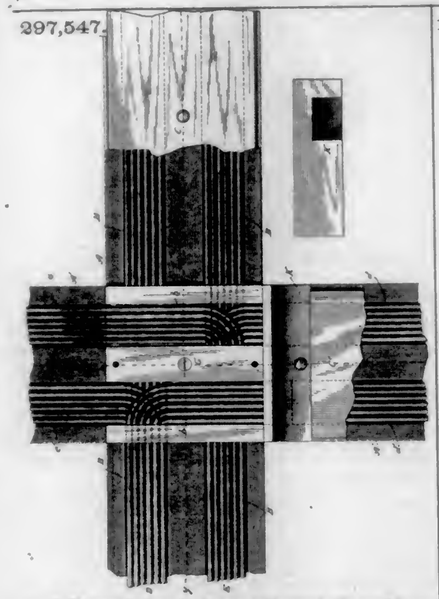
5. In a machine for rolling round articles, the combination of an annular or female roller, male rollers, supports for the journals of the latter admitting of the adjustment thereof at different angles, and means for forcing the male rollers toward the opposite surface of the female roller with the front end in advance of the rear end, substantially as specified.

6. The combination, with the annular or female roller A, provided with channels, of bearings therefor provided with channels, and means for supplying water to these channels, substantially as specified.



7. The combination, with the annular or female roller A and the male rollers B C, of a water-reservoir, and a roller rotating therein and in contact with the rollers B C, substantially as specified.

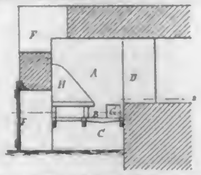
297,547. JUNCTION-BOX FOR ELECTRIC CIRCUITS. ALEXANDER P. WRIGHT, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 4, 1883. (No model.)



Brief.—Branch circuits are diverted from main circuits which are composed of a number of wires by cutting away the casing at the points where the branches diverge and inserting grooved supports, over which are led the branch wires, and whereby the main and branch conductors are separated.

Claim.—1. The combination, with the parallel conductors of an electric circuit, of a grooved holder for containing the main conductors, and a superposed grooved and perforated block for containing branches from the conductors and insulating the same, substantially as herein set forth.

2. The combination, with the parallel conductors of an electric circuit, of the block F, containing grooves and notches, and the superposed block G, containing transverse grooves and perforations, these parts being constructed and combined for forming a branch circuit or circuits in substantially the manner described.



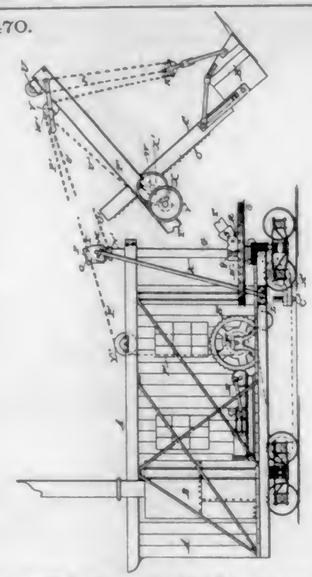
297,547.

3. The combination, with the grooved holders for the parallel conductors of a main and branch electric circuits, of a section, as F, having notches *a*, the block G, having transverse grooves, as *b*, and perforations, and a block or cover, all substantially as set forth.

4. The combination, with the grooved holders A and A′ and conductors composed of a number of wires, of a section, as F, with notches *a*, a block, as G, with transverse grooves and perforations for bending one or more wires from the section F over the block, and a cover for concealing and protecting the wires, all as set forth.

297,548. FIRE-GRATE. GEORGES ALEXIS-GODILLOT, Paris, France. Filed Jan. 15, 1884. (No model.)

Claim.—1. In a furnace, a fire-bed, H, constructed in the form of a semi dome, bell, cone, or pyramid, substantially as shown, and set with its back or vertical side against the wall of the furnace, and said fire-bed arranged with relation to the flue D, as shown, and adapted to operate substantially as set forth.



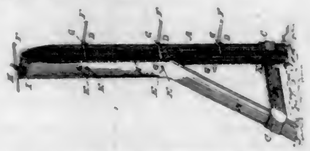
2. The combination, with a furnace-chamber constructed, as shown, with a charging-opening at its upper part, of the fire-bed H, of the form shown and described, set with its back or vertical face against the furnace-wall, and arranged with relation to the flue D, as shown, and the horizontal grate B, all arranged substantially as set forth.

REISSUES.

10,470. TRAVELING CRANE. HENRY M. BARNHART and EDWARD HUBER, Marion, Ohio. Filed Jan. 11, 1884. Original No. 285,100, dated Sept. 18, 1883.

Claim.—1. In a crane of the described class, the combination of a single hoisting-shaft, F, running in one direction, whether the load is to be raised or lowered, the chain-drums F′, journaled loosely upon the same shaft, and the clutch mechanism for coupling the drums to the shaft, whereby the crane-post may be turned right or left without reversing the shaft, substantially as and for the purpose shown and set forth.

10,470.



2. The mast G, provided with a head, I, having a recess, N, in its top, in which are journaled the sheaves P and sockets J′, adapted to receive the ends of the braces K, as and for the purpose shown and set forth.

3. The head I, having a recess, N, in its top, in which are journaled the sheaves P and sockets J and J′ J′, adapted to receive the head of the mast G and the ends of the braces K, as set forth.

4. The combination of the swinging jack-beams A″ A″, provided with jack-screws C″ and rods B″, by which the jack-beams are secured in their adjusted position, as and for the purpose shown and set forth.

5. The combination of the shaft F, the engine for rotating the same, the drums F′, journaled loosely upon the shaft, near each of its ends, the friction-clutches K′, the levers for operating said clutches, the chain G′, passing around the turn-table H, and secured at either end to the sliding drums F′, turn-table H, adapted to be rotated by the chain G′, hoisting-drum E′, loosely journaled upon the shaft F at its central part, friction-clutch M′, the lever for operating the clutch, hoisting-chain P′, mast G, pivoted to the turn-table, near its center, and provided with a head, I, and collar N′, loosely secured upon the mast G, below the head, and connected to the upper end of the crane T by a chain, O′, all constructed and combined as and for the purpose shown and described.

10,471. FENCE-POST. FANNIE S. SMITH, Topeka, Kans., assignor, by direct and mesne assignments, to H. THOMAS and W. F. THOMAS, same place, and L. C. LAURENT, Shawnee County, Kans. Filed Feb. 29, 1884. Original No. 292,141, dated Jan. 15, 1884.

Claim.—1. A metallic fence-post consisting of the standard formed by the parts A and A′ in one piece, disposed at right angles to each other, and having holes K E I, and notches D, connecting-brace B, and wire-ties C G H, all constructed and combined substantially as and for the purpose shown and described.

2. As an improved article of manufacture, a metallic fence-post formed of a single bar or strap bent at the point constituting the top of the post and doubled, one part having a quarter-turn, and the two parts being in contact and secured together to form the post-body, but being separated below so that the two may enter the ground apart from each other, thus forming a broad base for the post, the said two separated lower parts being tied or stayed by a horizontal brace, all substantially as set forth.

N. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

THE BURROW-GILES LITHOGRAPHIC COMPANY *v.* SARONY.

Decided March 17, 1884.

1. The object of section 4962 R. S. is to give notice of the copyright to the public by placing upon each copy in some visible shape the name of the author, the existence of the claim of exclusive right, and the date at which this right was obtained. This notice is sufficiently given by the words "Copyright, 1882, by N. Sarony," found on each copy of the photograph under consideration.
2. The construction placed upon the Constitution by the first act of 1790 and the act of 1802 by the men who were contemporary with its formation, many of whom were members of the convention which framed it, is of itself entitled to very great weight; and when it is remembered that the rights thus established have not been disputed during a period of nearly a century, it is almost conclusive.
3. An author in the sense in which the term is used in the Constitution is "he to whom anything owes its origin; originator; maker; one who completes a work of science or literature." So, also, by "writings" in this clause of the Constitution is meant the "literary productions" of those authors, and Congress has very properly declared these to include all forms of writing, printing, engraving, etching, &c., by which the ideas in the mind of the author are given visible expression.
4. No doubt entertained that the Constitution is broad enough to cover an act authorizing copyright of photographs so far as they are representatives of original intellectual conceptions of the author, and the facts being that the photograph in question was made entirely from the plaintiff's original mental conception, to which he gave visible form by posing the subject in front of the camera, selecting and arranging the costume, draperies, &c., arranging and disposing the light and shade, suggesting and evoking the desired expression, *Held* that the photograph in question is an original work of art, of which the plaintiff is the author, and of a class of inventions for which the Constitution intended that Congress should secure to him the exclusive right to use, publish, and sell, as it has done by section 4952 R. S.

IN ERROR to the Circuit Court of the United States for the Southern District of New York.

Mr. David Colman for the plaintiff in error.
Mr. Aug. T. Gurlitz for the defendant in error.

Mr. Justice MILLER delivered the opinion of the Court.

This is a writ of error to the Circuit Court for the Southern District of New York. Plaintiff is a lithographer, and defendant a photographer, with large business in those lines in the city of New York. The suit was commenced by an action at law in which Sarony was plaintiff and the Lithographic Company was defendant, the plaintiff charging the defendant with violating his copyright in regard to a photograph the title of which is "Oscar Wilde No. 18." A jury being waived, the court made a finding of facts on which a judgment in favor of the plaintiff was rendered for the sum of $600 for the plates and 85,000 copies sold and exposed to sale, and $10 for copies found in his possession, as penalties under section 4965 of the Revised Statutes.

Among the finding of facts made by the court the following presents the principal question raised by the assignment of errors in the case:

3. That the plaintiff, about the month of January, 1882, under an agreement with Oscar Wilde, became and was the author, inventor, designer, and proprietor of the photograph in suit, the title of which is "Oscar Wilde No. 18," being the number used to designate this particular photograph and of the negative thereof; that the same is a useful, new, harmonious, characteristic, and graceful picture, and that said plaintiff made the same at his place of business in said city of New York, and within the United States, entirely from his own original mental conception, to which he gave visible form by posing the said Oscar Wilde in front of the camera, selecting and arranging the costume, draperies, and other various accessories in said photograph, arranging the subject so as to present graceful outlines, arranging and disposing the light and shade, suggesting and evoking the desired expression, and from such disposition, arrangement, or representation, made entirely by the plaintiff, he produced the picture in suit, Exhibit A, April 14, 1882, and that the terms "author," "inventor," and "designer," as used in the art of photography and in the complaint, mean the person who so produced the photograph.

Other findings leave no doubt that plaintiff had taken all the steps required by the act of Congress to obtain copyright of this photograph, and section 4952 names photographs among other things for which the author, inventor, or designer may obtain copyright which is to secure him the sole privilege of reprinting, publishing, copying, and vending the same. That defendant is liable under that section and section 4965 there can be no question if those sections are valid as they relate to photographs. Accordingly, the two assignments of error in this court by plaintiff in error are, first, that the court below decided that Congress had and has the constitutional right to protect photographs and negatives thereof by copyright. The second assignment related to the sufficiency of the words "Copyright, 1882, by N. Sarony," in the photographs, as a notice of the copyright of Napoleon Sarony under the act of Congress on that subject. With regard to this latter question it is enough to say that the object of the statute is to give notice of the copyright to the public by placing upon each copy in some visible shape the name of the author, the existence of the claim of exclusive right, and the date at which this right was obtained. This notice is sufficiently given by the words "Copyright, 1882, by N. Sarony," found on each copy of the photograph. It clearly shows that a copyright is asserted, the date of which is 1882, and if the name Sarony alone was used it would be a sufficient designation of the author until it is shown that there is some other Sarony. When, in addition to this, the initial letter of the christian name Napoleon is also given, the notice is complete.

The constitutional question is not free from difficulty. The eighth section of the first article of the Constitution is the great repository of the powers of Congress, and by the eighth clause of that section Congress is authorized—

> To promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.

The argument here is that a photograph is not a writing nor the production of an author. Under the acts of Congress designed to give effect to this section the persons who are to be benefitted are divided into two classes, authors and inventors. The monopoly which is granted to the former is called a "copyright," that given to the latter, "letters-patent," or, in the familiar language of the present day, "patent-right." We have, then, copyright and patent-right, and it is the first of these under which plaintiff asserts a claim for relief.

It is insisted in argument that a photograph, being a reproduction on paper of the exact features of some natural object or of some person, is not a writing of which the producer is the author. Section 4952 of the Revised Statutes places photographs in the same class as things which may be copyrighted with "books, maps, charts, dramatic or musical compositions, engravings, cuts, prints, paintings, drawings, statues, statuary, and models or designs intended to be perfected as works of the fine arts." "According to the practice of legislation in England and America," says Judge Bouvier, (2 Law Dictionary, 363,) "the copyright is confined to the exclusive right secured to the author or proprietor of a writing or drawing which may be multiplied by the arts of printing in any of its branches."

The first Congress of the United States, sitting immediately after the formation of the Constitution, enacted that the—

> Author or authors of any map, chart, book or books, being a citizen or resident of the United States, shall have the sole right and liberty of printing, reprinting, publishing, and vending the same for the period of fourteen years from the recording of the title thereof in the clerk's office, as afterward directed. (1 U. S. S., 124, s. 1.)

This statute not only makes maps and charts subjects of copyright, but mentions them before books in the order of designation. The second section of an act to amend this act, approved April 29, 1802, (2 U. S. S., 171,) enacts that from the 1st day of January thereafter he who shall invent and design, engrave, etch, or work, or from his own works shall cause to be designed and engraved, etched, or worked, any historical or other print or prints, shall have the same exclusive right for the term of fourteen years from recording the title thereof as prescribed by law.

By the first section of the act of February 3, 1831, (4 U. S. S., 436,) entitled an act to amend the several acts respecting copyright, musical compositions, and cuts, in connection with prints and engravings, are added, and the period of protection is extended to twenty-eight years. The caption or title of this act uses the word copyright for the first time in the legislation of Congress.

The construction placed upon the Constitution by the first act of 1790 and the act of 1802 by the men who were contemporary with its formation, many of whom were members of the convention which framed it, is of itself entitled to very great weight; and when it is remembered that the rights thus established have not been disputed during a period of nearly a century, it is almost conclusive.

Unless, therefore, photographs can be distinguished in the classification on this point from the maps, charts, designs, engravings, etchings, cuts, and other prints, it is difficult to see why Congress cannot make them the subject of copyright as well as the others.

These statutes certainly answer the objection that books only, or writing in the limited sense of a book and its author, are within the constitutional provision. Both these words are susceptible of a more enlarged definition than this. An author in that sense is "he to whom anything owes its origin; originator; maker; one who completes a work of science or literature."—Worcester. So, also, no one would now claim that the word "writing" in this clause of the Constitution, though the only word used as to subjects in regard to which authors are to be secured, is limited to the actual script of the author, and excludes books and all other printed matter. By "writings" in that clause is meant the "literary productions" of those authors, and Congress very properly has declared these to include all forms of writing, printing, engraving, etching, &c., by which the ideas in the mind of the author are given visible expression. The only reason why photographs were not included in the extended list in the act of 1802 is probably that they did not exist, as photography as an art was then unknown, and the scientific principle on which it rests and the chemicals and machinery by which it is operated have all been discovered long since that statute was enacted. Nor is it to be supposed that the framers of the Constitution did not understand the nature of copyright and the objects to which it was commonly applied, for copyright, as the exclusive right of a man to the production of his own genius or intellect, existed in England at that time, and the contest in the English courts, finally decided by a very close vote in the House of Lords, whether the statute of 8 Anne, chapter 19, which authorized copyright for a limited time, was a restraint to that extent on the common law or not, was then recent. It had attracted much attention, as the judgment of the King's Bench, delivered by Lord Mansfield, holding it was not such a restraint in *Millar v. Taylor*, (4 Burrows, 2303,) decided in 1769, was overruled on appeal in the House of Lords in 1774. (Ibid., 2408.) In this and other cases the whole question of the exclusive right to literary and intellectual productions had been freely discussed.

We entertain no doubt that the Constitution is broad enough to cover an act authorizing copyright of photographs so far as they are representatives of original intellectual conceptions of the author. But it is said that an engraving, a painting, a print, does embody the intellectual conception of its author, in which there is novelty, invention, originality, and therefore comes within the purpose of the Constitution in securing its exclusive use or sale to its author, while a photograph is the mere mechanical reproduction of the physical features or outlines of some object animate or inanimate, and involves no originality of thought or any novelty in the intellectual operation connected with its visible reproduction in shape of a picture; that while the effect of light on the prepared plate may have been a discovery in the production of these pictures, and patents could properly be obtained for the combination of the chemicals, for their application to the paper

or other surface, for all the machinery by which the light reflected from the object was thrown on the prepared plate, and for all the improvements in this machinery and in the materials, the remainder of the process is merely mechanical, with no place for novelty, invention, or originality. It is simply the manual operation, by the use of these instruments and preparations, of transferring to the plate the visible representation of some existing object, the accuracy of this representation being its highest merit. This may be true in regard to the ordinary production of a photograph, and that in such case a copyright is no protection. On the question as thus stated we decide nothing. In regard, however, to the kindred subject of patents for invention, they cannot by law be issued to the inventor until the novelty, the utility, and the actual discovery or invention by the claimant have been established by proof before the Commissioner of Patents; and when he has secured such a patent, and undertakes to obtain redress for a violation of his right in a court of law, the question of invention, of novelty, of originality, is always open to examination. Our copyright system has no such provision for previous examination by a proper tribunal as to the originality of the book, map, or other matter offered for copyright. A deposit of two copies of the article or work with the Librarian of Congress, with the name of the author and its title-page, is all that is necessary to secure a copyright. It is, therefore, much more important that when the supposed author sues for a violation of his copyright the existence of those facts of originality, of intellectual production, of thought and conception on the part of the author should be proved than in the case of a patent-right. In the case before us we think this has been done.

The third finding of facts says, in regard to the photograph in question, that it is a

> Useful, new, harmonious, characteristic, and graceful picture, and that plaintiff made the same * * * entirely from his own original mental conception, to which he gave visible form by posing the said Oscar Wilde in front of the camera, selecting and arranging the costume, draperies, and other various accessories in said photograph, arranging the subject so as to present graceful outlines, arranging and disposing the light and shade, suggesting and evoking the desired expression, and from such disposition, arrangement, or representation, made entirely by plaintiff, he produced the picture in suit. * * *

These findings, we think, show this photograph to be an original work of art, the product of plaintiff's intellectual invention, of which plaintiff is the author, and of a class of inventions for which the Constitution intended that Congress should secure to him the exclusive right to use, publish, and sell, as it has done by section 4952 of the Revised Statutes.

The question here presented is one of first impression under our Constitution, but an instructive case of the same class is that of *Nottage v. Jackson*, (11 Queen's Bench Division, 627,) decided in that court on appeal August, 1883.

The first section of the act of 25 and 26 Victoria, chapter 68, authorizes the author of a photograph, upon making registry of it under the copyright act of 1862, to have a monopoly of its reproduction and multiplication during the life of the author.

The plaintiffs in that case described themselves as the authors of the photograph which was pirated in the registration of it. It appeared that they had arranged with the captain of the Australian cricketers to take a photograph of the whole team in a group, and they sent one of the artists in their employ from London to some country town to do it.

The question in the case was whether the plaintiffs, who owned the establishment in London where the photographs were made from the negative and were sold, and who had the negative taken by one of their men, were the authors, or the man who for their benefit took the negative. It was held that the latter was the author, and the action failed because plaintiffs had described themselves as authors.

Brett, M. R., said in regard to who was the author:

> The nearest I can come to is that it is the person who effectively is as near as he can be the cause of the picture which is produced—that is, the person who has superintended the arrangement, who has actually formed the picture by putting the persons in position and arranging the place where the people are to be—the man who is the effective cause of that.

Lord Justice Cotton said:

> In my opinion "author" involves originating, making, producing, as the inventive or master mind, the thing which is to be protected, whether it be a drawing, or a painting, or a photograph;

and Lord Justice Bowen says that photography is to be treated for the purposes of the act as an art, and the author is the man who really represents, creates, or gives effect to the idea, fancy, or imagination.

The appeal of plaintiffs from the original judgment against them was accordingly dismissed.

These views of the nature of authorship and of originality, intellectual creation, and right to protection confirm what we have already said.

The judgment of the circuit court is accordingly affirmed.

Supreme Court of the United States.

BLACK *et al* v. THORNE *et al*.

Decided March 24, 1883.

> It does not always follow that, because a party may have made an improvement and obtained a patent for it, another using the improvement will be mulcted in more than nominal damages for the infringement. If other methods in common use produce the same result with equal facility and cost, the use of the patented invention cannot add to the gains of the infringer or impair the just rewards of the inventor. The inventor may, indeed, prohibit the use or exact a license-fee for it, and if such license-fee has been generally paid its amount may be taken as the criterion of damages to him when his rights are infringed. In the absence of such criterion the damages must necessarily be nominal.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. Chas. N. Black for the appellants.
Mr. D. B. Eaton for the appellees.

Mr. Justice FIELD delivered the opinion of the Court.

This is a suit on the equity side of the Court for the infringement of two patents, issued to the plaintiffs' intestate, one for an alleged "new and useful improvement for burning tan-bark, bagasse, sawdust, and other kinds of fuel, in a wet state, for the purpose of creating heat to generate steam, or to be employed in heating or drying operations," and the other for a "new and useful improvement in furnaces, in using as fuel bagasse and other carbonaceous substances, too wet to be conveniently burned in the usual way," with a prayer that the defendants may be decreed to account for and pay to the plaintiffs the gains and profits derived from making and using furnaces containing the inventions and improvements of the deceased, and be enjoined from further infringement.

The defendants contested the validity of the patents, but the court sustained them, and held that the defendants had infringed them by the use of furnaces containing the improvements patented in burning wet tan to generate heat employed in the tanning of hides. It therefore decreed that the plaintiffs recover the profits and gains which the defendants had made from this use of the improvements, and ordered a reference to a master, to take testimony on the subject and state an account of them. It also granted the injunction prayed, restraining further infringement.

The master took testimony on the subject, and reported that the plaintiffs were entited to recover from the defendants as profits made by them from the infringement the cost or value of the wood which, but for the use of the patented inventions, they would have burned in generating heat for their tanneries, which amounted to over $44,000. Upon exceptions, this report was set aside, the court holding that the rule adopted to ascertain the profits made was erroneous. (*Black* v. *Thorne*, 12 Blatchf., 20.) The case was thereupon again sent to the master, and further testimony was produced, upon which he reported that there was no proof before him showing what profits, if any, had been made by the defendants from the use of the plaintiffs' improvements. This report was confirmed, and a decree entered pursuant to it, that no profits were to be recovered of the defendants. From this decree the case is brought here by appeal.

The question presented for our determination relates to the correctness of these reports, the plaintiffs contending for the first one, the defendants for the second.

The rule adopted by the master in his first report, to ascertain the profits made by the defendants from the use of the improvements, was clearly wrong. The claims of the patents were confined to the use of the improvements to produce heat by the burning of wet fuel. The object sought was the production of heat. The question, therefore, was what advantage in its production did the use of the improvements in burning wet tan have over other known methods in common use of producing the same result—that is, the same heat. So far as the improvements by burning wet tan gave advantages in producing heat over other methods there was a profit or gain to the defendants. We can suppose that such advantage might arise from the rapidity with which the heat was produced, or from the diminished cost of its production, or in various other ways. The difference between the cost of generating heat by the use of the improvements and wet tan and the cost of producing it by the use of wood as a fuel could not be the measure of profit, unless with those improvements or with other methods wood was the only means besides wet tan of producing the same heat, and that was not shown. Other substances may have answered equally well as fuel.

On the second hearing before the master it was shown, and he so found and reported, that there were methods and furnaces other than those of the plaintiffs, and other than those burning dry fuel alone, which would produce the same results in generating heat for the purposes for which the defendants used the heat, and which methods and furnaces they had a right to use, and that the saving to them, or profits made by them, by the use of the plaintiffs' inventions over the other furnaces, was not proved. Such being the case, the report could not have been otherwise than as it was.

It does not always follow that because a party may have made an improvement in a machine and obtained a patent for it, another using the improvement and infringing upon the patentee's rights will be mulcted in more than nominal damages for the infringement. If other methods in common use produce the same results with equal facility and cost, the use of the patented invention cannot add to the gains of the infringer or impair the just rewards of the inventor. The inventor may indeed prohibit the use or exact a license fee for it, and if such license fee has been generally paid its amount may be taken as the criterion of damage to him when his rights are infringed. In the absence of such criterion the damages must necessarily be nominal.

Decree affirmed.

The Official Gazette.

The OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of April 29, 1884.

DESIGNS.

14,975.—CHAIR.—*Charles Julius Bruschke*, Lake View, Ill. Application filed August 27, 1883. Term of patent 7 years.

14,976 and 14,977.—WATCH-CASE.—*John C. Dueber*, Newport, Ky. Applications filed December 31, 1883. Term of patents 7 years.

14,978.—WATCH-CHAIN.—*Charles K. Giles*, Chicago, Ill. Application filed September 13, 1883. Term of patent 7 years.

14,979.—ORNAMENTATION OF COTTON, SILK, OR OTHER FABRICS.—*Thomas Hardcastle*, Bradshaw Works, near Bolton, county of Lancaster, England. Application filed February 25, 1884. Term of patent 7 years.

14,980.—CURRY-COMB BACK.—*William P. Kellogg*, Troy, N. Y. Application filed November 17, 1883. Term of patent 7 years.

14,981.—SCONCE-FRAME.—*John C. Miller*, Meriden, Conn., assignor to *The Meriden Bronze Company*, same place. Application filed March 22, 1884. Term of patent 7 years.

14,982.—HOSIERY.—*George E. Nye*, Bristol, Pa., assignor of one-half to *Edward Tredick*, same place. Application filed February 18, 1884. Term of patent 7 years.

14,983.—HOSIERY.—*George E. Nye*, Bristol, Pa., assignor of one-half to *Edward Tredick*, same place. Application filed February 23, 1884. Term of patent 7 years.

14,984.—FOUNDATION-FRAME FOR A FLORAL PIECE.—*Henry F. Reed* and *Samuel Keller*, New York, N. Y. Application filed December 7, 1883. Term of patent 7 years.

14,985.—ORNAMENTATION OF UNDERSHIRTS.—*Seman A. Steenarton*, Montclair, N. J., and *Henry M. Keiser*, Brooklyn, N. Y. Application filed January 28, 1884. Term of patent 14 years.

14,986.—NEWEL-POST.—*Henry Textor*, Brooklyn, N. Y., assignor to *James S. Simpson* and *George F. Simpson*, both of same place. Application filed January 3, 1884. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

11,140.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"A black-band outer circle, a gold-band inner circle, a black interior space, and a gold shield, having upon them words and figures; also, the words 'GEORGE A. CLARK' and 'CLARK'S.'"

11,141.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"Two concentric circles, with a shield at the bottom upon the space between them and extending within the inner circle, the shield and the space between said circles being gold, and the figures and letters thereon black, and the circles and space within the inner circle black, with gold letters on said space; also, the words 'CLARK'S' and 'GEORGE A. CLARK.'"

11,142.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"Radiating lines, the words 'CLARK'S' and 'PAISLEY,' an ornamental border or line of circumference, and a peculiar arrangement of the lines formed by the words 'CLARK'S,' 'PAISLEY,' and 'CROCHET COTTON.'"

11,143.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"An arrangement of lines forming the outlines of a horseshoe, having within said outlines the words 'CLARK'S CROCHET COTTON.' Within said horseshoe, and parallel with said words, are the words and letter 'GEO. A. CLARK.' At the base of the line formed by them is the word 'AGENT.' At the bottom of the design, and between the two extremities of the horseshoe, is a shield, upon which are one or more numeral figures indicating the size of the thread. A line parallel with the interior line of the horseshoe surrounds or encircles the words and letter 'GEO. A. CLARK, AGENT,' and the shield, and a circular line forms the circumference of the entire design. Said circular line, the interior circular line, and the outline of the shield, and said words and letters are blue, the shield and the outlines of the horseshoe red, and the remaining portions of the design white."

11,144.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"Two concentric circles, having across the face of the inner circle two horizontal lines equidistant from the diameter of said circle, the space between said circles and between said lines being blue, with white lettering thereon, and the remaining space gold and white; also, the words, letter, and sign 'J. CLARK & CO.'"

11,145.—CAUSTIC POTASH AND LYE.—*Eliza N. Hall*, New York, N. Y. Application filed February 21, 1881.
"The representation of a ball upon a star of a solid color."

11,146.—PEGS FOR BOOTS AND SHOES.—*The Kearsarge Peg Company*, Bartlett, N. H. Application filed March 24, 1884.
"The figure of a red star or the word-symbol 'RED STAR.'"

11,147.—FLOUR.—*Philip Land* and *George Scaggyard*, Brownsville, Mo. Application filed March 31, 1884.
"The pictorial representation of a white swan upon water."

11,148.—OLIVE-OIL SOAP.—*Liebman & Butler*, New York, N. Y. Application filed February 28, 1884.
"The representation of three stars arranged in the form of a triangle."

11,149.—CIGARS.—*James Meade*, Penn Yan, N. Y. Application filed October 15, 1883.
"The words 'WILD ROSE' in connection with the picture of a female figure in a semi-nude state in the act of pulling roses from a bush in a field."

11,150.—WATCHES.—*Vacheron & Constantin*, Geneva, Switzerland. Application filed March 20, 1884.
"The representation of two interlaced horseshoes."

11,151.—BILL OR PAPER FILE HOLDERS AND CASES OF SHELVING FOR THE SAME.—*Edmund W. Woodruff*, Washington, D. C. Application filed March 19, 1884.
"The letters forming the word 'WOODRUFF' or 'WOODRUFF'S.'"

11,152.—LUMBER, BOARDS, LOGS, AND STAVES.—*Andrew Brown*, Buffalo, N. Y. Application filed March 12, 1884.
"The letter 'K.'"

LABELS.

4,099.—Title: "FRENCH ENAMEL OR PERFECT BEAUTIFIER."—*Madam Arnault & Co.*, Denver, Colo. Application filed April 7, 1884.

4,100.—Title: "DIETETIC OZONE WATER."—*The Chemical Ozone Manufacturing Company*, Boston, Mass. Application filed April 7, 1884.

4,101.—Title: "THE DOUBLE CONCENTRATED OZONE WATER."—*The Chemical Ozone Manufacturing Company*, Boston, Mass. Application filed April 7, 1884.

4,102.—Title: "OZONE POWDER."—*The Chemical Ozone Manufacturing Company*, Boston, Mass. Application filed April 7, 1884.

4,103.—Title: "SIMPLE OZONE WATER."—*The Chemical Ozone Manufacturing Company*, Boston, Mass. Application filed April 7, 1884.

4,104.—Title: "CONCENTRATED OZONE WATER.—*The Chemical Ozone Manufacturing Company*, Boston, Mass. Application filed April 7, 1884.

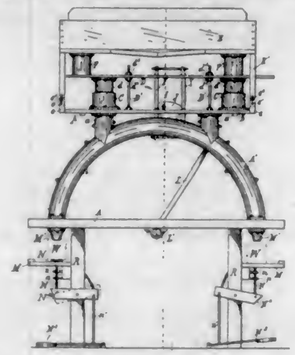
4,105.—Title: "FUMADORA," (FOR CIGARS.)—*Hamburger Bros. Co.*, Chicago, Ill. Application filed April 5, 1884.

4,106.—Title: "L. KNITTEL'S INDIAN HAIR TONIC."—*Louis Knittel*, Hoboken, N. J. Application filed April 2, 1884.

4,107.—Title: "PLATT'S CHLORIDES."—*Henry B. Platt*, New York, N. Y. Application filed April 8, 1884.

4,108.—Title: "IODIC COMP." (FOR A MEDICINE.)—*Paul S. Redfield*, Providence, R. I. Application filed April 5, 1884.

4,109.—Title: "ROGERS' GRAPOLINE." (FOR A MEDICAL PREPARATION.)—*James H. Rogers & Co.*, New York, N. Y. Application filed March 21, 1884.



4,110.—Title: "TENDER FEET." (FOR BOOTS AND SHOES.)—*Louis Sleininger*, Baltimore, Md. Application filed April 2, 1884.

4,111.—Title: "BRANDYRE" (FOR BRANDY AND WHISKY.)—*Henry Snyder, Jr.*, Brooklyn, N. Y. Application filed April 5, 1884.

PATENTS

GRANTED APR. 29, 1884.

297,549. **MACHINE FOR FILLING CANS.** GEORGE ACKERMANN, Cincinnati, Ohio, and JOHN WAGNER, Dayton, Ky., assignors of one-third to Charles F. Louden, Cincinnati, Ohio. Filed Dec. 27, 1883. (No model.)

Claim.—1. In a machine for filling cans, the combination of a curved tube occupying a portion of the circumference of a circle, a piston reciprocating in said tube, and mechanism for regulating the supply of canning material to the piston and delivering said material in front of the piston, substantially as and for the purposes specified.

2. In a machine for filling cans, a tube having a supply-opening and a delivering-opening, an interiorly-reciprocating piston, plate B, a measure-tube sliding with plate D, and a supply-box having a delivery tube or opening for delivery, at stated periods, to the measuring-tube, of the material to be canned, substantially as and for the purposes specified.

3. In a machine for filling cans, a tube carrying a reciprocating piston, plate B, adjustable telescopic measure, sliding plate D, and a supply-box having a tube or opening for delivery to the measure, substantially as and for the purposes specified.

4. A machine for filling-cans, consisting of a semicircular tube, having an interior piston provided with mechanism for causing it to move in both directions in said tube, and mechanism, substantially as described for delivering the material to said tube alternately in front of the opposite ends of said piston, the latter being adapted to force the material from the ends of said tube, substantially as and for the purposes specified.

5. In a can-filling machine, the semicircular tube A', provided with an interior piston, said piston being connected to mechanism for causing it to move back and forth in said tube, and the tube A' being provided with the inlet-tubes *a a'*, in combination with the box or receptacle E and intervening mechanism, substantially as described, for causing some of the contents of said box to be alternately delivered to the tubes *a a'*, substantially as and for the purposes specified.

6. The semicircular tube A', provided with inlet-tubes *a a'*, and the box E, supported above said tube and provided with tubes F F', in combination with the sliding carriage D^2, carrying the tubes C *d* and C' *d'*, said last-named tubes being adapted to communicate alternately with the tubes F F' above and the tubes *a a'* below, substantially as and for the purposes specified.

7. The semicircular tube A', provided with inlet-tubes *a a'*, having a plate, B, secured on their upper ends, and the box E, provided with tubes F F', and supported on brackets E', connected to the plate B, in combination with the sliding carriage D^2, consisting of the plates D and B', and carrying the tubes C *d* and C' *d'*, the plate B' resting and sliding on the plate B, and the plate D resting against the lower ends of the tubes F F', substantially as and for the purposes specified.

8. In a can-filling machine, the combination of the telescopic tubes C *d* C' *d'*, sliding plate D, rigidly connected to tubes *d d'*, plate B, and a forcing-tube provided with tubes or openings *a a'*, and the supply-box E, having tubes or openings F F', substantially as and for the purposes specified.

9. The combination of the box E, provided with tubes F F', and supported on brackets E', connected to plate B, and capable of vertical adjustment, and the carriage D^2, resting and capable of sliding on said plate B, and consisting of the plate B' D, carrying the telescopic tubes C *d* and C' *d'*, the plate D, when the plate B' rests on the plate B, being held against the lower ends of the tubes F F' by means of the standards D', having set-nuts d^2 d^2, substantially as and for the purposes specified.

10. The semicircular tube A', provided with the interior piston-heads, K' K^2, connected to opposite ends of a piston-rod, K, the latter being connected to one end of a vibrating rod, L, the other end of said rod being connected to a rock-shaft, L', in combination with the sliding carriage D^2, constructed substantially as described, and provided with a yoke, I', and the cam J, connected to a shaft, I, and engaging with said yoke, and the operating-shaft G, and connecting and operating mechanism, substantially as described, for causing the cam J to revolve and the rod L to vibrate, substantially as and for the purposes specified.

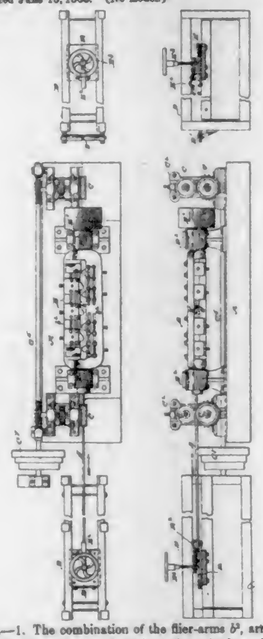
11. The semicircular tube A', having an interior piston, K K' K^2, connected to one end of a rod, L, the other end of said rod being connected to a rock-shaft, L', provided with a crank-arm, L^2, in combination with the driving-shaft G, shaft G^2, gear-wheels G' g^2, crank G^3, and connecting-rod *l*, substantially as and for the purposes specified.

12. The sliding carriage D^2, constructed and supported substantially as described, in combination with the shaft I, having cam J, and the driving-shaft G and shaft G^2, and connecting and operating mechanism, substantially as described, for causing the shaft I and cam J to revolve to cause the carriage D^2 to move back and forth, substantially as and for the purposes specified.

13. In combination with the curved tube suitably supported, a funnel, M', located at the end of the tube, and a piston-head operating in said tube, the head consisting of a shell, *k*, and an interior supplemental piston, K^2, adapted to be advanced beyond the end of the shell *k*, substantially as and for the purposes specified.

14. The semicircular tube A', connected to the table A, and having at each end a funnel, M', in combination with the interior piston-heads, K' K^2, each head consisting of a shell, *k*, and an interior supplemental piston, K^2, adapted to be advanced beyond the end of the shell *k*, substantially as and for the purposes specified.

15. The combination of the curved tube and funnel M', and a hollow piston-head, K, operating in said tube, and the supplemental piston K^2, adapted to lie in the hollow piston and to be advanced beyond the end of the latter, and an elastic spring for retracting the supplemental piston when pressure thereon by the piston-rod is removed, substantially as and for the purposes specified.



16. The combination of the shell *k* and the interior supplemental piston, K^2, connected to the piston-rod K, and having at its inner end a flange or stop, *k'*, and the spring k^2, compressed between said flange or stop and the bottom of the shell *k*, substantially as and for the purposes specified.

17. The semicircular tube A', constructed and supported substantially as described, and the shelves M, located beneath the ends of said tube, and each provided with a disk, N, and mechanism, substantially as described, for causing said disks to be raised and lowered, substantially as and for the purposes specified.

18. The table or shelf M, provided with adjustable stops *m* and with the disk N, in combination with the treadle N^2, rod *n'*, lever N^3, and rod N', for causing said disk to be raised, substantially as and for the purposes specified.

19. The semicircular tube A', having inlet-tubes *a a'*, the upper end of the last-named tubes being each provided with a sliding gate or cover, O, substantially as and for the purposes specified.

297,550. MACHINE FOR STRAIGHTENING METAL RODS. JOHN AGNEW, Cummings, assignor to the Agnew Shafting Company, Chicago, Ill. Filed June 18, 1883. (No model.)

Claim.—1. The combination of the flier-arms b^3, arranged in parallel planes on opposite sides of a plane through the axis, dies B^3, arranged opposite the axis, and suitable holding devices for securing the dies to the arms b^3, substantially as described.

2. In combination with the arms b^3 of the flier, arranged in different planes, as illustrated, dies applied to adjacent parallel faces of said arms, and caps B^4 and bolts b^4, for securing the said caps to the arms b^3, substantially as described.

3. In combination with the flier-arms and dies secured thereto, means for securing said dies adjustably lengthwise of the arms, substantially as described.

4. The combination, with the flier-arms b^3, provided with longitudinal slots, of dies B^3 and bolts b^4, arranged in the slots b^4, for adjustably clamping the dies in place on the arms, substantially as described.

5. In combination with the arms b^3 of the flier, arranged in parallel planes on opposite sides of the axis, recessed cap-plates B^4, bolts for securing said cap-plates to the arms and radial adjusting-screws B^5, substantially as described.

6. In combination with the arms b^3 of the flier, and the dies arranged on proximate faces of said arms, as shown, the recessed cap-plates B^4, resting on the arms b^3 at the sides and ends of the dies, clamping-bolts b^4 for holding said cap-plates to the arms, radial adjusting-screws B^5, and clamping-bolts b^4, substantially as described.

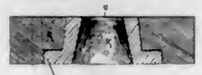
7. In combination with the alternating dies B^3, the supplemental dies or plates B^6, radially adjustable on the frame, and arranged in opposition to the extreme dies B^3, substantially as described, and for the purposes set forth.

8. The combination, with a flier carrying the straightening-dies, of two feeding devices, arranged one at one end and the other at the other end of the flier, and constructed, respectively, to push and draw the rod or shaft through the flier, substantially as described.

9. The combination, with the flier carrying straightening-dies, of two pairs of feed-rollers C C, one pair placed at each end of the flier, and axially in line therewith, and actuating mechanism constructed to rotate said feed-rolls simultaneously in the same direction and at equal speeds, substantially as described.

10. In combination with the flier carrying straightening-dies, the two pairs of feed-rollers C C, arranged at opposite ends of the flier, as shown, the shaft c of said feed-rolls provided with intermeshing gear-wheels c', the worm-wheels C^9, arranged on one shaft of each pair of feed-rolls, and a continuous worm-shaft, C^8, engaged with said worm-wheels, substantially as described.

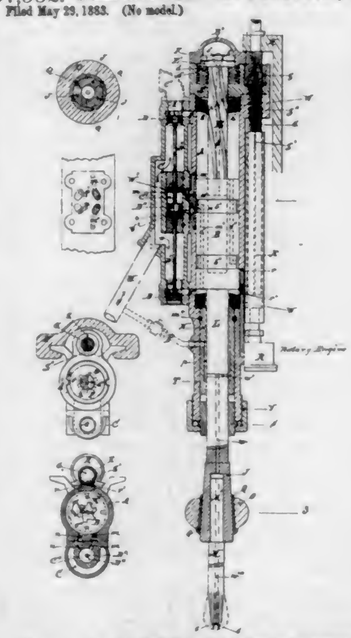
11. In combination with the uprights C^2, provided with the vertical slot c^2, the feed-roller shafts c, bearing-boxes C', interposed removable block, C^4, and adjusting-screws c^3, substantially as described.



12. The combination, with the feed-roller shafts c, and a support or supports for said shafts, and the slotted uprights C^2 the bearing-boxes C', screws c^3, and interposed springs, c^3, substantially as and for the purposes set forth.

13. The combination, with a flier of a rod-straightening machine, and feeding devices for carrying the rod or shaft through the flier, of ways arranged at opposite ends of the machine, carriages running in said ways, and devices for holding the ends of the shaft applied to the carriages, substantially as described.

14. The combination, with the flier carrying the straightening-dies, feed-rolls at opposite ends of the flier for advancing the rod or shaft being straightened, ways D, carriages mounted in said ways, and devices upon said carriages for holding the ends of the shaft, of a stationary roller, D', near the feed-rolls at the end of the flier at which the shaft emerges, for the support of the straightened rod or shaft, substantially as described.



15. The combination, with the hollow gudgeon b of the flier, of an axially-apertured wooden plug, B^7, fitted to admit the shaft to be straightened, substantially as described.

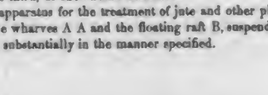
297,551. DIE FOR DRAWING METAL RODS. JOHN AGNEW, Cummings, assignor to the Agnew Shafting Company, Chicago, Ill. Filed June 18, 1883. (No model.)

Claim.—The internal die having an internal conical compressing-bore terminating in a plain cylindrical drawing or sizing face, a, an exterior flange, a', and an exterior conical form of less slant than its interior bore, whereby the drawing or sizing bore a is backed by thicker wall or strengthened against stress and wear, substantially as shown and described.

297,552. STEAM ROCK-DRILL. JOHN F. ALLEN, Brooklyn, N. Y. Filed May 29, 1883. (No model.)

Claim.—1. In a rock-drill, the piston B, having two recessed parts, b' b'', in combination with passage-ways c' and c'', respectively, said passages c' c'' connecting the upper groove or recess in the piston with the lower part of the cylinder, and the lower recess in said piston with the upper part of the cylinder, in the manner and for the purpose described.

2. The piston D'', moving in a closed cylinder, C', arranged in the valve-chest C, in combination with cylindrical valves D D, working in a valve-chest open at its ends, and connected together by the valve-rod D', substantially as set forth.

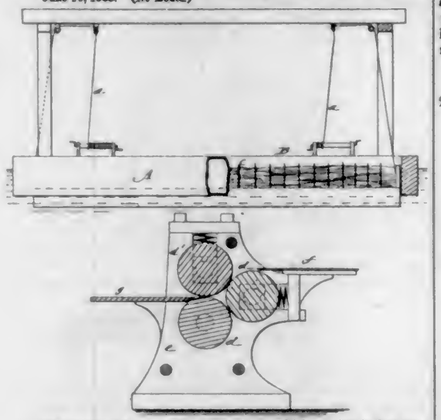


3. In a rock-drill, in combination with the cylinder A, provided with a piston, B, having two recesses, b' b'', and connected through passages c' c'', respectively, with the ends of cylinder A, and the cylinder C', provided with a piston, D'', attached to the valve-rod D', the passages n n' and m m', provided with self-acting valves, arranged to operate in combination with the edges of the piston B and of its recesses b' b'', in the manner and for the purpose substantially as described.

4. In a rock-drill, in combination with the central bolt, E, provided with an end flange, E', resting on disks d d', alternately held stationary in the cylinder-head A' and on said bolt E, the passage-ways h and h', disk F, with holes h'', closed by a self-acting valve, f, and the hollow chambered cap-piece B', arranged to operate by the pressure in the cylinder, substantially in the manner and for the purpose herein set forth.

5. In a rock-drill, the enlarged and tapering end J of the piston-rod I, divided or split in three or more parts, in combination with the gibs Q, made in two or more parts, the solid ring O, and the cutting-tool M, as and for the purpose described.

6. In combination with the piston of a rock-drill, working free in the cylinder, a series of disk-shaped springs, W, placed in the ends of the cylinder, substantially in the manner and for the purpose herein set forth.



297,553. MUSIC-BOOK HOLDER. CLINTON S. ANDEN, Providence R. I. Filed Aug. 18, 1883. (No model.)

Claim.—1. In a book-holder, the glass clamp-piece C, combined with a spring-clamp, B, provided with a retaining-band, b, and a back or supporting piece, A, as shown.

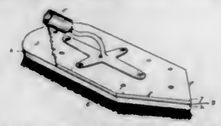
2. In a book-holder, a transparent clamp-piece, C, combined with a clamping device, said clamp-piece constructed substantially as described to operate on the face of the book-pages, to hold the book open.

297,554. PROCESS OF AND APPARATUS FOR THE TREATMENT OF RAMIE AND JUTE. NICHOLAS ARTHURS, New Orleans, La. Filed June 19, 1883. (No model.)

Claim.—1. A process of treating plants, which consists in first saturating the stalks with water; secondly, crushing them; thirdly, breaking them into fine pieces, and, fourthly, removing the lint or fiber from the material, as described.

2. The combination, with the frames e, having the feed and delivery tables f g, of three plain-faced rolls, d d d', of which two are held by springs to the third, as shown and described.

3. The apparatus for the treatment of jute and other plants, which consists in the wharves A A and the floating raft B, suspended between the wharves, substantially in the manner specified.



4. The combination of two pairs of rolls, h h h h, both pairs being longitudinally ribbed, but the ribs on the first being larger and coarser than those on the second pair, whereby the plants will be successively broken into coarse and fine pieces, as described.

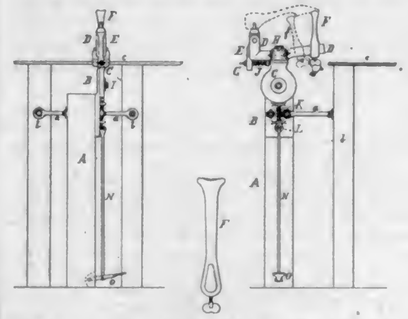
5. In apparatus for beating or crushing jute or other plants, the combination of the fluted roller o and the reciprocating beater p, substantially as shown in Fig. 7, for operation in the manner specified.

6. The cylinder i, made hollow, covered with boards, having four longitudinal blades, k, and provided with lugs k', carrying pins, as and for the purpose specified.

7. The crusher consisting of the top rolls, m, bottom rolls, l, and side rolls, m', as and for the purpose set forth.

297,555. SCRUBBING-BRUSH. HARRIET E. BAKER, Springfield, Mass. Filed Nov. 15, 1883. (No model.)

Claim.—1. An improved scrubbing-brush consisting of the block 2, having an apex or point at one end formed at an angle of less than ninety degrees, and with rice fibers or roots secured in said block, a cover, 4, having the same form and firmly secured to said block, and a water-proof packing, 3, secured between said block and cover, all combined substantially as described.

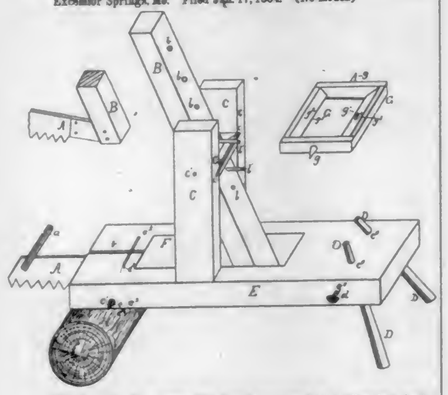


2. The combination, in a scrubbing-brush, of the block 2, having an apex or point at one end formed at an angle of less than ninety degrees, and with rice fibers or roots secured in said block, a cover, 4, having the same form and firmly secured to said block, a water-proof packing, 3, between said block and the cover, and a socket or shank secured to the cover adapted to receive and hold a handle, substantially as described

297,556. DEVICE FOR MANIFOLD COPYING. HERMAN G. BARLOW and JOHN B. BARLOW, Grand Rapids, Mich. Filed Sept. 20, 1883. (No model.)

Claim.—An improved blank for manifold copying, consisting of a sheet of paper divided into three equal sections by lines of perforations, and printed in the same manner herein shown and described, whereby the sections may be folded upon each other with a single sheet of copying-paper, in such manner that matter written upon one section will be reproduced upon the other two, substantially as set forth.

297,557. LASTING-JACK. JOS. BEAULIEU, Worcester, Mass., assignor of one-half to Levi Beaulieu, same place. Filed Feb. 13, 1884. (No model.)



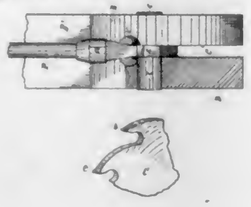
Claim.—1. The lasting-jack described, consisting of the standard B, supported and braced as set forth, the swivel C, with its joints at each end, and the arm D, carrying a spring-pin and rest for supporting the work, all constructed and operating as and for the purposes set forth.

2. The combination of the standard B, supported and braced as set forth, the swivel C, joined thereto by a movable joint held by a spring-bolt and notch, and connected to the arm D by a friction-joint at

right angles to the other, and the arm D, carrying the holding mechanism for the work, all constructed and operating substantially as described.

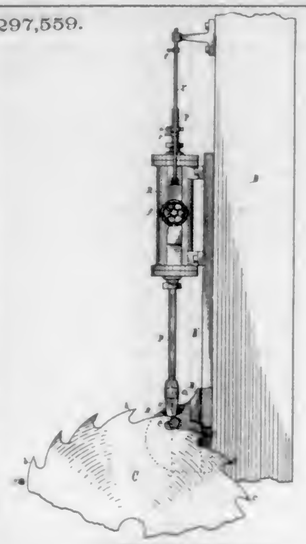
297,558. DRAG-SAW FRAME. MARLOW BECK and AUSTIN MCROREY, Excelsior Springs, Mo. Filed Jan. 17, 1884. (No model.)

Claim.—1. A crescent-saw frame composed of a vibrating shaft, B, supported in a yoke, G, between uprights C C, said uprights resting upon a horizontal piece, E, said piece having a slot, F, to receive the shaft, and a slot, f', to receive the saw, the front end of said piece resting upon the log to be sawed, and its back end upon legs D, all substantially as shown and described.



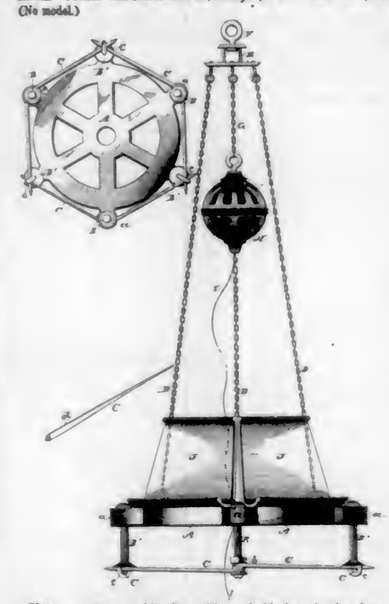
2. An improved crescent-saw frame for supporting the front end of a saw, composed of a vibrating shaft, B, said shaft being made adjustable in height, and supported in a yoke, G, said yoke having bearings in uprights C C, which are stayed upon a horizontal piece, E, said piece having a slot, F, to receive the shaft, and a slot, f', to receive the saw, and a bar, c^3, to stay the front end, and adjustable legs D, to support the back end of said frame, all substantially as shown and described.

3. The combination of a saw, A, with a frame composed of a shaft, B, supporting one end of said saw, supported in a yoke, G, having bearings in uprights C C, said uprights supported upon a horizontal piece, E, said piece having a slot, F, in which the shaft vibrates, and a narrow slot, f', said piece resting upon the log to be sawed at one end, and upon adjustable legs D D at the other, all substantially as and for the purpose set forth.



4. In an improved frame for carrying the front end of a crescent-saw, a vibrating shaft, B, adjusted in height by means of holes b, in which are placed pins b', a vibrating yoke, G, having arms g for bearings, and the front and back sides beveled from below and above g' g^3, forming an edge, g^3, and a horizontal piece E, made with a slot, F, to receive a vibrating shaft, and a slot, f', to receive a saw, and having a bar, c^3, over the slot f', and made with sharpened ends c^3, a pin, e, passing across the lower part of said slot f', to hold the saw up, the back end of said piece E being supported by means of legs D, adjusted in length by means of thumb-screws d, all substantially as shown and described, for the purpose specified.

297,559. SAW-SWAGING DEVICE. BENJAMIN F. BRIDGES, Big Rapids, Mich. Filed Aug. 17, 1883. (No model.)

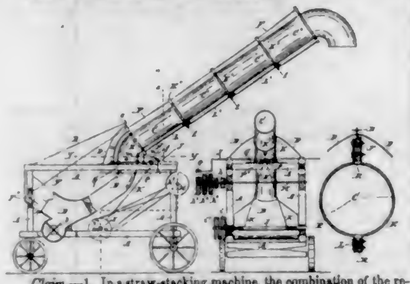


Claim.—The combination, with the die-support having the integral recessed extension, of the engine, swaging-hammer, and a die adapted for the swaging of a saw-tooth, all said parts constructed and associated in substantially the combination shown and described.

297,559.

297,560. COMBINED BAG AND TWINE HOLDER AND SHOW-RACK. GEORGE RANDOLPH BROWN, Palmyra, N. Y. Filed Oct. 5, 1883. (No model.)

Claim.—1. The combination, with a suitable base having depending fingers secured thereto, of a double-pointed needle centrally secured to one of the fingers, the opposite ends of the said needle adapted to be held in place by keepers secured to the fingers on opposite sides of the finger supporting the spring.



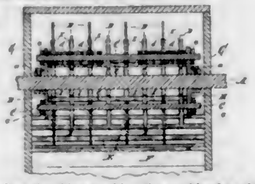
2. The combination, with a suitable base or frame and needle-attaching devices, of needles provided with sharpened upper edges, substantially as set forth.

3. The combination, with a swiveled link supporting a bag-holder, of a cord-holder suspended from said link between the bag-holder chains, substantially as set forth.

4. The combination, with a frame or base provided with bag-holding needles, and a central cord opening or passage, chains or equivalents, to the lower end of which the frame is suspended, and a swiveled link, of a chain or equivalent secured to the swiveled link between the chains to which the base or frame is secured, and a cord-holder suspended from said chain, substantially as set forth.

5. The combined device, consisting of a base provided with bag-supporting needles, racks for displaying or holding goods or other articles, and a twine or cord holder, all of the above parts combined as described.

297,561. STRAW-STACKING MACHINE. JAMES BUCHANAN, Indianapolis, Ind. Filed Oct. 12, 1883. (No model.)



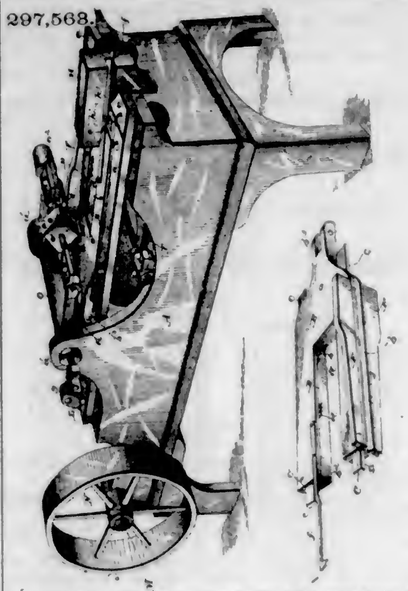
Claim.—1. In a straw-stacking machine, the combination of the receiver B, the fan b, the discharge-tubes C C' C', ring or shoulder G, anti-friction balls g g, the ropes K K, the shaft I, the arms m m, the shifting-rod J and arm j, the pulleys i i' on shaft I, the pulleys h h' and h^2 on shaft H, and the driving-belt O, substantially as described, and for the purpose specified.

2. In a straw-stacking machine, the combination of the receiver B, the fan b, the telescoping discharge-tubes C C' C', the iron bands E E' E', the blocks R R, the iron stays L L' L', the set-screws l l l, the braces n n, the shoulder G, and the flanges s s s, substantially as described, and for the purpose specified.

3. In a straw-stacking machine, the combination of the receiver B, the fan b, the telescoping discharge-tubes C C' C', ring G, the iron bands E E' E', the blocks R R, the wire rope F, the pivot s, and the braces D D D, substantially as described and specified.

297,562. THRASHING-MACHINE. JAMES BUCHANAN, Indianapolis, Ind. Filed Oct. 25, 1883. (No model.)

Claim.—In a thrashing-machine, the combination of the casing G, the receiver H, the solid concave bottom F, the grated concave formed by the round iron rods E E, the shaft A, the cast-iron disks B B, the iron rods C C, the beaters D D, the thin circular guide-plates I I, and the washers d d, all substantially as described, and for the purpose specified.



297,563. MACHINE FOR MAKING WEDGES. ARTHUR M. BURNHAM, Gardiner, Me. Filed Dec. 14, 1883. (No model.)

Claim.—1. In a machine for making wedges, the combination, with two rotary cutters situated in different horizontal planes, and each adapted to be moved toward and away from the other, of a carriage situated between the rollers and provided with devices for clamping the block therein.

2. The combination, with two cutter-carriers pivoted to the machine-frame and two revolving cutters, the shafts of which are journaled, respectively, in the free ends of the carriers, of a reciprocating carriage situated between the cutters and provided with devices for holding a block of wood therein.

3. The combination, with two cutter-carriers pivoted to the machine-frame and two revolving cutters, the shafts of which are journaled, respectively, in the free ends of the cutter-carriers, of a reciprocating carriage running between the cutters and provided with formers, and a

297,568.

single belt for operating the cutters and holding the cutter-carriers in contact with the formers.

4. In a machine for making wedges, the combination, with two cutter-carriers pivoted to the machine-frame, and cutters journaled, respectively, in the free ends of said carriers, of a carriage provided on its opposite faces with formers, against which the cutter-carriers rest, and a belt for holding the cutter-carriers in contact with the formers.

5. In a machine for making wedges, the combination, with rotary cutters, of a carriage adapted to reciprocate between the cutters and provided with dogs, which latter automatically engage the block of wood, carry it between the cutters, and automatically discharge it.

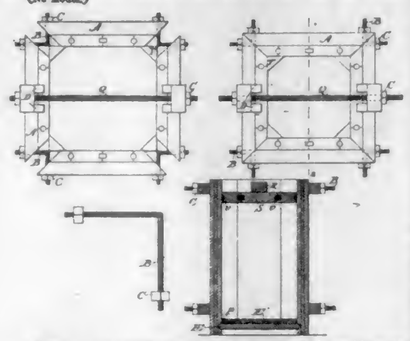
6. In a wedge-machine, the combination, with a carriage mounted upon ways, and provided with devices for automatically engaging and releasing the blocks, and further provided with formers for regulating the shape of the wedge, of an upper and lower rotary cutter and devices whereby the cutters are held in vertical adjustment, substantially as set forth.

7. The combination, substantially as before set forth, of the cutter, the reciprocating carriage, the hopper, and a feeding-hook secured to the carriage and adapted to draw a blank from the hopper at each reciprocation of the carriage.

8. The combination, substantially as before set forth, of the rotary cutters, the reciprocating carriage interposed between said cutters, the hopper, and a feeding-hook secured to the carriage and adapted to draw a blank from the hopper at each reciprocation of the carriage.

9. In a wedge-machine, the combination, with rotary cutters journaled in swinging frames, of a carriage mounted upon ways and provided with automatic devices for grasping and releasing the blocks, and mechanism whereby the carriage is reciprocated and the cutters rotated, substantially as set forth.

10. In a wedge-machine, the combination of swinging frames having rotary cutters journaled therein, automatically-operated dogs adapted to grasp, feed, and release the blocks, and formers for controlling the converging motions of the cutters, substantially as set forth.



11. In a wedge-machine, the combination, with two rotary cutters driven by a single belt and having opposite rotary motions, of a carriage adapted to slide upon ways and provided with an automatic clamping device, a hook adapted to engage a block in the hopper, and templets for determining the angle of the wedge, and the ways, substantially as set forth.

12. In a machine for making wedges, the combination, with a suitable frame, a reciprocating carriage, and revolving cutters, of a slotted lever pivoted at one end to the frame, a pitman connecting the opposite end of said lever to the carriage, and a crank journaled to the frame and engaging the slotted lever, substantially as and for the purpose set forth.

13. The combination, with suitable cutters and a reciprocating carriage, the latter provided with an oblong open slot, of sliding bars situated on opposite sides of the slot and projecting from both ends of the

carriage, the said bars being provided with diagonal lugs, and dogs provided with diagonal slots in which the lugs of the said bars rest and move, and the stops secured to the frame against which the bars abut, substantially as set forth.

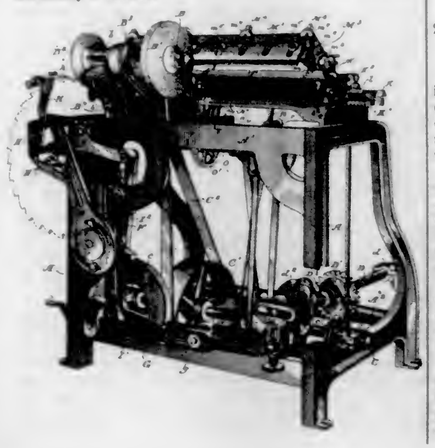
297,564. SILO. GEORGE E. BURT, Harvard, Mass. Filed Oct. 17, 1883. (No model.)

Claim.—1. A portable compressing silo composed of movable parts, constructed and arranged substantially as described.

2. The mechanism in a silo constructed with laterally-compressing sides, substantially as described.

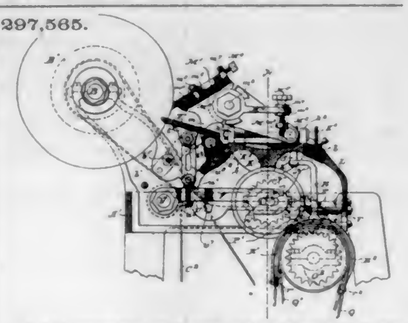
3. The bands A A, connecting with angle-irons B B, screws and nuts C C, in combination with a silo, substantially as described.

4. The combination of the lever F, the connecting-arms H H, the toggle-joints J J, pivots I, I, G, and X, with post D, all arranged in a silo, substantially as described.



5. The combination of the toggle-joints J J J J, the arm O, the posts D D, the platens R and S, and rod Q, all arranged substantially as described.

6. In combination with a silo, the platen R S, constructed with grooves, and yielding packing in its joints, substantially as described.



297,565. MACHINE FOR GRINDING CUTTER-KNIVES. LEWIS BUSH, Jr., Chicago, Ill., assignor to the American Machinery Company, same place. Filed June 1, 1883. (No model.)

Claim.—1. The combination, with a rotary grinding-disk and a longitudinally and laterally movable plate constructed to support a knife in position to be ground, of a movable table constructed to support said plate, and means constructed to give a vibratory motion to said table, substantially as described.

2. The combination, with a rotary grinding-disk, of a longitudinally-movable bed-plate, K, a knife-supporting plate, M', pivotally attached to said bed-plate and laterally adjustable thereon, a pivoted table, T, constructed to support said plate M', and means for vibrating said table, substantially as described.

297,565.

3. The combination, with a rotary grinding-disk and with a rotating shaft, N', provided with a crank-pin, n', of a longitudinally-movable bed-plate, K, a plate, M', pivotally attached to said bed-plate, a pivoted table, T, and a pivoted lever, V, connected to said table, and provided with a slot, v, constructed to engage the said crank-pin n', substantially as described.

4. The combination, with a rotary grinding-disk and with a rotating shaft, N', provided with a crank-pin, m', of a longitudinally-movable bed-plate, N, a plate, M', pivotally attached to said bed-plate, a pivoted table, T, a pivoted lever, V, connected with said crank-pin, a pitman, U, joining said lever with the said table, and adjustable connections between said pitman and lever, substantially as and for the purpose set forth.

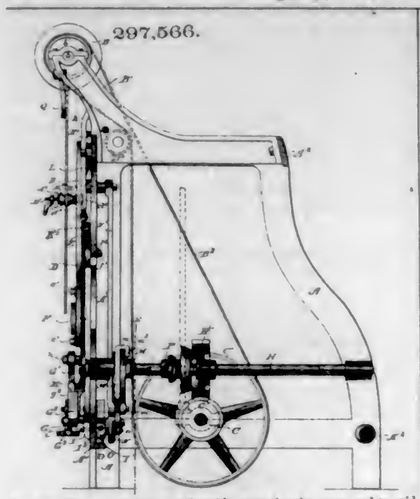
5. The combination, with a rotary grinding-disk and a sliding bed-plate, K, of arms M, pivoted to said bed-plate, a knife-supporting plate, M', pivotally connected with the free ends of said arms, means for adjusting the angle of the plate M' with reference to the arms, and means for supporting the said plate M', substantially as and for the purpose set forth.

6. The combination, with a rotary grinding-disk and a sliding bed-plate, K, of arms M, pivoted to said bed-plate, means for adjusting the pivot connecting said arms with the bed-plate laterally upon said plate, a knife-supporting plate, M', pivotally connected with the free ends of the arms, means for adjusting the angle of the plate M with reference to the arms, and means for supporting the said plate M', substantially as and for the purpose set forth.

7. In a unitary machine for grinding cutter-knives and sharpening saws, the combination, with a stationary rotating arbor carrying two grinding-disks, and with a driving-shaft, of means for supporting and giving the necessary movements to a saw in relation to one of the grinding-disks, and a movable carrier for supporting a cutter-knife in proper position with reference to the other disk, substantially as described.

8. In a unitary machine for grinding cutter-knives and sharpening saws, the combination, with a stationary rotating arbor carrying two grinding-disks, and with a suitable driving-shaft, of means for supporting and giving the necessary movements to a saw, and means for supporting a cutter-knife and giving it a transverse vibratory motion, substantially as described.

297,566. SAW-SHARPENING MACHINE. LEWIS BUSH, Jr., Chicago, Ill., assignor to the American Machinery Company, same place. Filed June 1, 1883. (No model.)



Brief.—The saw is automatically moved toward and from a rotating but otherwise stationary grinding-wheel, which first grinds the front or cutting face of the tooth, and then as the saw is simultaneously lowered and rotated the back of the tooth is ground, and by means of a former-block on the feed-lever the desired form is given to the back of the tooth.

Claim.—1. In a saw-sharpening machine, the combination, with the machine-frame and with a rotary grinding-disk mounted in stationary bearings, of a guide-plate, F, adjustably attached to the machine-frame, a sliding plate, E, means for supporting the saw from the plate E, constructed to permit said saw to be adjusted both laterally and vertically with reference to said plate, and means for reciprocating said plate, substantially as described.

2. In a saw-sharpening machine, the combination, with the machine-frame and with a rotary grinding-disk mounted in stationary bearings, of a guide-plate, F, adjustably attached to the machine-frame, a sliding plate, E, arm D, for adjustably supporting the saw upon the plate E, and means for reciprocating the said plate E, substantially as described.

3. In a saw-sharpening machine, the combination, with a rotary grinding-disk and with a sliding plate, E, for supporting the saw, of a lever, G, pivoted to the machine-frame and connected at one end to said plate E, means for operating said lever, and a guide-plate, F, pivoted to the machine-frame at its lower end at a point near the connection between

297,566.

the plate E and lever G, and adjustably secured at its upper end to said frame, substantially as and for the purpose set forth.

4. In a saw-sharpening machine, the combination, with a rotary grinding-disk, with a sliding plate, E, and with means for reciprocating said plate, of an arm, D, connected at one end to said plate so as to permit a rotary adjustment of said arm upon said plate, a pin, D', upon said arm for supporting the saw, and means for adjusting said pin longitudinally upon said arm and securing it in its adjusted position, substantially as described.

5. In a saw-sharpening machine, the combination, with the grinding-disk B, and with the sliding plate E, provided with a pivot-pin, e, of an arm, D, provided with an aperture for the insertion of said pivot-pin, with curved slots d, and with a longitudinal slot, d', bolts c', for securing said arm to the said plate, a pin, D', for supporting the saw, and means for adjustably securing said pin in the said slot d', substantially as described.

6. In a saw-sharpening machine, the combination, with a grinding-disk, B, and a sliding plate, E, for supporting the saw, of a lever, G, connected with said plate, a movable fulcrum for said lever upon the machine-frame, means for adjusting said fulcrum longitudinally of the lever, and means for operating said lever, substantially as and for the purpose set forth.

7. In a saw-sharpening machine, the combination, with a rotary grinding-disk, with a sliding plate, E, for supporting the saw, and with a crank-shaft, H, of a lever, G, provided with a longitudinal slot, g', a sliding block, I', provided with a pivot-pin, g, and a screw-shaft, I^2, for moving said block, substantially as described.

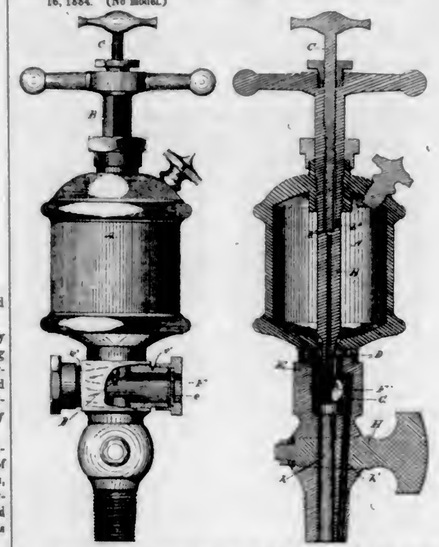
8. The combination, with the sliding plate E, and the shaft H, provided with a crank-pin, h, of the lever G, and adjustable means for connecting said lever with the crank-pin, substantially as described.

9. The combination, with the sliding plate E, the shaft H, provided with a crank-pin, h, and with the lever G, of a plate, G', adjustably attached to said lever, and provided with a slot, g^2, substantially as and for the purpose set forth.

10. In a saw-sharpening machine, the combination, with a grinding-disk, and with means for supporting the saw, of a feed-finger, k, a pivoted lever, K, a form-block, K^3, adjustably attached to said lever, a lever, L, having its end constructed to bear against said form-block, means for oscillating the said lever L, and a spring, K^3, for retaining the said form-block in contact with the said lever, substantially as described.

11. In a saw-sharpening machine, the combination, with the feed-finger k, with the lever K, and with means for operating said lever, of the plate K^4, sliding block K^6, adjusting-screw K^5, and means for adjustably securing the said plate to the said lever, substantially as described.

12. The combination, with the feed-finger k, with the lever K, provided with the form-block K^3, with the lever L, and with the shaft H, provided with an eccentric, M, of the lever N, provided with a movable fulcrum, n, and a pitman, N', substantially as described.



13. In the saw-sharpening machine described, the combination, with the lever K, provided with a form-block, as K^3, of a lever, L, arranged to engage the form-block, and having its pivotal point located above its point of contact with the said block, substantially as and for the purpose set forth.

14. The combination, with the feed-finger lever K, of a form-block, K^3, constructed of wood, and removably attached to said lever, substantially as and for the purpose set forth.

15. In a saw-sharpening machine, the combination, with a pin, D', for supporting the saw, of a stationary hollow cone, D^2, a cone, D^3, constructed to rotate freely on said pin, and means for adjusting said cone D^3 longitudinally upon said pin and holding it in its adjusted position, substantially as described.

16. The combination, with the pin D', and with the hollow cone D^3, of the cone D^3, the nut d^3, and a key, d^4, constructed to pass through a slot in said pin, substantially as described.

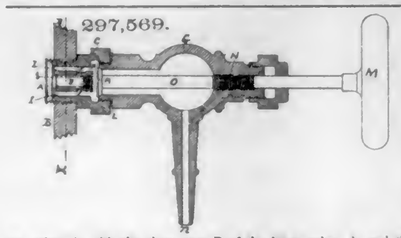
297,567. LUBRICATOR. MILTON S. CARELL, Quincy, Ill. Filed Feb. 16, 1884. (No model.)

Claim.—1. The combination, with the oil-cup having the valve-seat and opening at the bottom thereof, of the hollow stem through which the cup is vented, having the elongated tip or extension projecting through the valve-seat opening down into the chamber of the fitting, and the fitting having the glasses located in line with the tip of the elongated extension, whereby when the valve is raised slightly from its seat the oil will escape through the valve-seat opening, run down the elongated tip into the chamber of the fitting, and escape from said tip in the form of drops, which are visible through the glasses, substantially as described.

2. In combination with the oil-cup, projecting hollow spindle, horizontal sight-tube, and vertical delivery-tube, of the vent-tube opening into the delivery-tube at both top and bottom, substantially as described.

3. In a lubricator such as described, and in combination with the feeding devices, the fitting containing the sight-openings, and the vent-tube, the valve for closing or regulating the passage of steam through the vent-tube, substantially as described.

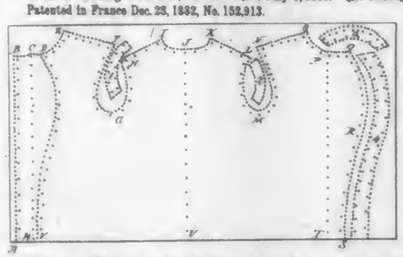
297,568. COMPOSITION FOR STAINING AND PRESERVING WOOD. SAMUEL CABOT, Jr., Boston, Mass. Filed July 16, 1883. (Specimens.)



Claim.—A composition for staining and preserving wood, composed of rectified creosote-oil, or any of the distillates of coal-tar which pass over between 125° and 200° centrigrade, about fifteen per cent. of finely-divided pigment, and about ten per cent. of drying-oil, substantially as set forth.

297,569. GAGE-COCK. WILLIAM CASEY, Algiers, La. Filed July 9, 1883. (No model.)

Claim.—In a gage having two valves, one being placed on the inside of the boiler, the combination of the ports I, cast in shell C of in-



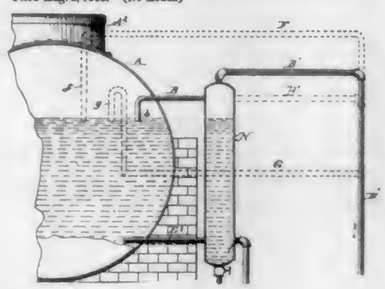
297,569.

ner valve, A, with the short stem D of the inner valve, A, and the screw N on stem O of the outer valve, R, all substantially as described, and for the purpose specified.

297,570. PATTERN FOR UNDER-GARMENTS. JEAN MARIE CLAUDIUS CHENIVESSE, Bourg St. Andéol, France. Filed July 5, 1883. (No model.) Patented in France Dec. 23, 1882, No. 152,913.

Claim.—1. The herein-described pattern for under-garments having the configurations shown and described, and provided with the lines of perforations A B C D E F G H I J K L M N O P Q R S T U V W, substantially as described, for the purposes specified.

2. The herein-described under-garment having the configurations shown and described, and provided with the lines of perforations A B C D E F G H I J K L M N O P Q R S T U V W, and, in combination therewith, of the bands 1, 2, and 3, substantially as described, for the purposes specified.

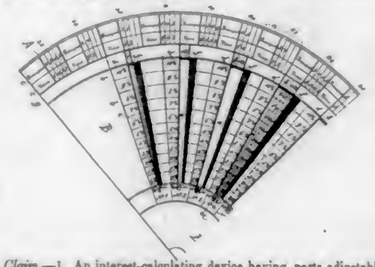


3. The herein-described pattern for under-garments having the configurations shown and described, and provided with the lines of perforations A B C D E F G H I J K L M N O P Q R S T U V W, and, in combination therewith, of the bands 1 2 3 4, substantially as described, for the purposes specified.

4. The herein-described sleeve-pattern having the configurations shown and described, and provided with the lines of perforations A' B' C' D' E' F' G' H' I' L', substantially as described.

5. In combination with the sleeve-pattern having the configurations shown and described, and provided with the lines of perforations A' B' C' D' E' F' G' H' I' K' L', the shirt-pattern having the configurations shown and described, and provided with the lines of perforations A B C D E F G H I J K L M N O P Q R S T U V W, substantially as described, for the purposes specified.

297,571. WITHDRAWN.



297,572. BOILER-FEEDER. WILLIAM CUNNINGHAM, Watsontown, Pa. Filed Aug. 2, 1883. (No model.)

Claim.—1. In a device for feeding water to a boiler in which the steam-supply to the pump is regulated by the height of the water, the combination of a steam-pump, a boiler, a cylinder intervening between the boiler and pump, and pipes connecting the cylinder with the boiler and pump, the cylinder having a steam-space in its upper part, said space being connected to the steam-space of the boiler by a pipe having its end bent downward, substantially as shown and described.

2. In a boiler-feeder, the combination of the boiler, the cylinder N, the steam-pipes B and B', the first entering the cylinder in the side, and the other at the top, the first pipe being bent downward in the steam-space of the boiler, the water-pipes E' E², and a steam-pump, whereby the boiler is fed automatically and water is prevented from entering the steam-cylinder of the pump, all substantially as shown and described.

297,573. INTEREST-CALCULATOR. ARNOLD DAVIDSON, Brooklyn, N. Y. Filed Aug. 16, 1883. (Model.)

Claim.—1. An interest-calculating device having parts adjustable one with relation to the other, upon which are displayed a table of interest and different expressions of each of the elements of principal, of rate, and of time in the interest-calculation problem, whereby such device is adapted to admit of the variation of the value of each and every of such elements, and thus show any amount of interest sought for, substantially as described.

2. A device for calculating interest which admits of the variation of any one of the three elements in the interest-calculation problem of principal, of rate, and of time, consisting of a lower disk or table bearing two of such elements, in conjunction with an interest-table and an upper disk or indicator bearing the remaining element, substantially as described.

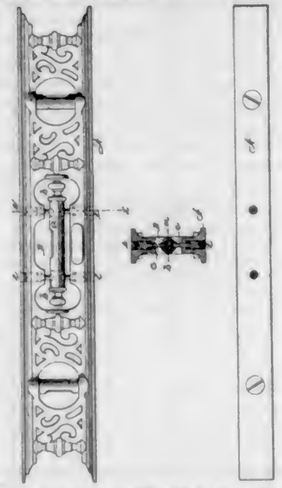
3. In combination with an interest-calculating device, a table having grouped together pairs of factors, each of which pair has a common multiple with the others of the same group, such group consisting of two of the elements of the interest-calculation problem of principal, of rate, or of time, substantially as described.

4. In combination with a superincumbent disk or indicator, a lower disk or other device having thereon an interest-table, a part whereof consists of two of the three elements in the interest-calculation problem of principal, time, or rate, grouped together in pairs, each pair of which respectively is composed of two factors of a multiple common to it and every other pair of the same group, substantially as described.

5. In a device for calculating interest, an indicator having apertures of various widths therein, and having inscribed thereon adjacent to such apertures the different values of one of the three elements in the interest-calculation problem of principal, of rate, and of time, in combination with another disk or table bearing computations of interest, and, in connection therewith, the two remaining elements, substantially as herein shown and described.

6. An interest-calculator consisting of an indicator having apertures of various widths therein, and adjacent to such apertures different expressions of rates of percentage, in combination with an interest-table displayed in columns upon a disk or other device, and having, in connection with such columns, different expressions of the elements of principal and of time, substantially as herein shown and described.

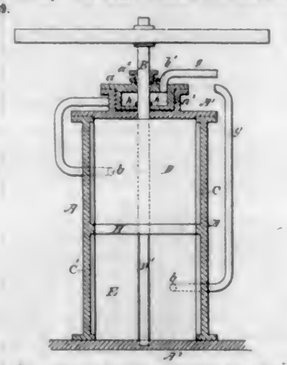
7. In combination with a calculating device having a table of figures thereon, an indicator having apertures therein, and tracing-cloth or other transparent material covering a portion of such apertures, substantially as and for the purpose set forth.



8. In an interest-calculating device, a lower disk or device having a computation table or tables thereon, and different expressions of two of the elements of the interest-calculation problem, in combination with an upper disk or indicator having therein apertures of various widths and bearing different expressions of the third element, substantially as herein described.

9. In a calculating device, a lower disk or device having a computation table or tables thereon and different expressions of two of the elements in the interest-calculation problem, in combination with an upper disk or indicator having apertures of various widths, adjacent to which are figure-columns and different expressions of the third element, substantially as described.

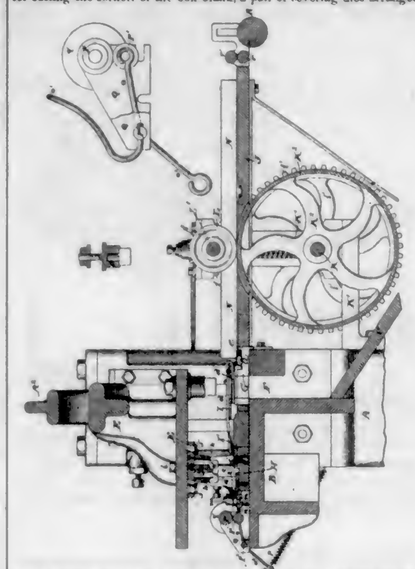
10. In combination with a lower disk having interest-computations thereon, a superincumbent revolubly indicator having a space or spaces thereon adapted to expose the subjacent interest-columns, and upon the margin of such space or spaces dollar and cent signs to various periods, whereby the proper value of the figures in the interest-computations displayed beneath is indicated, substantially as described.



11. The combination of the projecting disk A with the upper disk, B, having therein apertures *e* and partial coverings *f* of transparent material, and the interest table or tables constructed and arranged for the purposes and substantially as shown and described.

297,574. SPIRIT-LEVEL. LEONARD L. DAVIS, Springfield, MASS. Filed Mar. 10, 1884. (No model.)

Claim.—A spirit-level having a longitudinal opening, B, between its opposite faces, two screws passing through each of said faces, and having their points terminating opposite each other within said opening, and a bubble-glass case adapted to be hung upon the points of said screws, all combined and arranged substantially as set forth.



297,575. ROTARY ENGINE. ADOLF DECHER, Munich, Germany. Filed Oct. 11, 1883. (No model.) Patented in France Aug. 31, 1883, No. 144,929.

Claim.—In a rotary engine, the combination of a working-cylinder divided into two chambers by a horizontal partition, each chamber having two abutment-valves, E E, and steam inlet and outlet ports *b g*, with a shaft, B, provided with two piston-wings, D, for each chamber, a rotary valve, *k*, rigidly connected with shaft B, and operating in a valve-chest formed on one of the heads of the cylinder, and suitable connections between said valve, the source of steam-supply, and the cylinder-chambers, and connections to exhaust the spent steam from said chambers, said parts being constructed for co-operation substantially as described.

297,576. MACHINE FOR CUTTING STRAW-BOARD FOR PAPER BOXES. GEORGE H. DICKERMAN, Somerville, MASS. Filed June 9, 1883. (No model.)

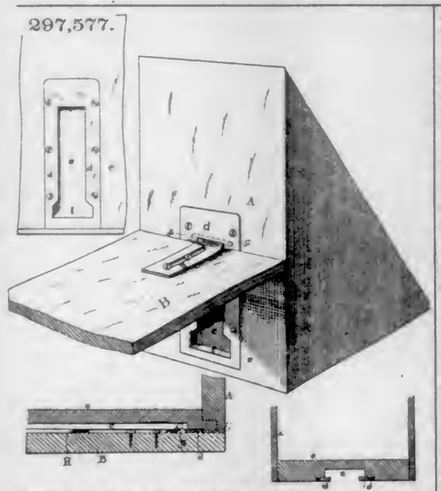
Claim.—1. In a machine for cutting straw-board for making paper boxes, the combination of two pairs of rectangular male and female dies for cutting the corners of the box-blank, a pair of severing-dies arranged

to be adjusted toward and from the corner-cutting dies, and two crease-embossing blades arranged upon opposite sides of said severing-dies, and adapted to be adjusted toward and from said severing-dies, substantially as and for the purposes described.

2. In combination with the fixed bed B and vertically-reciprocating cross-head E, the die-plate H, having adjustably secured thereon the stationary cutting-die *c'*, and, firmly secured thereto in fixed positions, the slotted stand O^2, and the plate O, carrying the cutter blade or die *i'*, and provided with the rectangular guide-blocks O^2, and adjustably secured to the cross-head E, all substantially as and for the purposes described.

3. The plate O, adjustably secured upon the cross-head E, and having firmly secured thereon the cutting-die *i'*, and the two crease or fold embossing-blades *k k*, bolted to the under side of said plate O, and arranged to be adjusted thereon toward or from the cutting-die *i'*, all arranged and adapted to operate substantially as and for the purposes described.

4. The combination of two pairs of corner-cutting dies, arranged to be adjusted in a direction at right angles to the line of feed of the material, a pair of severing-dies or cutters arranged to be adjusted in a direction parallel with the line of feed of the material, and a pair of embossing-blades arranged upon opposite sides of and parallel to the movable severing-die, and to be adjusted toward and from said severing-die, substantially as described.

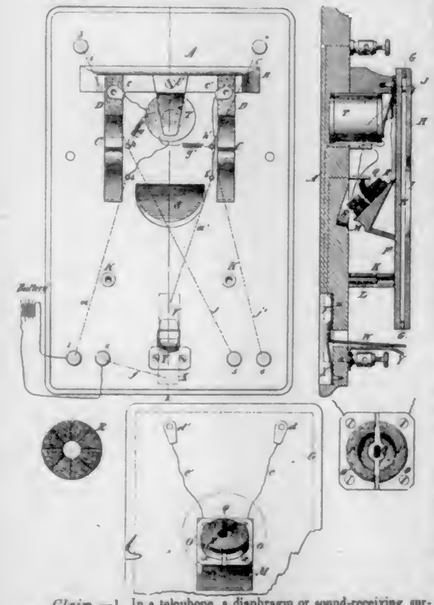


5. In combination with the vertically-reciprocating cross-head E and the severing and embossing dies, the delivery-roll P, mounted in fixed bearings, the shaft P^2, provided with the arms *o o*, *o'*, and o^2, the spring *p*, and the roll P', mounted in bearings in the movable ends of the arms *o o*, substantially as and for the purposes described.

297,577. PAPER-FILE. WILLARD D. DORENUS, Washington, D. C., assignor to Edmund W. Woodruff, same place. Filed Feb. 9, 1884. (No model.)

Claim.—1. A file holder or box, A, provided with undercut or flange groove *c*, and a shelf, B, combined with a T-head coupling-plate, H, or its equivalent, permanently attached to the shelf B, and engaged with the flanges *d* of the groove *c*, so as to permit a longitudinal or tilting movement of said box without disengagement at any moment.

2. A file holder or box, A, provided below with an undercut or flange groove, *c*, having an enlargement, *i*, and the shelf B, combined with a T-head plate, H, permanently attached to but capable of moving upon said shelf, the T-head lugs *g* of said plate being within said groove,



297,577.

to attach the box and shelf and be incapable of separation until said box has been withdrawn off the shelf and tilted, as shown and described.

3. The box A, provided with the undercut or flange groove *c* in the bottom *e*, and the shelf B, combined with the T-head plate H, fitted to enter and engage within the flanges of said groove *c*, and attached to said shelf, so that it may move thereon, as described, to permit the box A to move forward and tilt, as described, without at any moment being detached or detachable from said plate H.

297,578. TELEPHONE-TRANSMITTER. DANIEL DRAWBAUGH, Eberly's Mill, Pa., assignor to the People's Telephone Company, of New York. Filed Nov. 12, 1883. (No model.) Patented in Belgium Jan. 10, 1884, No. 63,302.

Claim.—1. In a telephone, a diaphragm or sound-receiving surface, two fixed electrodes coincidently inclined or having their upper surfaces inclined in the same plane, the said electrodes not being in electrical contact with one another, a loose electrode superimposed upon both of said fixed electrodes and resting upon said electrodes by gravity, and a means of maintaining said loose electrode in position upon the fixed electrodes, substantially as described.

2. In a telephone, a vertical diaphragm, two fixed electrodes supported upon said diaphragm and not in electrical contact with one another, a loose electrode superimposed upon both of said fixed electrodes and resting upon them by gravity, and a means of maintaining said loose electrode in position upon the fixed electrodes, substantially as described.

3. In a telephone, a diaphragm, a support secured to the rear side of said diaphragm and having an inclined upper surface, two fixed electrodes secured upon the inclined side of said support and not in electrical contact with one another, a loose electrode of like material resting upon said fixed electrodes, and a post of non-conducting material projecting from said support, and passing loosely through an aperture in said loose electrode, substantially as described.

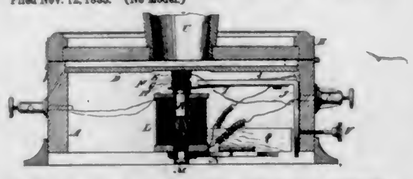
4. In a telephone, a diaphragm rigidly fastened at one side and having a greater part of its periphery free and unattached, two electrodes inclined or having inclined upper surfaces supported upon said diaphragm, and not in electrical contact with one another, a loose electrode of like material resting upon said fixed electrodes by gravity, and a means of supporting the loose electrode to prevent it from sliding off the fixed electrodes, substantially as described.

5. In a telephone, a diaphragm, two fixed electrodes of semicircular segmental form, coincidently inclined, supported upon said diaphragm, and not in electrical contact with one another, a loose electrode, annular in form, and resting by gravity upon said fixed electrodes, and a post projecting above said fixed electrodes, and passing loosely through the aperture in said loose electrode, substantially as described.

6. In a telephone, two electrodes, one of said electrodes being loose, of substantially wedge-shaped cross-section, or having one side made heavier than the other, so that when said electrode is suspended said weighted or thicker side may, by the action of gravity, assume a lower position than the unweighted or thinner side, the said loose electrode forming a bridge between the fixed electrodes, substantially as described.

7. In a telephone, the combination of the diaphragm E, support M, plates O O′, fixed electrodes P P′, post Q, and loose electrode R, substantially as described.

8. In a telephone, a diaphragm rigidly secured at one end to a support, the greater part of the periphery of said diaphragm being unattached, a piece or pieces of elastic material being interposed between said diaphragm and the support, the inner side of said diaphragm near the free end thereof resting against a piece or pieces of elastic material supported in contact with said side, but not attached thereto, substantially as described.



9. A telephone having no inclosing box or case, the electrodes being supported by the diaphragm, and the diaphragm being rigidly attached at one end to a support secured to the back or base board, substantially as described.

10. In a telephone, the combination of a diaphragm, E, supported at one end, the interposed frame or piece G, and cover H, having an orifice, I, the said cover being secured to and vibrating with the diaphragm, substantially as described.

11. In a telephone, the combination of the back or base board, A, the bar B, brackets C, posts L, and elastic tubes K, with the diaphragm E, interposed frame or piece G, and cover H, substantially as described.

12. In a telephone, the combination of the base-board A, bar B, brackets C, posts L, elastic tubes K, diaphragm E, interposed piece G, cover H, bracket M, socket-plates O O′, electrodes P P′, electrode R, post Q, induction-coil T, and circuit-connections, substantially as described.

297,579. TELEPHONE-TRANSMITTER. DANIEL DRAWBAUGH, Eberly's Mill, Pa., assignor to the People's Telephone Company, of New York. Filed Nov. 12, 1883. (No model.)

Claim.—1. In a telephone-transmitter, a diaphragm, an electrode supported by or otherwise connected so as to vibrate with said diaphragm, a second electrode sustained by a permanently-polarized vibratory support of inductive material in contact with the first electrode, the said support forming the armature of an electro-magnet having a permanently-polarized core, the contiguous ends of said armature and core being of like polarity, and the said electrodes and the coil of the electro-magnet being in circuit, substantially as described.

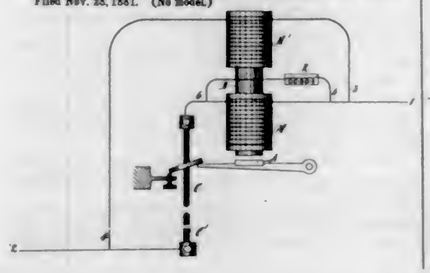
2. In a telephone, and in combination with the diaphragm thereof, and with an electrode supported by or vibrating with said diaphragm, a resistance-varying electrode mounted upon a vibratory polarized armature whose outward motion is resisted by a fixed polarized magnet, like poles being opposed, the power of the fixed magnet being varied in proportion to the strength of the current passing through a circuit in which is included both electrodes and a coil surrounding the fixed magnet, substantially as described

3. In a telephone, the combination of the diaphragm carrying one electrode, the vibrating electrode supported upon a polarized armature, the polarized magnet in the rear of the armature, the battery-coil, and circuit-connections, whereby the outward motion of the armature and its associated electrode is resisted by the polarized magnet with a force greater in proportion to the approach, and at the same time the power of the magnet is augmented in proportion to the pressure upon the electrodes incident to the increased contact produced by the motion of the diaphragm toward its associated electrode.

4. In a telephone-transmitter, a diaphragm or sound-receiving surface, an electrode supported by or otherwise connected so as to vibrate with said diaphragm, a second electrode sustained by a vibratory elastic support, a permanent magnet connected to and polarizing said support, a means of moving said magnet, and thereby the support, so as to adjust the initial pressure between the electrodes, and an electro-magnet acting upon said support, and included in circuit with the electrodes, substantially as described.

5. A telephone-transmitter containing an electrode supported by or vibrating with the diaphragm, and a second electrode supported upon a vibratory permanently-polarized armature, the said armature being arranged in front of the permanently-polarized core of an electro-magnet, two independent means of varying the initial pressure between said electrodes, one of said means consisting in a screw or analogous contrivance for moving the armature and its associated electrode, and the other of said means consisting in a device for moving the core of the electro-magnet nearer to or farther from the armature, and thereby causing said core to exercise a greater or less magnetic influence thereon, substantially as described.

6. In a telephone containing a diaphragm and a fixed electrode carried thereby or vibrating therewith, a vibratory electrode supported by an armature of inductive material, with a means of mechanically adjusting said armature, and also a means of magnetically adjusting said armature by the approach or recession of the pole of a permanent magnet, either or both of said means of adjustment of the armature operating to vary the initial pressure between the electrodes, substantially as described.

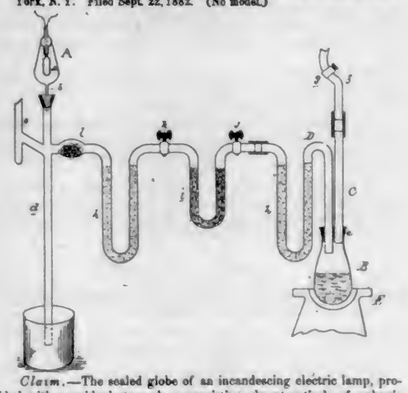


7. In a telephone, the combination of the diaphragm or other vibrating surface carrying an electrode, the opposing electrode supported upon an armature attached to one pole of a permanent magnet, and magnetized by induction therefrom, and the induction-coil supported upon and having its core magnetized by induction from another permanent magnet, and circuit-connections, substantially as described.

8. In a telephone containing circuit-connections, a diaphragm or sound-receiving surface, and an electrode carried by or vibrating with said diaphragm, an electrode having a vibratory support of inductive material polarized by a permanent magnet, the said support being placed in the magnetic field of a second permanent magnet, which second magnet constitutes the core of an induction-coil, substantially as described.

9. In a telephone, the combination of the diaphragm carrying an electrode, the polarized armature carrying a second electrode in contact with the first, the circuit-connections, and the induction-coil, whose core, polarized by induction, is located in line with the electrodes, and facing the armature to which one of said electrodes is attached, substantially as described.

10. The pivoted permanent magnet supporting the induction-coil and means for adjusting the same, in combination with the adjustable permanent magnet provided with a spring of inductive material carrying an electrode, and the diaphragm carrying a second electrode, substantially as described.



297,580. ELECTRIC-ARC LIGHT. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Nov. 28, 1881. (No model.)

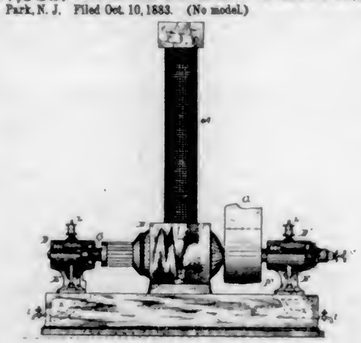
Claim.—1. In regulating mechanism for arc-lamps, the combination of the opposing solenoids or electro-magnets located one in the line and the other in a shunt around the arc, both of such solenoids or electro-magnets having the same resistance, substantially as set forth.

2. In regulating mechanism for arc-lamps, the solenoid or electro-magnets of the same resistance located in the line and in a shunt around the arc, in combination with a shunt around the solenoid or electro-magnet in the line, substantially as set forth.

297,581. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Sept. 22, 1882. (No model.)

Claim.—The sealed globe of an incandescing electric lamp, provided with a residual atmosphere consisting almost entirely of carbonic monoxide, substantially as set forth.

297,582. DYNAMO-ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J. Filed June 29, 1883. (No model.)



Claim.—1. The combination, with a solid cylindrical armature-core composed of disks strung on a shaft, and coils wound longitudinally thereon, of supports projecting from certain of said disks, forming longitudinal projecting rows, between which said coils are wound, substantially as set forth.

2. The combination, with the ordinary disks of the armature-core, of interspersed disks having slots or notches in their edges, and projecting supports inserted in said slots or notches, substantially as set forth.

3. The combination, with the ordinary thin disks of the core, of the interspersed thicker disks provided with projecting supports for the coils, substantially as set forth.

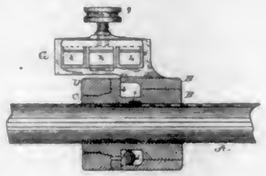
297,583. DYNAMO-ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J. Filed Oct. 10, 1883. (No model.)

Claim.—1. In a dynamo-electric machine driven by a belt, the shaft balanced in its bearings, and free to move in either longitudinal direction, substantially as set forth.

2. The combination, with a dynamo-electric machine driven by a belt, of means tending to move the shaft of the machine longitudinally in one direction, and means acting with equal force to move it in the opposite direction, substantially as set forth.

3. The combination, with a dynamo-electric machine driven by a belt, of a spring bearing against an end of the armature-shaft, substantially as set forth.

4. In a dynamo-electric machine driven by a belt, the combination of a spring bearing against an end of the shaft of the machine, and means tending to move said shaft against said spring, substantially as set forth.



5. A belt-driven dynamo-electric machine placed at a slight angle from a vertical position, and provided with means resisting the consequent sliding tendency of the shaft of the machine, substantially as set forth.

6. A belt-driven dynamo-electric machine placed at a slight angle from a vertical position, and provided with a spring bearing against the lower end of its shaft, substantially as set forth.

7. In a dynamo-electric machine driven by a belt, the combination of an adjustable spring bearing against an end of the shaft of the machine, and means tending to move said shaft against said spring, substantially as set forth.

8. The combination, with a dynamo-electric machine, of a bed-plate therefor, formed as an open-ribbed frame, one or more oil-receptacles within said bed-plate, and one or more ducts leading from the journal-boxes to said receptacles, substantially as set forth.

297,584. DYNAMO-ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J. Filed Oct. 10, 1883. (No model.)

Claim.—1. The combination, in a commutator-brush holder, of the shaft or spindle, a cylinder fixed thereon, a movable collar concentric to said cylinder and carrying the brush, and adjusting means connecting said collar and cylinder, substantially as set forth.

2. In a commutator-brush holder, the combination of the cylinder fixed upon the shaft or spindle, the movable collar carrying the brush and sleeved upon the fixed cylinder, and the adjustable spring connecting the two parts, substantially as set forth.

3. The combination of the shaft or spindle, the inner cylinder formed as a split sleeve, the clamping-ring, and the outer adjustable collar carrying the brush, substantially as set forth.

4. The combination of the shaft or spindle, the inner cylinder having a pin entering a groove in said shaft or spindle, the clamping-ring, and the outer movable collar carrying the commutator-brush, substantially as set forth.

5. The combination, with the inner cylinder fixed upon the shaft or spindle and the outer movable collar thereon, of the adjustable spring attached to the movable collar, and the pin connecting said spring with the fixed cylinder, substantially as set forth.

6. The combination, with the adjustable collar provided with a projecting tube and the spring within said tube, of the inner fixed cylinder and a connection between the spring and said fixed cylinder, substantially as set forth.

7. The frame carried by the brush-holder and supporting the brush throughout the greater part of its length, substantially as set forth.

8. The combination, with the adjustable cylinder having a projecting head, of the brush-supporting frame carried by such head, substantially as set forth.

9. The combination of the adjustable cylinder having a projecting head provided with an aperture, the brush-supporting frame fixed in such aperture, and the brush held in such frame and adjustable through said aperture, substantially as set forth.

10. The combination of the longitudinally-divided brush and the brush-supporting frame correspondingly divided, the ends of the brush-divisions projecting beyond the frame, substantially as set forth.

11. The commutator-brush composed of alternate metal strips and layers of wires, substantially as set forth.

12. The longitudinally-divided commutator-brush composed of alternate metal strips and layers of wires, substantially as set forth.

297,585. INCANDESCING CONDUCTOR FOR ELECTRIC LAMPS. THOMAS A. EDISON, Menlo Park, N. J. Filed Oct. 10, 1883. (No model.)

Claim.—1. The incandescing conductor for an electric lamp, consisting of a carbonized tightly-twisted strip of paper or other suitable carbonizable material, substantially as set forth.

2. The incandescing conductor for an electric lamp, consisting of a carbonized tightly-twisted strip of paper or other suitable carbonizable material provided with a carbonizable cementing material, substantially as set forth.

3. The filament for forming, on carbonization, the incandescing conductor of an electric lamp, consisting of a tightly-twisted strip of paper or other suitable carbonizable material, substantially as set forth.

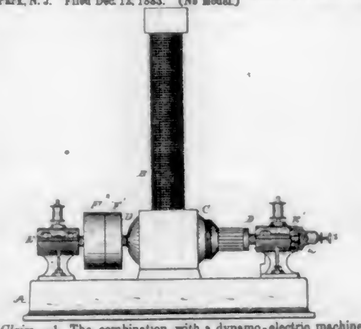
4. The filament for carbonization, consisting of a tightly-twisted strip of paper provided with a carbonizable cementing material, substantially as set forth.

5. The method of forming incandescing conductors for electric lamps, consisting in twisting a strip of carbonizable material into a homogeneous filament and carbonizing the same, substantially as set forth.

6. The method of forming incandescing conductors for electric lamps, consisting in twisting a strip of carbonizable material into a homogeneous filament, providing it with a carbonizable cementing material, and carbonizing the whole, substantially as set forth.

7. The method of forming incandescing conductors for electric lamps, consisting in twisting a strip of carbonizable material into a filament, treating the same with hydrofluoric acid or other gelatinizing or parchmentizing agent, to form a cementing material, and carbonizing the whole, substantially as set forth.

297,586. ELECTRICAL CONDUCTOR. THOMAS A. EDISON, Menlo Park, N. J. Filed Oct. 10, 1883. (No model.)



Claim.—1. The combination, with an electrical conductor, of a strip of parchment-paper wound spirally thereon, and a braided or wound retaining-covering, substantially as set forth.

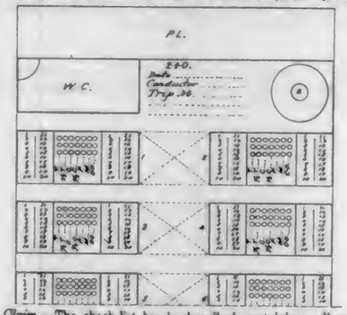
2. As an insulator for electrical conductors, japanned parchment-paper, substantially as set forth.

3. The combination, with an electrical conductor, of a strip of japanned parchment-paper wound spirally therron with its edges overlapping, and a retaining-covering, substantially as set forth.

297,587. DYNAMO-ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J. Filed Dec. 12, 1883. (No model.)

Claim.—1. The combination, with a dynamo-electric machine, o means opposing the attraction of the driving-pulley by the field-magne of the machine, substantially as set forth.

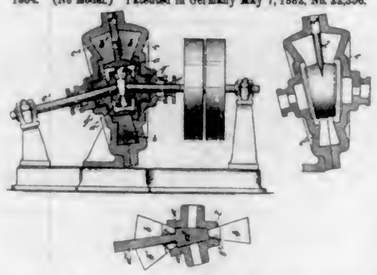
2. The combination, with a dynamo-electric machine, of a spring bearing on the end of the armature-shaft and opposing the attraction of the driving-pulley by the field-magnet, substantially as set forth.



3. The combination, with a dynamo-electric machine, of a driving-pulley nearly removed from the attraction of the field-magnet, and means opposing the slight attractive influence of said magnet upon said pulley, substantially as set forth.

4. The combination, with a dynamo-electric machine, of a driving-pulley partly of magnetic and partly of non-magnetic material, substantially as set forth.

5. The combination, with a dynamo-electric machine, of a driving-pulley partly of magnetic and partly of non-magnetic material, and means opposing the attraction of the field-magnet for said pulley, substantially as set forth.



6. The combination, with a dynamo-electric machine, of a driving-pulley partly of magnetic and partly of non-magnetic material, and a spring opposing the attraction of said pulley by the field-magnet of the machine, substantially as set forth.

297,588. CHECK-LIST FOR REGISTERING RAILWAY-PASSENGERS. SAML. D. ELDRED, Minonk, Ill. Filed June 9, 1883. (No model.)

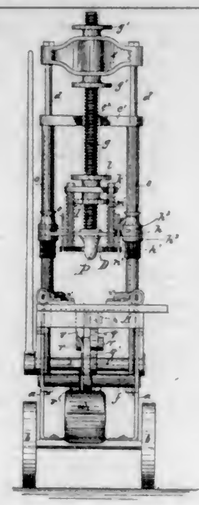
Claim.—The check-list herein described, containing a diagram of the interior arrangement of seats in a passenger-car, upon which the numbers of seats, station-numbers, and a series of letters indicating manner of payment of fare, are all combined substantially as and for the purposes described.

297,589. ROTARY ENGINE. CARL ENEK, Nuremberg, Bavaria, assignor to Victor Henry von Swaine, Wiesbaden, Germany. Filed Jan. 9, 1884. (No model.) Patented in Germany May 7, 1882, No. 22,356.

Claim.—1. A rotary engine consisting of the case *c c'*, beveled-gear wheels *a a'*, mounted upon shafts *e e'*, the said gear-wheels being connected with the paddles *b b'*, of the filler *d d'*, and of inlet and outlet pipes *f f'*, all combined and arranged substantially as herein shown and described.

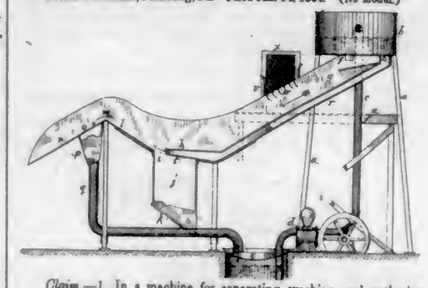
2. In rotary engines, the case *c c'*, made in two parts, that are so arranged as to form the flanged pipes *f f'*, in combination with the filler *d*, having tail-piece *d'*, substantially as shown and described.

297,590. GLASS-PRESS. LOUIS FISCHER, Pittsburg, Pa. Filed Dec. 28, 1883. (No model.)



Claim.—1. In a press, the table A, provided with hollow standards, the rods *d*, located within said standards, and the plunger P, in combination with mechanism for reciprocating the rods, substantially as set forth.

2. In a press, the table A, having suitable hollow standards, the rods located within said standards, and the platen D, carrying the plunger, and having the sleeves A, adapted to slide on the standards, in combination with mechanism for reciprocating the rods, substantially as set forth.



3. In a press, the table A, having hollow standards, the rods *d*, located within said standards, and the plunger P, in combination with the toggle-joint *g g'*, and mechanism for opening and closing said toggle-joint, substantially as set forth.

4. In a glass-press, the toggle-joint *g g'*, secured at one end to the table A, or a fixed part thereof, the other end being secured to the rods *d* below the table, in combination with the lever *e'* and the counter-weight, substantially as set forth.

297,590.

297,591. MACHINE FOR SEPARATING COAL FROM ASHES, &c. LOUIS O. FRAZIER, Pittsburg, Pa. Filed Jan. 14, 1884. (No model.)

Claim.—1. In a machine for separating, washing, and gathering small pieces of coke or breeze from ashes, clinkers, and the like, the combination of the elevated water-tank provided with a supply-pipe for feeding water thereto, and with holes through its bottom, the chute, and sub-raceway, said chute having the transverse opening at the lower end, an upward-inclined plane beyond said transverse opening, and the spout or declining slide provided with a sieve for separating the water from the breeze or washed coke, a funnel, a return-pipe, and a cistern, substantially as described.

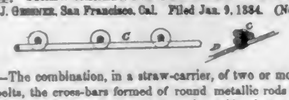
2. The combination of the water-tank and cistern provided with communicating supply and return pipes, with the downwardly-inclined chute and sub-raceway provided with a transverse opening at the foot of said chute, the shorter upward incline, and the discharge-spout having a sieve, substantially as shown and described.

297,592. SHOE. PIERRE DAMASE FERCHINGER, Paris, France. Filed Aug. 16, 1883. (Model.) Patented in France Feb. 13, 1883, No. 153,684.

Claim.—1. In the manufacture of boots and shoes, the herein-described pattern, having the shank portion *a'*, heel-sections *b b*, and counter *c f*, whereby a boot or shoe may be made having the shank, vertical

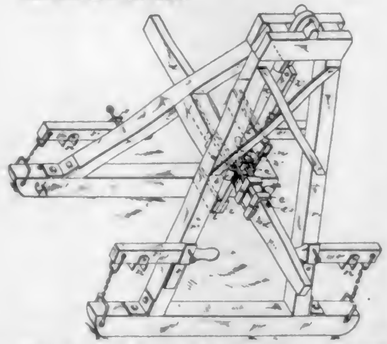
walls of the heel-case, and counter in one piece, substantially as described.

2. In the manufacture of boots and shoes, the herein-described pattern, having the sole portion *a*, shank portion *a'*, heel portions *b b*, and counter *c f*, whereby a boot or shoe may be produced having the outsole shank, vertical walls of the heel-casing, and counter made of a single piece of material, substantially as described.



297,593. MANUFACTURE OF SPLIT BLANKS. WILLIAM GARRETT Beaver Falls, Pa. Filed Oct. 19, 1883. (No model.)

Claim.—1. The improvement in the art of manufacturing laterally split or divided blanks which consists in indenting or impressing in a suitably rolled and heated bloom one or more lateral gaps or recesses along the entire length thereof, and thereafter reducing the bloom to the required thickness, and simultaneously closing up the recesses thereof without welding the same, substantially as set forth.



2. The improvement in the art of manufacturing laterally split or divided metallic blanks which consists in first rolling one or more lateral gaps or recesses in a bloom, and thereafter closing up said recesses and reducing the bloom to the required thickness by rolling the same parallel with the recesses thereof, substantially as set forth.

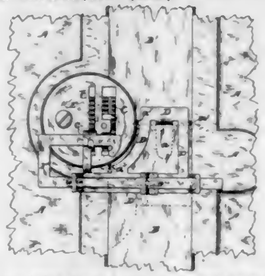
297,594. STRAW-CARRIER FOR THRASHING-MACHINES. MAXIMILLION J. GEBHART, San Francisco, Cal. Filed Jan. 9, 1884. (No model.)

Claim.—The combination, in a straw-carrier, of two or more flexible endless belts, the cross-bars formed of round metallic rods or wires bent to form loops or eyes, and rivets for securing said rods to said belts, substantially as and for the purpose described.

297,595. MECHANICAL POWER. WILLIAM SMITH GRAY, May, Tex. Filed Feb. 2, 1884. (No model.)

Claim.—1. As an improvement in mechanical powers, the combination, with the center bar having a pivoted cross-head at its lower end carrying two lifting-pawls, and two holding-pawls pivoted to the center bar above the cross-head, of two rack-bars working through the lower cross-head on the center bar and through a cross-head above the holding-pawls, and two levers for operating the pivoted cross-head and lifting-levers, substantially as specified.

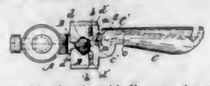
2. In a mechanical power, the combination, with the center bar, pivoted cross-head, and rigid cross-head thereon, and the rack-bars, lifting-pawls, and holding-pawls, of the swinging hooks at the ends of the rigid cross-head on the center bar, for engaging the holding-pawls and keeping them out of engagement with the racks, substantially as specified.



3. In a mechanical power, the combination, with the center bar and rack-bars and the lifting and holding pawls, of the pivoted cross-head having end sockets for the reception of the removable wooden levers, substantially as specified.

4. In a mechanical power, the combination, with the derrick, the posts of which are provided with the perforated stirrups, of the levers having clip-fulcrums, and chains provided with securing-pins connected at their power ends by chains to the runners of the derrick, substantially as specified.

5. In a mechanical power, the combination, with the pivoted cross-head at the lower end of the center bar, the rigid cross-head on the center bar, and the rack-bars connected by pivoted parallel bars at their lower ends, of the hold-pawls below the rigid cross-bar and the lifting-pawls pivoted in spaces in the pivoted cross-head on opposite sides of the center bar and provided with lever-handles, substantially as specified.



6. In a mechanical power, the combination, with the center bar provided with a base, a pivoted cross-head, a rigid cross-head, and lifting-pawls and holding-pawls, of the rack-bars having upper and lower pivoted cross-heads, substantially as specified.

297,596. HOLDER FOR SEWING-MACHINE ATTACHMENTS. JOHN M. GRIEST, Chicago, Ill., assignor to the Chicago Attachment Company, same place. Filed Nov. 5, 1883. (Model.)

Claim.—A holder for connecting attachments or parts of attachments to sewing-machines, the said holder consisting of a removable plate, D, having thereon the depending and horizontally-projecting yielding tongue *a* and one or more depending lugs, *a' a'*, substantially as and for the purposes set forth.

297,597. BINDING ATTACHMENT FOR SEWING-MACHINES. JOHN M. GRIEST, Chicago, Ill., assignor to the Chicago Attachment Company, same place. Filed Nov. 5, 1883. (Model.)

Claim.—The combination, in a binding attachment for sewing-machines, of the presser-foot A, cut-off at the needle-hole, and having thereon the studs *b b*, the set-screw B, and the binder C, the said binder having a neck or extension, C', and a flattened portion or shank, D, in which are the slots *d' d' d'*, an elongated needle-hole, and an opening, *d''*, all arranged, substantially as shown and described, with relation to each other, for the purposes set forth.

297,598. METHOD OF PRODUCING ARTIFICIAL PRECIOUS STONES. SAMUEL GROSSOURD, Les Mousierus, France. Filed Dec. 17, 1883. (No specimens.) Patented in France Oct. 25, 1883, No. 151,732.

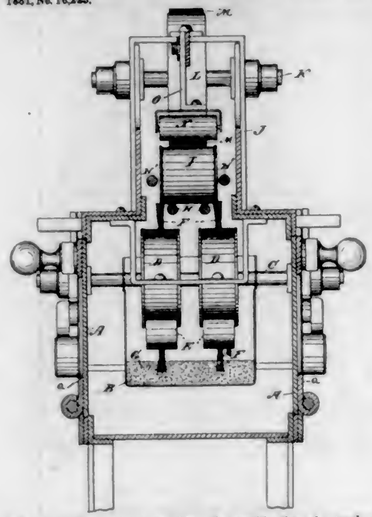
Brief.—Improvement on Letters Patent No. 280,467, dated July 3, 1883, and No. 290,040, dated December 11, 1883, to same inventor.

Claim.—1. The herein-described method of obtaining artificial precious stones, which consists in fritting, fusing, or melting together superposed layers of colored enamels, as described.

2. The herein-described method of obtaining imitation precious stones of a given color or of a variegated color, which consists in fritting, fusing, or melting together superposed layers of colored enamels to a foundation-layer of strass, as described.

3. The herein-described method of obtaining imitation precious stones of a given color, or of variegated colors, which consists in fritting, fusing, or melting together alternating superposed layerr of strass and colored enamels, as described.

4. As a new article of manufacture, an imitation precious stone composed of enamels of different colors, as set forth.

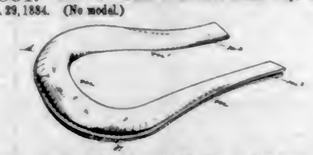


5. As a new article of manufacture, an imitation precious stone composed of enamels of different colors and strass, as described.

297,599. TWO-WHEELED VEHICLE. CHARLES S. HARPER, Sharon, Mass. Filed Apr. 27, 1883. (No model.)

Claim.—The combination of axle *b*, shafts *c*, cross-bars *d d*, springs *e e*, and links *f*, said cross-bars and springs being arranged relatively to

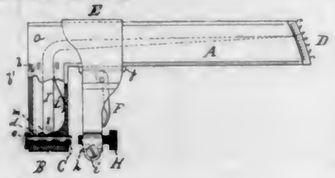
the axle to give the required balance to body *a* over the axle, and said springs and cross-bars being so relatively arranged that the springs shall be freely suspended in links *f* beneath said cross-bars, substantially as specified.



297,600. RESINING-MACHINE. BERNHARD HAUSHERR and JOHAN METZNERS, Cham, Switzerland, assignors to David S. Page, New York, N. Y. Filed Mar. 15, 1884. (No model.) Patented in Germany Feb. 19, 1881, No. 16,225.

Claim.—1. In a resining-machine, the combination of a track arranged to support and guide the articles to be resined, a reservoir for containing the resin, and an endless brush-band for applying the resin to the said articles, substantially as shown, and for the purpose specified.

2. The combination, in a resining-machine, of a track arranged to support and guide the articles to be resined, an endless band for moving such articles along said track, a reservoir for holding the resin, and an endless brush-band for applying the resin to said articles, substantially as shown, and for the purpose described.



297,601. CRUPPER. HIRAM H. HENDRIX, Kansas City, Mo. Filed Feb. 29, 1884. (No model.)

Claim.—1. A crupper formed with the swelled bow *m*, curved shanks *m'*, and arms *m²*, having an external shell made of a single blank, A, of leather, cut or formed with enlarged body *a*, curved portion *a'*, and portion *a²*, as set forth.

2. The crupper described, composed of the blank A, having parts *a a' a²* and inclined crease *f*, the filling-piece B, and the core C, the blank A and core C being secured by stitches *f''*, and the whole constructed and operating as set forth.

297,602. MICROMETER. THOMAS HOOKER, Syracuse, N. Y. Filed Mar. 21, 1883. (No model.)

Claim.—1. In a micrometer, a jaw connected to the needle and consisting of a sliding bar projecting at both ends from the head, substantially as specified.

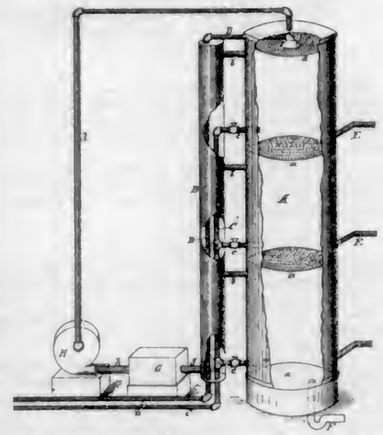
2. In a micrometer, a jaw consisting of a sliding bar provided with a stud operating in a slot in the index-needle, and with a handle or end projecting from the head, substantially as specified.

3. In a micrometer, a jaw consisting of a sliding bar arranged at a right angle to the index-needle and provided with a spiral stud, substantially as specified.

4. The arm E, carrying the adjusting-nut H and set-screw *i*, in combination with a body, A, carrying an index-needle, I, and a projecting sliding bar, C, having a rib, *d*, and handle *c*, substantially as shown and described.

5. The combination of the body A, carrying the needle I, spring L, and sliding projecting rod C, these elements constituting one portion of a micrometer, with the arm E, carrying the adjusting-screw H and set-screw *i*, constituting the remaining portion, and with means, substantially as shown and described, for adjustably securing one of said portions to the other, substantially as and for the purposes set forth.

6. The combination of the head B, sliding bar C, projecting at each end therefrom and having a stud, the slotted needle I, and the spring L, whereby the jaw may be opened and the needle operated from the outside of the head, and the jaw automatically self-closed against an object to be gaged.



7. In a micrometer, a jointless index-needle and sliding bar operating together, and both controlled by a spring acting directly upon the needle, and through that upon the sliding bar, constructed and operating together substantially as set forth.

8. In a micrometer, the combination of the needle I, sliding bar C, projecting at both ends, spring L, scale D, arm E, and screw H, with the body A, constructed and operating together substantially as and for the purposes set forth.
